JAMAICA, VT., 125 tons, highway bridge, to American Bridge Co.

HYDE PARK, MASS., 130 tons, garage and stock building for Edison Electric Illuminating Co., to McClintic-Marshall Co.

EAST HARTFORD, CONN., 2200 tons, Pratt & Whitney Aircraft Corporation plant, to Levering & Garrigues Co.

MONTICELLO, N. Y., 190 tons, telephone building, to unnamed bidder.

DOBBS FERRY, N. Y., 200 tons, telephone building, to Elby Structural Steel Co.

TARRYTOWN, N. Y., 3000 tons, assembly plant for Chevrolet Motor Co., to Mahon Structural Steel Co.

VESTA, N. Y., 175 tons, two highway bridges, to American Bridge Co.

NEWARK, N. J., 3800 tons, American Insurance Co. building, to Hedden Iron Construction Co.

RIVERTON, N. J., 150 tons, Delaware River bridge between Riverton and Belvidere, to Bethlehem Fabricators, Inc.

TRENTON, N. J., 1050 tons, Trenton Senior High School, to American Bridge Co.

FLORENCE, N. J., 200 tons, machine shop, to Belmont Iron Works.

MINERSVILLE, PA., 500 tons, factory for H. D. Bob & Co., reported to Bethlehem Construction Co.

NETRONA, PA., 120 tons, tank foundations, to Pittsburgh Bridge & Iron Co.

SEABOARD AIR LINE, 250 tons, bridge at Hopewell, Va., to Virginia Bridge & Iron Co.

DETROIT, 2800 tons, municipal airport, to Whitehead & Kales Co.

DETROIT, 800 tons, warehouse for Michigan Telephone Co., to Russell Steel Construction Co.

DETROIT, 1200 tons, plant addition for Detroit Steel Products Co., to Russell Steel Construction Co.

DETROIT, 100 tons, store, to Palmer Bee Co.

GRAND RAPIDS, MICH., 400 tons, Michigan Telephone Co., warehouse, to R. C. Mahon Co., Detroit.

MUSKEGON, MICH., 600 tons, building, to Massillon Bridge & Structural Co.

MICHIGAN CENTRAL RAILROAD, 800 tons, grade separation work in Detroit and vicinity, to McClintic-Marshall Co.

CLEVELAND, 130 tons, Lincoln Electric Co., all-welded warehouse, to Austin Co.

CLEVELAND, CINCINNATI, CHICAGO & ST. LOUIS RAILROAD, 2000 tons, two bridges in Indiana, to American Bridge Co.

NEWBURG, WIS., 110 tons, State highway bridge, to Wisconsin Bridge & Iron Co.

CHICAGO, 700 tons, Henrici restaurant, to unnamed bidder.

CHICAGO, 250 tons, Continental Can Co. building, to Mid City Iron Works.

ST. LOUIS, 350 tons, service building for Mack Truck Co., to Mississippi Valley Structural Steel Co.

ST. LOUIS, 150 tons, Procter & Gamble Co. building, to St. Louis Structural Steel Co.

COLUMBIA, MO., 375 tons, field house for University of Missouri, to Stupp Brothers Bridge & Iron Co.

POMONA, CAL., 100 tons, telephone building, to McClintic-Marshall Co.

HUNTINGTON PARK, CAL., 200 tons, factory for Axelson Machine Co., to Consolidated Steel Corporation.

SAN FRANCISCO, 500 tons, hotel, Post Street, to McClintic-Marshall Co.

OAKLAND, 100 tons, plates 54-in. riveted steel pipe for East Bay Municipal Utility District, to unnamed fabricator.

PORTLAND, ORE., 900 tons, office building, Tenth and Washington Streets, to Poole & McGonigle.

SEATTLE, 150 tons plates, digester for Rainier Paper & Pulp Co., to Willamette Iron & Steel Co.

LOS ANGELES, 100 tons, warehouse, 3275 East Slauson Avenue, to an unnamed bidder.

NEWPORT BEACH, CAL., 150 tons, bridge on Lido Island, to an unnamed bidder.

OLYMPIA, WASH., 100 tons, bridge over Solduc River, to an unnamed fabricator.

Structural Projects Pending

Inquiries for fabricated steel work include the following:

BOSTON, 1050 tons, Congress Street bridge.

BOSTON, 300 tons, fire department building in Bowdoin Square.

PROVIDENCE, R. I., 100 tons, Roger Williams Avenue bridge.

STAMFORD, CONN., 650 tons, First National Bank building.

BRISTOL, CONN., 200 tons, building for New Departure Mfg. Co.

NEW YORK, 2550 tons, pier 3, North River; Lane & Ogle, Inc., low bidder on general contract.

ELIZABETH, N. J., 600 tons, New York & New Jersey Telephone Co. building.

ALBANY, N. Y., 500 tons, printing building for J. B. Lyon Co.

PENNSYLVANIA RAILROAD, 14,000 tons, bridge over Hackensack River; Phoenix Bridge Co., low bidder.

PHILADELPHIA, 2000 tons, plant addition for Atwater Kent Co.

PHILADELPHIA, 5000 tons, convention hall and auditorium; call for bids about Aug. 15.

HARRISBURG, PA., 6000 tons, Agricultural Building.

CHICAGO, MILWAUKEE, ST. PAUL & PACIFIC, 800 tons, track elevation at Evanston, Ill.

CHICAGO, MILWAUKEE, ST. PAUL & PACIFIC, 650 tons, subway at Milwaukee.

CHICAGO, 2200 tons, public school.

CHICAGO, 400 tons, building for Crane Co.; Graham, Anderson, Probst & White, architects.

PRINCETON, WIS., 250 tons, State highway bridge; C. R. Meyer & Sons Co., Oshkosh, Wis., general contractor, steel to be sublet.

MILWAUKEE, 500 tons, emergency hospital.

ST. LOUIS, 8000 tons, approaches to McKinley bridge.

STATE OF ARIZONA, 2200 tons, mill buildings for a copper company.

SEATTLE, 3700 tons, plates, Cedar River pipe line; Western Pipe & Steel Co., low bidder.

PORTLAND, ORE., 105 tons, bridge over Nehalem River; bids opened.

LOS ANGELES, 1500 tons, Los Angeles Stock Exchange Building; bids about Sept. 1.

Automobile Outlook Bright

PHILADELPHIA, July 30.—It is generally believed that production for July in automobiles will prove greater than in July, 1928. Production during August is expected to exceed that of July, according to *Automotive Industries*, because of increased production schedules contemplated by several companies that are preparing to introduce new models.

Improvement in the agricultural outlook throughout the country, it is considered, will be a highly favorable influence on the automobile market during the next several months. It appears doubtful that output for any of the remaining months of this year will fall below that for the corresponding months of last year.

The Pennsylvania Railroad recently placed an order for 1000 all-metal box cars to be manufactured of pure iron sheets. The Armco ingot iron sheets for these cars will be rolled on the new continuous mills of the American Rolling Mill Co.

This Issue in Brief

Savings of more than one-half million dollars per year are expected to result from two-weeks war against waste. Over 3500 suggestions were received in automobile company's anti-waste campaign, conducted at a cost of $16,000.—Page 263.

* * *

Cuts labor expense 15 per cent and doubles plant output by installing conveyors for assembly operations. New material-handling system in Studebaker plant contains many unusal innovations.—Page 269.

* * *

Electric welding of merchant ships expected to save 8 to 10 per cent deadweight. Welding is being used increasingly in German yards for ship fabrication.—Page 323.

* * *

Erects small metal buildings without rivets, bolts, or welding. Pliers, wrench and screw-driver are all the tools to erect buildings with new locking device.—Page 281.

* * *

Alloy iron castings find their greatest use in automobile industry. Mayari pig iron is used to a considerable extent, principally for cylinder blocks and cylinder heads.—Page 282.

* * *

Conserves heat, reduces labor cost, and eliminates splashing by using new spherical hot-metal ladle. Keeps the metal hot longer than the old, straight-side ladle. Skull is practically eliminated.—Page 284.

* * *

Gain of 27 per cent in American machinery exports in first half of 1929 over same period of last year. Shipments were valued at more than 300 million dollars. June total was close to 50 millions, a gain over both May, 1929, and June, 1928.—Page 326.

Bearing bronzes should have not less than 4 per cent tin, and need not have more than 15 per cent lead. Bureau of Standards finds little advantage in greater lead content. Addition of 4 per cent zinc had a good influence on the properties of the bronze.—Page 265.

* * *

Reduce waste of storing obsolete patterns by making a periodic survey. Rule of thumb method of destroying patterns unused for a definite period may prove expensive. A better way is to have them looked over at intervals by an individual or committee acquainted with probable requirements.—Page 275.

* * *

Perfects chrome-plating process for aluminum. Can be applied to stampings, sheets and castings, enabling them to resist acids which affect aluminum. Will increase the durability of aluminum parts in service subject to wear. May also solve the problem of atmospheric corrosion in aircraft parts.—Page 325.

* * *

Avoids conveyor tie-ups when machine tools are under repair by *not* routing conveyors under machine tools. Instead, cylinder blocks are lifted from conveyors to machine tools by rope hoists.—Page 269.

* * *

Floor space saved by upending auto bodies awaiting movement to main assembly lines. A specially designed mechanical device "noses" bodies, reducing considerably the amount of storage space needed.—Page 272.

* * *

"Mike" carries instructions from operators on rolling mill floor to loud speaker in operating pulpit. Motors for new hot strip mill are controlled completely from pulpit.—Page 268.

Finished steel exports up 20 per cent for half year, imports down 28 per cent, compared with same period of 1928. More than one million tons of rolled and finished steel shipped out of United States during first six months.—Page 324.

* * *

Iron and steel scrap complaints should be registered with newly organized Trade Relations Bureau of Scrap Institute. Federal Trade Commission approves scrap code.—Page 286.

* * *

Charge for pattern storage should be made by jobbing foundries after patterns have been stored for a certain time. It is good practice to notify the customer at expiration of the free storage period.—Page 276.

* * *

Narrow conveyors obviate need for rotating stands for use in assembling motors. Chain conveyor is equipped with steel plate carriers which convey motors at a 30-deg. angle. Conveyor framework is so narrow that operators can get at motors easily.—Page 272.

* * *

Twenty-five per cent longer service claimed for ingot molds made of new low-sulphur iron. Cracking of ordinary cast iron molds is said to be due to differing coefficients of expansion of the steel matrix and the graphite in the cast iron.—Page 280.

* * *

Impractical to substitute welded-steel construction wherever cast metal is used, says machinery builder. Welded steel construction is ideal for special machines, only one or two of which are built per year, or for building the first standard machine of a new design.—Page 278.

ESTABLISHED 1855

Mechanization Aids Summer Work

STEEL has not had its usual summer dip in production, and an explanation is sought. In the common reckoning two general seasons of activity in buying and in production have been recognized—one a preparation for summer, the other a preparation for winter; whereupon summer would fall between these two periods. Another factor to which some observers have given attention is buying habits; executives desiring to take summer vacations and arranging their affairs in advance. That would explain seasonal periods in buying better than seasonal periods in delivery, for the executive could arrange simply a schedule of deliveries to be made during his absence.

A further thought on this subject is that in the past it was difficult to get workmen to perform well in summer, the work being arduous. Now, with increased mechanization all along the line, work is not so arduous, it being more a matter of controlling machinery. Notably that is the case at blast furnaces and in steel mills, where there are fewer men per unit of output, the men do not have as much physical exertion, and there are various appliances to make things more comfortable. In sheet and tin mill work in particular a veritable revolution has been wrought, working conditions for the hot mill crews being vastly improved.

On June 1 of this year steel mills had a large volume of shipping orders on books, and on July 1 the volume was simply diminished, still making a substantial total. It does not follow that consumption of steel was materially delayed; that if there had been much heavier deliveries in May the actual consumption would have been correspondingly greater; and the same may be said of June.

So far as the passage of time has thus far permitted, the sustained activity in steel production in the summer has quite fallen in with Mr. Farrell's wish expressed at the May meeting of the American Iron and Steel Institute: "Let us spread out this business. Do no let us try to do all the business that we can possibly do in three or four months of the year and have nothing left."

Improvement in equipment, appurtenances and methods has made work in summer easier and thus stimulates it. Here is one reason among several why we have more activity at the mills this summer than in the old-time summer. Along much the same line we see improvement in operation in winter. The railroads are the most notable example, functioning well in spite of the natural impediments of winter. It used to be considered necessary, for instance, for consumers to lay in large stocks of coal for winter. Nowadays they are quite indisposed to stock up to any extent. We have been getting down to steadier work all around.

We are quite aware that what is said above of the greater ease with which high production can now be attained in the summer season does not cover the larger question of the relation between current steel consumption and production. Leaders in the industry, who only two months ago, at the meeting of the American Iron and Steel Institute, were cautioning that "new building be kept within reasonable control" have since been led to ask whether the increasing uses of their products have not been stealing up on our capacity more rapidly than our forecasting formulas have led us to think. The answer to that question may show that the influences immediately shaping the course of the industry are not seasonal but stronger and more permanent.

Pots and Pans

RECENTLY a group of technical editors was privileged to inspect an extensive display of aluminum cooking utensils. Whatever the extent of his limitations as an art critic, one of those present could not escape the impression that the specimens exhibited a wide range in esthetic value. Among them were stew pans, egg cups and double boilers exactly like the ones sold nearly 20 years ago, by door-to-door canvassers, college boys at once earning money for schooling and providing an outlet for the new metal products. These pans conformed to shapes which were arrived at with the least effort and the simplest tools. Economy of production and simple utility were unquestionably the prime considerations in the mind of the manufacturer. Beauty—well, whoever thought of art in pots and pans in 1910?

More recently we have rediscovered the fact that simply because a thing is to be used every day it need not hence be ugly. Rediscovered, because artisans in bygone days successfully blended beauty with utility, even in metal in Damascened sword blades, forged wrought iron grills, hammered vessels, or embossed silverware. The combination of comeliness and grace is possible even in an aluminum stew kettle, for one notable specimen in the exhibit had eye-satisfying proportions of height to diameter; the handle was shapely and set at exactly the right angle; the sides bulged just enough for the height, and the thickness of the plate and roll on

the lip were correct for the other dimensions. A hundred years from now our great-great-grandchildren will give this stew kettle a place of honor in their home, alongside the silver teapot made by Paul Revere; not because the two pieces are antiques, but because they are specimens of metal work in which utility, form and mass have been harmoniously blended by artists who knew the capabilities of the metal they worked and the limitations of their manufacturing methods.

Mending a War Rent

DURING the week of Sept. 9 when our own Institute of Metals will be meeting with sundry steel men in Cleveland, the British Institute of Metals will journey to Düsseldorf and hold joint discussions with the Verein Deutscher Ingenieure and the Deutsche Gesellschaft für Metallkunde. The announcement tells us that the latter gathering is notable because it is the first formal meeting of British engineers with their German associates since 1914. Thus it is apparent, in form at least, that the directors of the British and German societies believe that the war is over.

Whether eleven years is sufficient to heal the deep wounds of the great cataclysm is doubtful; but intellectual intercourse must be resumed sooner or later. Many will absent themselves from the meetings, not a few who do attend will be nervous and somewhat constrained in behavior. Utter frankness, of course, will be impossible. The program recognizes this when it "requests business competitors not to apply for tickets to the various plant visitations." Such plainness of speech is to be preferred to the custom, more honored in the observance than the breach, at some American plants, of detaining the visitor with inconsequential matters until 11:30, then reaching the interesting operations just as the whistle blows for the lunch hour.

The New Natural Gas Boom

SQUARE the diameter in inches of a natural gas pipe line and multiply by 3000. The product is approximately the number of tons of coal per annum represented on a heat unit basis. A 20-inch pipe line represents about 1,200,000 net tons of coal per annum, one-fifth of 1 per cent of our total coal production of late. The lines will not all operate at capacity, but on the other hand the gas will be burned more efficiently than coal, so the comparison is a fair one to furnish a conception of what these pipe lines mean. The steel trade has been much interested in line pipe orders. Thus far the record in size is the 950-mile line from Texas to Chicago, involving 191,000 net tons; but still larger lines are being planned.

The reason natural gas discoveries in the last few years have been bringing such interesting news, and orders, to the steel trade is that the gas was discovered out West, where the distances are great and much of the gas must go several hundred miles to find enough people to consume it. At the same time the financing of these projects has become relatively easy.

The particular activity in this laying of natural gas lines covers thus far a period of less than two years. Lacking an exact count, we estimate that the lines completed in this period and those now being laid will transport about one-third as much natural gas as was produced in 1927. The production of that year was about 1,370,000,000, in thousands of cubic feet. The estimate of increase is only a rough one, but it gives an idea of the importance of the work. Additional projects come up at intervals, but in some quarters it is doubted that there will be enough gas to take care of them all.

In 1927 the three fuels produced, coal, petroleum and gas, represented about 22,624 trillion B.t.u., computed by standards adopted some time ago by the Bureau of Mines, 13,100 B.t.u. per pound of bituminous coal, 13,600 for anthracite, 6,000,000 per barrel of petroleum and 1075 per cubic foot of natural gas. The relative proportions were: Bituminous coal, 60.0 per cent; anthracite, 9.6 per cent; petroleum, 23.9 per cent; natural gas, 6.5 per cent. An addition of one-third to the natural gas would displace more than 3 per cent of the coal, assuming only equal efficiency in realizing the heat units, but the gas should do considerably better than that.

When the gas is piped long distances for domestic use it will frequently if not generally be mixed with gas manufactured from coal or coke. To the old time user of natural gas that is adulteration of the natural gas. To the gas maker it is enriching the manufactured gas, which may not run much over 500 B.t.u. per cubic foot.

The boom in the laying of natural gas lines has played a part worth taking into account in the heavy production of steel during the last 12 months. A 20-inch line 1000 miles long will require from 170,000 to 200,000 net tons of pipe, according to wall thickness, and any long line involves a considerable tonnage of feeder and branch line pipe. A description of the A. O. Smith plant, making electrically welded pipe at Milwaukee, was given in THE IRON AGE of July 11, 1929, pp. 92-4, it being stated that about 100,000 tons of steel a month was being delivered for the manufacture of 26 miles of this pipe daily.

Designing for Low Cost

WHEN a thing can be done in several ways and the least expensive of the acceptable ways is not chosen, there is waste. When, with a free choice of satisfactory materials, one of the more costly is selected, unnecessary expense results. These points are made in a recent article by Morton C. Tuttle, Boston builder, in discussing his industry. Considerations of durability, pleasing appearance, convenience in use and other desirable qualities are assumed to be evaluated in his equation.

"I have observed the building of factories for manufacturing similar metal products," Mr. Tuttle writes, "where some were of brick and timber, some of steel with timber floors, some of steel frame with concrete floors, and others all concrete. Here were four types of structure serving practically like pur-

poses but varying probably 20 per cent in cost. If the less expensive was adequate for its purpose, then, however efficiently the other buildings were erected, they were extravagant."

This same condition is met in manufacturing. It is by cutting corners, where analysis shows they may be cut to advantage, that many dollars are put on the right side of the ledger. But this presupposes competent engineering. The machine must be adequate for its purpose. It must have enough excess strength to allow for the inevitable increase in the loads that will be put upon it—going in many cases far beyond those which it was constructed to bear. The new use of tungsten-carbide tools is a parallel example to the old one of high-speed steel tools, of adding greatly to the stresses imposed on machines which were built before those tools were developed.

Nevertheless, the lesson the Boston builder would impress upon industry will bear repeating. It represents a policy that has become almost axiomatic in the most up-to-date of our industrial establishments. Only by lowering costs of production have the steel companies, in the past five years, been able to earn such dividends as they have paid. Dollars were taken from the cost of making each ton, not only by the Steel Corporation but by its competitors, and at times a good part of this saving was passed along to the buyers in lower prices for the product. The least expensive methods were chosen because they had to be chosen.

Mr. Hoover and the Laws

THE President has put great emphasis upon the necessity for obedience to the laws that have been made, and has pointed out that if we disregard our own laws we are consigning ourselves to destruction, adding that if we do not like the laws we should rescind them. In a way his ideas are reminiscent of what President Grant said to the effect that the best way to abolish a bad law is to enforce it. All of this is quite contrary to our custom of abolishing bad laws by forgetting about them—that is, disregarding them.

This complicated subject probably involves the very roots of our popular form of government. We enact laws in great volume and very many of them reflect no popular will. In the case of laws involving intricate economic and technical questions there is no popular will, inasmuch as 99 per cent or more of the people are entirely ignorant of the subject.

Our laws are largely enacted by trading, or, in the vernacular, by log rolling, and it is far easier to enact them in such a way than it is to undo them. So we continue to have on our statute books the sumptuary laws of the New England States, archaic automobile speed laws, statutes prohibiting the possession of firearms, and many others that are popularly disregarded, but are occasionally invoked when someone has an axe to grind and can make a temporary use of them. The disregard of the 14th and 15th amendments to the Federal Constitution, which began 50 years ago during the administration of President Hayes, is perhaps the most important national example.

But to make a more pointed comment, Mr. Hoover as a mining engineer is thoroughly familiar with the mining laws of the United States and knows how some of their fundamental provisions have been abolished by common consent in the mining districts. No one better than himself knows that if they were strictly observed we should not have a mining industry of the magnitude of the present. He knows, moreover, that the efforts to reform those laws, that have been made during a quarter of a century under the leadership of his own profession, have been a failure. This is, of course, an example of a technical subject about which the public knows little and is incompetent to have any opinion. It is in fact an example of a subject on which Congress ought not to be expected to legislate except in broadest principle.

CORRESPONDENCE

Foreigners Should Pay for Access to the American Market

To the Editor: Let it be noted that the "steel people" who appear at Washington and ask for high duties on what they sell and none on what they buy, as manganese, who find the American a capital fellow to sell to and a reprehensible person to buy from, are not the only people who seem to have this short-sighted idea. Even the down-trodden farmers want duties on farm products, and fertilizer on the free list!

It is time for the country to get rid of these narrow and suicidal ideas. The way to have protection is for everybody to work together and get it, as a national system; not just a series of special favors granted to those who can marshal the most convincing (to the committees) arguments, no matter how specious they themselves may know them to be.

Is it realized how much of a free trade country the United States is? What other country opens its doors so widely to free importations and admits an equal volume of goods duty free? And in that connection it is worth remembering that admission of goods duty free to the largest and highest market in the world is a good deal more than free entry into a small, low market such as most countries offer.

High prices in America are due to high taxes and high taxes are one and the same thing as high civilization and activity. They are inseparable. The American pays taxes far higher than he realizes and is entitled to recover his tax costs when he sells his goods, to leave him enough profit to enable him to do business.

Will somebody please explain in a reasonable way why a foreigner should be given a present of the right to sell goods here free of taxation by National and State Governments, when an American pays dearly for the privilege?

Let it be noted that the iron blast furnaces of the Eastern States, built to supply the domestic market with foundry irons, have been mostly put out of business since the war by increased freight rates and other increases, and that these higher freight rates were necessitated by higher absolute (not apparent only) taxation. The tax items hidden in the cost of a ton of foundry iron, made in America, delivered in Philadelphia, probably equal a good many dollars a ton, which the American producer must pay to make and deliver that iron. Why permit a furnace in India to sell iron in Philadelphia at a tax cost of $1.12½? What is there about the foreign producer that makes him so balky about sharing in the tax costs of this high-level market and entitles him to so much consideration, with none for the American?

ANSON G. BETTS.

West Cummington, Mass., July 25.

Again Block River and Rail Route to Youngstown

The Pittsburgh Coal Co. and its subsidiary, the Montour Railroad Co., both of Pittsburgh, have again been denied by the Interstate Commerce Commission the right to open a new combination river and rail route to connect the Monongahela Valley with the Youngstown district. Some months ago the commission refused to allow the Pittsburgh, Lisbon & Western Railroad, in which the coal company has a controlling interest, to construct two extension that would provide direct rail-and-water connection between Monongahela Valley coal lands and Youngstown. Later the coal company acquired control of the Youngstown Suburban Railroad, which obviated the necessity of building most of the northern extension of the Pittsburgh, Lisbon & Western and sought to have the case reopened.

An entirely new application now probably will be made to the commission, according to H. J. German, president of the Montour Railroad. Although the case is being conducted largely by the coal company and the Montour Railroad, Youngstown district steel companies are greatly interested, as the rail extension would provide Youngstown with direct rail service to the Ohio River and thus allow it to compete with Pittsburgh and Wheeling district companies in the down-river trade.

The Pittsburgh & Lake Erie and Pennsylvania railroads have filed proposed tariff schedules providing for a rate of $1.02 a ton on coal for the haul from Youngstown to the river. The river haul would cost 30c. a ton and, with the cost of transfer from barge to car, the cost of the rail-and-river haul would be higher than the present all-rail rate of $1.34 a ton.

Blaw-Knox Absorbing Steel Casting Co.

Directors of the Blaw-Knox Co., Blawnox, Pa., have ratified a contract with the Union Steel Casting Co., Pittsburgh, providing for exchange of stock whereby control of the Union company will pass to the Blaw-Knox Co. The contract is subject to the depositing by stockholders of the Union company of a sufficient number of shares to constitute control in an amount satisfactory to the Blaw-Knox Co. Similar contracts with the Lewis Foundry & Machine Co., Groveton, Pa., and the National Alloy Steel Co., Blawnox, Pa., have also been ratified by the Blaw-Knox directors.

The Blaw-Knox Co. manufactures transmission towers, concrete road forms, hammer welded steel products, steel floor grating, airplane hangars and a number of other fabricated steel products. The Union Steel Casting Co., a manufacturer of steel castings, also owns the entire capital stock of the Pittsburgh Rolls Corporation, Pittsburgh, which manufactures iron and steel rolls. The Lewis Foundry & Machine Co. is a maker of iron rolls and the National Alloy Steel Co. produces special alloy steel castings. The corporate identity of each of the above companies will be maintained.

Completes Metal Tariff Revision

WASHINGTON, July 30.—Republican members of the Senate Committee on Finance have completed work of revising the metal schedule of the House tariff bill, and while there are numerous reports as to changes, none can be verified. Members of the committee would not discuss the published report that the committee had voted not only to retain a duty on manganese ore but to apply it on concentrates of 10 per cent and more as against the present duty of 1c. a lb. on contained manganese of 30 per cent or more. Whether or not the committee actually has taken this action, the report has created surprise since it had been rather definitely stated that a majority of the Republican members were in favor of either reducing the present duty or removing it altogether and likewise lowering the compensatory duty on ferromanganese.

Cultivation of Structural Steel Mart Bears Fruit

Greater assistance to the fabricators of structural steel in Canada was pledged by Charles F. Abbott, executive director of the American Institute of Steel Construction, New York, in an address before the executives of leading Canadian firms at the Royal York Hotel, Toronto, July 30.

He said, in part: "Trade associations, such as ours, are not limited by the boundaries of a single country. In the development of markets for structural steel the problem in the United States is no different from what it is in Canada. This is especially true, inasmuch as we are primarily concerned with the sale of services—fabrication and erection. Members in Canada are just now very active, but not much more so than the fabricators of structural steel in the United States. Since the institute was organized in 1922 the annual tonnage of our members has more than doubled.

"This great increase in business has been due largely to the efforts we have made to standardize practices and to eliminate industrial waste. The results have been tangible savings to the builder and owner of a steel structure. Practically all the important cities in Canada and the United States have revised their building codes to conform to the recommendations our institute has proposed. Our present research activities promise to increase the use of structural steel to a much greater extent. The steel plate floor for bridges and buildings, making possible taller skyscrapers; steel hangars, which are increasing rapidly as the demands of aviation begin to be felt, and steel dams, of which the greatest developments are in the future, promise to multiply our tonnage several times over again.

"In this work the Canadian fabricators of structural steel have wholeheartedly cooperated in making possible research and market development that is proving highly beneficial to the industry in both countries. Firms that have shown the foresight to support the work of this association are those which the banker, the architect and the owner are beginning to classify as dependable. Our daily mail at our New York and Cleveland offices, and at the district offices established at strategic points throughout Canada and the United States, bears witness of this fact, for the institute is being called upon more and more to advise with buyers of steel structures."

Prest-O-Lite Starts Two New Plants

The Prest-O-Lite Co. has recently added two new acteylene gas plants located at 540 East Seventeenth Street, Wichita, Kan., and at Jones Street and Pennsylvania Railroad, Youngstown, Ohio. These plants will supply local industry with dissolved acetylene for oxy-acetylene welding and cutting. These two increase the number operated by the Prest-O-Lite Co. to 45 gas producing plants, situated in as many industrial centers.

New Detroit Company to Make Cold-Rolled Strip

A. J. Bopp, who has been Detroit district sales agent for the Weirton Steel Co. since 1917, has resigned to form the A. J. Bopp Steel Corporation, which will engage in the manufacture of cold-rolled strip steel, specializing in narrow light-gage material.

A plant site has been purchased in Detroit and contracts for building and equipment will be closed soon.

Fittings for Tubular Booms

American Marine Standards H30-1928 and H31-1929 relate to steel fittings for tubular steel cargo booms, The standards cover both the hinge fitting at the heel of the boom and the sheave fitting, or cap, at the outer end of the boom. Detailed dimensions, adopted as standard, are given in the pamphlet for booms for capacities of 5, 10, 15, 20 and 30 tons. Copies may be obtained for 5c. each from the Government Printing Office, Washington.

Iron and Steel Markets

August Outlook Promising

No Important Recession in Steel Output Indicated—Chicago Mill Bookings Gain—Automobile Industry to Take More Steel in Next Two Months

THE end of July has disclosed no marked recession from the high rate of steel output that has prevailed since early in the year. It is taken for granted that production statistics for the past month will indicate a new July record in steel ingots and an average operating rate approaching that of June. Present interest is not in past performance, but rather in the prospects for coming months.

At Pittsburgh there are evidences of gradual curtailment of steel works activities, although thus far reductions in open-hearth operations have been confined to smaller companies specializing in a few rolled products. Reports from other steel centers, although reflecting slower specifications for certain finished materials, indicate no current or imminent slackening in ingot output.

The Bethlehem Steel Corporation, according to a statement by President Grace, will continue to run at close to capacity throughout August. Chicago mills are not only holding their own, but are increasing their backlogs. Their sales of plates, shapes and bars were 50 per cent heavier than in the previous week, when bookings were fully abreast of the average to date this year. At Cleveland, sheet orders of some mills were larger than the total tonnage for the three preceding weeks of the month.

A particularly good augury, in view of the recent decline in demand for automobile steels, is the fact that motor car makers have arranged shipping schedules for August and September that, for the most part, call for more steel than was delivered to them during the past month. While the Chevrolet Motor Car Co. has reduced its production, the trend among other companies is upward.

The encouraging outlook in steel is commanding special attention in view of the importance of a high rate of operations in terms of steel company profits, as revealed by the quarterly report of the United States Steel Corporation. With prices over the first half of this year (measured by THE IRON AGE composite price for finished steel) averaging only 2¼ per cent higher than those of the first half of 1928, but with production 17 per cent higher this year than last, total earnings went up over 50 per cent, the showing of the first two quarters of the Steel Corporation this year being $132,101,000 and for the same quarters last year $87,867,000.

Competition by Alabama producers for pig iron business in Northern and Eastern markets has accentuated, rather than diminished. Southern basic iron has been quoted at $13 a ton, Birmingham, and less in recent bids for eastern Pennsylvania tonnage. Under this pressure, prices of furnaces in the Philadelphia district are giving ground, as evidenced by concessions of 50c. to $1 a ton from recent quotations on foundry grade. Buffalo producers, on the other hand, having accumulated substantial backlogs, are taking a stronger price position, and the situation with other furnaces on the Great Lakes is satisfactory.

The large demand for pipe for gas lines accounts, in large measure, for the unusual pressure on Chicago plate mills and the overflow of considerable plate tonnage to producers farther east. The placing of 250,000 tons of pipe by Henry L. Doherty & Co., New York, for a gas line from Texas to Chicago is in early prospect. The National Tube Co. has booked 8000 tons of 10 and 12-in. pipe for a line of the Southwestern Gas Co.

Of seasonal significance is an increase in bar specifications from the farm equipment industry, following the completion of inventories.

The construction outlook is promising. The award of 14,000 tons by the Pennsylvania Railroad for a Hackensack River bridge is imminent, and bids on a New York subway section, taking 13,200 tons, will be opened Aug. 2. Structural steel requirements for the Illinois Steel Co.'s expansion program at Gary are estimated at 40,000 to 50,000 tons. Fabricated steel lettings for the week were of average proportions, totaling 33,000 tons. Fresh inquiries called for 36,000 tons.

Rail mill operations continue to taper, now averaging 72 per cent of capacity at Chicago. Demand for track supplies is excellent, however, with new bookings of 7000 tons reported in that district and an inquiry for 6000 tons of tie plates from the New York, New Haven & Hartford pending. The New Haven will also buy rails.

With mill backlogs declining in some products, more is heard of price shading, although market levels as a whole are being maintained. In the Central West weakness in wire nails has become more general, with sales at $2.60 a keg, Cleveland or Pittsburgh, a drop of $1 a ton from the recent minimum. A few mills are competing more aggressively for galvanized sheets, on which 3.50c., Pittsburgh, the price to jobbers, has been extended in certain cases to consumers.

Scrap is buoyant at Pittsburgh, Chicago and other centers, with prices pointing upward.

Exports of rolled and finished steel in the first half, at 1,149,000 tons, showed a gain of 21 per cent over the total for the corresponding period last year.

THE IRON AGE pig iron composite has fallen to $18.38 a ton from the $18.42 of the last two weeks. The finished steel composite remains at 2.412c. a lb.

Pittsburgh

Expect Curtailed Operations By Mid-August With Better Business in September

PITTSBURGH, July 30.—July has been an exceptionally busy month for Pittsburgh district steel companies, but they will enter August with the declining tendency in specifications unchecked and an almost certain curtailment in operations before the middle of the new month. As it looks now such a curtailment will not be pronounced and will be followed by improved business during September.

Local steel makers, who have expected a falling off in steel demand for several weeks, are well pleased with the rate of business in July and are inclined to view with some favor the prospect of a slight slowing down during August. Operating facilities are feeling the strain of protracted capacity production more than ever now that hot weather has become a factor in output, and a longer breathing spell than is expected next month would be required to prepare the mills for a resumption of activity in the fall comparable to the record of the last four months.

Hot weather interfered with production during the last week, notably in the sheet and tin mill departments. As tonnage releases on sheets have shown very little decline, mills had no opportunity to improve their shipments, and deliveries on the common finishes of sheets are little better than they were a month ago. The same is true of plates, but on other products operations are on about a two-weeks basis, with high production justified only by an exceptionally heavy summer demand.

Wire specifications last week maintained the month's lead over the corresponding period in June, particularly in manufacturers' wire. Weekly tin plate specifications are sufficient to justify a 90 per cent of capacity operation by all leading makers.

Current demand for reinforcing bars is strong, but the requirements of cold-finishing mills are lighter and alloy steel bar shipments have declined sharply. Structural awards in this district are negligible, but large fabricators are well supplied with business and there are a number of large projects in prospect. An order for 20 barges requiring about 3000 tons of steel is said to have been placed recently with a local fabricator.

Prices show no additional weakness. Mills are taking a firmer stand in view of an expected improvement in demand by the end of August and are refusing to meet lower prices than 2.85c., Pittsburgh, on black sheets and 3.60c. on galvanized except to large jobbers. On wire nails large Pittsburgh jobbers have not been able to buy at less than 2.65c.

There is little activity in pig iron and sales are confined almost entirely to fill-in tonnage sufficient to carry melters through August. Prices are holding exceptionally well. The scrap market has also maintained its recent strength in the face of practically no mill buying.

Pig Iron.—Sales continue at about the level of recent weeks with business confined almost entirely to small lots for shipment during August. It

now seems certain that large buyers in the district are not going into the market for third-quarter tonnage of any size, but rather are buying in small lots which, together with iron due them on old contracts, will be sufficient for August requirements. In some quarters it is thought that a buying movement of considerable proportions will develop during September. The Standard Sanitary Mfg. Co. has made small purchases for its Pittsburgh and New Brighton, Pa., plants, but the total in neither case ran more than 1500 tons; at least three furnaces shared in this business and full market prices were obtained. Shipments are keeping up fairly well for this time of the year and there is little opportunity for furnace stocks to accumulate. In many cases aggregate sales of local agents for the week are entirely sufficient to take the output of the furnace which they represent. Prices are well established at $18.50, Valley, for foundry and basic iron, and $19 for malleable and Bessemer. A Pittsburgh district furnace is quoting prices 50c. over these figures.

Prices per gross ton, f.o.b. Valley furnace:

Basic	$18.50
Bessemer	19.00
Gray forge	18.00
No. 2 foundry	18.50
No. 3 foundry	18.00
Malleable	19.00
Low phos., copper free	27.00

Freight rate to Pittsburgh or Cleveland district, $1.76.

Prices per gross ton, f.o.b. Pittsburgh district furnace:

Basic	$19.00
No. 2 foundry	19.00
No. 3 foundry	18.50
Malleable	19.50

Freight rates to points in Pittsburgh district range from 63c. to $1.13.

Semi-Finished Steel.—Hot weather has affected steel production adversely in the last week, but correspondingly reduced demand from finishing mills has prevented any shortage. However, the supply of unfinished steel in this and nearby districts is still sufficient only to meet current demand and producers have not yet had the opportunity to accumulate stocks which they would normally maintain. Some of the smaller mills in the district whose open-hearth output goes into only one or two products have recently taken out furnaces, but the larger interests are still holding production at as near physical capacity as possible. Semi-finished steel is not being freely offered in the open market, but it is now nearly always possible to purchase spot tonnage in case of urgent demand. Large users of sheet bars have their requirements for this quarter under contract, but consumers of billets and slabs are reported to be delaying their commitments until the price is definitely settled. At present sheet bars, billets and slabs are generally quoted at $35, Pittsburgh or Youngstown, although a few makers with limited quantities for sale are asking a dollar more on spot tonnage. Wire rods are unchanged at $42, Pittsburgh or Cleveland, and the movement is very satisfactory for this time of the year.

Rails and Track Supplies.—The New York, New Haven & Hartford Railroad is expected to close this week on an unstated rail tonnage and is also inquiring for 5000 to 6000 tons of tie plates. Otherwise this market is rather quiet and little activity is expected before September. Specifications on contract business are coming in well for the summer period, but shipments have been tapering off gradually for several weeks. Prices are being regularly adhered to, except in the case of light rails, on which concessions are being made to meet the price of the rerolled product.

Bars, Shapes and Plates.—Tonnage releases on bars and shapes continue to taper, but local producers find demand for plates almost as strong as it was earlier in the spring, allowing little opportunity for improved deliveries. Mills are booked for six to eight weeks, and reports are current that the tight situation in Chicago is again forcing large consumers in that district to seek tonnage in this territory. Car builders in this district are still specifying plates freely, and an order for 20 barges reported to have been placed during the week will further extend the backlogs of local barge builders. Demand for bars has felt the summer lull this month, and backlogs of all mills have been substantially reduced. The cold-finishing mills are requiring considerably less steel than they were in June, and shipments of alloy steel bars have declined materially. Reinforcing bars are holding up well, and, although large tonnage awards have been lacking in the last two weeks, the volume of small business has been gratifying. Prospective structural business bulks large. An addition to the Bell Telephone Building in Pittsburgh will require about 3000 tons and another office building under consideration will take a greater tonnage. A local fabricator has been awarded 2000 tons of structural steel for two railroad bridges in Indiana. Prices on the heavy hot-rolled products show little if any weakness, with 1.95c., Pittsburgh, the ruling quotation.

Wire Products.—Shipments of manufacturers' wire during July will be fully equal to those of June, and one maker reports a gain this month of at least 10 per cent. Specifications are coming in at a high rate for this season. Other wire products are quiet, with demand for barbed wire and other agricultural products considerably reduced. Wire prices are well maintained at 2.50c. to 2.60c., Pittsburgh or Cleveland. Wire nails show little improvement and reports persist that prices are being sharply reduced at points down the Ohio River. However, large Pittsburgh jobbers have not been able to buy nails at less than 2.65c., Pittsburgh, and a $2 premium is occasionally required on small tonnages.

Tubular Goods.—The pipe market is alive with reports of large prospective gas lines, and, although local mills are not inclined to give credence to many of the current stories, it seems definitely assured that the development of electrically welded pipe has opened up unusual possibilities for the piping of natural gas to large centers of population. A second line into Chicago from the Texas fields, which would require at least 200,000 tons of pipe, is considered quite active, and in view of the heavy tonnage booked last week by the Milwaukee fabricator, makers of lap-welded tubing in the Pittsburgh and Youngstown districts expect to share in this business if it is placed. A gas line into New York and

Alloy Steel Bars

(F.o.b. makers' mill)

Alloy Quality Bar Base, 2.65c. to 2.75c. per Lb.

S.A.E. Series Numbers		Alloy Differential
2000	(½% Nickel)	0.25
2100	(1½% Nickel)	0.55
2300	(3½% Nickel)	1.50
2500	(5% Nickel)	2.25
3100	Nickel Chromium	0.55
3200	Nickel Chromium	1.35
3300	Nickel Chromium	3.80
3400	Nickel Chromium	3.20
4100	Chromium Molybdenum (0.15 to 0.25 Molybdenum)	0.50
4100	Chromium Molybdenum (0.25 to 0.40 Molybdenum)	0.70
4600	Nickel Molybdenum (0.20 to 0.30 Molybdenum, 1.25 to 1.75 Nickel)	1.05
5100	Chromium Steel (0.60 to 0.90 Chromium)	0.35
5100	Chromium Steel (0.80 to 1.10 Chromium)	0.45
5100	Chromium Spring Steel	0.20
6100	Chromium Vanadium Bars	1.20
6100	Chromium Vanadium Spring Steel	0.95
9250	Silicon Manganese Spring Steel (flats)	0.25
	Rounds and squares	0.50
Chromium Nickel Vanadium		1.50
Carbon Vanadium		0.95

Above prices are for hot rolled steel bars, forging quality. The ordinary differential for cold-drawn bars is ¾c. per lb. higher. For billets 4 x 4 to 10 x 10 in., the price for a gross ton is the net price for bars of the same analysis.

Billets under 4 x 4 in. carry the steel bar base. Slabs with a sectional area of 16 in. or over carry the billet price. Slabs with sectional area of less than 16 in. or less than 2½ in. thick, regardless of sectional area, take the bar price.

Rails

	Per Gross Ton
Standard, f.o.b. mill	$43.00
Light (from billets), f.o.b. mill	36.00
Light (from rail steel), f.o.b. mill	34.00
Light (from billets), f.o.b. Ch'go mill	36.00

Track Equipment

	Base per 100 Lb.
Spikes, ⅝ in. and larger	$2.80
Spikes, ½ in. and smaller	2.80
Spikes, boat and barge	3.00
Tie plate, steel	2.15
Angle bars	$2.75
Track bolts, to steam railroads	$3.80 to 4.00
Track bolts, to jobbers, all sizes, per 100 count	70 per cent off list

Welded Pipe

Base Discounts, f.o.b. Pittsburgh District and Lorain, Ohio, Mills

Butt Weld

Steel Inches	Black	Galv.	Iron Inches	Black	Galv.
⅛	45	19½	¼ and ⅜	+11	+36
¼ to ⅜	51	25½	½	23	5
½	56	42½	¾	28	11

Lap Weld

2	55	43½	2	23	9
2½ to 6	59	47½	2½ to 3½	28	13
7 and 8	56	43½	4 to 6	30	17
9 and 10	54	42½	7 and 8	29	16
11 and 12	53	40½	9 to 12	26	11

Butt Weld, extra strong, plain ends

⅛	41	24½	¼ and ⅜	+13	+48
¼ to ⅜	47	30½	½	23	7
½	53	42½	¾	28	12
¾	58	47⅞	1 to 2	34	18
1 to 1½	60	49½			
2 to 3	61	50½			

Lap Weld, extra strong, plain ends

2	53	42½	½	29	13
2½ to 4	57	46½	2½ to 4	34	20
4½ to 6	56	45½	4½ to 6	33	19
7 to 8	52	39½	7 and 8	31	17
9 and 10	45	32½	9 to 12	21	8
11 and 12	44	31½			

On carloads the above discounts on steel pipe are increased on block by one point, with supplementary discount of 5%, and on galvanized by 1½ points, with supplementary discount of 5%. On iron pipe, both black and galvanized, the above discounts are increased to jobbers by one point with supplementary discounts of 5 and 2½%.

Note.—Chicago district mills have a base two points less than the above discounts. Chicago delivered base is 2½ points less. Freight is figured from Pittsburgh, Lorain, Ohio, and Chicago district mills, the billing being from the point producing the lowest price to destination.

Boiler Tubes

Base Discounts, f.o.b. Pittsburgh

Steel		Charcoal Iron	
2 in. and 2¼ in.	40	1½ in.	1
2½ in.—2¾ in.	48	1¾ in.	8
3 in.	54	2 in.—2¼ in.	13
3¼ in.—3¾ in.	56	2½ in.—2¾ in.	16
4 in.	59	3 in.	17
4½ in. to 6 in.	48	3¼ in. to 3½ in.	18
		4 in.	20
		4½ in.	21

On lots of a carload or more, the above base discounts are subject to a preferential of two fives on steel and of 10 per cent on charcoal iron tubes. Smaller quantities are subject to the following modifications from the base discounts:

Lap Welded Steel—Under 10,000 lb., 6 points under base and one five; 10,000 lb. to carload, 4 points under base and two fives. Charcoal Iron—Under 10,000 lb., 2 points under base; 10,000 lb. to carload, base and one five.

Standard Commercial Seamless Boiler Tubes

Cold Drawn

1 in.	63	3 in.	48
1¼ to 1½ in.	55	3¼ to 3½ in.	50
1¾ in.	39	4 in.	53
2 to 2¼ in.	34	4½, 5 and 6 in.	42
2½ to 2¾ in.	42		

Hot Rolled

2 and 2¼ in.	40	3¼ to 3½ in.	56
2½ and 2¾ in.	48	4 in.	59
3 in.	54	4½, 5 and 6 in.	48

Beyond the above base discounts a preferential discount of 5 per cent is allowed on carload lots. On less than carloads to 10,000 lb. base discounts are reduced 4 points with 5 per cent preferential; on less than 10,000 lb., base discounts are reduced 6 points, with no preferential. No extra for lengths up to and including 24 ft. Sizes smaller than 1 in. and lighter than standard gage take mechanical tube list and discounts. Intermediate sizes and gages not listed take price of next larger outside diameter and heavier gage.

Seamless Mechanical Tubing

	Per Cent Off List
Carbon, 0.10% to 0.30%, base (carloads)	55
Carbon, 0.30% to 0.40%, base	50

Plus differentials for lengths over 18 ft. and for commercial exact lengths. Warehouse discounts on small lots are less than the above.

other Eastern cities is under consideration, and although such a line would likely originate in West Virginia, a much more distant field is being considered. As mentioned in THE IRON AGE last week, a part of the feeder pipe required for the Southwestern Gas Co. line running from Monroe, La., to Birmingham, Ala., and Atlanta, Ga., was placed with the Republic Iron & Steel Co., to be made by the electrical welding process. The 10-in. and 12-in. pipe required for this line has been placed with the National Tube Co., the requirements being about 8000 tons. Seamless pipe is fairly active, with mills in the district operating at around 75 per cent of rated capacity. Mechanical and boiler tubing are also moving steadily.

Sheets.—Hot weather interfered with sheet production during the last week, but operations held at close to 95 per cent of capacity. Tonnage releases on all finishes of sheets continue large, and capacity output during August would not completely dispose of mill commitments. The price situation is unchanged, with galvanized sheets quotable at 3.50c. to 3.60c., Pittsburgh, and black at 2.85c. Companies producing blue annealed sheets on jobbing mills refuse to take business on the No. 10 base at less than 2.20c., Pittsburgh, but makers of wide strips are freely making concessions of $2 or more a ton. On the No. 13 gage base, concessions from the 2.35c., Pittsburgh, price are not common.

Tin Plate.—Weekly specifications justify 90 per cent operations, with most makers and mills holding at about that rate. This is considered very satisfactory for the summer months, and crop reports from most parts of the country justify the belief that current demand will not taper off very much during August.

Strip Steel.—Demand for strip steel is spotty and few makers are able to maintain well-rounded production. Companies serving the two large makers of low-priced automobiles have heavy commitments on certain sizes and widths, but are able to make deliveries in a week or two on other sizes. In some cases specifications this month are running ahead of June, but these are exceptional and most mills would consider a July tonnage as high as June more than satisfactory. No further price weakness is reported, hot-rolled material holding at 1.90c. and 2c., Pittsburgh, and cold-rolled at 2.75c.

Coal and Coke.—Demand for furnace coke is seasonably dull, and the leading interest in the Connellsville region has taken out a number of ovens. Independent producers have also curtailed slightly. Prices on the furnace grade are unchanged at $2.75 to $2.85, Connellsville, with slightly higher quotations ruling on future requirements. Shipments of foundry coke are probably at the low point of the year, with prices generally weak on all except the premium grades. The coal market is without feature, unless the continued chaotic price situation might be considered as such.

Warehouse Business.—Movement of steel out of warehouse stocks is fairly satisfactory for this time of the year, with activity well distributed throughout the various lines. Galvanized corrugated sheets are moderately active and demand for reinforcing bars is good. New extras on cold-finished steel bars, which were recently announced by mills, will have no effect on warehouse prices before the third quarter. Jobbers are now selling blue annealed sheets on the two bases established some time ago by the mills, with the No. 10 gage quoted at 3.45c. per lb. in lots of 1 to 10 sheets, and the No. 13 gage at 3.60c. per lb. Warehouse prices on wire nails have developed weakness, and nails are now quotable at $2.90 to $3, base, per keg.

Old Material.—Despite a week of exceptionally light activity, the scrap market has retained its strength, and although quotations cannot be changed on the basis of actual sales, the tendency seems to be toward higher prices. High quotations on the heavy grades of steel have forced up prices on the light materials and developed a scarcity in such products as short shoveling steel turnings and machine shop turnings. Compressed sheets are very tight as buying prices in Detroit have advanced, and heavy water movement from that point is diverting tonnage which might ordinarily come to Pittsburgh into other territories. No sales of compressed sheets at higher than $18.50 have been reported in this district, but dealers are forced to pay a price at Detroit which figures to $18.50, delivered Pittsburgh, without the ordinary brokers' commission. Specialties continue scarce and heavy steel axle turnings have advanced 25c. on a recent sale. There are hold-ups at two consuming points in this district but other large plants are requiring scrap at an undiminished rate, and if steel operations continue at the present schedules through the early part of August, an even stronger scrap market is expected. Bids will be taken on Aug. 7 on the July Pennsylvania Railroad list, which contains 55,000 tons. The Baltimore & Ohio list, which closes Aug. 5,. contains 18,400 tons.

Prices per gross ton delivered consumers' yards in Pittsburgh and points taking the Pittsburgh district freight rate:

Basic Open-Hearth Grades:	
No. 1 heavy melting steel	$18.50 to $19.00
No. 2 heavy melting steel	16.50 to 17.00
Scrap rails	18.00 to 18.50
Compressed sheet steel	18.00 to 18.50
Bundled sheets, sides and ends	17.00 to 17.50
Cast iron carwheels	16.50 to 17.00
Sheet bar crops, ordinary	19.50 to 20.00
Heavy breakable cast	13.00 to 13.50
No. 2 railroad wrought	18.50 to 19.00
Hvy. steel axle turnings	16.50 to 17.00
Machine shop turnings	12.00 to 12.50
Acid Open-Hearth Grades:	
Railr. knuckles and couplers	21.50 to 22.00
Railr. coil and leaf springs	21.50 to 22.00
Rolled steel wheels	21.50 to 22.00
Low phos. billet and bloom ends	22.50 to 23.00
Low phos., mill plates	22.50 to 23.00
Low phos., light grades	20.50 to 21.50
Low phos., sheet bar crops	20.50 to 21.50
Heavy steel axle turnings	16.50 to 17.00
Electric Furnace Grades:	
Low phos., punchings	20.00 to 21.00
Hvy. steel axle turnings	16.50 to 17.00
Blast Furnace Grades:	
Short shoveling steel turnings	12.50 to 13.00
Short mixed borings and turnings	12.50 to 13.00
Cast iron borings	12.50 to 13.00
Rolling Mill Grades:	
Steel car axles	21.50 to 22.00
Cupola Grades:	
No. 1 cast	15.00 to 16.00
Rails 3 ft. and under	20.00 to 21.00

Common wire nails, per keg	2.90 to 3.00
Cement coated nails, per keg	3.05

To Make High-Strength Iron Castings

Davies & Thomas Co., Catasauqua, Pa., and William Sargent, Newark, N. J., have taken licenses from a group of German firms to manufacture high-strength iron castings under the so-called "Perlit" process. The first-named firm is now adapting its foundry for production, which will start in the near future.

The Third National Fuels Meeting, to be held in Philadelphia, Oct. 7-10, will have a series of papers on the domestic heating plant. The domestic use of gas, oil, electricity, anthracite and bituminous coal and coke will be covered.

"Oil Heat" is the title of a booklet issued by the Oil Heating Institute, 342 Madison Avenue, New York, and devoted to the use of oil-burning equipment for domestic purposes. It is illustrated with both line cuts and half-tones, the former using color.

Semi-Finished Steel, Raw Materials, Bolts and Rivets

Mill Prices of Semi-Finished Steel

Billets and Blooms

	Per Gross Ton
Rerolling, 4 in. and under 10 in., Pittsburgh	$35.00

Chicago

Bookings of Steel Mills Growing—No Pre-Autumn Recession Looked For—Wire Nails Weak

CHICAGO, July 30.—Sales of plates, shapes and bars are fully 50 per cent heavier than in the previous week, when new purchases were abreast of the average for the year. Lower rolling schedules in rail mills and reduced demands for automobile steels have simplified the problem of distributing steel among finishing departments. No longer handicapped by the allocation of semi-finished steel, Western mills have set out to increase their plate mill bookings and thereby to check, in some measure, the flow of orders to Eastern mills.

It is worthy of note that sales of rails and semi-finished steel were almost wholly lacking in the past week, while for the third consecutive seven-day period plate bookings have overshadowed new commitments in other steel products.

Producers' books are growing, while specifications hold steady at the current shipping rate, which is virtually equal to local mill capacity. The general market, while satisfactory throughout the summer, now seems to be growing even more active and thoughts of a possible slowing down before fall have passed from the minds of buyers and sellers.

Preliminary estimates indicate that steel ingot production for July has established a record for that month. Each of the seven months in 1929 has been a record for that particular month.

The local scrap market is in the hands of brokers, who are gaining confidence in the near future, as indicated by their willingness to take long positions. Railroad lists are being bid at higher prices and miscellaneous lots of the heavy-tonnage grades are quickly taken out of the market at steadily advancing prices.

Pig Iron.—Shipments of Northern iron will not establish a record for July, but the tonnage added to the total for the previous six months sets a record for any seven months' period. With one merchant stack out for relining, heavy drafts are being made against stocks in the hands of producers. In fact, it is thought by some that, had full pig iron producing capacity been available in July, shipments would have set a record. Six merchant furnaces are in blast, and it is probable that the Iroquois stack will be relined in time to be lighted by the middle of August. Stocks at furnaces are low, a situation which is unusual at the approach of the final quarter. New purchases are in moderate volume. A number of melters who are now buying third quarter iron are extending their contracts to cover the remainder of the year. Silvery releases are larger from users in western Michigan. Recently reduced prices, which lack strength, have failed to stimulate widespread buying. Stocks at charcoal iron furnaces, though smaller than in the late spring, are still of ample size to insure prompt delivery of most grades. The Southern iron market is quiet except for odd carlots placed in many cases as trial orders.

Prices per gross ton at Chicago:

N'th'n No. 2 fdy., sil. 1.75 to 2.25	$20.00
N'th'n No. 1 fdy., sil. 2.25 to 2.75	20.50
Malleable, not over 2.25 sil.	20.00
High phosphorus	20.00
Lake Super. charcoal, sil. 1.50	27.04
So'th'n No. 2 fdy. (all rail)	$19.51 to 20.51
Low phos., sil. 1 to 2, copper free	29.50
Silvery, sil. 8 per cent	29.79
Bess. ferrosilicon, 14-15 per cent	46.29

Prices are delivered consumers' yards except on Northern foundry, high phosphorus and malleable, which are f.o.b. local furnace, not including an average switching charge of 61c. per gross ton.

Ferroalloys.—New sales of spiegeleisen are light, and shipments against past obligations are smaller. Consumers of ferromanganese are ordering freely against old contracts.

Prices delivered Chicago: 80 per cent ferromanganese, $112.56; 50 per cent ferrosilicon, $83.50 to $88.50; spiegeleisen, 19 to 21 per cent, $40.76.

Plates.—For the second week, plate sales account for a large part of current orders to local mills, in fact, a larger share than last week, in view of a lack of rail and semi-finished purchases recently. Chicago plate mills are operating at capacity and new specifications, which are fully equal to shipments, assure heavy output for some time to come. Backlogs are unusually heavy, not only in proportion to local capacity, but also with respect to the season. Tank building programs continue to make headway, though no awards are reported. Fabricating shops are taking steel plates as fast as mills can make deliveries, which now range from six to eight weeks. New business in railroad equipment is light. The Great Northern is asking for prices on 300 underframes. In some quarters this is looked upon as a feeler, which may lead to the purchase of cars rather than underframes. Specifications from car shops are of moderate size, and shipments against past releases are large, while shops are pressing for quicker deliveries. Recent heavy sales of plates, largely for the manufacture of pipe, are interpreted by some as indicating a desire to hold more of this business for local mills. The drop in demand for automobile steels and a lessened rate of rail output is easing the problem of allotting steel to finishing departments. This permits greater production by plate mills.

Hot-Rolled Strip.—Specifications are fully equal to production, which is at local mill capacity. Prices are steady.

Structural Material.—Fabricators are looking to the future with greater confidence as the pending list grows and a more liberal number of small-tonnage contracts are placed. Although shop backlogs are not materially changed in size, enough work has been placed to keep unfilled business practically stationary, which is more than fabricators had expected in the midsummer weeks. Although official figures are not available, it is variously estimated that the Illinois Steel Co.'s expansion program will call for 40,000 to 50,000 tons of structural material. A Detroit fabricator is said to have taken 2000 tons for a branch plant of the Chevrolet Motor Car Co., and the Big Four railroad has ordered 2000 tons for a bridge at Terre Haute, Ind. Plans are being prepared for the Garrett Biblical Institute building at Chicago. Bids will be taken on the 6000 tons needed some time in the early fall. It is reported that legal obstacles are delaying the award of 3600 tons for the Thompson Building, Chicago.

Mill prices on plain material, per lb.: 2.05c. base, Chicago.

Bars.—Sales of bars are practically double those in the previous week, which were fully abreast of the average for the year. Specifications are equal to shipments, which are going forward at local mill capacity. Demand for mild steel bars is well diversified both as to character of specifications and as to consumers. Agricultural implement manufacturers are taking larger quantities now that inventories are out of the way. Forgers are taking heavier tonnages and cold-drawn steel producers, as well as bolt and nut makers, are taking liberal quantities. Prices for mild steel bars are steady at 2.05c. a lb., Chicago. Demand for alloy steel bars is steady from the majority of users, but consumption by automobile manufacturers is at low ebb, judged by releases to Chicago mills. In some cases, schedules that called for larger releases about Aug. 1 have been postponed to Aug. 15. This, however, is not taken as a reflection of the state of automobile

Warehouse Prices, f.o.b. Chicago

	Base per Lb.
Plates and structural shapes	3.10c.
Soft steel bars	3.00c.
Reinforc'g bars, billet steel	2.15c. to 2.35c.
Reinforc'g bars, rail steel	1.85c. to 1.95c.
Cold-fin. steel bars and shafting—	
Rounds and hexagons	3.60c.
Flats and squares	4.10c.
Bands (1/8 in. in Nos. 10 and 12 gages)	3.20c.
Hoops (No. 14 gage and lighter)	3.75c.
Black sheets (No. 24)	4.05c.
Galv. sheets (No. 24)	4.90c.

Hot-pressed nuts, sq., tap. or blank	60
Hot-pressed nuts, hex., tap. or blank	60
No. 8 black ann'l'd wire, per 100 lb.	$3.45
Com. wire nails, base per keg	3.20
Cement c't'd nails, base per keg	3.20

business, but rather as an indication that motor car manufacturers have not been able in all cases to get new models under way as rapidly as they had expected. Output of alloy steel bars in this district stands between 70 and 75 per cent of capacity. Spot buying is in moderate volume. Iron bar shipments and specifications are steady. Backlogs are light. The general situation in the rail steel bar market is unchanged from a week ago.

Wire Products.—Prices for nails throughout practically the whole of the Middle West show more weakness than a week ago. Demand from all classes of buyers is light. One disturbing factor, also affecting woven wire fencing, is the recent announcement by mail order houses that freight will be paid on all orders. Local sellers, already confronted with a weak and slow market, are intently watching this development without comment. Shipments of wire and wire products, as a whole, have gained in volume in the last few days and July now promises to be the best seventh month since 1922. Demand for concrete mesh is in good volume but below that of 12 months ago. Wire rope sales are large and shipments are heavy. Buyers are pressing for deliveries of electrical cable, which is sold up to November. General demand for electrical wire is active. Mill prices for wire and wire products are given on page 303.

Rails and Track Supplies.—New orders for standard-section rails total 1500 tons. Of unusual occurence in the light rail market are three orders that total 500 tons, the bulk of which will be shipped to Western copper producers. Rail output in this district is slowly tapering, the average now being about 72 per cent of capacity. New business in track fastenings is brisk, with 7000 tons in new orders. Inquiry is of little moment at present.

Prices f.o.b. mill, per gross ton: Standard section open-hearth and Bess. rails, $43; light rails, rolled from billets, $36. *Per lb.:* Standard railroad spikes, 2.80c.; track bolts with square nuts, 3.80c.; steel tie plates, 2.15c.; angle bars, 2.75c.

Bolts, Nuts and Rivets.—Specifications are in good volume except on small rivets, the demand for which is measurably lighter. Spot sales are in moderate volume and prices are steady.

Reinforcing Bars.—Contracts for reinforcing bars are more numerous, but they are scattered over a wide territory. Competition remains keen and current prices are weak. Rail steel reinforcing bars ordinarily bring 1.85c. to 1.95c. a lb. and the billet steel commodity is commonly quoted at 2.15c. to 2.35c. a lb. out of Chicago warehouses. From some viewpoints the future looks bright. The pending list is large and during the week several general contracts have been placed, pointing to early awards for reinforcing bars. Small-tonnage awards are more numerous and odd lots of small size are frequently coming out for figures. New contracts and fresh inquiries are shown on page 318.

Cast Iron Pipe.—Glamorgan Pipe & Foundry Co. has been awarded 1670 tons of 3 to 12-in. Class B pipe by Chicago at $46.05 a ton, delivered, or $37.85 a ton, Birmingham. Aberdeen, S. D., is said to have placed 12,000 ft. of 8-in., 14,000 ft. of 10-in. and 10,000 ft. of 12-in. pipe with the United States Pipe & Foundry Co. The McWane Cast Iron Pipe Co. has been awarded 18,000 ft. of 6 and 8-in. pipe by Clio, Mich. Hamilton County, Ohio, will take bids Aug. 2 on 43,000 ft. each of 6 and 8-in. pipe, 3800 ft. of 12-in. and 34 tons of fittings. Public utilities are buying occasional carloads and railroads are finding use for small quantities of cast pipe. Deliveries are prompt on practically all sizes.

Prices per net ton, del'd Chicago: Water pipe, 6-in. and over, $45.20 to $46.20; 4-in., $49.20 to $50.20; Class A and gas pipe, $3 extra.

Sheets.—Specifications are in larger volume than shipments, which have been cut to 80 per cent of hot mill capacity. Curtailment of production is due to hot weather during the last five or six days. New buying is steady and in good volume, and prices for sheets are firm except when delivery is made to the Southwest. Jobbers continue to order freely and light tank makers are busier, as indicated by larger specifications to hot mills.

Base prices per lb., deliv'd from mill in Chicago: No. 24 black sheets, 3.10c.; No. 24 galv., 3.85c.; No. 10 blue ann'l'd, 2.35c. Deliv'd prices at other Western points are equal to the freight from Gary, plus the mill prices, which are 5c. per 100 lb. lower than Chicago delivered prices.

Cold-Rolled Strip. — Operations have been cut to a range of 70 to 75 per cent of capacity, following a decline in specifications. New buying is light, with prices steady.

Coke. — Shipments of by-product foundry coke are at local oven capacity. New buying is confined to small lots. Prices are steady at $8 a ton, local ovens.

Old Material.—Dealers are bidding up railroad lists in an attempt to take a long position in the market. Expiration of several large commitments in the local market, steadiness of demand from large consumers and an upward movement in the Pittsburgh market all tend to confirm brokers' belief that there is strength underlying the local market and that prices will go up rather than down. In the meantime quotations remain at a dead level, with undercurrents of strength shown in some grades that were notably weak at the middle of the month. Steel mills discount the argument of sellers of scrap that the pressure placed on blast furnaces will soon necessitate heavy repairs, with resultant increase in the use of cold metal and larger quantities of scrap. Shipments of borings barely meet the needs of local consumers, as increasing tonnages are being moved from Michigan to Eastern markets. Brokers are bidding as high as $15.75 a gross ton, delivered, for odd carloads of heavy melting steel. The Chicago & North Western has offered 1500 tons, and the Baltimore & Ohio will sell 15,000 tons on Aug. 5.

Prices deliv'd Chicago district consumers:

Per Gross Ton

Basic Open-Hearth Grades:	
Heavy melting steel	$14.75 to $15.25
Shoveling steel	14.75 to 15.25
Frogs, switches and guards, cut apart, and misc. rails	16.50 to 17.00
Hydraul. compressed sheets	13.00 to 13.50
Drop forge flashings	10.50 to 11.00
No. 1 busheling	13.00 to 13.50
Forg'd cast and r'l'd steel carwheels	18.50 to 19.00
Railroad tires, charg. box size	18.50 to 19.00
Railroad leaf springs cut apart	18.50 to 19.00
Acid Open-Hearth Grades:	
Steel couplers and knuckles	16.75 to 17.25
Coil springs	19.00 to 19.50
Electric Furnace Grades:	
Axle turnings	14.50 to 15.00
Low phos. punchings	16.50 to 17.00
Low phos. plates, 12 in. and under	16.50 to 17.00
Blast Furnace Grades:	
Axle turnings	10.75 to 11.25
Cast iron borings	9.75 to 10.25
Short shoveling turnings	9.75 to 10.25
Machine shop turnings	7.00 to 7.50
Rolling Mill Grades:	
Iron rails	16.00 to 16.50
Rerolling rails	17.50 to 18.00
Cupola Grades:	
Steel rails less than 3 ft.	17.75 to 18.25
Steel rails less than 2 ft.	18.25 to 18.75
Angle bars, steel	17.00 to 17.50
Cast iron carwheels	14.00 to 14.50
Malleable Grades:	
Railroad	16.75 to 17.25
Agricultural	15.50 to 16.00
Miscellaneous:	
*Relaying rails, 56 to 60 lb.	23.00 to 25.00
*Relaying rails, 65 lb. and heav.	26.00 to 31.00

Per Net Ton

Rolling Mill Grades:	
Iron angle and splice bars	15.00 to 15.50
Iron arch bars and transoms	21.00 to 21.50
Iron car axles	26.00 to 26.50
Steel car axles	16.50 to 17.00
No. 1 railroad wrought	13.50 to 14.00
No. 2 railroad wrought	13.00 to 13.50
No. 1 busheling	9.00 to 9.50
No. 2 busheling	7.00 to 7.50
Locomotive tires, smooth	14.50 to 15.00
Pipes and flues	10.00 to 10.50
Cupola Grades:	
No. 1 machinery cast	14.50 to 15.00
No. 1 railroad cast	13.75 to 14.25
No. 1 agricultural cast	13.25 to 13.75
Stove plates	12.25 to 12.75
Grate bars	11.75 to 12.25
Brake shoes	10.50 to 11.00

*Relaying rails, including angle bars to match, are quoted f.o.b. dealers' yards.

U. S. Aluminum Expansion

United States Aluminum Co., New Kensington, Pa., will erect a new machine shop, rehabilitate old New Kensington Brewing Co. property and build an addition to Arnold tube mill at total cost of $1,000,000. Machine shop will be of brick and steel construction, 130 x 482 ft., with 50-ton cranes on working floor and with light tool equipment on mezzanine floor. The brewing company brick buildings will be improved for storage of patterns and materials for adjoining machine shop. Tube mill addition will be 155 x 425 ft., and will house tube drawing and heat treating equipment with inspection and packing facilities.

New York

Pig Iron Sales of 10,000 Tons—Structural Steel Activity Sustained—Weakness in Sheets

NEW YORK, July 30.—Pig iron sales during the week totaled 10,000 tons, and pending business aggregates 20,000 tons. The largest inquiry, 10,000 tons for American Radiator Co. plants in the West, is still open. A Connecticut melter is in the market for 5000 tons and a New England textile manufacturer wants 1000 tons. The Thatcher Co., Newark, N. J., is inquiring for 500 tons of foundry iron for the current quarter. The Eastern Malleable Iron Co., Naugatuck, Conn., recently closed against an inquiry for 1000 to 2000 tons, and is in the market for additional tonnage. Foundry melt is spotty in some areas, but on the whole, if one is to judge from pig iron shipments, is well sustained. Hot weather, of course, has tended to slow up operations to some extent. Outside of a sale of 1000 tons of Alabama iron to a New England consumer, orders for Southern iron have been confined to scattered small lots. Representatives of Southern producers, however, are active in covering this market and in developing ways of delivering iron on the most economical basis. The water-and-rail rate from Birmingham to Savannah, Ga., and via steamship to New York, amounting to $5.50 a ton, with free lighterage at this end, is being ignored for the time being because of the possibility of its suspension. The rate of $3.50 a ton to Norfolk, Va., on iron for transshipment by barge northward has not been protested. The handling charge at Norfolk is 35c. a ton and barge rates to New York range from $1.10 to $1.20 a ton (1000 tons or more). If loaded from barge on Pennsylvania Railroad cars for further shipment, handling costs of 15c. a ton or less are waived. Effective Aug. 1 a railroad rate of $1.01 a ton to local New Jersey points will be available from Jersey City. As a consequence the total transportation charges from Birmingham to these New Jersey points will be $5.96 a ton, or a delivered price on foundry grade at $14.50, Birmingham, of $20.46. The main difficulty is arranging for barge shipments of 1000 tons or more from Norfolk. New York State furnaces are well booked and have no excessive stocks. No sales at less than $17.50, Buffalo, have been reported, and a considerable tonnage, made up largely of smaller lots, has been sold at $18, base.

Prices per gross ton, delivered New York district:

Buffalo No. 2 fdy., sil. 1.75 to 2.25	$22.41 to $22.91
*Buf. No. 2, del'd east. N. J.	20.78 to 21.28
East. Pa. No. 2 fdy., sil. 1.75 to 2.25	20.89 to 22.02
East. Pa. No. 2X fdy., sil. 2.25 to 2.75	21.39 to 22.52

Freight rates: $4.91 from Buffalo, $1.39 to $2.52 from eastern Pennsylvania.

*Price delivered to New Jersey cities having rate of $3.28 a ton from Buffalo.

Warehouse Business.—Buying from stock is restricted to small lots, but there is still a fair tonnage of structural material moving and a moderate volume of business in sheets is reported. Black and galvanized sheet prices are subject to shading of $1 to $2 a ton and even greater concessions are occasionally made on substantial orders for blue annealed. Softness of blue annealed sheet prices is attributed to the wide spread between present warehouse and mill quotations, which, on the basis of 2.20c., base Pittsburgh, or 2.54c., delivered New York, from the mill, is about $27 a ton.

Cast Iron Pipe.—The usual season of quiet in pressure pipe buying has set in and not much activity is expected until inquiry begins to appear for fall delivery of pipe. A substantial number of orders are being placed for carload lots, but about the largest recent award in this district was 625 tons of 8-in. Class C pipe for Yonkers, N. Y., on which the low bid was $35.70 per net ton, delivered, quoted by the United States Pipe & Foundry Co. The freight rate from Burlington to Yonkers is $3.80 per ton. On 27 tons of 6-in. Class B pipe for Newburgh, N. Y., R. D. Wood & Co. were the low bidders with a price of $34.64 per ton and a $2.90 per ton freight rate from Florence, N. J.

Prices per net ton deliv'd New York: Water pipe, 6-in. and larger, $33.60 to $34.60; 4-in. and 5-in., $36.60 to $37.60; 3-in., $43.60 to $44.60. Class A and gas pipe, $3 extra.

Reinforcing Bars.—Numerous small orders, which have totaled a fairly good volume in the aggregate, have been placed. Prices have not changed.

Billet steel reinforcing bars in 40, 50 and 60-ft. lengths, 2.05c. per lb., Pittsburgh, and 2.30c. per lb., Pittsburgh warehouse, for cut lengths. Out of New York warehouse, 2.90c. per lb. for lots of 5 tons or more, 3.05c. for lots of 2 to 5 tons and 3.30c. for less than 2 tons, all delivered at job.

Finished Steel.—Despite a slight slackening in demand for bars and plates, business continues unusually good for midsummer. An important producer says that bookings in July were about 25 per cent ahead of those in the same month of 1928. Orders and specifications have come from a wide range of consumers. Prices are firm and show no change. Pronounced activity in structural steel is still a feature. Lettings in the past week have included 3000 tons for a Chevrolet assembly plant at Tarrytown, N. Y., 2200 tons for the new building of the Pratt & Whitney Aircraft Corporation at East Hartford, Conn., and 3800 tons for an office building in Newark, N. J. Two thousand tons for a plant addition to the Atwater Kent factory in Philadelphia was the largest of the fresh inquiries. Pending business is heavy and awards in the next month are expected to insure fairly good operations for district fabricating shops. The placing of 14,000 tons for a bridge across the Hackensack River by the Pennsylvania Railroad is expected in a few days. The Phœnix Bridge Co. is low bidder. The

CARNEGIE LIBRARY OF ATLANTA

contract for 2550 tons for pier 3, North River, should be awarded this week. Aug. 2 is the date set for opening bids for 13,200 tons for a section of the New York subway in Queens. Sheet steel manufacturers comment on the rather incongruous situation in the sheet market. Although sales have been exceptionally good and most mills are unable to make deliveries in less than four to six weeks—factors which should give strength to the market—prices have sagged somewhat, especially in galvanized and black sheets. The former grade is selling at 3.60c., Pittsburgh, to consumers and 3.50c. to jobbers, with an occasional dip to the latter figure on an order for a consumer. Even lower quotations are said to rule in the South on roofing and siding material.

Mill prices per lb., deliv'd New York: Soft steel bars, 2.29c.; plates, 2.22½c.; structural shapes, 2.19½c.; bar iron, 2.14c.

Coke.—Demand for foundry coke is fair. Standard furnace coke is moderately active and quotations are unchanged at $2.75 to $2.85 per net ton, Connellsville. Special brands of beehive foundry coke are $4.85 per net ton, ovens, or $8.56 per net ton, delivered to northern New Jersey, Jersey City and Newark and $9.44 to New York or Brooklyn. By-product coke is quoted at $9 to $9.40 a net ton, Newark or Jersey City, and $10.06, New York or Brooklyn.

Old Material.—Heavy melting steel prices paid by brokers for delivery to eastern Pennsylvania and occasionally for shipment to the Pittsburgh district continue firm, with a slight tendency to advance. Other grades of scrap are inactive and prices are unchanged. No. 1 heavy melting steel is quoted by brokers at $16.25 to $16.50 per ton, delivered eastern Pennsylvania, and brokers buying for shipment to western Pennsylvania are offering $18.25 per ton, delivered, or $12.95 per ton, New York. Rerolling rails are being bought at $17.50 per ton, delivered to eastern Pennsylvania, and cast iron carwheels are stronger by about 50c. a ton. Cast scrap is quiet.

Dealers' buying prices per gross ton, f.o.b. New York:

No. 1 heavy melting steel	$12.75 to $13.35
Heavy melting steel (yard)	8.00 to 9.75
No. 1 hvy. breakable cast.	10.75 to 11.75
Stove plate (steel works).	8.00 to 8.25
Locomotive grate bars....	8.25 to 8.75
Machine shop turnings....	7.50 to 7.75
Short shoveling turnings..	7.50 to 7.75
Cast borings (blast furn. or steel works).....	7.00 to 7.25
Mixed borings and turnings	6.75 to 7.25
Steel car axles.....	19.50 to 20.00
Iron car axles.....	24.00 to 25.00
Iron and steel pipe (1 in. dia., not under 2 ft. long)	10.75
Forge fire	9.75 to 10.25
No. 1 railroad wrought...	12.00 to 12.50
No. 1 yard wrought, long..	11.00 to 11.50
Rails for rolling.....	13.25 to 13.75
Cast iron carwheels.....	12.50 to 13.00
Stove plate (foundry)....	8.00 to 8.50
Malleable cast (railroad).	14.00 to 14.50
Cast borings (chemical)..	10.00 to 10.50

Prices per gross ton, deliv'd local foundries:

No. 1 machry. cast.....	$17.00
No. 1 hvy. cast (columns, bldg. materials, etc.), cupola size.....	15.00
No. 2 cast (radiators, cast boilers, etc.)	14.50

Cleveland

August Outlook Is for July Rate, a Midsummer Record—Upturn in Sheet Orders

CLEVELAND, July 30.—Steel production in this district shows no decline, except such as had been occasioned by extreme heat. Measured by output, the month has established a new record for midsummer, not excepting the war years and the unusual summer activity of 1920.

Incoming business, as compared with June, has shown some falling off, but the decline has been less than was expected. The effect of the reduced scale of new buying and shipping releases has been to lower the tonnage of unfilled orders on mill books, but mill operations have been held at a high rate. On the basis of orders now definitely scheduled, it appears certain that mill output in August will be continued at about the current rate.

Except in some widths and gages of sheet and strip steel, mills are not in need of orders, and even in these products the need is not urgent. A few mills are competing more aggressively for business in galvanized sheets, and the continuous sheet mills have given concessions on the gages and widths they roll. Generally, however, the price situation is fairly steady.

The only marked change in the past week was an upturn in sheet orders. Whether buyers had been holding off in the expectation of lower prices or for some other reason, the fact is many of them were forced to come into the market. Last week's sheet orders with some mill offices were larger than the total tonnage for the preceding three weeks of the month.

Automobile demand is somewhat spotty, but on the whole is still good. A few plants which were shut down or had curtailed output because of vacations or changes in models are again in production, although at a moderated pace. The Chevrolet Motor Car Co. has cut its schedules, but the general trend among other companies is upward as compared with the early part of July. Shipping schedules for steel that have been arranged for August and September by automobile manufacturers and body builders generally call for more steel than has been shipped to these companies during July.

Pig Iron.—Pig iron business showed further improvement, with sales totaling about 25,000 tons, which was 5000 tons more than was sold in the previous week. Inquiry, however, is very light, but Lake furnaces are well sold up through this quarter. Melters are not yet taking much interest in their fourth quarter requirements. Shipments are running only slightly less than in June. A steel company that sells merchant iron is using nearly all of its product in its own open-hearth furnaces and is virtually out of the market for the remainder of this quarter. An Indiana company that was in the market for 5000 tons of foundry iron is understood to have closed. Prices are steady at $18.50, Cleveland, for outside shipment, at $19 for local delivery and at $20, Lake furnace, for Michigan delivery.

Prices per gross ton at Cleveland:

N'th'n fdy., sil. 1.75 to 2.25	$19.50
S'th'n fdy., 1.75 to 2.25....$20.00 to	20.50
Malleable	19.50
Ohio silvery, 8 per cent...	28.00
Basic Valley furnace.....	18.50
Stand. low phos., Valley.. 26.50 to	27.00

Prices except on basic and low phosphorus are delivered Cleveland. Freight rates: 50c. from local furnaces; $3 from Jackson, Ohio; $6 from Birmingham.

Warehouse Business. — Although July is usually a dull month in jobbers' sales, this month has been an exception. Business has been in smaller volume than in June, but has outstripped all sales records for July. The decline from June has not been severe. Prices are well maintained.

Reinforcing Bars.—Inquiry is light. The largest contract was 500 tons for the Cleveland Electric Illuminating Co. at Ashtabula, Ohio, taken by the Bourne-Fuller Co.

Semi-Finished Steel.—While the production of semi-finished steel now seems to be ample for all requirements, there is no surplus, and the furnaces and mills of the local producer are being operated at full capacity to take care of contract business. The price remains at $35, Cleveland, Youngstown or Pittsburgh, for billets, slabs and sheet bars.

Bolts, Nuts and Rivets.—Orders for bolts and nuts have increased during the past few days. Total bookings for July will be larger than those of June. Demand for rivets has not improved and falls considerably short of makers' capacity.

Plates, Shapes and Bars. — New business and contract specifications for plates, shapes and bars during July have reached a volume closely approximating that of June. While the structural steel market is quiet at the moment, considerable new

*Net base, including boxing and cutting to length.

work is in prospect. Meanwhile, fabricating shops are busy on contracts and are calling for steady shipments of plain material. Plate demand in this district is sustained by the continued activity of boiler and tank fabricating shops. The Cleveland producers of steel bars are taking a good deal of the local tonnage. Outside mills are not competing strongly for this business, especially on the larger tonnages, which occasionally bring out price concessions when considered on a delivered basis.

Old Material.—Despite the strength at Pittsburgh and Youngstown, the local scrap market continues quiet, with prices unchanged. Local mills are not buying and, in fact, have not yet taken in all of the material due them on contracts. At Youngstown, $18.50 is being paid for heavy melting steel and $18 for hydraulic compressed bundles. Production of scrap by Detroit automobile plants has declined this month.

Prices per gross ton delivered consumers' yards:

Basic Open-Hearth Grades:	
No. 1 heavy melting steel	$15.00 to $15.50
No. 2 heavy melting steel	14.50 to 15.00
Compressed sheet steel	14.50 to 15.00
Light bundled sheet stampings	12.00 to 12.50
Drop forge flashings	13.00 to 13.25
Machine shop turnings	9.25 to 9.50
No. 1 railroad wrought	13.50 to 14.00
No. 2 railroad wrought	16.00 to 16.50
No. 1 busheling	13.25 to 13.75
Pipes and flues	9.00 to 9.50
Steel axle turnings	12.50 to 13.00
Acid Open-Hearth Grades:	
Low phos., forging crops	17.75 to 18.00
Low phos., billet, bloom and slab crops	18.50 to 18.75
Low phos., sheet bar crops	18.00 to 18.50
Low phos., plate scrap	18.00 to 18.50
Blast Furnace Grades:	
Cast iron borings	10.75 to 11.00
Mixed borings and short turnings	10.75 to 11.00
No. 2 busheling	10.75 to 11.00
Cupola Grades:	
No. 1 cast	16.75 to 17.25
Railroad grate bars	11.00 to 12.00
Stove plate	12.00 to 12.50
Rails under 3 ft	18.50 to 19.00
Miscellaneous:	
Railroad malleable	18.00 to 18.50
Rails for rolling	16.25 to 16.50

Sheets.—Demand took a spurt in the past week. Some local sales offices received a larger tonnage of orders last week than in all of the rest of July. In some instances, automobile companies and body builders have arranged steel shipping schedules for August and September that call for larger tonnages than were shipped in July. The price situation reflects continued weakness in galvanized sheets, on which 3.50c., Pittsburgh, which has been the price to jobbers, has been extended in certain cases to consumers. Black sheets remain at 2.85c., Pittsburgh. Light gage blue annealed material, especially in the wider sizes, continues fairly firm in price, but the heavy gage narrow material, such as is rolled by the continuous mills, is being sold at concessions. Some sheet mills still have substantial backlogs. Deliveries of nearly all grades have shortened, but rollings sufficient for three or four weeks are in hand in many grades. On some grades, orders extend into September.

Strip Steel.—While there has been a let-down in the call for strip steel, the mill situation is still fairly good. No marked curtailment of production is reported in hot-rolled strip. Some makers of cold-rolled strip are in need of orders, while others have a fair volume ahead of them. The easing has occurred chiefly in wide strips, which can be had in one to two weeks.

Wire Products. — Manufacturers' wire is being shipped in good volume. While the automobile industry is not taking as much as it was a month or two ago, the shipments to that industry are regarded by the mills as highly satisfactory for this time of year. Plain wire prices are steady, but irregularities persist in wire nail prices.

Philadelphia

Steel Specifications Smaller — Pig Iron Prices Begin to Be Affected By Southern Competition

PHILADELPHIA, July 30.—Operating rates of steel mills are being maintained, but specifications against current contracts are smaller and backlogs on mill books have declined from the total a month ago. Prices are firm on plates, shapes and bars and a firmer tone is evident on black and galvanized sheets, since the recent recession of about $2 a ton in quotations.

Pig iron is lacking in strength in the face of competition from Southern sellers, but concessions have not been large. With the exception of heavy melting steel, iron and steel scrap is quiet and prices show no tendency to advance.

Reinforcing Bars.—Projects calling for small tonnages of bars are numerous, but competition is keen among distributers, so that 1.95c. per lb., Pittsburgh, or 2.27c., delivered Philadelphia, with no extra for cutting to length is still obtainable on billet steel bars. An outstanding inquiry is for 700 tons of reinforcing bars in a build- for the Atwater Kent Mfg. Co., Philadelphia. Billet steel bars are quoted at 1.95c. to 2.05c., Pittsburgh, or 2.27c. to 2.37c., delivered Philadelphia, with the $5 extra for cutting to length sometimes disregarded by sellers. Rail steel reinforcing bars are quoted at 1.95c., Franklin, Pa., or Tonawanda, N. Y., or 2.27c., delivered Philadelphia, with no extra for cutting to length.

Pig Iron.—Southern basic iron is being quoted openly at $13.50 per ton, furnace, but recent bids for eastern Pennsylvania business have been at $13 a ton and less. Consequently, with consumers in this district considering the purchase of Birmingham basic iron, the eastern Pennsylvania market is lacking in strength and $20 to $20.50 per ton, delivered, is representative of the current trend. Foundry iron prices have been shaded by sellers of Southern iron from $14.50 per ton, Birmingham furnace, and in the past week a consumer in this district has closed on 1000 tons of Southern iron. While eastern Pennsylvania furnaces are not inclined to meet the delivered prices of Southern iron, they recognize that the saving to the buyer must be reduced to a minimum, which has resulted in shading $21.50, furnace, by 50c. to $1 a ton. Except for an inquiry from the Sun Shipbuilding Co., Chester, Pa., for about 500 tons of No. 2 and No. 2X foundry iron, current inquiry is for small lots.

Prices per gross ton at Philadelphia:

East. Pa. No. 2, 1.75 to 2.25 sil.	$21.26 to $22.26
East. Pa. No. 2X, 2.25 to 2.75 sil.	21.76 to 22.76
East. Pa. No. 1X	22.26 to 23.26
Basic (del'd east. Pa.)	20.00 to 20.50
Gray forge	20.50 to 21.00
Malleable	21.25 to 21.75
Stand. low phos. (f.o.b. N. Y. State furnace)	22.00 to 23.00
Cop. b'r'g low phos. (f.o.b. furnace)	23.50 to 24.00
Va. No. 2 plain, 1.75 to 2.25 sil.	24.04
Va. No. 2X, 2.25 to 2.75 sil.	24.54

Prices, except as specified otherwise, are deliv'd Philadelphia. Freight rates: 76c. to $1.64 from eastern Pennsylvania furnaces; $4.54 from Virginia furnaces.

Bars.—Deliveries are shorter, ranging from two to three weeks, but operating rates of mills are well maintained with sufficient tonnage on the books to carry producers over the period of mid-summer quiet. Prices are firm at 1.95c. per lb., Pittsburgh, or 2.27c., delivered Philadelphia.

Shapes.—Fabricators are well engaged with contracts and not inclined to quote so low for new business as has been the case in the past. Shape mills are maintaining a good rate of operation, but prices although firmer, show no tendency to advance from

1.95c. to 2.05c., f.o.b. nearest mill to consumer, or 2.01c. to 2.11c., delivered Philadelphia.

Plates.—The volume of specifications against contracts is smaller, but this is generally considered as a temporary condition of business, attributable to the summer. Deliveries still range from two to three weeks and prices are firm at 2.05c., per lb., Coatesville, or 2.15c., delivered Philadelphia.

Sheets.—Black and galvanized sheets have settled to 2.85c., Pittsburgh, or 3.17c., delivered Philadelphia for black and 3.60c., Pittsburgh, or 3.92c., Philadelphia, for galvanized. Occasionally concessions of $1 a ton are made from these prices on sizable tonnages. Blue annealed sheets are being maintained at 2.35c. per lb., Pittsburgh, or 2.67c., delivered Philadelphia for No. 13 gage, and light plates blue annealed are quoted at 2.20c., Pittsburgh, or 2.52c., delivered Philadelphia for No. 10 gage.

Imports.—In the week ended July 27, a total of 970 tons of chrome ore arrived at this port from Greece and 1060 tons of pig iron was received, of which 979 tons was from British India and 81 tons from Sweden. Steel imports consisted of 52 tons of steel bands from Belgium and 20 tons from the United Kingdom and 92 tons of steel billets from Sweden.

Old Material.—A Pencoyd, Pa., mill has closed on a small tonnage of No. 2 automobile scrap at $14.50 per ton, delivered, an advance of 25c. from its previous buying price. No. 1 heavy melting steel is firm at $16.50 to $17 per ton, delivered, but other grades are inactive and prices lacking in strength, especially cast scrap.

Prices per gross ton delivered consumers' yards, Philadelphia district:

No. 1 heavy melting steel	$16.50 to $17.00
Scrap T rails	16.00
No. 2 heavy melting steel	12.50 to 14.50
No. 1 railroad wrought	16.00 to 16.50
Bundled sheets (for steel works)	11.50
Hydraulic compressed, new	14.50 to 15.00
Hydraulic compressed, old	12.00 to 12.50
Machine shop turnings (for steel works)	11.50 to 12.00
Heavy axle turnings (or equiv.)	14.00 to 14.50
Cast borings (for steel works and roll. mill)	11.00 to 11.50
Heavy breakable cast (for steel works)	15.00 to 15.25
Railroad grate bars	12.00 to 12.50
Stove plate (for steel works)	12.00 to 12.50
No. 1 low phos., hvy., 0.04% and under	22.00 to 23.00
Couplers and knuckles	19.50 to 20.50
Rolled steel wheels	19.50 to 20.50
No. 1 blast f'nace scrap	10.50 to 11.00
Wrot. iron and soft steel pipes and tubes (new specific.)	15.00
Shafting	19.00 to 19.50
Steel axles	23.00 to 23.50
No. 1 forge fire	14.00
Cast iron carwheels	16.50 to 17.00
No. 1 cast	16.50 to 17.00
Cast borings (for chem. plant)	14.50
Steel rails for rolling	16.50 to 17.00

To Assist on Census of Manufactures

WASHINGTON, July 30.—Revision of inquiries on the general schedule of the manufactures' census will be prime purpose of an executive committee named at a meeting last Friday at the Department of Commerce of the Advisory Committee for the Census of Manufactures. There also was appointed a publicity committee, which will institute a campaign to acquaint business men with the scope and importance of the statistics with the hope of obtaining complete cooperation in getting necessary data.

The executive committee, approved by Secretary of Commerce Lamont, includes the following: Col. L. S. Horner, president, Niles-Bement-Pond Co., New York, chairman, and Walter S. Tower, Bethlehem Steel Co..

National Machine Tool Show in Cleveland

The most complete range of machine tools, equipment and accessories ever assembled, it is stated by its management staff, will be on display in the 1929 National Machine Tool Builders' Exposition, which will occupy the West Annex, Arena and Arcade of the Public Auditorium in Cleveland, from Sept. 30 to Oct 4 inclusive.

The exposition will be visited, according to official forecast, by some 15,000 executives, engineers, production specialists, buyers, superintendents, shop foremen and operating men from among the diversified machine tool using industries in this country and abroad.

In direct charge of the 1929 exposition is the following committee: Chairman: J. Wallace Carrel, Lodge & Shipley Machine Tool Co.; P. E. Bliss, Warner & Swasey Co.; Ralph E. Flanders, Jones & Lamson Machine Co.; Robert M. Gaylord, Ingersoll Milling Machine Co.; James E. Gleason, Gleason Works; and ex-officio Henry Buker, Brown & Sharpe Mfg. Co., president of the association.

What the Railroads Did in 1928

"Statistics of Common Carriers," issued by the Interstate Commerce Commission in pamphlet form, shows that the railroads in 1928 transported 2,361,622,636 net tons of revenue freight an average distance of 183.31 miles. During the same year 790,327,447 passengers were carried an average of 39.99 miles each. The freight earned a revenue averaging 1.081c. for each ton-mile. The passengers produced a revenue of 2.85c. average for each passenger-mile.

Investment of the railroads in lines, plant and equipment is given as $24,873,474,285, an increase of 1.7 per cent over the preceding year. Use of this property produced total revenues aggregating $6,111,735,511. Against this the operating expenses amounted to $4,427,995,036, giving an operating ratio of 72½ per cent. Taxes amounted to $389,432,415 and dividends to $431,030,910. The dividends were at the rate of 7.09 per cent on the stocks on which they were declared, and of 5.03 per cent on the total stocks outstanding.

Steel Furniture Makers Adopt Trade Rules

WASHINGTON, July 30.—The Federal Trade Commission has issued new trade practice rules covering the steel office furniture industry. Manufacturers held a conference with the commission in Washington on April 13 and voted to adopt rules governing the conduct of the industry. The conference represented more than 80 per cent of the volume of business and 65 per cent of the number of companies in the industry.

Expands Capacity for Stainless Iron

The Duraloy Co. of Pittsburgh has recently installed a 1½-ton Moore Lectromelt Furnace at its plant at New Cumberland, W. Va. Extensive additions have also been made to the machine shop, thus facilitating the output of machined chromium alloy castings in greater quantities.

Steel Traffic to Hold Up

Iron and steel freight traffic in the third quarter will approximately equal that of the second and will show a gain of 8 per cent over the third quarter of 1928, according to an estimate by the iron and steel committee of the Atlantic States Shippers Advisory Board.

Passing upon a complaint by the Vulcan Mold & Iron Co., Latrobe, Pa., Examiner Lewis L. Prout in a report to the Interstate Commerce Commission, made public yesterday, held that the rate of $2.02 per ton of pig iron from Hubbard, Ohio, and certain other points in the Mahoning and Shenango valleys to Latrobe is not unreasonable. It was recommended that the complaint be dismissed.

A 44-page booklet has been issued by the New Jersey Zinc Co., 160 Front Street, New York, entitled "Rolled Zinc." It is fully illustrated and contains tables and other information concerning the various rolled zinc products made by that company.

Tractors are coming more and more into use in India, according to a report received by the Department of Commerce from Assistant Trade Commissioner R. C. Cockburn, Calcutta.

Pacific Coast

Bids Received on Seattle Pipe Line—Large Amount of Reinforcing Work Pending—Structural Awards Decline

SAN FRANCISCO, July 27 (*By Air Mail*).—Demand for steel products, especially structural shapes, has eased off and few large tonnages are up for figures or pending. The outstanding development of the week was the tabulation of bids on the 3700-ton riveted Cedar River pipe line at Seattle, Wash., which showed the Western Pipe & Steel Co. to be the low bidder. Cast iron pipe bookings were also heavy, Oakland and Pasadena, Cal., placing 2173 tons and 852 tons respectively. Prices are being well maintained and little shading is being indulged in.

Pig Iron.—Both sales and inquiries for foundry iron are limited to unimportant lots. Specialty plants, such as stove and sanitary ware manufacturers, are operating on fairly heavy schedules, but jobbing plants remain on restricted schedules. Quotations are unchanged.

Prices per gross ton at San Francisco:

*Utah basic	$25.00 to $26.00
*Utah fdy., sil. 2.75 to 3.25	25.00 to 26.00
**Indian fdy., sil. 2.75 to 3.25	25.00 to 26.00

*Delivered San Francisco.
**Duty paid, f.o.b. cars San Francisco.

Bars.—Important reinforcing bar lettings of the week included 550 tons for the Vance Building, Seattle, placed with the Northwest Steel Rolling Mills; 300 tons for an office building in Santa Monica, Cal., and 208 tons for highway work in Alameda County, Cal., the latter two projects being placed with unnamed interests. At the present time pending business exceeds 3000 tons, the largest project calling for 1150 tons for the West Garfield Street bridge, Seattle, bids on which open next week. Los Angeles out-of-stock prices are firm at 2.30c. a lb. base, on lots of 250 tons and up, 2.40c. a lb., on carload quantities and 2.70 c., on smaller lots. San Francisco prices are $2 a ton lower. Movement of merchant bar material has not improved of late, sales and inquiries being confined to small tonnages composed of a wide range of sizes. Prices on this class of steel remain firm at $2.35c. a lb., c.i.f. Coast ports.

Plates.—The East Bay Municipal Utility District has placed 100 tons of 54-in. riveted pipe with an unnamed interest. The only other important letting of the week, which went to the Willamette Iron & Steel Co. called for 150 tons for a digester for the Rainier Pulp & Paper Co., Seattle. Bids opened last week on the Cedar River pipe line, Seattle, show the Western Pipe & Steel Co. as being low. An award is expected within the next few days. Prices appear firm at 2.35c. c.i.f. Pacific ports.

Shapes.—Structural lettings have fallen off. Only four awards of over 100 tons were reported. Poole & McGonigle secured 900 tons for an office building in Portland, Ore., the McClintic-Marshall Co. took 500 tons for a hotel in San Francisco and the Consolidated Steel Corporation booked 200 tons for a factory addition in Huntington Park, Cal. Pending business is the lightest in several months. New inquiries include 1500 tons for the Los Angeles Stock Exchange Building, bids on which will be called for in September. Bids were opened this week on 105 tons for a bridge over the Nehalem River in Oregon. No change has occurred in prices, 2.35c., c.i.f., being firm.

Cast Iron Pipe.—Important cast iron pipe awards include 2173 tons of 6 to 20-in. Class 150 and Class B pipe for the East Bay Municipal Utility District, Oakland, booked by the United States Pipe & Foundry Co. The Pacific States Cast Iron Pipe Co. took 75 tons of 4-in. Class 150 pipe and the United States Pipe & Foundry Co. booked 777 tons of 6 to 12-in. Class 150 and 24-in. Class B pipe for Pasadena, Cal. Griffith Co. secured 185 tons of 4 to 12-in. Class B pipe for the improvement of Broadway, Santa Monica, Cal. Pending business calls for less than 2500 tons, no new inquiries of importance having come up for figures.

Steel Pipe.—Movement of standard steel pipe is holding up well, but most orders call for relatively small lots, as distributers have well balanced stocks. No action has yet been taken by the Pacific Gas & Electric Co., San Francisco, on its inquiry for 2263 tons of 8⅝-in. O. D. gas pipe for installation in Monterey, Salinas and Gilroy, Cal. This company also contemplates the laying of a 16-in. line across the Carquinez Straits bridge to serve lower valley points.

Coke.—Sales and inquiries cover small lots for prompt shipment. English beehive coke is quoted at $16 to $17 a net ton, delivered incoming dock, while by-product coke is quoted at $12.50 to $13.50 a ton.

Warehouse Prices, f.o.b. San Francisco

	Base per Lb.
Plates and struc. shapes	3.15c.
Soft steel bars	3.15c.
Small angles, ⅞-in. and over	3.15c.
Small angles, under ⅞-in.	3.55c.
Small channels and tees, ¾-in. to 2¾-in.	3.75c.
Spring steel, ¼-in. and thicker	5.00c.
Black sheets (No. 24)	4.90c.

Cement c't'd nails, 100 lb. keg	3.40

Birmingham

More Pig Iron Inquiry from the East—Steel Bookings 10 Per Cent Smaller than a Month Ago

BIRMINGHAM, July 30.—Merchant producers of pig iron anticipate a heavy movement to Eastern points on the new rail and steamer rates which are scheduled to go into effect the last of this week. While these rates have been protested, so far they have not been suspended. Several round tonnages already have been booked for East Coast points and inquiries from that section in the last few days indicate considerable interest in Birmingham iron. A few trial orders have already been shipped. Sales in the district were a little better last week. Several orders for 3000 to 4000 tons were booked. Some of the larger users have covered their third-quarter requirements, while others are buying for immediate requirements only. The smaller consumers prefer to buy iron as it is needed. The base price of $14.50, Birmingham, for No. 2 foundry continues. Shipments are at about the same rate as throughout July. Seventeen blast furnaces remain active. Of this number nine are on foundry iron, seven on basic and one on recarburizing iron.

Prices per gross ton, f.o.b. Birmingham dist. furnaces:

No. 2 fdy., 1.75 to 2.25 sil.	$14.50
No. 1 fdy., 2.25 to 2.75 sil.	15.00
Basic	14.50

Finished Steel.—New business is estimated to be around 10 per cent less than at this time last month, but it is considerably larger than 12 months ago. There has been a gradual decline in orders during the latter part of July, due to the usual summer lull, which in past years has arrived several weeks earlier. In view of their substantial backlogs the mills have not been forced to curtail operations and except in rails they are practically at capacity. Business in wire products has declined from the June rate, but the aggregate is considerably ahead of last year. Deliveries of finished steel, as a whole, are in about the same volume as in the past several weeks. Prices are steady and unchanged. None of the pending structural projects has been placed. The Gulf States Steel Co. is expected to award an important tonnage for new buildings at Alabama City this week. Lettings and fresh inquiries for reinforcing bars are not up to the average. Twenty-two open-hearth furnaces out of a total of 23 have been active throughout July.

Cast Iron Pipe.—Awards in the pressure pipe market are few and in small to medium tonnages. Several important municipal projects, financed

by recent bond issues, are being held up due to the unsatisfactory market for the securities. Inquiries indicate a fair tonnage in prospect, considering conditions. Private buying has been of little consequence for several weeks. Pending projects include about 20,000 ft. of 6 and 8-in. pipe for West Greenville, S. C., to be awarded July 30; about 4 miles of 8 to 12-in. for Hollywood, Fla., to be awarded Aug. 15; about 9 miles of 16 to 20-in. pipe for Griffin, Ga., to be awarded about Sept. 1, and a fair-sized project at Kenner, La. Shipments continue in good volume and some plants have made reductions in stocks during July. Quotations remain at $37 to $38 a net ton, Birmingham, for 6-in. and larger diameters.

Coke.—A steady movement of material on contracts is about the only activity in the foundry coke market. The number of active ovens in the district is unchanged, but output is reported to be less than in June. The base price remains $5 a net ton, Birmingham.

Old Material.—Light buying in steel grades continues, but outside of this the market is at a standstill. Prices are without change.

Prices per gross ton, deliv'd Birmingham dist. consumers' yards:

Heavy melting steel	$12.50
Scrap steel rails	12.50
Short shoveling turnings	9.00
Cast iron borings	9.00
Stove plate	$11.50 to 12.00
Steel axles	21.00
Iron axles	23.00
No. 1 railroad wrought	10.00 to 10.50
Rails for rolling	14.00 to 15.00
No. 1 cast	13.50
Tramcar wheels	13.00
Cast iron carwheels	12.50 to 13.00
Cast iron borings, chem.	13.50 to 14.00

Boston

Pig Iron Producers Advance Quotations—Marked Scarcity Gives Scrap Market Stronger Tone

BOSTON, July 30.—Buffalo furnaces with comfortable backlogs for third quarter delivery have advanced prices $1 a ton to $18.50, base furnace, while others are asking $18. Furnaces east of Buffalo have not changed prices, but intimate they will do so within the near future. Business in the past week was less active, but sales included 1000 tons of Buffalo and 500 tons of Southern iron to a Massachusetts machinery manufacturer, 1000 tons of malleable to a Connecticut foundry and smaller tonnages, the aggregate being about 5000 tons. A small tonnage of Indian iron was sold at $22.50 a ton on dock here, duty paid. A Worcester, Mass., foundry is in the market for 1000 tons of No. 2X and No. 1X, and a Massachusetts machinery builder for 1000 tons of low phosphorus iron.

Foundry iron prices per gross ton deliv'd to most New England points:

†Buffalo, sil. 1.75 to 2.25	$21.78 to	$22.78
†Buffalo, sil. 2.25 to 2.75	22.28 to	23.28
*Buffalo, sil. 1.75 to 2.25	22.41 to	23.41
*Buffalo, sil. 2.25 to 2.75	22.91 to	23.91
East. Penn., sil. 1.75 to 2.25		23.65
East. Penn., sil. 2.25 to 2.75		24.15
Va., sil. 1.75 to 2.25		25.21
Va., sil. 2.25 to 2.75		25.71
Ala., sil. 1.75 to 2.25	21.41 to	23.27
Ala., sil. 2.25 to 2.75	21.91 to	23.77

Freight rates: $4.91 all rail from Buffalo, and $4.28 rail and water; $3.65 from eastern Pennsylvania; $5.21 all rail from Virginia; $6.91 to $8.77 from Alabama.

*All rail rate.

†Rail and water rate.

Coke.—The outstanding development of the week was the placing of an order for 82 ovens with the Koppers Co. by the New England Coal & Coke Co. The demand for foundry coke holds up well despite a slight letup in the melt of iron due to the excessive heat. Prices are still $11 a ton, delivered within a $3.10 freight rate zone.

Reinforcing Steel.—Aggregate sales of billet steel bars for the week were 600 tons, including 200 tons for a Harvard University dormitory to be supplied by J. C. Coleman & Sons Co. Sellers are holding firmly to 2.66½c. a lb., base, from stock. The market for rail steel bars is quiet at 2.26½c., base, delivered common Boston freight rate points.

Warehouse Business.—The usual summer letdown in the movement of iron and steel out of warehouses is noted, but business is running ahead of a year ago and prices are being maintained. Dealers in domestic wire nails are experiencing competition from German nails.

Cast Iron Pipe.—The Boston Consolidated Gas Co. has split 2000 tons of 6 to 24-in. pipe with two Northern foundries, and Westfield, Mass., has purchased 100 tons of 6 and 8-in. from the Warren Pipe & Foundry Co. West Hartford, Conn., has rejected bids for 3600 tons of 36 and 42-in. cast iron pipe and has purchased cement pipe from the Lock Joint Pipe Co. at $369,-204.25. Hamden, Conn., will close bids Aug. 2 on 3000 ft. of 10-in. pipe.

Imports.—Imports of pig iron at this port so far this month amount to 548 tons, all from India. The Mystic Iron Works, Everett, Mass., so far this month, has unloaded 10,560 tons of Newfoundland and 5950 tons of Bona ores.

Old Material.—Quotations on forge flashings are a shade easier owing to a marked slowing up in demand, but prices for other kinds of scrap tend upward. Higher prices on steel scrap have failed to bring out much material. Dealers say that never before was steel scrap as scarce as it is today. No. 1 heavy melting steel is generally $12.50 to $12.75 a ton, on cars shipping point, with specially selected stock $13. Scrap T-rails are bringing practically as much as No. 1 steel, and dealers are scouring New England for abandoned trolley lines. The export market is inactive. It is expected, however, that a steamer will load 1500 tons here in the latter part of August for Danzig delivery.

Buying prices per gross ton, f.o.b. Boston rate shipping points:

No. 1 heavy melting steel	$12.50 to $13.00
Scrap T rails	12.00 to 12.50
Scrap girder rails	11.00 to 11.50
No. 1 railroad wrought	11.00 to 11.50
No. 1 yard wrought	9.00 to 9.50
Machine shop turnings	6.60 to 7.10
Cast iron borings (steel works and rolling mill)	6.50 to 6.60
Bundled skeleton, long	9.50 to 10.50
Forge flashings	10.00 to 10.25
Blast furnace borings and turnings	6.00 to 6.25
Forge scrap	9.00 to 9.25
Shafting	14.00 to 14.25
Steel car axles	18.00 to 19.00
Wrought pipe 1 in. in diameter (over 2 ft. long)	9.75 to 10.00
Rails for rolling	12.50 to 13.00
Cast iron borings, chemical	10.00 to 10.25

Prices per gross ton deliv'd consumers' yards:

Textile cast	$14.50 to $15.00
No. 1 machinery cast	15.00 to 15.25
No. 2 machinery cast	13.00 to 13.25
Stove plate	11.00 to 11.50
Railroad malleable	18.50 to 19.00

Special attention has been paid to the drinking water problem of steel mills, foundries and similar institutions by the Frigidaire Corporation, Dayton, Ohio, in the development of five new series of electric water coolers. Realizing that workers in places where temperatures are high and much physical labor is done do not dare drink water that is too cold, Frigidaire engineers have brought out factory-type coolers that produce water at any temperature desired.

The Reliance Machinery Sales Co., 1407 Brighton Road, Pittsburgh, has been appointed distributer in the Pittsburgh district of back-geared, screw cutting lathes manufactured by South Bend Lathe Works, South Bend, Ind.

Canada

Short Wheat Crop May Affect Imports of Pig Iron from United States—Structural Demand Active

TORONTO, ONT., July 30.—Although there is little future buying of pig iron, a number of melters are showing interest in the market and spot demand is being maintained at a satisfactory level. Deliveries on contract and spot shipments are in good volume, with the current movement 15 to 20 per cent above that of a year ago. Some melters are complaining that prices are high, and action on a few large orders has been postponed. Shading is reported in some districts where desirable tonnages are in prospect, but the greater part of current business is being taken at quoted prices. Any adverse effect that the short wheat crop in the Canadian West may have on the iron and steel industry will be chiefly in imports, due to the fact that agricultural implement makers get practically their entire raw material requirements from United States producers.

Prices per gross ton:

Delivered Toronto	
No. 1 fdy., sil. 2.25 to 2.75	$24.60
No. 2 fdy., sil. 1.75 to 2.25	24.10
Malleable	24.60
Delivered Montreal	
No. 1 fdy., sil. 2.25 to 2.75	$26.00
No. 2 fdy., sil. 1.75 to 2.25	25.50
Malleable	26.00
Basic	24.50
Imported Iron, Montreal Warehouse	
Summerlee	$33.50
Carron	33.00

Structural Steel.—A more pronounced buying movement has developed in structural steel. The Dominion Bridge Co., Lachine, Que., has been awarded 6000 tons of steel for the new Aldred Building at Montreal. Orders for 100 to 500 tons have improved of late and at the present time a number of substantial tonnage contracts are pending.

Old Material.—Demand is holding at a good level in spite of the holiday listlessness of the market. While new business is spotty, total sales for the week were in good volume. Mills have again dropped out of the market, with the result that there is very little demand for heavy melting steel and turnings. Foundries, taking small individual tonnages, are buying at frequent intervals with the consequence that new business is making good headway as compared with a year ago. Prices are firm, but without change.

Dealers' buying prices:

St. Louis

Scrap Prices Continue to Rise—Pig Iron Buying Light—Steel Specifications Improve

ST. LOUIS, July 30.—Sales of pig iron during the last week were very small, the St. Louis Gas & Coke Corporation disposing of 250 tons of malleable to one East Side melter and 50 tons of high silicon iron to a local jobbing foundry. The small volume of sales is ascribed to the uncertainty caused by recent recessions in the price of Southern iron, melters being fearful of placing orders except for immediate requirements lest there be further reductions. The local maker has made no change in its published quotations, although it is understood to be meeting the market in competitive territory. The melt in the district continues heavy, activities during the last 30 days having been at a considerably higher rate than the average for the same period in the last several years, according to the Federal Reserve Bank of St. Louis. The bank statement also says that jobbing foundries, particularly those specializing in railroad castings, report orders substantially larger than a year ago, and that sales of farm implements and stoves during the first half of the year were considerably larger than during the same period in 1928.

Warehouse Prices, f.o.b. St. Louis

	Base per Lb.
Plates and struc. shapes	3.25c.
Bars, soft steel or iron	3.15c.
Cold-fin. rounds, shaftings, screw stock	3.75c.

Less than 200 lb	50
Hot-pressed nuts, hex., blank or tapped, 200 lb. or more	60
Less than 200 lb	50

Prices per gross ton at St. Louis:

No. 2 fdy., sil. 1.75 to 2.25, f.o.b. Granite City, Ill.	$20.00
Malleable, f.o.b. Granite City	20.50
N'th'n No. 2 fdy., deliv'd St. Louis	22.16
Southern No. 2 fdy., deliv'd	18.92
Northern malleable, deliv'd	22.16
Northern basic, deliv'd	22.16

Freight rates: 75c. (average) Granite City to St. Louis; $2.16 from Chicago; $4.42 from Birmingham.

Finished Steel.—An improvement in specifications against contracts for plates, shapes, bars and sheets is reported by mills. The price situation on sheets of all kinds is said to be firm. Railroads have completed allocations of their third-quarter requirements in plates, shapes and bars and sheets. A total of 875 tons of structural steel business in three projects was reported by fabricators in the district. Generally the structural trade is quiet.

Old Material — Consumers have been pressing dealers for deliveries on contracts, with the result that dealers' prices have been increased in the hope of stimulating shipments from the country. Receipts in this market have been light, and there is said to be a heavy short interest on the part of dealers. Advances range from 25c. to $1 a ton. Railroad lists: New York Central, 14,500 tons of 80, 85 and 100-lb. relaying rails; Union Pacific, 2565 tons; Chicago, Milwaukee, St. Paul and Pacific, 118 carloads and 2000 tons steel rails; Big Four, 1900 tons; Missouri-Kansas-Texas, 500 tons; Missouri Pacific, 116 carloads; St. Louis-San Francisco, six carloads.

Dealers' buying prices per gross ton, f.o.b. St. Louis district:

No. 1 heavy melting or shoveling steel	$14.00 to $14.50
No. 2 heavy melting or shoveling steel	13.25 to 13.75
No. 1 locomotive tires	15.50 to 16.00
Miscel. stand.-sec. rails including frogs, switches and guards, cut apart	16.25 to 16.75
Railroad springs	18.50 to 19.00
Bundled sheets	9.50 to 10.00
No. 2 railroad wrought	14.00 to 14.50
No. 1 busheling	10.00 to 10.50
Cast iron borings and shoveling turnings	9.50 to 10.00
Iron rails	15.00 to 15.50
Rails for rolling	16.75 to 17.25
Machine shop turnings	8.50 to 9.00
Heavy turnings	10.00 to 10.50
Steel car axles	19.00 to 19.50
Iron car axles	27.50 to 28.00
Wrot. iron bars and trans.	22.00 to 22.50
No. 1 railroad wrought	13.00 to 13.50
Steel rails, less than 3 ft.	18.00 to 18.50
Steel angle bars	14.50 to 14.75
Cast iron carwheels	14.50 to 15.00
No. 1 machinery cast	15.00 to 15.50
Railroad malleable	15.50 to 16.00
No. 1 railroad cast	15.00 to 15.50
Stove plate	12.50 to 13.00
Agricult. malleable	15.00 to 15.50
Relay. rails, 60 lb. and under	20.50 to 23.50
Relay. rails, 70 lb. and over	26.50 to 29.00

Union Twist Drill Co., Athol, Mass., has appointed the Pacific Mill & Mine Supply Co., Los Angeles, Cal., as its dealer in the Los Angeles district. The latter will carry a comprehensive stock of milling and gear cutters, hobs, drills, reamers, taps and dies.

Cincinnati

Sheet Backlogs Continue to Taper—Scrap Gains in Strength, Pig Iron Dull

CINCINNATI, July 30.—The continual sagging of the Southern pig iron market has contributed an undertone of uncertainty to the market and, although the quotations of Northern furnaces have not been affected, consumers of Northern iron are buying only in small quantities, in the expectation that price revisions will become more general. The prevailing Southern quotation is $14.50, base Birmingham, and a few small sales have been made at this price, but there have been no large inquiries to bring out concessions, and it is the opinion in the trade that $14 would be the lowest figure at which business could be done. A Muncie, Ind., melter is asking for 100 to 300 tons of Northern foundry iron, and a Cambridge, Ind., consumer wants 500 tons of the same grade. A third Indiana consumer is inquiring for 300 tons of malleable for third quarter.

Prices per gross ton, deliv'd Cincinnati:

So. Ohio fdy., sil. 1.75 to 2.25	$19.89 to $20.39
Ala. fdy., sil. 1.75 to 2.75	17.69 to 18.19
Ala. fdy., sil. 2.25 to 2.75	18.19 to 18.69
Tenn. fdy., sil. 1.75 to 2.25	17.69 to 18.19
S'th'n Ohio silvery, 8 per cent	26.89

Freight rates, $1.89 from Ironton and Jackson, Ohio; $3.69 from Birmingham.

Finished Material.—Backlogs of district sheet mills were reduced slightly during the past week, as production exceeded demand. The volume of new business, however, was about equal to that of the preceding week and was better than usual for July. Although deliveries are a shade easier than a month ago, the situation is still far from satisfactory from the consumers' point of view and, consequently, some of them are specifying in excess of their needs to insure sufficient material to sustain production at a good rate. While most of the automobile manufacturers have withdrawn from the market until the annual inventory period during the latter part of August is passed, several companies are specifying sheets for new models. Despite the present recession of automotive requirements, district mill operators look for a brisk market in the early fall. Galvanized sheets for roofing materials are in increasing demand and, although reports of price discontent in the Southeast are being heard, manufacturers say that no sagging of the market is likely.

Coke.—Specifications for by-product foundry coke during July were better than in the preceding month, thus reflecting the continued activity of the foundries in this district. Oven operations are abreast of the demand and, consequently, shipments are about up to date. New business, however, is very light and consists chiefly of spot orders for immediate use.

Old Material.—Firmness in other markets is being reflected here, causing a slight scarcity in first class scrap. Dealers are paying good prices for heavy melting steel and specialty grades of scrap and, although there is very little buying, consumers are taking material on contract at a good rate. Scrap rails and cast iron borings are up 25c. a ton, while No. 2 busheling has broadened its spread 25c., making the new quotation $7 to $7.50, an increase of 25c. on the bottom and 50c. on the top.

Dealers' buying prices per gross ton, f.o.b. cars, Cincinnati:

Heavy melting steel	$13.50 to $14.00
Scrap rails for melting	14.00 to 14.50
Loose sheet clippings	9.00 to 9.50
Bundled sheets	11.00 to 11.50
Cast iron borings	9.25 to 9.50
Machine shop turnings	8.50 to 8.75
No. 1 busheling	10.50 to 11.00
No. 2 busheling	7.00 to 7.50
Rails for rolling	14.50 to 15.00
No. 1 locomotive tires	14.25 to 14.75
No. 2 railroad wrought	13.25 to 13.75
Short rails	18.50 to 19.00
Cast iron carwheels	12.75 to 13.25
No. 1 machinery cast	19.25 to 19.75
No. 1 railroad cast	15.25 to 15.75
Burnt cast	10.25 to 10.75
Stove plate	10.25 to 10.75
Brake shoes	10.25 to 10.75
Agricultural malleable	14.25 to 14.75
Railroad malleable	15.25 to 15.75

4-in.	34.00

Youngstown

Best July Steel Output on Record—Pipe Demand Large

YOUNGSTOWN, July 30.—Another month of record-breaking steel production ends this week. Schedules in the district have averaged above 85 per cent, making this the best July on record. From present indications, August production and shipments will be equally as satisfactory. Makers of steel pipe have a larger volume of inquiries now than at any time this year, and much of this tonnage will be transferred to order books in August, it is expected. The Republic Iron & Steel Co., for example, is booked ahead for six weeks in its pipe mills, well into September. Most of the new pipe tonnage is for pipe line projects. The Republic company is producing substantial tonnages of 4-in. and 6-in. tubing on its new electric welding tube mill. Foundations have been laid for two additional mills to roll larger pipe by this method under the Johnson patents, but it will be well into next year before they are completed. The new capacity will provide an additional outlet for the company's plate mill at Lansingville.

Reports that the Republic company received an order for 100,000 tons of steel tubing from a Southern interest are incorrect, officials advise. The bulk of the order referred to was placed some time ago with the A. O. Smith Corporation, and the remainder was divided among a number of other producers.

Schedules this week in the Mahoning Valley show 46 of 51 independent open-hearth furnaces active, 113 of 120 sheet mills under power, tin mills close to capacity, independent bar mills at 80 per cent and strip mills at above 90 per cent.

Valley steel companies are devoting considerable attention to water transportation, both of finished steel and inbound raw materials. The Sheet & Tube company has made arrangements for warehouse facilities at Memphis, Tenn., and expects to ship as much of the stock as possible by way of the Ohio and Mississippi rivers. Some Sheet & Tube company coal is being shipped from Pennsylvania to Ohio partly by barge. Valley pipe makers are making substantial shipments, especially of seamless tubing, to southern California via Baltimore and the Panama Canal.

Iron Castings Business Reported Good

The Gray Iron Institute, Terminal Tower Building, Cleveland, reports that production in June of 119 member foundries was 28,114 tons, which was at the ratio of 113.2 per cent, considering the average monthly production during the last three calendar years as 100. Forty foundries report business prospects as good, 56 fair and 7 poor.

New Members

The following new members have been elected: Barnett Foundry & Machine Co., Irvington, N. J.; Kelly Foundry Co., Pittsburgh; James McKinney & Son, Albany, N. Y.; Brooklyn Foundry Co., Astoria, N. Y.; Old Colony Foundry Co., East Bridgewater, Mass.; Gibby Foundry Co., East Boston, Mass.; L. W. Pond Machine & Foundry Co., Worcester, Mass., and Central Foundry Co., Joplin, Mo.

Buffalo

With Heavy Furnace Backlogs, Pig Iron Prices are Firm —Steel Operations at Capacity

BUFFALO, July 30.—With all the Buffalo furnaces having heavy backlogs, the situation in this district on pig iron is firmer, and this has been made apparent by a tightening of prices on eastern delivery. One interest has instructed its Eastern agents to accept no more iron of any tonnage without referring it to the home office. Under no circumstances will this furnace accept any business in the East more than $1 under the Buffalo base. This particular interest sold 25,000 tons during June and has already booked 24,000 tons for the fourth quarter. The Eastern Malleable Co. is understood to have withdrawn its inquiry for 3000 tons of malleable. A Massachusetts inquiry for 4000 tons mentioned last week has been partially placed and it is understood that part of the tonnage came to Buffalo. A Franklin, Pa., melter bought 800 tons. The Massey-Harris inquiry from Batavia has not yet been placed and the tonnage has been expanded to include the requirements of the Toronto plant.

Prices per gross ton, f.o.b. furnace:

No. 2 fdy., sil. 1.75 to 2.25	$19.50
No. 2X fdy., sil. 2.25 to 2.75	20.00
No. 1 fdy., sil. 2.75 to 3.25	21.00
Malleable, sil. up to 2.25	20.00
Basic	18.50
Lake Superior charcoal	27.28

Finished Iron and Steel.—The market for all grades manufactured in this district continues very good and operations of the local mills show no evidence of any seasonal falling off. Open-hearth operation is as high now as it has been at any period of this year and mill operation is close to 100 per cent. One interest is maintaining its mills at double turn except when it is unable to get the steel. There has been a steady booking of small lots of reinforcing bars and fabricated structural, but no large tonnage has been placed during the week.

Old Material. — The outstanding transaction of the week was the purchase of 2000 tons of stove plate at $13.50. There have been a few small sales of heavy melting steel, and the market remains unchanged. Dealers continue to pay $17 on an old order of No. 1 at $17.25 to $17.50 and $14.25 to $14.50 on an old order of No. 2 heavy melting steel. Dealers are also paying as high as $11 on old cast iron borings orders. Strength of specialties in the outside markets is having a firming effect on the Buffalo market for knuckles and couplers, rolled steel wheels and coil and leaf springs. With Pittsburgh and Youngstown points paying $22, volume of receipts in the Buffalo territory has been curtailed.

Prices per gross ton, f.o.b. Buffalo consumers' plants:

Basic Open-Hearth Grades:		
No. 1 heavy melting steel	$17.00 to	$17.25
No. 2 heavy melting steel	14.75 to	15.00
Scrap rails	16.50 to	17.00
Hydraul. comp. sheets	14.50 to	14.75
Hand bundled sheets	12.00 to	12.50
Drop forge flashings	14.25 to	14.50
No. 1 busheling	15.50 to	16.50
Hvy. steel axle turnings	14.00 to	14.50
Machine shop turnings	7.50 to	7.75
No. 1 railroad wrought	13.00 to	13.50
Acid Open-Hearth Grades:		
Knuckles and couplers		19.00
Coil and leaf springs		19.00
Rolled steel wheels		19.00
Low phos. billet and bloom ends	20.00 to	20.50
Electric Furnace Grades:		
Short shov. steel turnings	12.00 to	12.50
Blast Furnace Grades:		
Short mixed borings and turnings	11.00 to	11.50
Cast iron borings	10.50 to	11.00
No. 2 busheling	10.00 to	10.50
Rolling Mill Grades:		
Steel car axles	18.75 to	19.25
Iron axles	21.00 to	22.00
Cupola Grades:		
No. 1 machinery cast	16.00 to	17.00
Stove plate	13.00 to	13.50
Locomotive grate bars	12.50 to	13.00
Steel rails, 3 ft. and under	19.00 to	19.50
Cast iron carwheels	14.00 to	14.50
Malleable Grades:		
Industrial	18.00 to	18.50
Railroad	18.00 to	18.50
Agricultural	18.00 to	18.50
Special Grades:		
Chemical borings	12.50 to	13.50

Warehouse Prices, f.o.b. Buffalo

	Base per Lb.
Plates and struc. shapes	3.40c.
Soft steel bars	3.30c.
Reinforcing bars	2.95c.
Cold-fin. flats, sq. and hex.	4.45c.
Rounds	3.95c.
Cold-rolled strip steel	5.85c.
Black sheets (No. 24)	4.20c.
Galv. sheets (No. 24)	4.85c.
Blue ann'l'd sheets (No. 10)	3.50c.
Com. wire nails, base per keg	$3.60
Black wire, base per 100 lb.	3.75

Detroit

Dealers' Stocks Still Small in Low-Priced Cars

DETROIT, July 30.—The most encouraging aspect of the present situation in automotive production lies in the fact that the demand for automobiles continues to exceed the volume usually expected during midsummer. Consequently, the decline in production at this season has been smaller and more gradual than in former years. In fact, dealers' stocks in the low-price car field are still exceedingly small in some sections of the country, buyers being forced to wait for delivery. And this demand is not controlled by any one manufacturer, as indicated by production volume in the Ford, the Chevrolet and the Willys-Overland plants. The Ford Motor Co. turned out its two millionth car on July 24 and it is reported that the minimum wage scale of Ford employees is soon to be increased.

The Durant Motor Co., Inc., announces a new model, the 6-63, a six-cylinder car priced midway between the 6-60 and the 6-66 models.

By Aug. 1, demand for automotive steel should begin to show an improvement and specifications for September and October deliveries should begin to come in.

Orders for hot and cold-rolled strip so far this month show an increase of about 25 per cent over those received during the same period of 1928. Full-finish automobile sheets show a fairly satisfactory demand, with prices firm. However, there no longer exists any difficulty in getting semi-finished material at second quarter prices.

Automobile body sheets remain at 4.10c., Pittsburgh, with cold-finished bars at 2.30c. Hot-rolled strips, 6-in. and narrower, stand at 2c., Pittsburgh, with wider than 6-in. at 1.90c., Pittsburgh.

The market is experiencing the usual slowing up in the structural field. Small-lot orders for steel have declined considerably during the past month, and at the present time there are not enough small alteration or addition jobs to keep the small fabricators busy.

Plans are being completed for the Capital Savings Bank at Lansing, Mich., which will be a 22-story building. No estimate of the steel requirements is yet available.

The Electric Autolite Co. announces plans for a $275,000 office building in Toledo, and the Detroit Aircraft Corporation has authorized the erection of a seaplane hangar in Grosse Isle, near Detroit.

With some further reductions in automobile production, scrap dealers are finding some difficulty in buying additional tonnage. The market is firm, with top prices of the range frequently being paid on blast furnace grades.

Dealers' buying prices per gross ton, f.o.b. cars, Detroit:

Hvy. melting and shov. steel	$14.00 to $14.50
Borings and short turnings	9.00 to 9.50
Long turnings	8.00 to 8.50
No. 1 machinery cast	12.50 to 13.00
Automobile cast	13.00 to 13.50
Hydraul. comp. sheets	13.75 to 14.25
Stove plate	9.00 to 9.50
New No. 1 busheling	12.50 to 13.00
Old No. 1 busheling	11.00 to 11.50
Sheet clippings	8.75 to 9.25
Flashings	12.75 to 13.25

Cut Tacks and Cut Nails

Simplified Practice Recommendation R47-28, promulgated by the United States Bureau of Standards, relates to cut tacks and small cut nails for a great variety of industrial purposes. Standard sizes for each such use are given in the pamphlet mentioned, which may be obtained for 10c. from the Government Printing Office, Washington. Standards include sizes of packages for the various kinds of tacks and nails.

Non-Ferrous Metal Markets

Copper Sales Larger, Tin Quiet, Lead Weak, Zinc Dull

NEW YORK, July 30.

Copper.—Impressive gains in foreign sales were made during the past week. Bookings averaged about 1400 tons daily with sales yesterday and today totaling approximately 3000 tons each. More liberal buying is attributed to the fact that consumers have let stocks dwindle to such a low point that they are forced into the market to fill immediate requirements. Domestic users, on the other hand, have purchased only small lots, but are inquiring for fair-sized tonnages. Producers declare that the pressure which has been exerted by customers to obtain lower prices is proving of no avail. They assert that the shading of quotations at the present time, after they have withstood the effects of an extended period of comparative inactivity, would be a needless concession. They expect their position to be strengthened by July production figures, which admittedly will show the results of the curtailment of output. The outlook is favorable for an improvement in domestic sales during August, while producers are confident that foreign users must continue buying at a steady rate to cover current needs. Electrolytic copper is quoted at 18c., delivered in the Connecticut Valley, and at 18.30c., c.i.f. usual European ports. Lake copper is unchanged at 18c. to 18.12½c., delivered.

Tin.—Following two weeks of exceptionally heavy buying, sales of Straits tin receded sharply the past week and were well under 1000 tons. Although some business has been booked for the last quarter of the year, the bulk of the tonnage was for spot delivery. The quietness of the market, however, did not adversely affect prices, which have fluctuated little. This is shown by the fact that spot Straits tin sold on July 24 at 47.25c., New York, and today was quoted at the same figure. Sellers are not pressing for orders at the moment and buyers have indicated a lack of interest. The London group did not take an active part in trading until late today, when they bought 200 tons, thereby imparting an underlying tone of firmness to the London market. Prices have trended slightly upward with spot standard quoted at £213 12s. 6d., future standard at £217 7s. 6d. and spot Straits at £217

THE WEEK'S PRICES. CENTS PER POUND FOR EARLY DELIVERY

	July 30	July 29	July 27	July 26	July 25	July 24
Lake copper, New York	18.12½	18.12½	18.12½	18.12½	18.12½	18.12½
Electrolytic copper, N. Y.*	17.75	17.75	17.75	17.75	17.75	17.75
Straits tin, spot, N. Y.	47.25	47.00	....	47.125	46.875	47.25
Zinc, East St. Louis	6.80	6.80	6.80	6.80	6.80	6.80
Zinc, New York	7.15	7.15	7.15	7.15	7.15	7.15
Lead, St. Louis	6.55	6.55	6.55	6.55	6.55	6.55
Lead, New York	6.75	6.75	6.75	6.75	6.75	6.75

*Refinery quotation; price ¼c. higher delivered in the Connecticut Valley.

Prices on rolled non-ferrous products are unchanged from those prevailing one week ago.

List Prices, Per Lb., f.o.b. Mill

On Copper and Brass Products, Freight up to 75c. per 100 Lb. Allowed on Shipments of 500 Lb. or Over

Sheets—
- High brass ..... 23.25c.
- Copper, hot rolled ..... 26.75c.
- Zinc ..... 10.25c.
- Lead (full sheets) ... 11.00c. to 11.25c.

Seamless Tubes—
- High brass ..... 28.25c.
- Copper ..... 29.25c.

Rods—
- High brass ..... 21.25c.
- Naval brass ..... 24.00c.

Wire—
- Copper ..... 19.87½c.
- High brass ..... 23.75c.

Copper in Rolls ..... 26.75c.
Brazed Brass Tubing ..... 30.87½c.

Aluminum Products in Ton Lots

The carload freight rate is allowed to destinations east of Mississippi River and also to St. Louis on shipments to points west of that river.

- Sheets, 0 to 10 gage, 3 to 30 in. wide ..... 33.00c.
- Tubes, base ..... 42.00c.
- Machine rods ..... 34.00c.

Chicago Warehouse

(Prices Cover Trucking to Customers' Doors in City Limits)

Sheets—	Base per Lb.

Zinc, slab	7.75c. to 8.25c.
Lead, American pig	7.50c. to 8.00c.
Lead, bar	9.50c. to 10.00c.
Antimony, Asiatic	10.50c. to 11.00c.
Aluminum No. 1 ingots for remelting (guaranteed over 99% pure)	25.00c. to 26.00c.
Alum. ingots, No. 12 alloy,	24.00c. to 25.00c.
Babbitt metal, commercial grade,	30.00c. to 40.00c.
Solder, ½ and ½	31.00c. to 32.00c.

Metals from Cleveland Warehouse

Delivered Prices Per Lb.

Tin, Straits pig	52.25c.
Tin, bar	54.25c.
Copper, Lake	19.50c.
Copper, electrolytic	19.25c.
Copper, casting	18.75c.
Zinc, slab	7.75c. to 8.00c.
Lead, American pig	7.25c. to 7.50c.
Lead, bar	9.75c.
Antimony, Asiatic	16.00c.
Babbitt metal, medium grade	18.75c.
Babbitt metal, high grade	56.50c.
Solder, ½ and ½	31.75c.

Old Metals, Per Lb., New York

Buying prices represent what large dealers are paying for miscellaneous lots from smaller accumulators and selling prices are those charged customers after the metal has been properly prepared for their uses.

	Dealers' Buying Prices	Dealers' Selling Prices
Copper, hvy. crucible	14.50c.	16.00c.
Copper, hvy. and wire	14.25c.	15.75c.
Copper, light and bottoms	12.50c.	13.75c.
Brass, heavy	8.50c.	9.50c.
Brass, light	7.50c.	8.50c.
Hvy. machine composition	11.50c.	12.75c.
No. 1 yel. brass turnings	9.75c.	10.50c.
No. 1 red brass or compos. turnings	11.25c.	12.25c.
Lead, heavy	5.25c.	5.75c.
Lead, tea	4.25c.	5.25c.
Zinc	3.50c.	4.25c.
Sheet aluminum	14.00c.	16.00c.
Cast aluminum	12.25c.	14.25c.

2s. 6d. The primary market at Singapore has been steady at £221.

Zinc.—With producers adhering strictly to 6.80c., East St. Louis, for prime Western zinc, sales have been of negligible volume. Consumers are only interested in covering immediate requirements and consequently orders have been confined to small lots.

Lead.—Weakness in the price of lead was revealed the past week when sales were made at 6.50c., St. Louis, but quotations rapidly were reestablished at 6.55c. after a few orders had been taken at the lower figure. Bookings yesterday were about 1000 tons, but today buying fell off somewhat. Most consumers are specifying August deliveries.

Antimony.—The apparently pacific settlement of the Chino-Russian dispute has resulted in an easier market in Chinese metal, with spot selling at from 8.62½c. to 8.75c. and futures at 8.50c., duty paid, New York. The flurry of buying a week ago probably will still be reflected in continued light buying during the coming week.

Nickel.—The price of ingot nickel is 35c. a lb., of shot nickel 36c. and of cathodes of electrolytic nickel 35c.

Aluminum.—Virgin metal, 98 to 99 per cent pure, is selling at 23.90c. a lb., delivered.

Non-Ferrous Metals at Chicago

CHICAGO, July 30.—The volume of sales is heavier and prices are unchanged. The old metal market is steady both in quotations and purchases by consumers.

Prices per lb., in carload lots: Lake copper, 18.50c.; tin, 48c.; lead, 6.65c.; zinc, 6.90c.; in less-than-carload lots, antimony, 9.62½c. On old metals we quote copper wire, crucible shapes and copper clips, 14c.; copper bottoms, 11.50c.; red brass, 11.50c.; yellow brass, 8c.; lead pipe, 4.50c.; zinc, 3.25c.; pewter, No. 1, 24.50c.; tin foil, 26c.; block tin, 36c.; aluminum, 12.87½c.; all being dealers' prices for less-than-carload lots.

Reinforcing Steel

Awards Drop to Low Point and Inquiries Are Small

LETTINGS dropped to a low point the past week, totaling only 4300 tons. The largest job was 1000 tons for a power house at Powerton, Ill. An office building at Seattle, Wash., will take 550 tons. Fresh inquiries of 3100 tons included 800 tons for a building at Barrington, Ill. Awards follow:

CAMBRIDGE, MASS., 200 tons, Harvard University dormitory, to J. C. Coleman & Sons.

DELAWARE, LACKAWANNA & WESTERN RAILROAD, 150 tons, coal pockets in Brooklyn, to McClintic-Marshall Co.

NEW YORK CENTRAL RAILROAD, 175 tons, shops at Harmon, N. Y., to McClintic-Marshall Co.

POWERTON, ILL., 1000 tons, power house, to American System of Reinforcing.

ASHTABULA, OHIO, 500 tons, Cleveland Electric Illuminating Co. building, to Bourne-Fuller Co.

KALAMAZOO, MICH., 100 tons, Park Hotel, to Concrete Engineering Co.

STEVENS POINT, WIS., 250 tons, Hardware Mutual Life Insurance Co. building, to Concrete Engineering Co.

CEDAR RAPIDS, IOWA, 500 tons, filtration plant, to Laclede Steel Co.

SANTA MONICA, CAL., 300 tons, office building, Third and Santa Monica Streets, to unnamed bidder.

SACRAMENTO, CAL., 208 tons, highway work in Alameda County, to unnamed bidder.

ELLENSBURG, WASH., 200 tons, normal school, to Northwest Steel Rolling Mills.

OLYMPIA, WASH., 125 tons, highway work, to Northwest Steel Rolling Mills.

SEATTLE, 550 tons, Vance Building, to Northwest Steel Rolling Mills.

Reinforcing Bars Pending

Inquiries for reinforcing steel bars include the following:

BOSTON, 300 tons, Boston & Maine Railroad hotel.

PHILADELPHIA, 700 tons, building for Atwater Kent Mfg. Co.

CHICAGO, 300 tons, Naval Hospital building.

CHICAGO, 250 tons, Fine Arts Building; R. C. Wieboldt & Co., general contractors.

CHICAGO, 130 tons, Irvale apartment building.

CHICAGO, 450 tons, Wilbur Wright School; W. E. O'Neil, general contractor.

CHICAGO, 125 tons, Parker School; Hanson Brothers, general contractors.

CHICAGO, 100 tons, Swift & Co., fertilizer plant.

CHICAGO, 275 tons, Henrici Restaurant; R. C. Wieboldt & Co., general contractors.

CHICAGO, tonnage not stated, apartment building on North Clark Street; Rosenthal & Cornell, general contractors.

BARRINGTON, ILL., 800 tons, Jewel Tea Co. building; Lundoff Bicknell Co., general contractor.

SAN FRANCISCO, 300 tons, opera house and war memorial buildings; bids postponed indefinitely.

New Chicago Maker of Rolled Products

A new company now in process of being incorporated for the purpose of manufacturing rolled steel products has acquired the former Whitman & Barnes Company plant, 120th and Morgan Streets, Chicago. The Sessions Engineering Co., Chicago, is engineer.

Boiler Makers Adopt Rules

WASHINGTON, July 30.—Trade practice rules governing the range boiler industry were issued yesterday by the Federal Trade Commission. On the basis of volume of business, it was estimated by the commission that 60 per cent of the industry was represented at the conference at which the rules were adopted.

Railroad Equipment

Orders and Inquiries for Locomotives Better

THE placing of two fair-sized orders and the appearance of inquiries from a number of carriers indicate a revival of interest in locomotive buying. The Northern Pacific and the Chilean State Railways have each contracted for 11 locomotives, while the New York Central is in the market for 35 oil-electric battery locomotives. The Burlington is considering the purchase of 25 locomotives. The Canadian Pacific has ordered 100 80-ton ore cars. Details of the week's business follow:

Canadian Pacific has ordered 100 80-ton ore cars from Canadian Car & Foundry Co.

Cudahy Packing Co. has ordered 50 steel underframes from Pullman Car & Mfg. Corporation.

Chicago, Milwaukee, St. Paul & Pacific has bought 15 steel caboose underframes from Bettendorf Corporation.

Chicago & Great Western has ordered two baggage mail cars from Pullman Car & Mfg. Corporation.

Northern Pacific has purchased 11 Yellowstone-type locomotives from Baldwin Locomotive Works.

Chilean State Railways has ordered 11 locomotives from Baldwin Locomotive Works.

Burlington is considering purchase of 25 locomotives.

St. Louis Southwestern is expected to buy 10 locomotives.

New York Central is in market for 35 oil-electric battery locomotives.

Nashville, Chattanooga & St. Louis will buy five freight locomotives.

Kentucky & Indiana Terminal is in market for 8 switching locomotives.

Louisville & Nashville is said to be contemplating purchase of passenger locomotives.

Minneapolis, St. Paul & Sault Ste. Marie is considering purchase of passenger engines.

Ford Scrap Sales in 1928

The Ford Motor Co., Detroit, has announced that the sale of scrap material of all kinds netted the company $3,573,877.60 during 1928. This figure represents only the scrap that was sold in the open market. Considerable quantities were used in the Ford company's own blast furnaces and open-hearth furnaces. The Ford company ships about 900 tons of scrap a day, of which about 500 tons is in the form of borings and turnings from machine shops; 300 tons of sheet steel scrap from the stamping shops and about 125 tons in the form of drop forge flashings obtained from the manufacture of such parts as the camshaft.

Brass Ingots Reduced

CHICAGO, July 30.—Brass ingot prices at Chicago were reduced July 29. Brass ingots of 85-5-5-5 composition were reduced from 16¼c. a pound to 15¾c.; 80-10-10 brass from 17½c. to 16¾c., and yellow brass ingots from 13c to 12¾c.

PERSONAL

The late LEWIS MILLER, who was for nearly 40 years the head of Aultman, Miller & Co., Akron, Ohio, manufacturers of Buckeye harvesting machinery, which he invented, was cofounder in 1873 with the late BISHOP JOHN H. VINCENT, of the famous Chautauqua Institution, at Chautauqua Lake, N. Y. On July 24 the centenary of Mr. Miller's birth was celebrated at Chautauqua. At the evening exercise in the amphitheater, before an audience of 10,000, THOMAS A. EDISON and HENRY FORD, guests of honor, made brief responses. Addresses were made by ADOLPH S. OCHS, publisher of the New York *Times*; DR. ELMER A. SPERRY, president of the American Society of Mechanical Engineers, who brought greetings from the national engineering societies; ALVIN I. FINDLEY, editor *The Iron Age*, and JUDGE WILLIAM L. RANSOM, New York, president of the board of trustees of the Chautauqua Institution.

—

W. E. WORTH has been appointed Pacific Coast representative, with offices at 216 Pine Street, San Francisco, for the American Gas Furnace Co., Elizabeth, N. J.

—

GEORGE W. DAVIS, formerly of the Chicago office of Gears & Forgings, Inc., Cleveland, has been made district manager of the Minneapolis office of the company.

—

ARTHUR W. KLINGMAN, for 25 years associated with the Bourne-Fuller Co., Cleveland, has been made vice-president of the Foster Bolt & Nut Mfg. Co., Cleveland.

—

I. EDMUND WAECHTER has resigned as superintendent of the Illinois Foundry Co., Springfield, Ill., to become general superintendent of the L. N. N. Foundry Co., Cleveland.

—

GEORGE H. BANCROFT, for the past four years assistant purchasing agent for the Willys-Overland Co., Toledo, Ohio, has been appointed purchasing agent, succeeding the late WILLARD H. CALKINS. He was graduated from the University of Michigan in 1912 and taught engineering there for two years. Later he engaged in the general practice of engineering until after the war and in 1919 entered the automobile industry with the Oakland Motor Car Co.

—

J. T. BENCHOFF has been made district manager of the newly-opened office in the Marshall Building, Cleveland, of the Landis Machine Co., Waynesboro, Pa.

—

CHARLES E. EVELETH, who since 1927 has been a vice-president of the General Electric Co., in charge of the manufacturing department with C. C. CHESNEY and W. R. BURROWS, has been transferred to the engineering department of the company, and will be associated with E. W. ALLEN. Mr. Eveleth will give special attention to the problems of the designing departments and works laboratories, and Mr. Allen will have charge of the commercial engineering, the contract service and district engineering departments.

—

HENRY S. RAWDON, who, as announced in THE IRON AGE of July 25, has been appointed chief of the Division of Metallurgy, Bureau of

HENRY S. RAWDON

Standards, Washington, was born in England. He was educated in the public schools in Michigan and was graduated from Michigan Normal College. He was a high school principal and superintendent for six years. In 1912 he received the degree of metallurgical engineer from the University of Michigan. As assistant physicist in charge of metallography in the division of metallurgy of the Bureau of Standards, he was sent to England and France to study the question of phosphorus and sulphur in steel. He has been active in committee work of the American Society for Testing Materials and other technical societies.

—

JAMES F. EDNIE, foreman of the tool-treating shop of the armor plate department, Carnegie Steel Co., Homestead, Pa., has become assistant metallurgist of the Union Switch & Signal Co., Swissvale, Pa.

—

ARTHUR T. KATHNER, inventor of the Kathner normalizing furnace, has sailed for Europe to further the sale and servicing of his furnace.

S. F. SIDES has been appointed direct sales representative in Los Angeles for the Union Twist Drill Co., Athol, Mass. He has been associated for the past eight years with the Goddard & Goddard Co., Detroit, in the Pacific Coast territory.

—

R. M. BRUSHINGHAM has been made district manager of the Edgar Allen Steel Co., Inc., New York, in charge of its Detroit office, which will be opened at 704 Fisher Building, Aug. 3. He was associated for 12 years with the Colonial Steel Co., for the past four years as representative in Detroit.

—

THOMAS O'BRIEN, formerly manager of the Farrell, Pa., works, American Sheet & Tin Plate Co., has been appointed manager of the Gary, Ill., tin mill of that company, succeeding W. C. LOYD, who has resigned. Mr. O'Brien has been succeeded at Farrell by JOHN A. BUTLER, recently manager of the company's New Castle, Pa., works. E. R. THOMPSON has been named manager at the New Castle works. JOHN N. CROMBIE, recently assistant manager of the company's Laughlin works, Martins Ferry, Ohio, has been made assistant manager of the Shenango works at New Castle. HAROLD S. PYLE has been named assistant manager of the Laughlin works, succeeding Mr. Crombie. R. B. SAYLOR has been appointed assistant manager of the Wellsville, Ohio, works, and A. G. RINDERKNECHT has been named to a similar position at the Dover, Ohio, works. These appointments are effective Aug. 1.

—

GROVER C. BROWN, chief civil engineer at the Cambria plant of the Bethlehem Steel Co., Johnstown, Pa., has been appointed management representative at that plant. He succeeds C. L. BAKER, who has been transferred to the company's Lackawanna, N. Y., works.

—

JOHN ECKERLE, president, Aluminum Industries, Inc., Cincinnati, sailed on the Bremen, July 29, for a tour of Germany and of several other European countries.

—

JAMES A. FARRELL, president and chief executive officer of the United States Steel Corporation, sailed for Europe on the Leviathan July 27. He was accompanied by Mrs. Farrell, James A. Farrell, Jr., and Miss Rosamond Farrell. After visiting Paris the party will go to San Sebastian, Spain, on the coast of the Bay of Biscay.

—

CHARLES E. SATLER has resigned as secretary of the United Engineering & Foundry Co., Pittsburgh, after 44 years of service with the company. GEORGE H. FRIESEL, treasurer, has been elected secretary in addition to his regular duties. J. H. HILLMAN, JR., chairman Hillman Coal & Coke

Co., and prominently identified with numerous Pittsburgh industrial enterprises, has been elected a director of the United company.

—

JEAN ROCHE, senior engineer at Wilbur Wright Field, Dayton, Ohio, will become president of the Aeronautical Corporation of America, Cincinnati, Aug. 15. He is the inventor of a flivver plane. He formerly worked for the Standard Airplane Co., at Elizabeth, N. J.

—

J. BLAIR SUTTON, president, Sutton Engineering Co., Pittsburgh, has returned from a three months' business trip in Europe.

—

E. C. FAUSTMANN, formerly vice-president of the Royal Typewriter Co., Hartford, Conn., has been made president to succeed G. E. SMITH, who resigned.

—

J. H. COLLIER, general manager of the Crane Co., Bridgeport, Conn., plant, has been made general supervisor of the company's European valve business. A. E. MACDONALD, Bridgeport plant superintendent, succeeds Mr. Collier as general manager.

—

KENNETH M. LANE, designer of the airplane which last May broke the world's altitude record, has been appointed chief of the aeronautical engineering section of the Department of Commerce.

Obituary

WILLIAM PIGOTT, vice-president, Pacific Coast Steel Co., Seattle, Wash., died in Vancouver, B. C., July 19, following a stroke of apoplexy suffered on July 4.

—

JOHN FELTES, vice-president, Standard Electric Tool Co., Cincinnati, died of pneumonia at his home in Cincinnati, July 24.

—

LOUIS WAKEMAN PENFIELD, president, Hadfield Penfield Steel Co., Cleveland, died Monday night, July 29, at his home in that city, following a long illness. He was 72 years of age.

Sharp Drop in Canadian Motor Car Output

Automobile production in Canada in June totaled only 21,492 cars, compared with 31,559 in May. The latter figure represented the first recession following the rapid rise in output from January through April. Compared with May, output in June showed declines in closed passenger models, trucks and chassis and increases in open passenger cars, taxicabs and buses.

New Trade Publications

Steel Castings.—Nugent Steel Casting Co., Chicago. A two-page illustrated leaflet describes steel castings which are used in the production of the Buda 619 heavy-duty motor car which is a small gasoline-driven engine. All castings used in the chassis of this engine are made of steel.

Steel Castings.—Lebanon Steel Foundry, Lebanon, Pa. A four-page leaflet, illustrated, describes the application of special electric steel castings which are used by the Worthington Mower Co. in the production of its special motor-driven and other lawn mower equipment where light-section steel castings are essential.

Cupola Blowers.—General Electric Co., Schenectady, N. Y. A four-page illustrated leaflet describes the single-stage centrifugal air compressors for cupola blowing produced by that company. Charts are given showing the results of the use of these blowers as well as tables, giving air volume requirements and size of sets recommended for various iron to coke ratios.

Roof Slabs.—Federal Cement Tile Co., Chicago.—A 36-page catalog describes featherweight concrete insulating roof slabs manufactured by this company. The catalog contains the story and detail drawings of these slabs, specifications and data in regard to weights and dimensions, detail drawings and essential data about featherweight nailing concrete roof slabs and a partial list of users of the products. The catalog is profusely illustrated.

Controllers and Switchboards.—Electric Controller & Mfg. Co., Cleveland. Three bulletins have been issued by this company. No. 970, describing a.c. manual controllers, includes the V-4 dinkey controller for use with duplex drives having two motors mechanically connected to the same drive. No. 1021, covering d.c. type S crane switchboards, includes 115-volt and 550-volt ratings. Dimensions have been revised to apply to newly designed shunt contactor. No. 1037-D, covering a.c. and d.c. type B limit stops, has been revised to show dimensions of the new style contactor.

Electric Meters.—Sangamo Electric Co., Springfield, Ill. Bulletin No. 78, consisting of 16 pages, tells of the uses of Sangamo type N ampere-hour meter. Illustrations of parts and wiring diagrams are shown in this booklet.

Twist Drills.—New Process Twist Drill Co., Taunton, Mass. A new edition of a catalog covering complete line of high speed and carbon twist drills has been issued. Catalog includes photographs showing methods of manufacturing forged twist drills.

Power Pumps. — Goulds Pumps, Seneca Falls, N. Y. Catalog "S" and handbook, bound together in limp covers, includes 72 pages in the catalog and 32 pages in the handbook. The catalog is thoroughly illustrated and includes a wide variety of types of pumps operated by steam or from belts or by electric motors. The handbook is full of data, including installation diagrams, illustrative examples intended to assist in selecting the proper pump and figuring the suction lift, head, horsepower, pulley sizes, etc. This is in the nature of a treatise on the subject.

Flexible Couplings. — Westinghouse Electric & Mfg. Co., East Pittsburgh. Circular 1838, devoted to flexible couplings made at Nuttall works. Particulars relating to construction, application and maintenance of couplings designed for use with speed reducers are included.

Marine Oil Engines.—Ingersoll-Rand Co., 11 Broadway, New York. Bulletin of 24 pages, illustrating and describing Diesel engines for marine use in driving a wide variety of vessels.

Diesel Engines.—Busch-Sulzer Brothers-Diesel Engine Co., St. Louis. Four pamphlets devoted to Diesel engines used in developing electric power. Information regarding operation and maintenance expenses is given in some detail.

Rail Steel Bars.—Rail Steel Bar Association, 228 North La Salle Street, Chicago. Booklet of 16 pages, devoted to the use of rail steel bars for concrete reinforcement. Illustrations show methods of preparation of the bars, methods of bending and installation. Standard specifications of the American Society for Testing Materials are given.

Blow Guns and Forge Blowers.—Schutte & Koerting Co., Philadelphia. Bulletin 4-T, of four pages, illustrates and describes blow guns for the use of compressed air and forge blowers. The illustrations, which are in color, show the action of the compressed air and its entrainment of air from the main suction lines.

Bonding Cement for High Temperature.—Chicago Fire Brick Co., 1439 Elston Avenue, Chicago. Folder of four pages devoted to a high-temperature bonding cement recommended for bonding fire brick in a wide variety of metallurgical and other furnace uses. It is shipped in two forms—hotset, to be mixed with water, and coldset—a concentrated, hydrated mixture.

Flexible Shafts. — Stow Mfg. Co., Binghamton, N. Y. Bulletins 100 and 150 of four pages each illustrate and describe a line of flexible shafting for use in a wide variety of services, of which that of the dentists' equipment is perhaps most familiar. Considerable data will be found in the pamphlets covering this flexible shafting and its uses.

Electrically Welded Pipe.—A. O. Smith Corporation, Milwaukee. Bulletin 505 of 52 pages, illustrated, tells of the Smith method of welding steel plate into pipe by electrical means and gives many illustrations of the use of this pipe. Data of an engineering character cover sizes, weights and strength, and even such items as the freight cost entering into the use of this pipe.

Air Compressor and Vacuum Pumps.—Pennsylvania Pump & Compressor Co., Easton, Pa. Bulletin No. 147, consisting of 24 pages, contains an interesting cross-sectional view of the company's compressor, together with description and illustrations of Pennsylvania methods of compressor regulation.

European Mills Lack Export Business

Unsettled Condition in Far East Is Factor—Government Committee to Survey British Steel Industry—English Pig Iron Strong

(*By Cable*)

LONDON, ENGLAND, July 29.

PIG iron demand is now affected by the holiday periods and but little improvement is expected before early fall. Cleveland makers, however, are well booked for two months and further advances in prices are regarded as possible, although with raw material output increasing and an expected decrease of costs, Cleveland makers are at present willing to book forward business at current prices.

Hematite iron is stiffening, as low priced ore and fuel contracts are expiring. Based on current raw material prices, hematite iron costs more than £4 ($19.40) a ton to produce, so that the tendency is upward. Meanwhile, consumers' demands have eased with the holiday season.

Finished steel is generally quiet for export, but domestic consumers have bought moderately and Northeast Coast makers are hastening to execute orders before their vacation periods begin. Prices are strong with an upward tendency.

Continental sales here are at a minimum and mills are actively seeking to increase sales, so that prices are declining.

Tin plate inquiry is fair, but business is slow. An important Welsh group is well sold up to the end of the year at full prices. Consequently, makers are generally inclined to take a firmer view and more mills are suspending rather than to sell tin plate at 18s. 3½d. ($4.43) per base box, f.o.b. works port. The market is therefore expected to develop a firmer tone.

Galvanized and black sheets are inactive.

The Government committee appointed to inquire into conditions in the iron and steel industry comprises Lord Sankey, A. U. Alexander, Sir Cecil L. Budd, T. C. Cramp and Sir William Plender. The committee will consider and report upon the present condition and prospects and make recommendations as to any action which may appear desirable and practicable to improve the position of the iron and steel industries in world markets.

Dorman, Long & Co. have secured a contract for £262,000 ($1,270,700) for a memorial road and bridge at Bangkok, Siam.

German raw steel output in June was 1,430,000 metric tons. Belgian production in June was 342,000 tons of pig iron and 339,000 tons of raw steel. On July 1, 57 Belgian furnaces were in blast. Belgian mills have booked 75,000 tons of rails and other contracts through the International Rail Makers' Association are pending.

Luxemburg production in June totaled 242,000 metric tons of pig iron and 218,000 tons of raw steel. On June 30, there were 38 furnaces in blast. Saar output in June was 187,000 metric tons of pig iron and 190,000 tons of raw steel. On June 30 there were 28 furnaces in blast.

Summer Quiet in Great Britain

Holidays Curtail Business—Last Quarter Pig Iron Sold —Steel Export Committee Going to South America

LONDON, ENGLAND, July 19.—Midsummer quiet has set in and, with Scottish plants closed for a week to 10 days and holiday periods coming in other sections, little improvement in business is expected until fall. It is noteworthy, however, that the number of blast furnaces in operation has steadily increased throughout the year. Since last December the number in blast has been augmented by 15 furnaces and more are operating now than at any time since August, 1927. Pig iron production in the past six months has been about 5 per cent greater than in the first half of 1928, and the increase would have been even greater had not the output in February been unusually small.

The improvement in the pig iron market has been largely due to the curtailment of imports because of in-

British and Continental European Export prices per gross ton, f.o.b. United Kingdom Ports, Hamburg and Antwerp, with the £ at $4.85

creased costs at Continental furnaces. This has not only aided British furnaces in their own domestic market, but has enabled them to regain certain foreign markets. Cleveland furnaces, which are in a particularly prosperous position, have opened their books for last quarter contracts following withdrawal from the market for several weeks. Hematite iron lacks the strength exhibited by Cleveland prices, as there is no control among hematite producers of prices and production. However, makers have little iron to sell for delivery before August and are able to sell without shading ruling market quotations. Export demand for hematite is improving, with both Belgian and Italian consumers actively inquiring for tonnage.

Steel mills have not had a comparable improvement in business, as their market is still partly influenced by Continental competition. At present, however, European mills report a lack of substantial tonnage for export. The unsettled situation in the Far East and depreciated exchange are obstacles to betterment in demand, but the steel makers' export committee has negotiated some good business in ship material for Japan. Following their recent Canadian visit, members of export committee are sailing in August for a tour of South America.

Under the Labor Party administration the question of safeguarding iron and steel has become less prominent, although certain members of the opposition are still urging its adoption. The new government, however, is opposed to protection, although it announced that a comprehensive inquiry will be made into the position of the iron and steel industry.

According to Lloyd's Register of Shipbuilding, vessels under construction in the United Kingdom in the quarter ended June 30 totaled 1,453,906 tons, an increase of 96,531 tons from the previous quarter. Tonnage under construction abroad decreased 96,118 tons to 1,384,319 tons at the end of the second quarter.

Germany Buys Russian and Indian Manganese Ore

HAMBURG, GERMANY, July 16.—The largest manganese ore contract this year has just been placed. A German consumer has bought 100,000 tons of Caucasian manganese ore from Poti, Georgia, at 1s. to 1s. 1d. (24c. to 26c.) per unit, delivered, the price varying with the quality of the ore. A contract for 26,000 tons of Indian manganese ore has been closed at 1s. ½d. to 1s. 1½d. (25c. to 27c.) per unit, depending upon the quality.

Construction of an all-welded 8000-bbl. oil barge has been begun by Truss-Weld Barge Co., Elizabeth, N. J. It will be 134 ft. long, 33 ft. beam and 12.5 ft. deep, and is especially planned for service on the New York State Barge Canal.

German Steel Business Improving

Unemployment Declining As Domestic Buying Increases —Export Trade Good But Prices Are Irregular

BERLIN, GERMANY, July 16.—Business has begun to improve and the number of unemployed has declined to less than one-third of the February total. While foreign trade has receded, seasonal improvement is expected in the fall. In the domestic market, building is more active and manufacturers are again expanding output. Demand from machinery builders is heavier and there is an active market in small finished products, cutlery and hardware.

Producers of semi-finished material have sufficient tonnage on their books to carry them into October in many instances, although in large measure this is the result of the increased activity of their own finishing mills rather than a larger demand from rolling mills that buy in the open market. Business in bars, bands, heavy and light-gage sheets has improved, but medium-gage sheets are inactive and show a downward tendency.

Export business in the past fortnight has been irregular and rather restricted. The German syndicates have endeavored to maintain their export prices, although affected by weaker quotations in France and Belgium. Business in steel bars in South America, the Dutch East Indies and the Far East is quite active, but consumers of bars in other markets have not been buying recently. An effort by German sellers to maintain bar prices at £6 per ton (1.30c. per lb.), which is 8s. ($1.94) per ton less than the high point reached this year, has been unsuccessful, and this month the Stahlwerksverband has reduced its quotations to a range of £5 17s. 6d. to £5 18s. per ton (1.27c. to 1.28c. per lb.).

Exports of Solingen cutlery are increasing and sales to France, Great Britain and Italy are reported satisfactory, with unusually large sales to British India, although at low prices.

Imports of heavy iron and steel, including scrap, in the first quarter of this year, totaled 738,017 tons, while exports were 2,313,737 tons. An interesting feature of the scrap trade was the virtual balance between exports of 123,401 metric tons and imports of 120,061 tons. In other products there was a considerable difference between imports and exports. Imports of pig iron totaled 69,008 tons and exports 139,685 tons; imports of shapes, including bars and bands, totaled 275,668 tons, while exports were 536,537 tons; imports of wire were 42,764 tons and exports 221,849 tons; sheet imports were 29,511 tons and exports 214,801 tons, and rail and steel tie imports were 48,969 tons and exports 155,175 tons.

Labor Scarcity in France Attracts Foreigners

BORDEAUX, FRANCE, July 15.—Labor shortage continues in a majority of French industries. The total number of unemployed listed in the Paris area during one week in May was 335. In the metallurgical and engineering industries at this time there were 2451 offers of employment and only 208 applicants. From mines and quarries there were 1772 offers of employment and only 13 applicants. In the same week 1694 foreign workers were added to French industrial payrolls.

German Machinery Exports Gaining

BERLIN, GERMANY, July 16.—The Machinery Manufacturers' Association reports a further gain in orders booked in June. Domestic orders for machinery have been increasing since March and foreign business has been active since last fall. In the first half of this year 44 per cent of all machinery sales by members of the association was for export, compared with 36 per cent in the first half of last year. The greatest demand was for power equipment and machine tools. Builders of printing machinery and mechanical mining equipment report that they are increasingly dependent on foreign business. On the basis of orders now on the books of association members, output for the year will exceed the 1928 total by 200,000,000 m. ($47,600,000).

Germany Sells More Wire and Cable to United States

HAMBURG, GERMANY, July 16.—In May the United States advanced to first place as a buyer of German wire rope, taking 115 tons. The United Kingdom was second with 105 tons, Holland was third with 102 tons and Brazil fourth with 101 tons. In wire nails the United States has advanced as a buyer of the German product from seventh place in 1928 to third place this year. In May the United Kingdom received 1500 tons of wire nails, China 860 tons and the United States 730 tons. The United States also ranked third as a buyer of barbed wire, Brazil leading with 1600 tons, India second with 900 tons and the United States third with 700 tons. Germany's total exports of wire and wire products were 62,000 tons in May.

German Use of Welding on Ships Increasing Rapidly

HAMBURG, GERMANY, July 16.—Electric welding is being increasingly used for the fabrication of ships in Germany, having been adopted by Messrs. Blohm & Voss, Hamburg; by Deschimag, a merger of five German yards; by the Deutsche Werft at Kiel, which is building German battleships and by the Government yard at Wilhelmshafen. The latest use of electric welding is in the construction of merchant ships up to 10,000 to 12,000 tons. The next ships to be built by Deschimag at Bremen and Hamburg for the North German Lloyd line will be electrically welded.

In addition to the larger vessels, all river craft and steel barges on the Oder, Elbe and Rhine rivers are being electrically welded, and such craft exceeds the German tonnage on the seas.

While the weight saved on merchant vessels through electrical welding will be less than on warships with their heavy armor plate, it is expected to amount to 8 to 10 per cent (deadweight). The German Lloyd and British Lloyd have put electrically welded ships in the highest registered class, and the insurance companies accept them at 100 per cent value.

Swedish Exports Improve While Imports Decline

STOCKHOLM, SWEDEN, July 16.—Business in iron and steel has improved and orders on mill books for rolled products are larger than a year ago. Prices have advanced recently as a result of the increase in scrap quotations, but export prices are unchanged. In the first five months of this year exports of iron and steel totaled 109,164 metric tons, while imports, not including pig iron and scrap, totaled 104,508 tons. Imports, however, showed a decline from the total of 120,031 tons for the first five months of 1928, while exports increased from the 102,379 tons for that period.

Iron Ore Imports Continue Heavy in June

WASHINGTON, July 26.—June imports of iron ore, while less than those for May, continued the heavy movement of the past few months. The total was 243,913 gross tons, compared with 275,762 tons in May and with 284,134 tons in April. The imports were 188,892 tons in June, 1928. For the six months the imports reached 1,467,736 tons, which is 18 per cent higher than the total for the like period of last year.

Chile furnished a little more than half of the total imported in June. For the six months of the year, Chile's contribution was almost 53 per cent, with Cuba second and Sweden back in third place.

Gain in Italian Output of Machinery

The increased production of machinery in Italy since the war is revealed in a study of the Italian machinery industry by A. A. Osborne, assistant American commercial attaché, Rome. A characteristic of the industry is the small scale on which most establishments operate. Less than 5000 out of a total of 700,000 companies employed more than 100 workers each, according to a census made in 1927. Production, however, is so far advanced that in certain lines it is equal to domestic demand. Plants are equipped for the manufacture of most heavy electrical machinery and hydraulic equipment.

There is comparatively little output of machinery for special purposes, which in most cases must be obtained abroad. Moreover, most companies produce items of a widely diverse character, because the demand for any one class of machines is so restricted and competition is so keen that few establishments confine themselves to the production of specialized lines.

Thomas W. Ward, Ltd. Buys Yorkshire Blast Furnaces

LONDON, ENGLAND, July 19.—The properties of the Yorkshire Iron & Coal Co., Ltd., Leeds, recently acquired by the Frodingham Iron & Steel Co., Ltd., Scunthorpe, Lincolnshire, have been, for the most part, sold by the Frodingham Company to Thomas W. Ward, Ltd., Sheffield. The purchase includes the four blast furnaces and plant near Ardsley, the collieries near Morley and a large acreage of land. The new owner is expected to modernize part of the plant and to dismantle the rest.

United Steel Works Exports 40 Per Cent of Output

HAMBURG, GERMANY, July 16.—The United Steel Works, Düsseldorf, has issued the report for the third quarter of its business year—from April 1 to June 30. Production in all departments of the corporation showed an increase from the previous quarter, Jan. 1 to March 31. Coke output was 2,608,471 metric tons, compared with 2,431,578 tons in the preceding quarter, pig iron production 1,710,172 tons, compared with 1,660,403 tons, and steel ingot output 1,882,182 tons compared with 1,824,733 tons.

The number of employees on June 30 was 176,207, compared with 171,876 on March 31. The total, however, was 9700 less than at the end of the company's third quarter last year. The value of all sales during the quarter was 407,500,000 m. ($96,585,000) of which 159,200,000 m. ($37,889,600), or about 40 per cent, represented export business

Less Plate Work Placed in June—Half Shows Gain

WASHINGTON, July 30.—Orders for fabricated steel plate totaled 45,893 tons in June, against 47,763 tons in May, according to reports made to the Department of Commerce by 48 firms. The production ratios for the two months were 57.4 per cent and 59.8 per cent respectively. Of the June orders, 6890 tons was for oil storage tanks, compared with 10,087 tons in May; 4433 tons for refinery materials and equipment, against 4053 tons; 1998 tons for tank cars, compared with 960 tons; 5444 tons for gas holders, against 5300 tons; 1003 tons for blast furnaces, against 1245 tons, and 26,125 tons for stacks and miscellaneous requirements, compared with 26,118 tons in May.

For the first six months of the year, orders totaled 283,589 tons, representing 59.2 per cent of capacity, compared with 260,483 tons, or 54.4 per cent of capacity, for the corresponding period of last year. Comparative distribution of the tonnage during the first half of 1929 and during the corresponding period of last year, respectively, was as follows: Oil storage tanks, 76,154 tons and 111,010 tons; refinery materials and equipment, 28,867 tons and 16,032 tons; tank cars, 24,831 tons and 12,163 tons; gas holders, 27,257 tons and 20,261 tons; blast furnaces, 5761 tons and 3666 tons; and stacks and miscellaneous 20,719 tons and 97,351 tons.

Despatch Oven Co., Minneapolis, Minn., has appointed the Industrial Engineering & Equipment Co., 1341 Syndicate Trust Building, St. Louis, as its district sales representative for the State of Missouri and the southern portion of Illinois.

Less Steel Exported in June

Half-Year Increase Over Last Year Was 17½ Per Cent—Meanwhile Imports Fell 10 Per Cent

WASHINGTON, July 26.—Declining 13,705 gross tons, exports of iron and steel products from the United States in June totaled 247,811 tons, against 261,516 tons in May. For the six months ended with June, however, exports increased to 1,591,839 tons, a gain of 234,476 tons over the 1,357,363 tons exported during the corresponding period of last year. Exports in June, 1928, were 260,767 tons, or 12,956 tons in excess of the movement for June of the current year. The daily average shipment abroad in June, this year, was 8260 tons, against 8436 tons in May.

Imports in June also showed a slump, dropping to 63,635 tons from 74,272 tons in May, a decrease of 10,637 tons. For the first half of the present year imports declined 36,243 tons from those of the corresponding period of last year, the totals being 394,088 tons in 1928 and 357,845 tons in 1929. Imports in June of last year amounted to 66,602 tons, or 2967 tons above those for last month. The daily average import movement in June was 2121 tons, compared with 2396 tons in May.

Declines in exports in June as compared with May were reflected in 23, and gains were made in 14, of the 37 products listed in THE IRON AGE table. The sharpest drop was made in the outgoing shipments of scrap, with a total of 42,816 tons in June, against 55,916 tons in May. Steel bar exports decreased to 12,249 tons from 14,720 tons; plates to 17,640 tons from 20,185 tons and pig iron to 3101 tons from 8088 tons.

On the other hand, exports of galvanized sheets rose to 12,604 tons from 11,342 tons; tin plate to 18,041 tons from 14,537 tons; plain structural material to 31,268 tons from 30,331 tons, and fabricated material to 7363 tons from 6652 tons.

Among important gains in exports for the first six months over outgoing shipments for the like period of last year were those made in steel bars, which increased to 112,620 tons from 70,768 tons; plates increased to 107,296 tons from 71,726 tons; hoops, bands and strip steel, increased to 42,858 tons from 27,697 tons, and plain structural material, increased to 145,866 tons from 89,873 tons. The greatest decline was in exports of steel rails, which decreased to 85,566 tons from 109,124 tons.

Imports of Iron and Steel into the United States

(In Gross Tons)

	June		Six Months Ended June

All other	1,603	1,270	9,445	6,969
Total	247,811	260,767	1,591,839	1,357,363

Decreases were reflected in June in imports of 17 of the 26 products listed while gains were made in eight when compared with May, with no incoming shipments either month of steel telegraph and telephone wire. The most important changes were in pig iron and structural shape imports, the former declining to 11,396 tons in June from 14,393 tons in May while structural shapes dropped to 12,274 tons from 14,744 tons. The gains were of minor character.

Of the 5534 tons of ferromanganese imported in June, 2620 tons came from Canada, 1261 tons from the United Kingdom, 1164 tons from Norway, 237 tons from Italy, 116 tons from France and 100 tons from Germany. Sweden supplied 1358 tons of the 3170 tons of steel bars imported, while 769 tons came from Belgium and 490 tons from France. Of the 3245 tons of hoops and bands imported, 1280 tons came from Germany, 1114 tons from Belgium and 453 tons from France.

Of the 12,274 tons of shapes imported in June, Belgium furnished 6400 tons; Germany, 4065 tons; and France, 1455 tons. France supplied 6437 tons of the 6679 tons of cast iron pipe imported during the month. Russia supplied 22,547 tons of the 51,290 tons of manganese ore concentrates imported in June, while 21,253 tons came from Brazil, 4880 tons from India and 2325 tons from Canada, according to the records of the Department of Commerce.

Exports of iron and steel in June were valued at $8,605,494, against $8,350,746 in June of last year, despite the larger quantity shipped during the earlier month. For the six months of the current year the value was $55,560,889, compared with $45,806,173 for the corresponding period of last year. Imports of iron and steel in June were valued at $787,728, against $663,458, also despite the larger shipments of last year. For the six months of 1929 the value was $4,303,909, against $3,956,450, an increase of $347,459 in value, in the face of a decline in tonnage.

Steel Furniture Orders Decline in June

WASHINGTON, July 30.—Orders for steel furniture in the "business group" in June were valued at $2,530,723, as against $2,814,423 in May, according to reports received by the Department of Commerce from 34 manufacturers. Shipments totaled $2,584,539 and $2,783,992 respectively, while unfilled orders at the end of June amounted to $2,320,642, compared with $2,400,734 at the end of May. Orders and shipments for the first six months of the current year were valued at $18,062,198 and $17,994,374 respectively, against $18,592,422 and $18,078,708 respectively for the corresponding period of last year.

Orders for $949,553 worth of shelving furniture were placed in June, according to reports from 16 producers, compared with $1,120,990 in May. Shipments were valued at $910,534 and $989,120 respectively, while unfilled orders at the end of June were valued at $934,834, against $897,361 at the end of May. Orders and shipments for the first six months of the year were valued at $6,330,636 and $6,017,167 respectively.

UNITED STATES IMPORTS OF IRON AND STEEL PRODUCTS

(In Gross Tons)

	June	May
Austria	34	60
Belgium	9,888	13,577

Employment for Seventh District Little Changed

Industrial employment in the seventh federal reserve district remained practically stationary during the period May 15 to June 15, according to a statement issued by the Federal Reserve Bank of Chicago. Plants with an approximate total of 350,000 workers showed a decline of 0.1 per cent. Pay-rolls increased 0.6 per cent, a partial recovery from the decrease of 1.4 per cent reported for the previous period. In comparison with a year ago, employment was approximately 7 per cent heavier, both in the number of workers and in volume of pay-roll.

Steel Boiler Orders Smaller

WASHINGTON, July 30.—Orders for 1685 steel boilers, with a total of 1,822,799 sq. ft., were placed in June, against 1751 with 2,144,607 sq. ft. in May, according to reports to the Department of Commerce by 80 manufacturers. For the first six months of the year, orders totaled 8725 boilers, with 9,743,852 sq. ft., compared with 9167 boilers, with 8,534,985 sq. ft. for the corresponding period of last year.

Net earnings in the first half of 1929 for the Foote-Burt Co., manufacturer of drilling and boring machinery, Cleveland, amounted to $241,711 after all charges. This was equal to $2.48 a common share. Earnings in the first half of 1928 were $320,632.

Hamilton Bridge Co. to Build Toronto Plant

TORONTO, ONT.—The Hamilton Bridge Co., Hamilton, Ont., has acquired a site on the waterfront from the Toronto Harbor Commissioners and will erect there a structural steel plant at a cost of about $350,000.

At the proposed plant the company can receive steel shipments by water. It is reported to be the company's plan to bring steel by boat from Chicago through the Welland Canal.

Chrome-Plated Aluminum On Market

Chromium plating of aluminum, by a process discovered by Harry F. Gardner, formerly of the United States Bureau of Standards, is now being done commercially by the Perma-Chrome Process Corporation in Cleveland. It is reported that all varieties of aluminum objects, such as castings, stampings and flat sheets, have been successfully plated in quantity.

A bare aluminum sheet which had scleroscope hardness of 7, tested 16 points hard after plating. The new surface is said to remain bright after long exposure to boiling water, fruit juices, and the various organic liquids formed during cooking, and which rapidly tarnish pure aluminum. It is also anticipated that the added hardness will be useful to improve gas engine pistons and other parts which must resist wear; it may also solve the problem of atmospheric corrosion of aircraft parts.

The officers of the Perma-Chrome Process Corporation are J. V. Whitbeck, president, Clyde Morgan, vice-president, William Chandler, general manager and J. I. Krall, secretary and treasurer.

Shippers to Be Consulted in Designing Cars

A plan to allow shippers a voice in specifying the design of freight cars to be purchased by railroads has been proposed by the Allegheny Regional Advisory Board, a group made up of representatives of carriers in the Pittsburgh and nearby districts. The plan proposes that, in the interests of maximum efficiency, economy and safety, designs for all kinds of new car equipment be submitted to expected users for suggestions and approval.

Metal Bases for Plaster

Expanded metal lath, woven wire and other forms of metallic backing, for use as a support for plaster or stucco in construction work, form the subject of United States Government Master Specification No. 553, issued by the Bureau of Standards. The seven-page pamphlet gives details of the standard sizes adopted for these purposes.

Nearly 50 Millions in Machinery

Exports in June Gain Over May—Half-Year Was 27½ Per Cent Ahead of 1928—Imports Higher

WASHINGTON, July 26.—Reflecting an increase of $1,646,667, exports of machinery of all kinds from the United States in June were valued at $49,732,282, compared with $48,085,615 in May. Meanwhile a gain of $6,649,355 was made over exports for June of last year, when the value was $43,082,927.

For the six months of 1929, exports of machinery were valued at $305,209,299, an increase of $65,459,783 over exports for the corresponding period of last year, valued at $239,749,516. Exports of machinery and all vehicles in June were valued at $104,994,973, against $89,925,919 in June of last year; for the six months they were valued at $671,818,336, compared with $508,139,793 for the corresponding period of 1928.

Exports of industrial machinery, as classified by the Division of Statistics, Department of Commerce, were valued at $22,392,023 in June, against $22,158,220 in May, an increase of $233,803. In June of last year they were valued at $19,877,543. For the six months ended with June they were valued at $138,446,882, compared with $108,356,700 for the corresponding period of last year.

Exports of power-driven metal-working machinery, as listed in THE IRON AGE table, totaled 886 units, valued at $1,537,399, against 812, valued at $1,173,198, in May. Exports of agricultural machinery and implements in June were valued at $12,041,000, against $10,295,000 in June of last year. For the six months they were valued at $72,068,000, compared with $54,012,000 for the corresponding period of last year.

Imports of machinery and vehicles in June were valued at $3,714,910, against $4,059,694 in May and $2,530,218 in June of last year. For the six months of 1929 they were valued at $21,860,050, an increase of $7,927,897 over imports for the first six months of 1928, valued at $13,932,153.

Imports of machinery as listed in THE IRON AGE table were valued at $2,609,261 in June, against $3,191,787 in May and $1,904,697 in June of last year. For the first six months of the present year they were valued at $16,414,371 as compared with $10,290,973 for the corresponding period of last year, an increase of $6,123,398.

Imports of industrial, office and printing machinery in June were valued at $2,111,168, against $2,213,314 in May and $1,745,976 in June of last year. For the first six months of 1929 they were valued at $12,487,534, an increase of $4,056,754 over incoming shipments for the corresponding period of last year, valued at $8,430,780.

Approximately 135 large business corporations now own airplanes for the use of their salesmen, executives and for the transportation of parts, supplies, and other services, the Ryan Aircraft Corporation, St. Louis, has found after making a survey of the rapidly increasing use of the airplane by business interests. Four, six and eight-place cabin planes, powered with a single motor, are the common types.

Machinery Exports from the United States

(By Value, in Thousands of Dollars)

	June		Six Months Ended June	
	1929	1928	1929	1928

Vehicles, except agricultural	468,089	250,732	2,638,264	1,427,616
Total	$2,609,261	$1,904,697	$16,414,371	$10,290,973

Machinery Markets and News of the Works

Sales and Inquiries Large

Machine Tool Builders Report No Improvement in Deliveries —Outlook for August Favorable

THERE was increasing evidence the past week that machine tool buying is not likely to feel the usual unfavorable effect of hot weather and of the vacation season.

Sales were well sustained and inquiries were on a sufficiently large scale to suggest that August may bring even better bookings than July, which have been surprisingly good.

It is not strange, under the circumstances, that machine tool builders report no improvement in deliveries, which in some cases run into November, December and the early months of next year. Recognizing the serious delays in deliveries at present, the Pratt & Whitney Co. has placed orders for about $200,000 worth of tools, including 10 universal turret lathes, for the new plant of the Pratt & Whitney Aircraft Corporation, although this plant is not expected to be ready to operate until next January or February.

The General Electric Co. has closed for two turret lathes, seven engine lathes and a number of presses for its electric refrigerator department at Schenectady, N. Y., and will buy additional equipment soon. Kearney & Trecker Corporation, Milwaukee, has recently expended about $150,000 for tools for a plant addition.

In the Chicago district, dealers are quoting against a list for the International Harvester Co. which ultimately will call for $1,500,000 worth of machine tools. The list already put out totals about $150,000.

An inquiry for 30 lathes for delivery to Russia has appeared, but otherwise the foreign market is without feature.

New York

NEW YORK, July 30.—Following a slight recession in machine tool buying, business is again at the former high level. It is suggested by some sellers that there may be postponements of buying until after the machine tool exhibit in Cleveland the week of Sept. 30, but it is also pointed out that with the possible exception of lathes, deliveries are at present rather extended, in some cases being well into November, and buyers may not be inclined to delay.

The General Electric Co., Schenectady, continues an active buyer for its electric refrigerator department. It has closed on part of its list of 30 tools for that division, including two of a total of five turret lathes, seven engine lathes and a number of presses. In the past week it has inquired for additional engine and turret lathes and bench milling machines.

A recent outstanding purchase was made by the Pratt & Whitney Co., Hartford, Conn., for the Pratt & Whitney Aircraft Corporation, which is building a new plant. The list, including 10 universal turrent lathes, reached a total of about $200,000 and is expected to be followed by further sizable orders. In addition to large lot buying, there is a considerable volume of single tool business to replace obsolete equipment. In the past week, the Erie Railroad has inquired for a 36-in. shaper and the New York Central for a 54-in. boring mill.

Plans have been filed by Keller Mechanical Engineering Co., 70 Washington Street, Brooklyn, manufacturer of die-cutting machinery, etc., for one-story plant, 180 x 300 ft., at Belleville, N. J., with one-story office adjoining, 50 x 120 ft., to cost about $100,000 with equipment. It is understood that present works will be removed to new location and capacity increased. Fletcher-Thompson, Inc., 738 Broad Street, Newark, N. J., is architect and engineer.

Hugo E. Magnuson, 420 Lexington Avenue, New York, architect, has plans for a two-story automobile service, repair and garage building at Brooklyn, to cost about $100,000 with equipment.

Cerro de Pasco Copper Corporation, 44 Wall Street, New York, has plans for expansion and improvements at properties near Kingman, Ariz., including two new concentrating mills, electrolytic zinc plant, tramway system, power plant and other units, to cost more than $10,000,000 with equipment.

Nassau & Suffolk Lighting Co., Island Park, N. Y., has arranged for increase in capital from $6,500,000 to $10,000,000, part of fund to be used for expansion in electric light and power properties.

Anaconda Wire & Cable Co., subsidiary of Anaconda Copper Mining Co., 25 Broadway, New York, has work under way on expansion at wire mill at Hastings, N. Y., to include installation of considerable additional equipment to cost over $1,500,000. Company will also carry out similar development at Sycamore, Ill., Anderson, Ind., and Muskegon, Wis., to cost over $750,000 with equipment.

Aero Supply Mfg. Co., College Point, L. I., manufacturer of aircraft apparatus, parts, etc., has plans for one-story unit, 50 x 140 ft., to cost about $35,000 with equipment. Peter M. Coco, 433 Steinway Avenue, Long Island City, is architect.

Cutler-Hammer Mfg. Co., Milwaukee, manufacturer of electric control devices, switches, etc., is reported planning Eastern branch plant near New York, initial unit to cost over $500,000 with equipment.

Irving Kudroff, 15 West Thirty-eighth Street, New York, architect, has plans for a six-story automobile service, repair and garage building, to cost about $130,000 with equipment.

Leonard K. Madden, 9 First Street, Troy, N. Y., and associates have organized Electric Master Machine Co., with capital of $200,000, and will operate local plant for production of special machinery and parts. William C. Ratz, 916 Jacob Street, is interested in new organization.

Westinghouse Lamp Works, Inc., Bloomfield, N. J., a subsidiary of Westinghouse Electric & Mfg. Co., 150 Broadway, New York, has awarded general contract to White Construction Co., 95 Madison Avenue, New York, for two additions, five and four stories, 50 x 100 ft., and 50 x 200 ft., to cost over $650,000 with equipment.

Tung-Sol Lamp Works, Inc., 95 Eighth Avenue, Newark, manufacturer of radio tubes and equipment, will soon break ground for an addition, totaling about 82,000 sq. ft. floor space, to cost more than $200,000 with equipment.

Board of Chosen Freeholders, Court House, Hackensack, N. J., will take bids at once for one-story power plant at Bergen Pines, Oradell, to cost $125,000 with equipment. Henry R. Kent & Co., 5 Erie Avenue, Rutherford, N. J., are engineers.

Sonoco Products Co., 95 Boyd Avenue, Jersey City, N. J., manufacturer of cardboard tubing, fiber spools and kindred products, has taken over former plant of American Motor Co., Grant Avenue, Plainfield, N. J., where it will concentrate production. Factory at Jersey City is being removed to new location and capacity will be increased.

Guilbert & Betelle, 24 Branford Place, Newark, architects, have plans for a power plant at Hillside, N. J., for company whose name is temporarily withheld, to cost more than $45,000 with equipment.

Officials of Sonatron Tube Co., 57-59 State Street, Newark, manufacturer of radio tubes and equipment, are organizing new company, to take over present organization, as well as Televocal Corpo-

ration, 588 Twelfth Street, West New York, N. J., and Magnatron Corporation, 406 Jefferson Street, Hoboken, N. J., both manufacturers of similar apparatus. Companies will be consolidated and expansion carried out. Sonatron company has plans for a six-story addition, 67 x 120 ft., to cost about $125,000 with equipment, for which Siegler & Greenberg, 164 Market Street, are architects.

North Jersey District Water Supply Commission, 24 Commerce Street, Newark, will soon take bids for electric motors, switchboards and other electric power equipment, to cost about $100,000, and for pumping machinery to cost about $50,000, for Wanaque aqueduct project.

Reliance Steel Products Co., 43-49 Ralph Street, Bellville, N. J., has been recently incorporated with capital of $125,000 to manufacture screw products.

Macval Pump & Engineering Co., Inc., New York, will manufacture on contract 50 to 1500 gal. per min. bronze rotary pumps for fire and industrial purposes.

American Machinery Supply Corporation, 24-26 Mechanic Street, Newark, N. J., has been formed to deal in new and used tools. Charles J. McPhillips is president and Paul Kifner secretary-treasurer.

South Atlantic

BALTIMORE, July 26.—Contract has been let by Black & Decker Mfg. Co., Pennsylvania Avenue, Towson, Baltimore, manufacturer of portable electric tools, etc., to William H. Sands, Towson, for two-story addition to cost about $140,000 with equipment. George N. Mackenzie, 3d., 5 North Guilford Avenue, Baltimore, is architect.

Wyatt & Nolting, Keyser Building, Baltimore, architects, have plans for two and six-story automobile service repair and garage building, to cost about $900,000 with equipment.

Tennessee Mineral Products Co., Spruce Pine, N. C., a unit of United Feldspar Corporation, 10 East Fortieth Street, New York, is said to be planning extensions in local properties and will install machinery for feldspar production in two mines, including hoisting, conveying and other handling equipment.

Duke Power Co., Charlotte, N. C., operating electric light and power properties in North and South Carolina, has arranged for an increase in capital from $100,000,000 to $150,000,000, part of fund to be used for extensions and improvements.

Reid-Avery Co., Cleveland and Chesapeake Avenues, St. Helena, Baltimore, manufacturer of oxy-acetylene and electric welding rods, electrodes, etc., has approved plans for a one-story addition, 50 x 210 ft., to cost about $30,000 with equipment.

Standard Wholesale Phosphate Co., Continental Building, Baltimore, has plans for a new one-story unit, 120 x 300 ft., at Williamston, N. C., to cost over $90,000 with machinery. C. G. Crockett is plant manager in charge.

Cunliffe-Cadillac Co., Baltimore, local representative for Cadillac automobile, has leased multi-story building to be erected at Charles and Twenty-fourth Streets, for which general contract has been let to North Eastern Construction Co., 6 West Madison Street, for a new service, repair and sales building, to cost $150,000 with equipment. Howard Baldwin, 339 St. Paul Street, is architect.

Claude Neon Virginia Corporation, Richmond, Va., has been formed by Baltimore interests, headed by Norman A. Hill, 12 Clay Street, Baltimore, with capital of $75,000 and 2500 shares of stock, and plans establishment of plant at Richmond to manufacture electric lighting equipment, displays, etc., under Claude Neon patents. New company is represented by William H. Hudgins, 213 St. Paul Street, Baltimore.

City Council, High Point, N. C., has plans for a municipal electric light and power house, to cost over $75,000 with equipment. William C. Olsen, Exchange Place, Raleigh, N. C., is consulting engineer.

The Crane Market

INQUIRY for electric overhead cranes has slackened considerably and award of pending business is somewhat delayed by the vacation season. An outstanding list of overhead cranes recently issued, calls for six 30-ton electric cranes for substations of the Board of Transportation, New York. The inquiry is from the General Electric Co., Schenectady, N. Y., and the Westinghouse Electric & Mfg. Co., Pittsburgh. There are two more lists of overhead equipment pending, which have been in the market for some weeks. Builders are well booked with business, following one of the best six-month periods since the armistice, and it is noteworthy that dealers in used overhead cranes are actively seeking equipment to supply an increased demand. Locomotive crane business is light, but there is a fair volume of pending business, especially from contractors.

Among recent purchases are:

Goldsmith Brothers Smelting & Refining Co., Chicago, 3-ton, 40-ft. span, electric traveling crane from Northern Engineering Works.

Philadelphia

PHILADELPHIA, July 29,—Bids are being asked on general contract by Atwater Kent Mfg. Co., Philadelphia, until Aug. 6 for one-story, sawtooth roof addition, totaling 450,000 sq. ft., to cost $1,200,000 with equipment. Company has broken ground for four-story power plant, to cost $200,000 with machinery. Ballinger Co., Twelfth and Chestnut Streets, is architect and engineer for both structures.

Girard Smelting & Refining Co., Tioga and Richmond Streets, Philadelphia, will soon ask bids on general contract for one-story addition, to cost about $140,000 with equipment. H. B. Tobias, Otis Building, is architect.

Philadelphia & Reading Coal & Iron Co., Reading Terminal, Philadelphia, has plans for new steam-operated electric generating plant on Susquehanna River at Herndon, Pa., to utilize pulverized coal as fuel, to cost about $6,000,000 with transmission system. Application has been made for charters for 33 electric transmission companies to operate in townships in eastern part of State. Transmission lines will be constructed through different townships. A. J. Maloney is president.

W. F. Potts Son & Co., Inc., 1224 Cherry Street, Philadelphia, iron and steel products, has awarded a general contract to Fred A. Havens Co., 845 North Nineteenth Street, for one-story storage and distributing plant, to cost about $30,000. M. A. Webster, 1600 Arch Street, is architect.

Kay Steel Wheel Co., Los Angeles, manufacturer of automobile wheels, etc., has leased part of building at Delaware Avenue and South Street, Philadelphia, for Eastern factory branch and distributing plant. Company has been occupying property in this vicinity heretofore.

Grinnell Automatic Sprinkler Co., Commercial Trust Building, Philadelphia, manufacturer of fire extinguishers and equipment, has purchased property at Erie Avenue and D Street, 200 x 337 ft., for new two-story factory branch and distributing plant. It will cost over $100,000 with equipment, and will replace present plant at Seventeenth Street and Sedgley Avenue, which will be removed to new location. Main plant is at Providence, R. I.

Mechanicsburg Borough School Board, Locust and Arch Streets, Mechanicsburg, Pa., is said to be planning installation of manual training equipment in new two-story high school addition to cost about $185,000, for which bids will be asked on general contract early in August. C. J. Lappley, Front and Harris Streets, Harrisburg, Pa., is architect.

Louis Sylvester, president, and other officials of Scranton Button Co., Scranton, Pa., are organizing American Record Co., to take over and consolidate company noted with Cameo Record Corporation, 114 East Thirty-second Street, and Regal Record Co., 10 West Twentieth Street, New York. New company will have assets estimated at $8,000,000 and will specialize in production of talking machine records; plant of Scranton company will be developed as primary manufacturing works and increased facilities will be provided. Mr. Sylvester will head consolidated organization.

Bro-Dun Metal Products Co., North West End Avenue and McKinley Street, Lancaster, Pa., has been organized by Jerome S. Dunie and Edgar P. Brock, 1045 Woods Avenue, with capital of $25,000, to operate local foundry for production of brass, bronze, aluminum and other castings.

Sylvania Products Co., Emporium, Pa., manufacturer of radio tubes and equipment, is establishing branch factory at Lock Haven, Pa., for production of new screen grid-type tube and affiliated specialties.

New England

BOSTON, July 29.—Some local machine tool dealers did a good business the past week, planers, shapers, radial drills and lathes being in most active demand. Fully 90 per cent of tools sold were for 1930 delivery. Sales of some types of equipment undoubtedly are restricted because of deferred deliveries. Business in used tools is confined to small and unimportant equipment.

Machine tool prices tend upward; press brakes are higher, as well as planers and shapers.

July sales of small tools probably will exceed those of the corresponding month last year, and June this year.

Harry Katz, 525 Park Street, Hartford, Conn., has plans for an automobile body and radiator repair shop. Welding equipment is under consideration.

L. W. Bills, 73 Hancock Street, Lexington, Mass., has started work on a two-story, 24 x 42 ft., machine shop, to cost $15,000 without equipment.

Reed & Prince Mfg. Co., Duncan Avenue,

Worcester, Mass., is erecting a two-story addition, 106 x 209 ft.

Yale & Towne Mfg. Co., Stamford, Conn., has awarded a contract for a one-story foundry addition, 100 x 150 ft. A new furnace will be installed.

New Britain-Gridley Machine Co., 140 Chestnut Street, New Britain, Conn., is making alterations to its plant. Conveying equipment will probably be required.

New Britain Machine Co., South Street, New Britain, Conn., machine tools, has started work on a one-story addition, 24 x 260 ft.

Westinghouse Electric & Mfg. Co., East Springfied, Mass., is building a one-story foundry addition, 30 x 80 ft.

American Coal & Charcoal Co., 55 Derby St., Salem, Mass., has plans for coal pocket, 45 x 80 ft., for which conveying equipment is needed.

Morgan Brass Foundry, Lincoln Avenue, Providence, R. I., destroyed by fire last week, has plans for a new plant. Hoisting equipment, furnaces and general brass foundry equipment will be needed.

Thomas Smith & Co., 288 Grove Street, Worcester, Mass., metal punches and bolts, have started work on a one-story addition, 56 x 58 ft.

Contract has been let by Vanadium Metals Co., Boston Post Road, Groton, Conn., to H. R. Douglas & Son, Barrows Building, New London, Conn., for one-story foundry, 50 x 124 ft., to cost about $40,000 with equipment.

Bassick Co., Austin Street, Bridgeport, Conn., manufacturer of casters, metal furniture trimmings, etc., is said to be planning one-story addition, to cost about $45,000 with equipment.

Wright & Corson Co., Bridgeport, Conn., manufacturer of rivets, machine screws and kindred products, has work under way on removal of equipment from local plant to new factory at Milford, Conn., recently completed, and will concentrate production at latter place in future. New plant will represent investment of about $500,000.

New Departure Mfg. Co., Bristol, Conn., manufacturer of ball bearings, has awarded general contract to Aberthaw Co., Boston, for one-story forge shop extension, 50 x 82 ft., to cost over $40,000 with equipment.

Agawam Airport, Inc., Agawam, Mass., operated by H. L. Bowles, Springfield, Mass., and associates, has authorized construction of hangar with repair and reconditioning shop, to cost about $90,000 with equipment.

C. J. Cox Engineering Co., 625 Putnam Avenue, Cambridge, Mass., manufacturer of mechanical specialties, has awarded general contract to C. J. Pitcher, 46 Cornhill Street, Boston, for one-story shop addition and improvements in present works, to cost about $35,000.

Homer D. Bronson Co., Beacon Falls, Conn., manufacturer of sheet metal stampings, hinges and butts for automobiles, cabinets, etc., has awarded general contract to Oscar Lacroix Construction Co., Waterbury, Conn., for one-story addition, 35 x 100 ft., to cost about $40,000 with equipment. W. E. Hunt, Torrington, Conn., is architect.

Dewey & Almy Chemical Co., 235 Harvard Street, Cambridge, Mass., has taken out permit for one-story machine shop, to cost about $30,000 with equipment.

Chase Brass & Copper Co., Waterbury, Conn., a subsidiary of Kennecott Copper Corporation, 120 Broadway, New York, has purchased Irvine Brass & Copper Co., Minneapolis, Minn., manufacturer of kindred brass and copper products, which will be operated as branch works.

Boston & Maine Railroad Co., North Station, Boston, is razing passenger car repair shop at freight yards between Somerville and Cambridge, and will soon begin work for new engine house with repair facilities, to cost more than $1,000,000 with equipment, for which plans have been completed.

Detroit

DETROIT, July 29.—Grand Trunk Railway Co., 400 East Jefferson Street, Detroit, has plans for one-story car repair shop at Ferndale, Mich., to cost more than $45,000 with equipment. Engineering department is in charge.

Board of Trustees, University of Michigan, Ann Arbor, has plans for extension and improvements in power house, including underground system, and will proceed with work at once, to cost over $400,000.

Bohn Aluminum & Brass Co., Joseph Campau Avenue, Detroit, has awarded general contract to Krieghoff Co., 6661 French Road, for three-story addition, primarily for manufacture of aluminum parts for aircraft, to cost $125,000 with machinery.

Evans Auto Loading Co., Inc., Dime Bank Building, Detroit, manufacturer of automobile loading devices and equipment, is arranging for a bond issue to total about $1,200,000, part of fund to be used for expansion. Company is establishing a factory branch on Pacific Coast to manufacture battery boxes and kindred specialties.

Huntington Regulator Co., Flint, Mich., manufacturer of gas regulators and other regulating devices, is said to be planning a new factory at Lansing, Mich., to cost over $45,000 with equipment. Present factory will be removed to new location and capacity increased.

Detroit Butcher Supply Co., 1455 Gratiot Avenue, Detroit, manufacturer of knives, fixtures, etc., has plans for two-story unit, to cost about $55,000 with equipment. Pollmar & Ropes, Hoffman Building, are architects.

Whitmar & Leonard, Inc., Grand Rapids, care of W. C. Whitmar, city, recently organized to manufacture gliders and other aviation equipment, is planning early operation of a local plant. Charles S. Leonard, Grand Rapids, will be an official of new company.

Clark Equipment Co., Buchanan, Mich., manufacturer of axles, wheels, transmissions and other automotive equipment, has arranged for a stock issue of $2,280,000, part of fund to be used for expansion. Negotiations are being completed for purchase of controlling interest in Frost Gear & Machine Co., Jackson, Mich., manufacturer of kindred equipment, which will be operated as a subsidiary. Company will also develop business of Clark Tructractor Co., manufacturer of gasoline-propelled industrial trucks, etc., another subsidiary. Eugene B. Clark is president.

Pontiac Redi-Mixed Corporation, Pontiac, Mich., recently formed with capital of $75,000, by W. R. Ransom and T. S. McGaughan, Pontiac, and associates, is planning construction of new concrete-mixing plant, with bins, loading equipment, etc., to cost $35,000 with machinery.

Officials of Moreland Brothers Co., Adrian, Mich., oil products, have arranged for change of name to Moreland Oil Co., and plan expansion. Company is arranging for sale of bond issue to total about $100,000, part of fund to be used for extensions.

Ford Motor Co., Detroit, has filed plans for one-story addition to aircraft manufacturing plant at Dearborn, Mich, to cost more than $100,000 with equipment.

Allied Motor Industries, Inc., has bought Wills St. Clair plant at Marysville, including 144 acres, on St. Clair River, for manufacture of airplane engines.

Ramisch Tool & Die Co., Kalamazoo, Mich., has been organized to manufacture metal dies, stampings and patterns. Purchase of equipment is contemplated.

Michigan Aero-Engine Corporation, Lansing, Mich., has been organized to manufacture Rover aviation engines. H. B. Lundberg is president and general manager.

Marine Aircraft Corporation, Detroit, has been organized as subsidiary of Detroit Aircraft Corporation, and will manufacture amphibians and flying boats. C. B. Fritsche is vice-president of the latter company.

Buffalo

BUFFALO, July 29.—National Lime, Cement & By-Products Corporation, Stock Exchange Building, Buffalo, is arranging for construction of new lime plant on site recently acquired near Tuscumbia, Ala., to cost more than $350,000 with equipment. It is expected to make machinery purchases early in fall. Autery Engineering Co., Sheffield, Ala., is in charge of surveys for plant.

Kee-Lox Mfg. Co., 10 Keelox Place, Rochester, N. Y., manufacturer of carbon and other processed papers, has awarded general contract to Werner Spitz, 11 Comfort Street, for two additions, two and three stories, to cost about $60,000 with machinery. Leander McCord, Taylor Building, is architect.

Fire, July 24, destroyed a part of storage and distributing plant of Irving Engineering Co., 74-80 Jewett Avenue, Buffalo, automobile fronts and kindred products. Plans are being considered for rebuilding.

Carborundum Co., Buffalo Avenue, Niagara Falls, N. Y., manufacturer of grinding wheels and other abrasive materials, has awarded a general contract to Laur & Mack Contracting Co., College Street and Highland Avenue, for four-story addition, to cost about $100,000 with equipment.

Acoustic Products Co., 50 West Fifty-seventh Street, New York, manufacturer of radios and equipment, has purchased Federal Telephone Mfg. Corporation, 1738 Elmwood Avenue, Buffalo, and its subsidiaries, Federal Radio Corporation and Federal Orthosonic, Ltd., and will consolidate. Purchasing company will develop Buffalo plant to maximum capacity for manufacture of radio apparatus, including cases and frames, supplementing production now being carried out at Saginaw, Mich., and will also increase manufacturing facilities at last-noted works.

Walker Lee, Jr., Powers Building, Rochester, architect, will take bids at once for automobile service, repair and garage building, to cost $100,000 with equipment.

Consolidated Packaging Machinery Corporation, 1400 West Avenue, Buffalo, has been incorporated to continue manufacture of a general line of automatic packaging machinery.

Chicago

CHICAGO, July 29.—Chicago machine tool dealers have begun to quote against the International Harvester Co.'s list which, it is said, will ultimately call for about $1,500,000 worth of machine tools. Inquiries before the trade total $150,000 for tools on which satisfactory deliveries are difficult to obtain. Kearney & Trecker Corporation, Milwaukee, has recently closed for $150,000 worth of machine tools for an addition. On the whole, business in July has been in good volume, such in fact that improvement in deliveries is of small moment.

It is reported that the Nash Motors Co. is planning for extensive replacements at its Kenosha plant. Crane Co., Chicago, which has ordered a 72-in. boring mill, will buy several radial drills and is interested in milling machines and turret lathes. Both inquiries and purchases by the railroads are of small size. Chicago Board of Education will buy a two-wheel dry grinder, an 11-in. x 4-ft. engine lathe, an 18-in. band saw and three motor-in-head lathes.

Valley Forge Steel & Tool Co., has purchased property at corner of Monroe and Jefferson Streets, Chicago, improved with six-story loft structure. It will occupy about one-third of building and will carry on a general business in tool steels and metal cutting tools.

Goodman Mfg. Co., 4834 South Halsted Street, Chicago, manufacturer of mining machinery, will build a three-story brick factory, 58 x 73-ft. L. E. Ritter, Marquette Building, is architect.

Victor X-Ray Corporation, 223 South Seeley Avenue, Chicago, will build a five-story plant addition, 104 x 126-ft. to cost $150,000. S. N. Crowen, Willoughby Tower, is architect.

Standard Perforating Co., Forty-ninth Place, Chicago, will build a factory containing 13,000 sq. ft. of floor space.

Superstructure has been begun by Monarch Aircraft Co., Rockford, Ill., for one-story plant, 120 x 140 ft., for parts production and assembling, to cost more than $85,000 with equipment.

Englewood Desk Co., Inc., 5820 Lowe Avenue, Chicago, has awarded general contract to Charles Magnuson, 7431 Merrill Avenue, for rebuilding part of two-story plant recently destroyed by fire, to cost about $40,000 with equipment.

Economy Machine Products Co., 5206-14 Lawrence Avenue, Chicago, has awarded a general contract to Chicago Industrial Construction Co., 53 West Jackson Boulevard, for one-story addition, 60 x 90 ft., to cost about $30,000 with equipment. J. M. Brandstetter, 2001 West Pershing Road, is architect and engineer.

Rockford Drop Forge Co., Rockford, Ill., will soon begin work on one-story addition, 85 x 275 ft., with extension 60 x 72 ft., to cost about $150,000 with equipment. Lockwood Greene Engineers, Inc., 400 North Michigan Avenue, Chicago, is architect and engineer.

Minnesota Mining & Mfg. Co., Forest and Fauquier Streets, St. Paul, Minn., manufacturer of abrasive materials, mining specialties, etc., has awarded a general contract to William M. Murphy & Son, Pioneer Building, for two-story and basement addition, to cost about $150,000 with equipment. Toltz, King & Day, Inc., Builders' Exchange Building, is architect and engineer.

Scully Steel & Iron Co., 203 South La Salle Street, Chicago, has asked bids on general contract for one-story storage and distributing plant, to cost about $40,000 with equipment.

K-B Auto-Radio Laboratories, Inc., Chicago, has leased factory at 2925 Calumet Avenue, totaling about 15,000 sq. ft. floor space, for manufacture of radio equipment and devices.

Board of Education, Pueblo, Colo., is said to be planning installation of manual training equipment in central junior high school addition at Broadway and Orman Streets, to cost $130,000, for which superstructure will soon begin. Walter DeMordaunt, First National Bank Building, is architect.

Continental Grain Co., Chamber of Commerce, Minneapolis, Minn., has filed plans for new grain elevator on Twenty-fifth Avenue, S. E., to include elevating, conveying, screening and other equipment, to cost about $100,000. A. B. Marcy is secretary.

Pittsburgh

PITTSBURGH, July 29.—The machinery trade has not shown marked activity the past week, but July sales with most dealers in this district appear close to the June level, and unusually high for a mid-summer month. A large part of the business of local agents is for replacement parts and repairs, as equipment in plants has been taxed to the utmost in recent months, and in some cases companies have postponed placing new tools until production capacity is not being utilized so highly. For this reason many dealers expect the machine tool business to remain active for some time.

Westinghouse Electric & Mfg. Co. has not begun to place the bulk of tools on its third quarter list and no action has been taken on equipment for the new plant of the Aluminum Co. of America at New Kensington, Pa. Otherwise prospective inquiry of outstanding size is light, but requirements of the large steel mill expansion projects in this district are furnishing local dealers with plenty of figuring.

Plans are being drawn by Reliance Steel Castings Co., Twenty-eighth and Smallman Streets, Pittsburgh, for one-story foundry addition, to cost about $55,000 with equipment. Lake & Davidson, 6200 Penn Avenue, are architects.

Iron City Tool Works, Inc., Pittsburgh, has been formed with capital of $50,000, to take over and expand company of same name with plant at 3201 Smallman Street, specializing in manufacture of tools and implements, steel shapes, etc.

Penn Airplane Co., Sharon, Pa., is considering rebuilding part of assembling plant destroyed by fire June 20.

E. I. duPont deNemours & Co., Wilmington, Del., has approved plans for addition to electric generating plant at branch nitrogen works at Belle, W. Va., to cost more than $100,000 with equipment.

Hancock Mfg. Co., New Cumberland, W. Va., recently organized, has work in progress on new mill for production of steel stampings, and will increase size, as originally planned, from 30 x 208 ft. to 70 x 208 ft., to cost about $80,000 with equipment.

Pennsylvania Power Co., Sharon, Pa., has plans for two-story equipment storage and distributing plant, with repair shop, to cost $100,000 with equipment. Stevens & Wood, Inc., 20 Pine Street, New York, is engineer. Company is a subsidiary of Pennsylvania-Ohio Edison Co., Youngstown.

Indiana

INDIANAPOLIS, July 29.—Contract has been let by Edwards Iron Works, Inc., South Bend, to C. A. Jordan Co., 725 Wilbur Street, for one-story storage and distributing plant, to cost about $45,000 with equipment.

Board of School Trustees, Monroe City, has authorized installation of manual training department in new two-story and basement high and grade school, to cost about $115,000, for which bids will soon be asked on general contract by John Bayard, 231 Main Street, Vincennes, architect.

Mal-Gra Castings Co., Cambridge City, manufacturer of malleable castings, is planning to rebuild part of foundry destroyed by fire July 18.

Arthur Church, 231 East River Street, Peru, architect, has plans for a one and three-story automobile service, repair and garage building, 135 x 145 ft., to cost about $100,000 with equipment.

General Outdoor Advertising Co., 120 West Maryland Street, Indianapolis, manufacturer of displays, signs, etc., is planning erection of new plant on property recently secured under lease, to cost more than $70,000 with equipment. Present works will be removed to new location on completion of building, scheduled in October.

J. D. Adams Mfg. Co., 217 South Belmont Avenue, Indianapolis, manufacturer of road-building machinery and equipment, has plans for new factory branch and distributing plant at Dallas, Tex., to cost close to $40,000 with equipment. Erection will be in charge of H. P. Inge, Republic Bank Building, Dallas.

Cleveland

CLEVELAND, July 29.—Plans are under way by Willard Storage Battery Co., East 131st Street and St. Clair Avenue, Cleveland, for new plant at Los Angeles for initial output of 2000 electric storage battery units daily, to cost about $1,000,000 with machinery.

Spaulding Fibre Co., 124 St. Clair Avenue, Cleveland, manufacturer of sheets, rods, tubes, etc., has plans for a one-story plant unit, 100 x 100 ft., to cost over $60,000 with equipment. McGarry & McGarry, 241 Euclid Avenue, are architects. Headquarters of company are at Tonawanda, N. Y.

Plibrico Jointless Firebrick Co., 1840 Kingsbury Avenue, Chicago, has acquired plants and properties of Portsmouth Refractories Co., Portsmouth, Ohio, including refractory plant at Firebrick, Ohio, and about 1200 acres of raw material lands in Lawrence and Scioto Counties. Extensions and improvements will be made, including installation of mechanical drying and weathering system; part of works will be developed for calcining flint clay for refractory furnace linings.

Hercules Motors Corporation, Canton, Ohio, manufacturer of gasoline engines for motor buses, trucks, etc., has disposed of stock issue to total $4,500,000, part of proceeds to be used for expansion.

General Fireproofing Co., Youngstown, Ohio, has awarded general contract to Rust Engineering Co., Koppers Building, Pittsburgh, for four-story addition totaling 90,000 sq. ft. floor space, for production of aluminum chairs, to cost $250,000 with machinery.

Automobile Service Corporation of America, Inc., care of Shattuck & Layer, 134 North La Salle Street, Chicago, archi-

tects, has plans for an automobile service, repair and garage at Cleveland, consisting of three units, each one story, 30 x 256 ft., 30 x 120 ft., and 110 x 115 ft., to cost over $100,000 with equipment.

Middle States Air Service, Inc., care of C. W. Frank, Akron Savings & Loan Building, Akron, Ohio, architect, has plans for a hangar with shop and repair facilities at local airport, to cost about $150,000 with equipment. It is expected to ask bids on general contract in August.

Cleveland Chain & Mfg. Co., Cleveland, is erecting an addition to care for increased business. L. D. Round is president.

Lincoln Electric Co., Cleveland, has awarded contract to Austin Co. for an all-welded warehouse, 68 x 200 ft., to cost $65,000.

Cincinnati

CINCINNATI, July 29. — Although a slight letup in the volume of fresh booking is noticed by machine tool builders in this district, new business on the whole is good for this season of the year and better than during the same period, last year. Production is being sustained at an unusually high level for midsummer. Although there is a recession in the call for specialty tools, this is offset by the constant inquiry for one or two standard machines and a widening source of demand.

While action is being awaited on two previous inquiries from Russian commissions, which passed some time inspecting plants in this district, a third request for quotations has been received. This is for 30 lathes of all sizes and types.

Board of Education, Cincinnati, plans installation of manual training department in new school on Victory Boulevard, to cost $1,000,000, for which bids will be asked on general contract in August. Garber & Woodward, 4 West Seventh Street, are architects.

Texas Corporation, 524 Walnut Street, Cincinnati, headquarters at Houston, Tex., has plans for an oil storage and distributing plant, to cost about $50,000 with equipment.

Hobart Mfg. Co., **Troy, Ohio, manufacturer** of meat choppers and kindred products, has plans for a one-story addition, to cost about $20,000 with equipment.

E. R. McKenzie, 2432 Parkway Place, Memphis, Tenn., and associates have organized Machine Mfg. & Supply Co., with capital of $100,000, and plans early operation of local plant for production of mechanical specialities.

Hart Mfg. Co., 1600 North Western Parkway, Louisville, manufacturer of furnaces, castings, etc., plans rebuilding part plant destroyed by fire July 20.

Knoxville Iron Co., Knoxville, Tenn., has work under way on expansion program, including installation of additional machinery, to cost more than $150,000.

Commerce Garage Co., 321 Race Street, Cincinnati, will take bids in August for seven-story service, repair and garage building, 60 x 200 ft., to cost $450,000 with equipment. Hillsmith & Co., Chamber of Commerce Building, are architects and engineers.

Reynolds Metal Co., Louisville, is said to be planning call for bids on general contract about middle of August for initial unit of plant on Bell's Lane, three-stories, to cost $150,000 with equipment. Arthur G. Tafel, 142 South Third Street, is architect. Company is affiliated with United States Foil Co., Louisville.

Milwaukee

MILWAUKEE, July 26. — Practically no recession has taken place in the machine tool trade, manufacturers reporting good flow of orders and inquiries. Automobile plants have reduced production, and wood-working factories are experiencing a depression in almost all lines except that of radio cabinet manufacture. Deliveries have improved on some items, but not on special equipment or milling machines. Inquiries forecast a brisk fall season.

Preferred stock of National Gauge & Equipment Co., LaCrosse, Wis., has been acquired by Moto-Meter Gauge & Equipment Co., division of Moto-Meter Corporation, Long Island City, N. Y., following purchase last fall of all common stock by Moto-Meter interests. LaCrosse plant will be remodeled and an adjoining building will also be occupied for manufacturing. Equipment for vitreous enameling is being added.

Milwaukee Circulating Pump & Mfg. Co., 331 Ninth Street, Milwaukee, maker of forced water equipment for internal combustion engines, has changed its name to Hein-Werner Motor Parts Corporation, following a reorganization in which S. A. Perkins, secretary-treasurer of Waukesha Motor Co. acquired large holdings. Plant and offices of Hein-Werner corporation will be moved to Waukesha, where a two-story plant, 175 x 300 ft. will be erected at a cost of about $200,000. Machinery in Milwaukee plant will be moved to Waukesha.

Unit Corporation of America, 5301 Burnham Street, Milwaukee, specializing in manufacture of gears, transmissions and other automotive specialties, have started work on new building, 100 x 225 ft., for Universal Power Shovel division of company. It will cost $125,000 with equipment.

Liberty Foundry Co., 368 State Street, Wauwautosa, Milwaukee County, Wis., is about to contract for an addition, 26-ft. high with floor area of 27,350 sq. ft.

Wisconsin-Timken Axle Co., High Street, Oshkosh, Wis., is erecting two additions, 40 x 40 ft., and 24 x 30 ft.

Bell Machine Co., Oshkosh, Wis., maker of woodworking machinery, has begun construction of 2-story addition, 50 x 85 ft., to cost about $35,000 with machinery.

City of Kiel, Wis., has retained W. G. Kirchhiffer, Madison, Wis., consulting engineer, to design additions for water supply system, including one 750-gal. and one 300-gal. pumps, air lift pump, air compressor and an extra reservoir. Theodore Brill is city clerk.

St. Louis

ST. LOUIS, July 29.—Contract has been let by Beacon Airways of America, Inc., Board of Trade Building, Kansas City, Mo., to J. F. Gier, 410 East Fifty-fourth Street, for one-story plant, 60 x 155 ft., to manufacture aircraft, to cost about $100,000 with equipment. Clarence E. Shepard, Huntzinger Building, is architect.

Mallinckrodt Chemical Works, Inc., 3600 North Second Street, St. Louis, has awarded general contract to Woerman Construction Co., Syndicate Trust Building, for a power house, to cost about $80,000 with equipment.

City Council, Oklahoma City, Okla., is arranging fund of $435,000 for extensions in municipal airport, including hangars, repair and reconditioning shops, and other buildings.

Board of Education, Coffeyville, Kan., is planning installation of manual training equipment in new high school, to cost $500,000, for which bids will soon be asked on general contract. Glenn H. Thomas, W. K. H. Building, Wichita, Kan., is architect.

Johnson-Norton Buick Agency, Oklahoma City, Okla., local representative for Buick automobiles, is considering three-story and basement service, repair and sales building, 125 x 165 ft., to cost about $120,000 with equipment.

Mid-Southern Air Terminal, Inc., Little Rock, Ark., care of William J. Blythe, Boyle Building, has taken options on property near city for airport, and plans construction of hangars, repair shops, oil storage and other buildings, to cost more than $85,000 with equipment.

Inland Waterways Corporation, Helena, Ark., E. C. Horner, head, has plans for grain elevator and transfer terminal, with elevating, conveying, screening and other equipment, to cost $130,000. W. F. Schulz, Memphis, Tenn., is engineer.

New Era Motors, Inc., care of J. E. Roberts, 17 East Forty-fifth Street, New York, organized to manufacture Ruxton automobile, an eight-cylinder, front drive car, has arranged with Gardner Motor Co., Inc., Main and Rutgers Streets, St. Louis, for initial manufacture of new automobile, and will not operate temporary plant in that city as previously announced. Both parts manufacture and assembling will be handled by Gardner company. New Era company plans erection of permanent plant at Detroit later.

Board of Education, St. Joseph, Mo., is planning installation of manual training equipment in new Garfield-Jackson high school, to cost $260,000, for which plans will be drawn by Walter B. Tootle, Lacey Bank Building, architect. William B. Ittner, 911 Locust Street, St. Louis, is associate architect.

Sunnen Products Co., manufacturer of valve grinders, valve lifters and compressors, has purchased 3½-acre site at Maplewood, Mo., a suburb of St. Louis, for erection of a plant containing about 25,000 sq. ft. of floor space, to cost $25,000.

Gulf States

BIRMINGHAM, July 29.—Plans are being completed by Standard Oil Co. of Louisiana, Baton Rouge, for extensions in local refinery, including installation of equipment for gasoline production, to cost over $5,000,000 with machinery.

Ha-Boy Metal Products Co., 1443 West Forsyth Street, Jacksonville, Fla., manufacturer of metal goods for automobiles, including all-metal ventilating shades, etc., is planning an expansion to more than double present capacity, to cost over $40,000 with equipment. William E. Boyett is head.

Southern Steel Works, Inc., 908 Lucien Avenue, Birmingham, has begun an expansion program at steel fabricating plant, to include new punch shop, cutting shop and other units, with one-story extension to beam shop, to cost over $90,000 with machinery.

Model Brass Foundry Co., 2309 Hickory Street, Dallas, Tex., has plans for exten-

sions and improvements in foundry, to cost over $25,000.

Humble Oil & Refining Co., Houston, Tex., is planning extensions in refinery at Baytown, Tex., including installation of equipment for gasoline production, to cost over $2,000,000.

Airport Committee of City Council, Brady, Tex., has authorized purchase of property on Mason Highway, about four miles from city, as site for municipal airport, and plans early construction of hangar, repair shop, oil storage and other buildings, to cost more than $65,000 with equipment.

Southern Cotton Oil Co., Sheffield, Ala., will erect a one-story addition, to cost about $45,000 with equipment.

Cranfill-Reynolds Co., Dallas, Tex., has been formed with capital of 1,000,000 shares of stock, no par value, to take over a group of oil companies, including Cranfill & Reynolds, Inc., Cisco, Tex.; Moody-Seagraves Co., Fort Worth, Tex.; Petroleum Pipe Line Co. and Central Texas Refining Co., Corsicana, Tex., as well as Cody Petroleum Co., Cody, Wis. Headquarters of consolidated organization will be at Dallas. Plans are under way for expansion in different refineries and pipe line construction. O. R. Seagraves is chairman of board of new organization.

Seaman Foundry Co., 2307 Grand Avenue, Dallas, Tex., is planning an expansion program, including installation of additional equipment for production of iron and other castings, to cost about $25,000.

American Gas & Power Co., Birmingham, operating Birmingham Electric Co., Birmingham Gas Co. and other light and power utilities, has purchased Industrial Gas Corporation, Birmingham, and will consolidate. Purchased company was formerly a subsidiary of Alabama By-Products Co. Plans are under way for expansion, including pipe line construction.

Alamo Airplane Co., Milam Building, San Antonio, Tex., has plans for one-story aircraft plant, including parts and assembling departments, to cost about $30,000 with equipment. Company will manufacture three models of airplanes to retail at popular price. Boyd Hammond is company engineer, in charge.

Pacific Coast

SAN FRANCISCO, July 25.—Contract has been let by California Corrugated Culvert Co., Fifth and Parker Streets, Berkeley, Cal., to Pacific Coast Engineering Co., Oakland, for one-story addition to cost about $25,000 with equipment. F. C. Williams, 74 New Montgomery Street, San Francisco, is architect.

Standard Auto Body Co., Fifteenth Street and Central Avenue, Los Angeles, will take bids at once for one-story addition, 100 x 150 ft., to cost about $65,000 with equipment. Richard D. King, Van Nuys Building, is architect.

Board of County Supervisors, Fresno, Cal., has plans for one-story repair shop at Fresno district fair grounds for County road equipment, to cost $25,000.

Southern California Gas Co., Los Angeles, has applied for permission to build a pipe line from Huntington Beach to San Diego, Cal., about 250 miles, with daily capacity of 50,000,000 cu. ft., to cost more than $2,500,000 with booster stations, etc.

Board of School Trustees, Rivera, Cal., has rejected bids for a one-story manual arts building at local high school, and will ask new bids later, following voting of additional appropriation. Robert H. Orr, Corporation Building, Los Angeles, is architect.

Edward Hines Western Pine Co., Burns, Ore., operated by Edward Hines Lumber Co., 2431 South Lincoln Street, Chicago, has work under way on initial units of new lumber mill at Burns, to cost more than $2,000,000 with machine shops, power house and other units. Completion is scheduled in about six months.

Oregon-Washington Railroad & Navigation Co., Portland, will soon begin an addition to engine house with repair facilities at Huntington, Ore., to cost $30,000 with equipment.

M. J. Grewe, 1800 East Forty-sixth Street, Denver, and associates, are planning early erection of plant near Phoenix, Ariz., for manufacture of sand-lime brick, initial units to cost about $100,000 with power house, machine shop and other structures.

Western Oil Co., Los Angeles, has begun construction of new gasoline refinery in Wilmington district, to cost $2,500,000 with machinery.

General Water Heater Co., Front Street, Burbank, Cal., has awarded general contract to Union Engineering Co., Huntington Park, for two one-story additions, 60 x 175 ft., and 46 x 82 ft., to cost about $40,000 with equipment.

Canada

TORONTO, July 29.—While small individual orders are responsible for the greater part of current demand for machine tools, business as a whole is in satisfactory volume. Inquiries continue good and new business appearing is sufficient to indicate that the season will show a new record in sales compared with that of other years. Demand is not confined to any one district, but appears to be general throughout Canada.

H. G. Acres & Co., Ltd., consulting engineer, Niagara Falls, Ont., has been commissioned to rebuild the municipal hydroelectric plant at Edmundston, N. B., at a cost of $300,000. Bids for construction and equipment will be called soon.

Progress Spring Bed Co., Ltd., 988 Debullion Street, Montreal, will soon call for tenders for a five-story factory. M. E. Coshof, 1237 Phillips Square, is architect.

Bakelite Corporation of Canada, Ltd., 163 Dufferin Street, Toronto, has purchased site at St. Catharines, Ont., and will erect a plant.

Building Repairs & Alterations, Ltd., Royal Bank Building, Toronto, will build a two-story factory, 50 x 80 ft.

Several building contracts have been awarded for construction of a roundhouse and repair shops, for Toronto, Hamilton & Buffalo Railway Co., James and Hunter Streets, Hamilton, Ont., to cost $500,000.

Chrysler Corporation of Canada, Ltd., Walkerville, Ont., which recently completed erection of its main building and first of a series of three units of its plant at a cost of $1,750,000, will now erect an administration building and other units.

Canadian Industries, Ltd., will erect a sulphuric acid plant near International Nickel Co.'s refinery at Copper Cliff, Ont. Sulphur fumes from nickel plant will be used in manufacture of sulphuric acid, nitre cake, and other chemicals. It is proposed to start work next fall.

Western Canada

Westminster Paper Co.'s plant at New Westminster, B. C., was destroyed by fire, with a loss estimated at $1,000,000.

Canadian Brown Steel Tank Co., is contemplating erection of a plant at 20th Street and Pacific Avenue, Brandon, Man.

Carter-Halls-Aldinger, Ltd., Royal Bank Building, Winnipeg, has general contract for an addition to paper plant at LaVerandrye and St. Jeane Streets, Winnipeg.

Foreign

PLANS have been aproved by Otis Elevator Co., Eleventh Avenue and Twenty-sixth Street, New York, for branch plant at Sydney, Australia, including facilities for parts production and assembling, to cost more than $500,000 with equipment.

Intercontinents Power Co., operated under management of Gannett, Seelye & Fleming, Inc., 602 North Second Street, Harrisburg, Pa., engineer, with electric light and power utilities in Argentina, Brazil and Chile, known as S.A. Cia Sud Americana de Servicios Publicos, and S. A. Luz Electrica de Tres Arroyos, is disposing of a bond issue of $3,000,000, part of fund to be used for acquisition of additional properties, and extensions in power plants and system.

H. S. Denny, president, Mentor Exploration & Development Co., Ltd., Toronto, and other officials of that company are organizing Canadian Salvador Mines, Ltd., a subsidiary, to take over and operate gold and silver mining properties of Central American Mines, Ltd., in Republic of Salvador. New organization will carry out expansion program, including installation of mining and surface equipment.

Kolster Radio Corporation, 200 Mount Pleasant Avenue, Newark, N. J., operating Kolster-Brandes, Ltd., London, England, manufacturer of radio sets and equipment, has completed an agreement between last-noted organization and Telephon-fabrik Berliner Aktiengesellschaft, Berlin, Germany, for a consolidation of interests in that country. Latter company will manufacture Kolster-Brandes radios and equipment at Berlin and Hanover plants.

Goodyear Tire & Rubber Co., Akron, Ohio, is reported planning new plant in Argentina, for manufacture of automobile tires and tubes, to cost over $1,000,000 with machinery. Charles A. Stillman, vice-president, recently visited country noted to make survey and complete arrangements.

Royal Dutch Co., London, England, operating oil properties and refineries in different parts of world, is planning construction of new refinery near Budapest, Austria, to cost over $1,000,000 with equipment. It will be operated by Batavian Petroleum Co., a subsidiary.

It was doubtless apparent to all readers of the article entitled "Trouble Shooting With Microscopes," by Messrs. Smith and Riggan, THE IRON AGE, July 18, page 146, that Figs. 1 and 2 were transposed. The text makes it clear that the coarse grained structure shown in Fig. 2 is characteristic of steel castings as cast, while the fine grain of Fig. 1 represents the same after a proper anneal.

THE IRON AGE

New York, August 8, 1929

ESTABLISHED 1855 VOL. 124, No. 6

Apprentices Trained Four Years

Worthington Company Program Includes Both Practical Training and Class Room Work—Junior Student Engineers' Course Also Conducted

BY JOHN F. BIEHL*

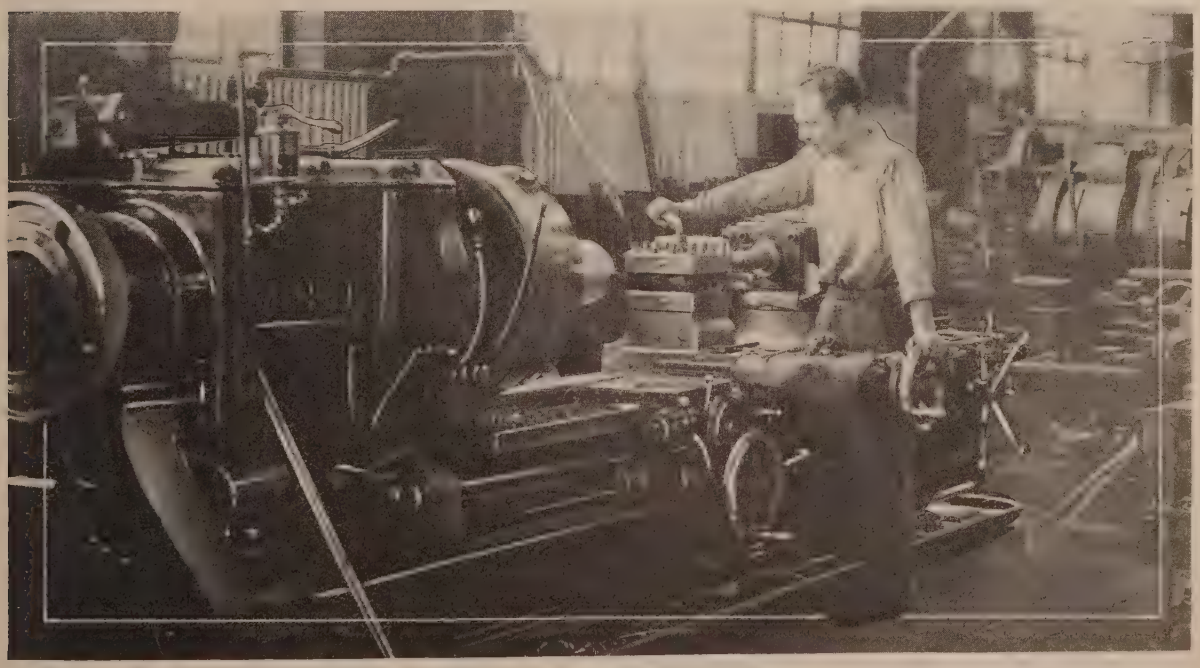
IN September, 1920, our plant put into operation a training program for pattern and machinist apprentices which had been approved by a committee consisting of the works manager, department superintendent, production superintendent and several interested foremen. Since that time the committee has held periodic meetings to revise the program to provide for expansion of training activities along lines not originally contemplated.

All machinist apprentices are under the direct supervision of an instructor whose duties are to teach them how to operate machine tools, to submit weekly apprentice reports to the educational director, and to cooperate with department foremen in obtaining the most satisfactory results. Incidentally, foremen are not expected to spend their time with beginners.

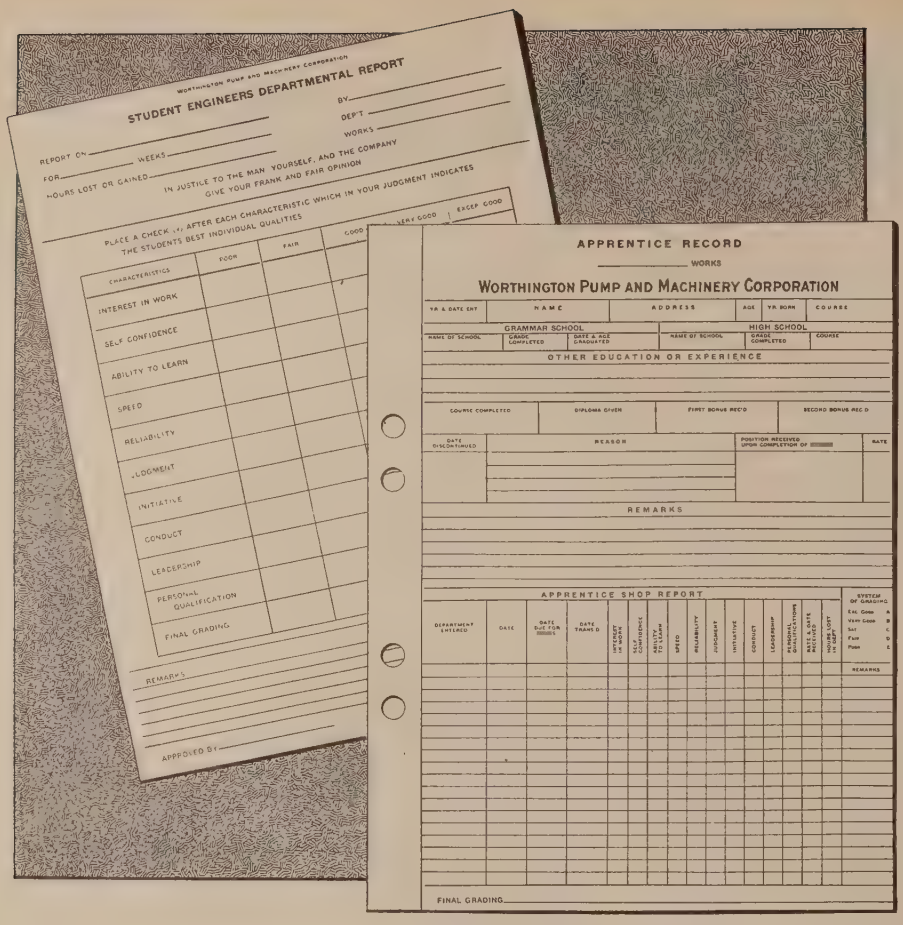
The present training program for machinist apprentices covers four years, or a total of 9984 working hours. Details of the program are given on another page and divided as shown.

Jig and tool apprentices are selected from boys who have had experience up to the tool grinding period, although occasionally one who has progressed further is chosen. Rates are the same as those for machine apprentices. Pattern shop apprentices are given foundry training during the first six months and during the next three and one-half years work in the pattern shop under the direct supervision of the department superintendent, who, from time to time, calls upon the educational director for

*Laidlaw Works, Worthington Pump & Machinery Corporation, Elmwood Place, Ohio.



Machinist Apprentices Receive Practical Training in Operating Machine Tools During Four-Year Course



Records of Apprentices and of Junior Student Engineers Are Kept on Forms Shown Above

assistance. There is only a slight difference in rates as compared with those for machinist apprentices.

In addition to the practical training already outlined, machine apprentices receive "related training," which is based on a program formulated by the Ohio State Department of Vocational Education and by the company. It consists of:

First Year.—Review of general school arithmetic presented in the form of shop mathematics, pertaining to decimal equivalents, etc.; blue print reading and study of machine tools; practical application of calipers, micrometers, etc. Classes are conducted twice each week from September to June.

Second Year.—Mechanical drawing 2 hr. a night once a week. Algebra first half of term and geometry the latter half, with practical applications; instruction 1 hr. twice a week from September to June.

Third Year.—Study of steam engines and compressors 1½ hr. once a week. Trigonometry first half of term and strength of materials latter half; 1 hr. twice a week from September to October.

Fourth Year.— Practical applications of mechanism first half of term and mechanics second half, 1 hr. twice a week; jig and tool design (drafting, etc.) 1½ hr. once a week; short course in business English and industrial economics given at most convenient time during year.

Pattern shop apprentices receive instruction in all of the above subjects except jig and tool design.

On account of the location of the plant outside the corporate limits of Cincinnati and the inability of the Elmwood Place, Ohio, public schools to pay nonresident tuition in the Cincinnati schools, the company has been compelled to operate its own related training department. The results have proved satisfactory, the outstanding advantage to the company having been the possibility of determining at close range the apprentice's ability to fill future positions, as well as judging his immediate work.

Related training is carried on after regular work hours. All instructors are employees occupying responsible positions with the company, but are certified by the State Department of Education. They receive compensation for their services as instructors, one-half of their salary being paid by the company and one-half by the State. They meet monthly with the educational director to discuss the work the apprentices are doing.

The program outlined in 1920 called for 16 machinist apprentices, four to graduate each year. However, the results have been so successful that the number has been increased from 16 to 24, or six graduates each year. The present allotment of apprentices is as follows:

Seven helpers and errand boys (beginners)
One tool counter assistant
Two tool grinders (over 18 years of age)
Two drill operators
One small lathe operator
One large lathe operator
Two vertical boring mill operators
One horizontal boring mill operator
One cylindrical grinder operator (generally not included in course)
One shaper, milling machine and planer operator (usually one on milling machine and one on planer)
One assembler
One tool apprentice
One jig apprentice
One special draftsman
One turret lathe operator

The quota of machinist apprentices was arrived at by (a) making a survey of the machines that apprentices could operate within the child labor laws; (b) by considering the number of department employees and of machine shop mechanics; (c) by studying the possibility of utilizing services of apprentices in slack periods to insure carrying out the company's policy of continuous employment throughout the four years of apprenticeship. These factors also were considered in establishing the quota of pat-

Training Program for Machinist Apprentices

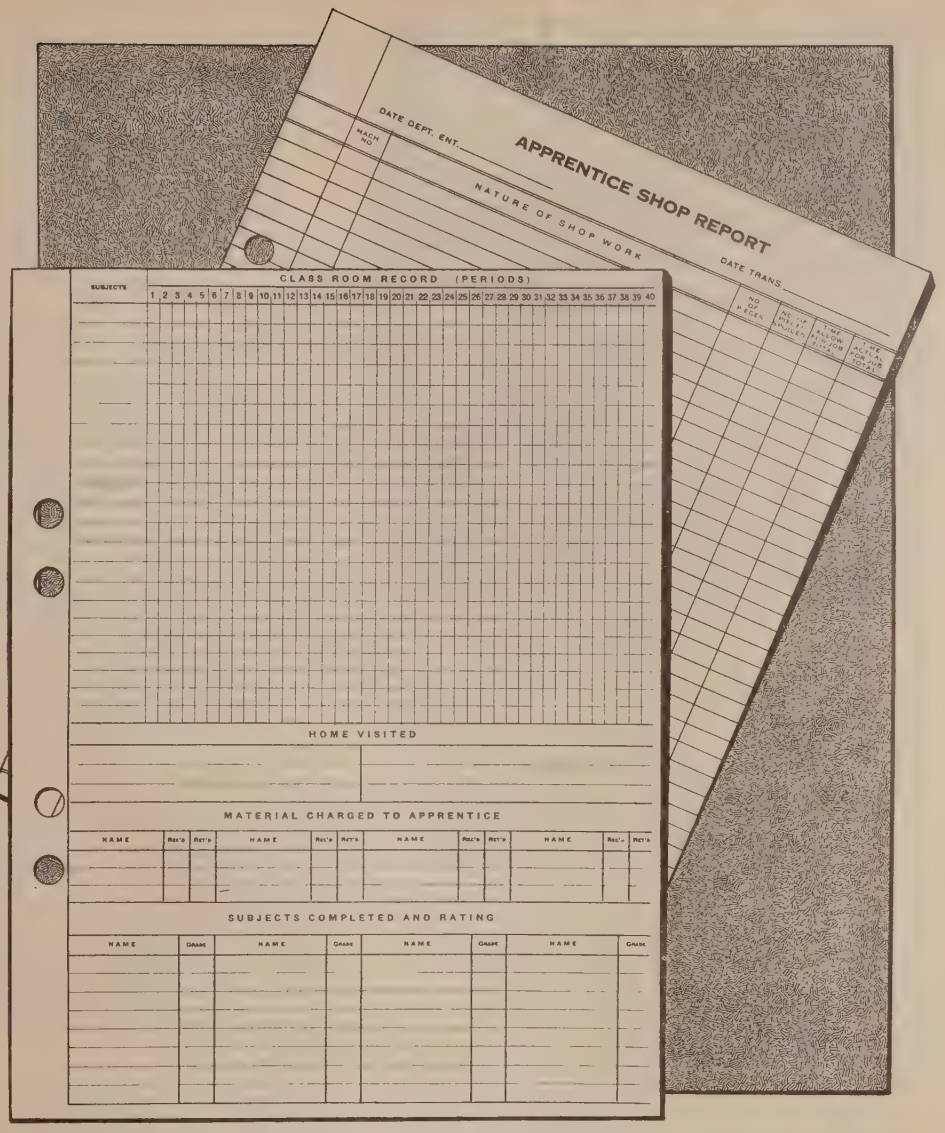
Type of Work	Length of Time	Period of Training	Rate per Hour
Errand and helper	Probationary	1	25c.
Tool or jig counter	3 months	2	27c.
Drill operation	3 months	..	...
Tool grinding	3 months	3	29c.
Shaper and miller	6 months	4	31c.
Small lathe	6 months	5	33c.
Large lathe	6 months	6	35c.
Horizontal or vertical boring mill	6 months	7	37c.
Unit assembly	3 months	..	...
Layoff work	6 months	8	39½c.
Erection	6 months	9	42c.
Total	4 years		

tern apprentices.

The present ratio of machinists to apprentices is approximately 10 to 1. In the pattern shop four apprentices constitute a full quota, one apprentice completing his training period each year. The ratio of pattern makers to apprentices is about 5 to 1.

Forms used in connection with apprenticeship training have been confined to a school and shop record, related training record, foreman's conclusion regarding the apprentice at the close of the training period and a personal weekly apprentice report. While the first three are important, the most valuable is the personal weekly apprentice report, which sets forth the work done by the apprentice during the week—amount of repetitional work, number of pieces spoiled, time allowed on job and time in which job was actually completed. For apprentices not working on machine tools, the report acts as a safeguard against incomplete training.

Inasmuch as the report is used primarily to judge the apprentice's work and ability, it also affords a check of the shop instructor's efforts. His efficiency is reflected in the data pertaining to spoiled work and in the time in which the jobs were actually completed.



The Shop and Class Room Standing of Each Apprentice Is Rated on Cards (Above), Which Are Kept on File

Each week the accounting department supplies the educational director all work tickets of machinist apprentices. These are checked and the total hours lost or gained by each apprentice are noted. A summary of the total loss or gain of all machinist apprentices is prepared, and a copy is forwarded to the instructor to inform him of apprentices in need of further instruction.

Subsequent History of Machinist Apprentices

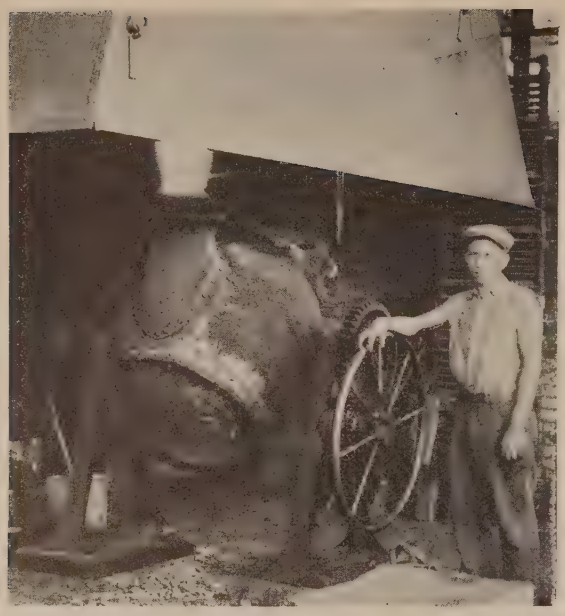
The record of machinist apprenticeship training since 1920 is shown in a table. The 18 graduates of the course still in the company's employ are as follows: one milling machine operator, one lay-off worker, one machine repairer, one vertical boring mill and general utility operator, two lathe operators, two vise hands, one lathe department inspector, one road man, one radial drill department inspector, one vertical drill department inspector, one jig and tool designer, one erector, one horizontal boring machine operator, two jig makers and one tool maker.

Expressed in percentages, graduates of the machinist apprenticeship course have filled positions as given in the following classification:

	Per Cent
Machine tool operators	27.80
Inspectors	16.66
Draftsmen	5.55
Vise hands	33.33
Jig makers	11.11
Tool makers	5.55

In 1924 the apprenticeship training program was supplemented by a junior student engineers' course, which is confined to high school graduates technically inclined and to young men who have been compelled, on account of conditions beyond their control, to discontinue their technical training at college. The object of the course is to develop men for positions beyond the ability of the apprentice, such as sales, engineering and road work.

Practical training provided in this course consists of foundry practice; operation of drill presses, lathes, boring mills and milling machines; lay off; unit assembly; hydraulic testing; erection of medium and small compressors; and experimental engineering. The period for each of these tasks ranges from two to six months. To round out his experience the student selects the type of work he desires, such as sales, erection or engineering, for an in-



Foundry Practice Is Stressed in Course for Foundry Apprentices

tensive training period of nine months. His rate of pay graduates from 32c. an hour during the first six months' period to 50c. during the eighth and final period.

Junior students are put through a related training course in the following subjects:

Analytical geometry
Strength of materials
Mechanical drawing
Use of slide rule
Calculus
Business English
Elements of steam engineering
Mechanics
Thermodynamics
Industrial economics
Advanced engineering drawing
Study of compressors
Departmental student conferences
Principles of factory management
Applied electricity (at local technical school)

Foundry apprenticeship training was put into operation in June, 1927. The practical and related training is of such nature as to attract men whose services can be utilized in other work besides molding and core making, if necessary. During the first three years of this program the apprentice is instructed in making small and large cores, core finishing, bench molding, side floor molding, main floor molding and cupola practice. The last year he is permitted to select either molding or core making. He starts his training period at 37c. an hour and at the end of the fourth year is receiving 60c. Related training embodies blue print reading and sketching, monthly meetings with department heads, algebra, geometry, physics, chemistry, strength of materials, metallography, industrial economics, foremanship and factory management. Foundry practice is emphasized throughout the entire course.

When all training programs of the company are operating according to their respective quotas in 1930, there will be 60 young men in training, divided as follows: machinist apprentices, 40 per cent; pattern apprentices, 7 per cent; junior students, 27 per cent; foundry apprentices, 26 per cent.

No Difficulty in Getting Recruits for Courses

Previous to 1923 difficulty was experienced in getting applications for apprenticeship courses, largely because both parents and boys were primarily interested in wages instead of training for future employment. However, the favorable publicity given the program by the employees and by the apprentices themselves regarding its benefits and the opportunities at the expiration of the apprenticeship period resulted in employees getting their own sons and close friends to take advantage of the training courses. While some applicants are secured through efforts of outside organizations, the greatest source of supply has been the vocational department of the Cincinnati public schools.

All changes of rates and transfers are made by the educational director and are forwarded to the department superintendent for approval. In accordance with the agreement entered into by the apprentice and the company in regard to the training program, prompt transfers and changes of rates are made, unless some unusual condition arises which makes desirable the temporary postponement of changes. There are times, for instance, when rush orders or lack of sufficient help make it advisable to retain an apprentice beyond the allotted period. This is never done without explaining to him the reasons and without setting, if possible, a definite date when he will be transferred. To avoid impairment of production, foremen are notified by the instructor at least one week in advance of changes and of the new boys they will receive.

The use of nickel as such does not eliminate internal shrinkage in castings, according to the experience of R. F. Harrington, metallurgist, Hunt-Spiller Mfg. Corporation, Boston. He was incorrectly reported in this particular in THE IRON AGE of July 4 in the report of the International Foundry Congress in London. The latter part of the report of Mr. Harrington's discussion is correct, namely, that he has a high regard for nickel in respect to its ability to permit of a more uniform structure in the various sections of castings having light and heavy sections.

Machinist Apprentices, 1920-1929

Year	Total Employed	Number Departed Before Agreement Signed	Number Departed After Agreement Signed	Total Finished or Still Training	Per Cent Completed Course or Still Training	Graduates Still in Employ	Who Left Employ

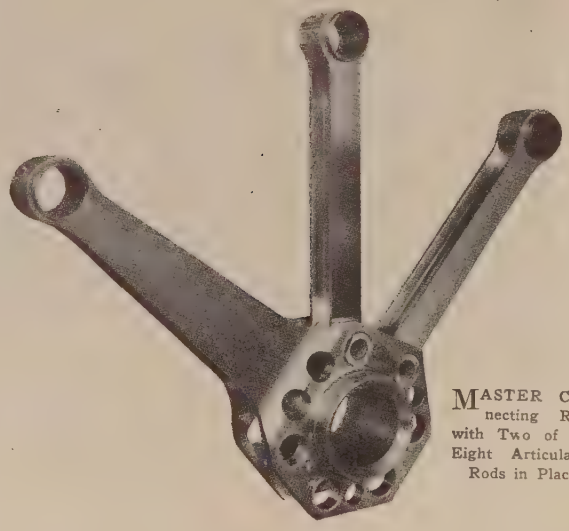
Note: Three graduates left the company's employ after graduation, but two have returned.

Machining Two Connecting Rods

Forgings for Master and Articulated Rods Pass Through Boring, Reaming, Milling, Drilling, Facing and Grinding Operations

BY FAY LEONE FAUROTE*



MASTER Connecting Rod, with Two of the Eight Articulated Rods in Place

UPON receipt of the forgings for the master connecting rod, they are inspected and corresponding numbers are stamped on the rod and test piece, which is cut off close to the hub. These test pieces are held by the inspection department until the heat-treating department notifies the inspectors that the rods are to be heat treated. The forgings are then annealed if necessary.

Next they are put in a three-jaw chuck. After facing, a 1½-in. drill is put through, followed by a 2⅜-in. drill, then a 2 15/32-in. boring bar, which is followed by a 2½-in. reamer. The flange is then rough faced to 1¼ in. from center of rod and turned to 3.156-in. diameter hub. The hub is rough faced to 3/16 in. from finished face, after which the rod is put in a 24-in. Bullard, where two operations are performed: First, the flange is rough faced to 2½ in. and turned to 3.156 ± 0.005 in. diameter. The hub is also rough faced from finished face to 19/32 in. or 3 9/32 ± 0.005 in. overall.

A 1 7/32 in. hole is then drilled through the wrist pin hub. It is then reamed to 1.250 ± 0.001 in. diameter.

For the rough milling operation the part is then put in a Cincinnati Hydromatic miller, two rods at a time clamped in a fixture. This operation rough mills the side of the channel, making 13/16 in. dimension at wrist pin boss to ⅞ in., holding 3 5/32 in. dimension at large end to 3 7/32 in. The rods are then reversed and the operation is repeated.

Then the five sides of the cheeks are rough milled on a Sundstrand Rigidmil, making 2.700 in. dimension to 2 49/64 in. The rough milling of the edges of the channel and the side of the cheek, making 2.700 in. dimension to 2 49/64 in. and allowing 1/16 in. for finish on the edges of the channel, are performed on two rods at a time on a Hydromatic miller; as is also the operation of rough milling to 1¼ in. wide, holding depth ⅛ in. from center. Parts are reversed and the operation repeated, making a web thickness of ¼ in.

A vertical miller is used to rough mill the wrist pin boss, making 0.828 in. radius to 57/64 in. radius. After the edges are smoothed with a file, the master connecting rod is heat treated so that it will register a Brinell hardness of 302 to 320, after which it is sand-blasted, pickled, neutralized in a lime solution and blown off with live steam.

After inspection for cracks, seams and other defects, it is placed in a fixture and the crankpin hole is finish-bored to 2.700 in. diameter. The side of the cheek is then finish-faced 2 7/16 in. from the other face or 1 3/16 in. from the center. It is then finish-turned to 3 1/32 in. diameter, finish-faced 3 1/32 in. diameter boss to 3/16 ± 0.005 in. from face of cheek. Finally, it is finish-turned to 2 13/16 in. diameter, starting 11/16 in. from end X and making the cut 1⅜ in. wide. The inside is finish reamed to 2.726 ± 0.002 in. diameter.

Held on an expansion arbor, the cheek is finish-faced to 2⅜ in. overall. The rod is finish-turned to 3 1/32 in. diameter and the hub finish-faced to 3.172 ± 0.002 in. overall. The rod is then put on a drill press and the wrist pin hole is rough bored to 1.366 in. diameter, after which it is finish reamed to 1.381 ± 0.001 in. diameter.

Both edges of the channel are then finish milled on a Hydromatic miller, two rods at a time, after which the channel itself is finish milled 1⅜ in. wide, depth 1/16 in. from center. The parts are then reversed and the operation repeated, making the web thickness ⅛ in. A vertical miller is employed to finish mill the wrist pin boss 1 21/32 ± 0.010 in. Two rods are loaded in a fixture on a Cincinnati Hydromatic miller and the side of the channel is finish milled to 13/16 in. from center. The rods are reversed and the operation repeated, making 1⅝ in. dimension at end of wrist-pin hub.

A Sundstrand Rigidmil finish mills the five sides of the cheeks to 2.700 ± 0.010 in. On a horizontal miller the master connecting rod is milled to 1⅝ in. radius at pin boss—depth 1/16 in. to center. The rod is then reversed and the operation repeated, holding the web at ⅛ in. thickness. A No. 3 standard Milwaukee vertical miller finish mills the center web 1⅜ in. wide to ⅝ in. dimension.

After disk grinding the five sides to remove tool marks, the corners of the cheeks are ground to a 3/16 in. radius. The part is then pickled for 5 min. in an alcohol solution containing 5 per cent nitric acid, neutralized and then inspected for cracks and flaws.

On a Bryant grinder the crankpin hole is rough ground to 2.745 ± 0.001 in. diameter, and the right face of the hub cleaned up to 0.187 ± 0.002 in. to cheek. The rod is then placed in a fixture and rough ground on an Abrasive

grinder to 1⅜ in. dimension (centerline to right face of hub). A bench operation forms a 3/32-in. radius and removes shoulder in channel on both sides. The rod is then polished all over.

A Blanchard surface grinder is used for grinding the face of the long hub to 3.147 ± 0.002 in. dimension. A four-spindle drill drills two 39/64 in. holes and reams them to ⅝ in. diameter. The jig is then turned over and the operation is repeated.

Drilling of the eight knuckle-pin holes is accomplished on a 16-spindle head Foote-Burt drill, boring 0.874 in. holes to 0.869 ± 0.001 in. diameter and 0.879 in. holes to 0.874 ± 0.001 in. diameter. A Leland-Gifford drill is used for counterboring eight 17/32-in. radius holes one side only (0.875 in. diameter holes) to 0.005 in. maximum depth (on short-hub side). The eight knuckle-pin holes are then rough reamed to 0.873 in. and 0.878 in. diameter, and finish reamed to 0.874 ± 0.0005 in. diameter and 0.879 ± 0.0005 in. diameter, being sure that the 0.879 in. diameter holes are on the counterbored side.

Using a Milwaukee No. 2 vertical miller, the flats are milled, blending out with face of cheek to 1.540 and 1.518 in. dimension. This is repeated four times by indexing. With a Leland-Gifford four-spindle drill twelve ⅜-in. holes are drilled through one side. Then the jig is turned over and four ⅜-in. holes are drilled through and eight No. 3 (0.213-in. diameter) holes are drilled through one side (¼-in. 28 P. tapped holes). Using a four-spindle Leland-Gifford drill press, eight ¼-in.—28 U. S. standard thread holes are tapped and eight ¼-in. tapped holes 1/32 in. x 45 deg. are countersunk.

Then a 1.406-in. hole 1/64 in. x 45 deg. is countersunk for the wristpin; the part is reversed and the operation repeated. With a sensitive drill eight 5/32-in. diameter holes at 18½ deg. angle are drilled into the eight 0.874-in. diameter holes. The Leland-Gifford four-spindle sensitive drill is used to drill one No. 13 (0.185-in. diameter) hole through one side of the long hub.

With an Abrasive surface grinder the master connecting rod is rough ground to 1.390 in. dimension, after which the web at bottom of rod is ground to 3/64 in. from centerline x 1⅜ in. wide, holding 1/32 in. radii in corners. The rod is reversed and the operation repeated, making web 0.093 ± 0.005 in. thick. The next operation, with a Bryant chucking grinder, is to chuck short hub out and finish grind the 2.7505 — 0.0005 in. diameter crankpin hole to size. Also with a Bryant chucking grinder the wrist-pin hole is ground to 1.406 ± 0.001 in. diameter.

The rod is finish ground 1.390 ± 0.002 in. dimension between the cheeks, with an Abrasive grinder, holding cheeks equal thickness. The rod is reversed and the operation repeated. A 5/16-in. diameter hole is then drilled with a four-spindle Leland-Gifford sensitive drill in the wrist-pin hub and a No. 19 drill (0.166 in.) in side of hub. The latter is then counterbored 0.250 ± 0.002 in. diameter to 0.046 ± 0.003 in. dimension and 5/16 in. diameter to 1/32 in. deep.

The burrs at holes are now removed and sharp edges, 1/64 in., are broken to 1/32 in. The holes are inspected, as is the alinement of crank-pin and wristpin hole. Next the wristpin bushing is pressed into place with an air arbor press (the 5/16 in. and ¼ in. holes lining up). A No. 19 (0.166 in. diameter) hole is drilled through the wall of the bronze bushing with a Leland-Gifford sensitive drill.

Then the rod is taken to the bench, where dowel is driven in place, a hardened plug is inserted in the bush and the metal at bottom of 5/16-in. counterbore is staked in to hold dowel. Next the wrist-pin hole is finish bored and reamed with a drill press to 1.250 ± 0.001 in. diamter, the sharp edges are removed at the bench, the hole is inspected and its alinement with the crankpin hole is checked.

After the master connecting rod has been given a fine polish all over on a polishing jack, the connecting rod bearing is pressed into place with an arbor press (⅛-in. holes in rod and bearing should be approximately in line). A No. 14 (0.182-in. diameter hole is drilled with a Leland-Gifford sensitive drill ⅛ in. deep to point of drill in bearing. It is drilled through with a ⅛-in. diameter drill and redrilled with a No. 14 flat-end drill to square up bottom of hole x ⅛ in. deep. Finally, a dowel is driven into place, the rod is washed thoroughly in the gasoline tank, inspected and delivered to finished stores.

How Articulated Rod Is Machined

THIRTY-FIVE operations are necessary for the machining of the articulated rod. The forgings are purchased from outside vendors and upon delivery to rough stores are inspected, heat treated if necessary, and then put through the Brinell test for hardness.

Both sides are then rough-milled and one side surface ground. The pin holes are drilled and reamed, and after the channels are rough-milled the rods are pickled, limed and washed, after which they are inspected for seams, laps, cracks and other defects.

They are then ground on both sides, the edges and radius are milled, after which the channel is finished milled. They are then given a stamp and serial numbers.

The end radii are milled, the pin holes drilled and reamed, the three small holes drilled, and after burrs are removed they are pickled, neutralized, washed and inspected. They are then rough-polished, the holes are ground, the sides disk ground, and the rods then inspected for alinement.

After taking off the rough edges, the bushings are pressed in, holes are drilled for pins, pins put in, after which the two bushings are finish-bored and inspected. If necessary the bushings are again finish-bored, after which the articulated rods are buffed and polished all over, washed in kerosene, inspected and delivered to the finished stock room.

Modern Ship is One-Tenth Copper, Says Association

A modern 30,000-ton ship is about one-tenth copper, according to the Copper and Brass Research Association, 25 Broadway, New York, which has completed a survey of shipbuilding. The bronze propellers of such a ship may contain 53,500 lb. of copper, shaft sleeves 53,000 lb., main propelling machinery 200,000 lb., electrical gear and wiring, 3,000,000 lb., and even such inconspicuous installations as voice tubes, it is stated, may require 100,000 lb. of copper.

The Copper and Brass Research Association says that prospective building programs of the world's merchant marine and navies indicate the construction of 3,000,000 gross tons of shipping a year. The yearly increase in world tonnage should amount to 1,000,000 or more tons. An average of 1,000,000 tons or more is lost or broken up each year.

"The United States now finds itself possessed of about 10,000,000 tons of shipping, nearly 500 per cent more than in 1914," the survey says. "A great deal of this is war heritage and almost 3,000,000 tons is now idle. Eventually, it is believed, this idle tonnage will be scrapped as there is little possibility that it could be operated at a profit in competition with ocean bound trade. Of the remaining 7,000,000 tons much of it is obsolete and is losing money. For this reason it may be retired from service as time and circumstances may warrant."

Byers New Process for Wrought Iron*

Inventor Describes Fundamentals of Method Whereby Pilot Plant Produces 200 Tons of Wrought Iron Daily— Puddler Eliminated by Steel Plant Equipment

BY JAMES ASTON

WROUGHT iron manufacture of today is usually associated with hand puddling. The essential steps in the process are:

1. Melting down the charge of pig iron in a cupola.
2. Refining the metal to a low content of the several metalloids.
3. Disintegration of or "graining" the mass in the slag bath resulting from refining.
4. Balling up the metallic mass and thereby incorporating with it a portion of the slag.
5. Compacting the composite mass with ejection of surplus slag.

The operation requires skill and severe manual effort, with an accompaniment of small outputs and high costs of manufacture.

It is to be expected that human ingenuity has been requisitioned to increase output and minimize manual labor. Numerous so-called "mechanical puddling" processes have been devised, with a dominance of failures, but with a few attaining a commendable degree of success. In general, the methods have employed furnaces of a rotary or oscillatory type, with the focus of attention upon obtaining agitation of the charge in simulation of the manual effort of the puddler.

Any successful method to displace hand puddling in the production of wrought iron must maintain or improve upon the characteristics of product obtained in hand puddling; it must do this with increased unit masses and aggregate output; and it must decrease manufacturing costs to an extent proportional to the expected expansion of the market for the product. Failures have been in part due to inconsistencies in quality of material produced, in part to difficulties of maintenance of equipment, and in part to manufacturing costs which, in comparison with those of hand puddling, were not attractive to capital. Metallurgically, disintegration of the refined base metal to secure minute and uniform intermingling with the slag is the crux of the problem, and was the focus of attention in the development of the Byers new process.

JAMES ASTON, inventor of the Byers new process for making wrought iron, started his researches on the subject in 1915. Eleven years later, when the principal operations had been verified on a tonnage basis, he resigned from the staff of A. M. Byers Co. to become head of the Department of Mining and Metallurgical Engineering at the Carnegie Institute of Technology

Plant and Operation at Warren

Operation at the plant of A. M. Byers Co. began at Warren, Ohio, in July, 1927. After a few months on a moderate scale, in which there was an ironing out of some of the mechanical difficulties, production was put upon a regular and steadily increasing basis. Today, with some extensions of the original equipment, output is in excess of 200 gross tons per day, with operations on two-turn, six-day week program.

The process is divisible into several steps, which correspond to the above mentioned major subdivisions of the hand puddling method. The plant consists of several units, each of which is adapted to carry out its special phase of the operation.

Bessemer grade pig iron is melted in a 12-ft. cupola, similar to those used in supplying metal to Bessemer plants when direct blast-furnace metal is not available. It has a melting capacity of about 15 tons per hour, and operates continuously for a week, after which patching of the lining in the tuyere zone is necessary. The cupola is mechanically charged. There is a pickup of 4 to 5 points of sulphur; however, it is adequately eliminated by the use of about 20 lb. per ton of soda ash, added to the ladle on tapping. The full requirement for each heat is tapped at one time, then taken in a ladle to the converter house by an overhead crane.

Refining is done in two 2-ton side-blown acid-lined converters, operating on a cycle of about 25 min. for each vessel. The metal is blown "full" with an analysis when teemed averaging C, 0.06; Mn, 0.03; P, 0.10; Si, 0.02; S, 0.05. In contrast with Bessemer steel practice, no additions are made to the ladle metal, and it is important also to bear in mind in such comparison that the ladle metal in the new process operation is merely a semi-finished material which subsequently undergoes completion of metalloid removal, and the important functions of degasification and deoxidation during the reactions involved in processing. The Bessemer converter is admirably adapted to the refining stage of the operation, producing metal in batches of moderate size on a relatively brief, steady cycle.

The slag incorporated in wrought iron is essentially a ferrous silicate, high in iron oxide. In hand puddling practice it is a combination of oxides resulting from the reactions of refining, with such additional ingredients as may result from a fluxing of materials on the furnace hearth. It will vary somewhat, for good or evil in results, with the nature of the charge material, individualism in practice, and character of furnace materials. A typical composition is FeO, 70 to 75 per cent; Fe_2O_3, 5 to

*This paper was prepared for presentation at the Cleveland meeting of the American Institute of Mining and Metallurgical Engineers to be held in September, 1929. Copyright, 1929, by the institute.

FIRST a "Thimble" Is Partly Filled with Iron Silicate Slag, Melted in a Tilting Open-Hearth Furnace, and Then a Weighed Amount of Blown Bessemer Steel Gradually Poured Into the Thimble. Rapid cooling of the steel liberates gases so rapidly that the metal disintegrates into a sponge

10; SiO_2, 10 to 12; MnO, 2; Al_2O_3, 2; P_2O_5, 2; and occasional or small amounts of CaO, MgO, or other oxides. The iron silicate is the important or dominant ingredient, with the others secondary or merely incidental.

In the new process, preparation of the slag consists of independent melting of the constituent ingredients in the proportions for the desired composition. Puddling-furnace tap cinder (where available), heating-furnace cinder, roll scale, iron ore, and sand represent available sources of supply. The composition is maintained in close conformity to the slag found in good wrought iron, with adjustments in line with experience which has shown that improved characteristics of product may be obtained.

The melting is done in a tilting regenerative open-hearth furnace, oil-fired, of 20-ton steel rating. It is of standard type, magnesite lined, but with additional water cooling to protect the hearth from the heavy scouring action of the molten slag. Make-up slag is transferred in a ladle to the processing floor as required.

Disintegration of the metallic mass is the dominant feature in the manufacture of wrought iron, in order that a sponge shall be formed to serve as a carrier of the slag. This phase of the new process probably represents the first recognition of the dominance of this feature and a consequent concentration of effort in devising effective means of comminution; it is the keystone of the new process.

The operation is carried out in a set of unlined, stationary cups or thimbles, resting upon standards along the pouring platform. The average heat of blown metal is about 5000 lb., and this formed into two balls, for which two cups are employed. The cups are rectangular, roughly 3 by 4 ft. in bottom dimensions, and 5 ft. deep; with considerable taper to the top. One of the cups carries about 2½ to 3 ft. of slag, brought on as needed from the melting furnace. Into this slag, about 2500 lb. of blown metal is poured in a steady stream over the lip, as shown in the illustration. The weight and rate of pouring are under observation on the crane scale from which the ladle is suspended. The average pouring time is about 3 min., being equivalent to a 1 to 1½-in. nozzle stream.

During pouring, there is marked churning and agitation of the slag, with a boiling action causing it to rise to the top of the cup; but there is no violence in the observable reactions. From time to time moderate amounts of cold granulated slag are shoveled into the cups during pouring, largely for the purpose of quieting a too vigorous boil, which might cause the rising slag to flow over the rim of the vessel.

Immediately upon completion of the pour, the boil subsides and the slag level goes down markedly. The cup is picked up with the crane, and the excess slag is poured into the adjoining empty cup, which is then ready to receive the remaining half of the ladle metal. The decanted cup now contains the solidified, spongy mass of metal, intermingled with liquid slag, conforming in all respects to the product of the best hand puddling practice. The ball is dumped upon a carriage, and transferred to a hydraulic press to be compacted into a bloom. Naturally, the slag take-up of the ball necessitates a make-up supply to the cups from time to time, as indicated by the level of slag in the vessels; the general requirement with present practice approximating 600 lb. per ton of wrought iron produced. It must be realized, however, that the slag incorporated in the wrought iron is very much less than the melting make-up, since the greater part is recovered after squeezing.

The ball, which is at a welding heat, is compacted to a solid, rectangular bloom about 12 by 14 in. by 5 ft., in a manipulator type hydraulic press, and is immediately sent to a 29-in. three-high blooming mill, where it is

roughed down to appropriate sizes. On the same heat, additional rolling in a 24-in. three-high mill produces the shipping product, either billets suitable for a direct rolling to skelp, or standard muck-bar sections used for piling. A steadily increasing proportion of the output is in billet form.

Fundamental Principle of New Process

The simplicity, positiveness, and smoothness of the operation is a matter of general comment. While operations are simple, they are built upon physico-chemical principles.

Refining of the base metal and the preparation and melting of the slag need no explanation. The mechanical admixture of base metal and slag is the crux of the situation. The execution is most effective if one is solid and the other liquid; preferably a solidification of the iron, because of its higher fusion point and preponderant volume in the product. The metal is poured at a temperature in excess of its fusion point of 2750 deg. Fahr., while the slag, liquid at all stages of the operation, has a general working temperature of about 2300 to 2400 deg. Fahr. Under present operating conditions, the slag volume relative to metal poured into the cup is six or eight to one. This is considerably in excess of the quantity needed to absorb the heat of solidification of the metal, without becoming superheated to a temperature above or dangerously near the fusion point of the iron. With these conditions, therefore, the slag is an active quenching medium which solidifies the metal promptly and continuously as it enters the bath.

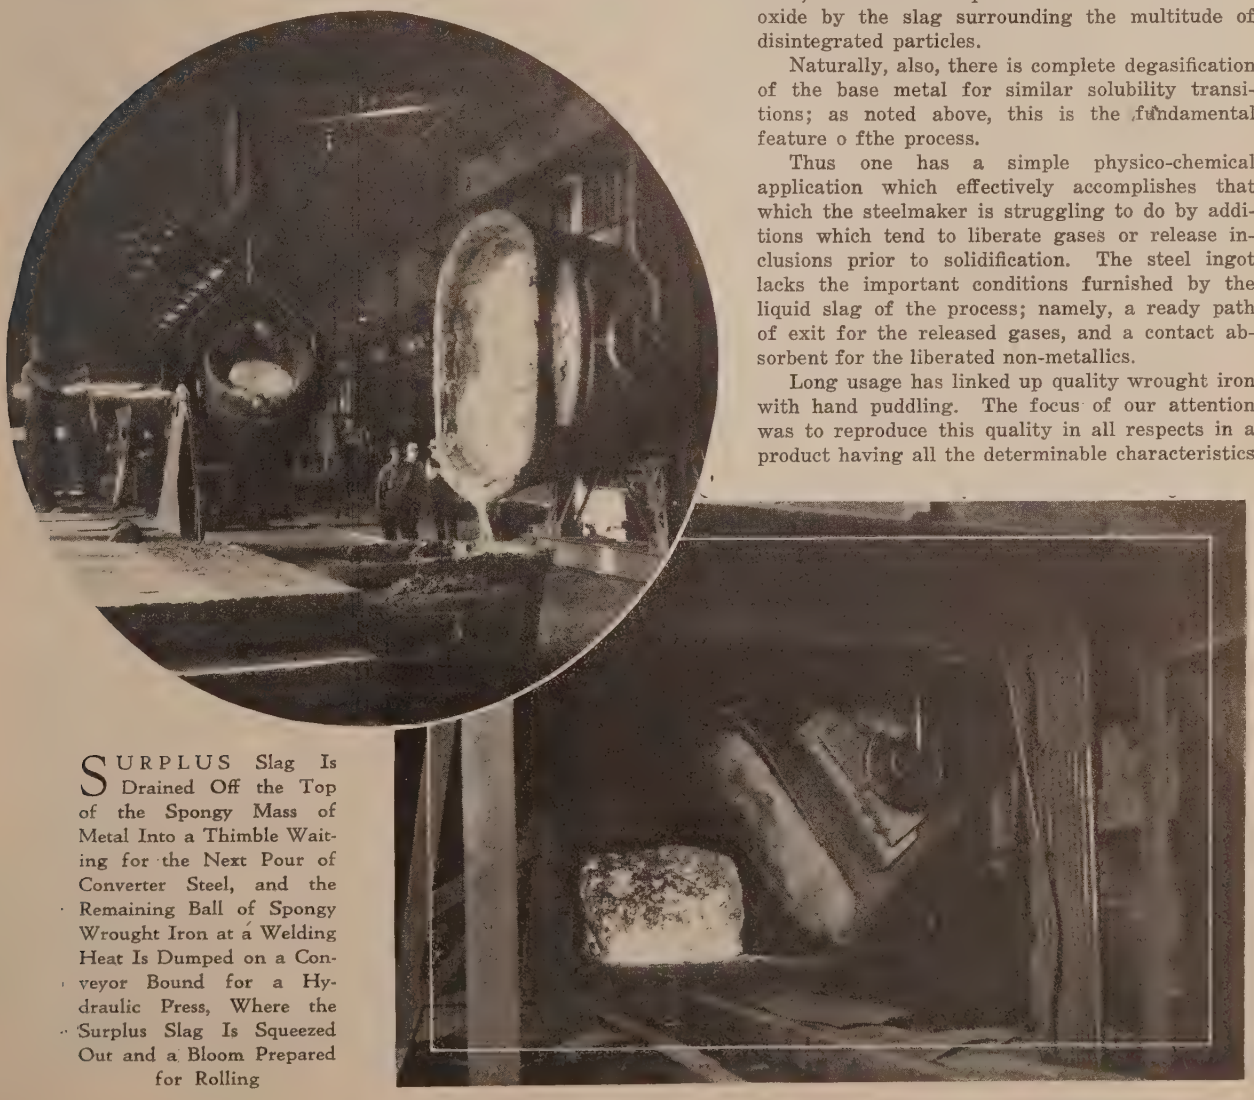
Accompanying this is the all-important principle upon which the process is founded. It is a well-established fact that molten iron or steel carries large volumes of gas in solution; and that the solubility relationship becomes nil upon change from liquid to solid. The rate of gas evolution is proportional to the speed of solidification. The operating conditions of the process as described are such that the metal is shattered by the gas evolution as it solidifies. Being heavier than the slag, it settles to the bottom of the cup as a spongy mass, which coheres as a result of a welding temperature automatically maintained in the heat exchange.

There are some interesting and important accompaniments of this operation. In view of the oxidizing and basic nature of the slag, the metalloid content of the blown metal is appreciably reduced during pouring, particularly with respect to carbon, manganese, and sulphur. In fact, with increasingly higher carbon metal, the additional gas created by reaction of carbon with the iron oxide of the slag may bring about a violent reaction resulting in a heavy boil and overflow of a slag from the cup. And yet the seemingly paradoxical result is reached of effective deoxidation of the base metal by reason of the change of solubility of iron oxide in iron from a considerable degree to nil on change of state from liquid to solid, and the absorption of the liberated iron oxide by the slag surrounding the multitude of disintegrated particles.

Naturally, also, there is complete degasification of the base metal for similar solubility transitions; as noted above, this is the fundamental feature o fthe process.

Thus one has a simple physico-chemical application which effectively accomplishes that which the steelmaker is struggling to do by additions which tend to liberate gases or release inclusions prior to solidification. The steel ingot lacks the important conditions furnished by the liquid slag of the process; namely, a ready path of exit for the released gases, and a contact absorbent for the liberated non-metallics.

Long usage has linked up quality wrought iron with hand puddling. The focus of our attention was to reproduce this quality in all respects in a product having all the determinable characteristics



SURPLUS Slag Is Drained Off the Top of the Spongy Mass of Metal Into a Thimble Waiting for the Next Pour of Converter Steel, and the Remaining Ball of Spongy Wrought Iron at a Welding Heat Is Dumped on a Conveyor Bound for a Hydraulic Press, Where the Surplus Slag Is Squeezed Out and a Bloom Prepared for Rolling

of wrought iron. The results have measured up to the objective. The material conforms to all standards set for wrought iron—chemical, metallographic, and physical; a conclusion subscribed to by many investigators, including railroad and government representatives, after careful examination and test. This is confirmatory of our own studies in laboratory, mill and field.

In many respects, the new process product has superiority of quality. Greater uniformity results from the controllability of operations and the elimination of individualism. There is benefit in the added work put upon the larger mass in squeezing and rolling. Uniformly low content of carbon in the blown metal has resulted in virtual elimination of blisters, the bane of wrought iron manufacture. Low metalloid content, and particularly the controllability and adjustability of metal and slag character independently, has benefited the welding and other physical properties of the product. In addition, this operating advantage points the way to the manufacture of wrought iron of special characteristics and adaptability, including the possibility of entry into the alloy field.

It is almost needless to point out the advantages accruing from the general parallelism to steelworks' practice in equipment, personnel, and operating procedure. Tonnages of individual blooms and in the aggregate are a matter largely of engineering expediency. The all important item of lowered costs of manufacture is an accompaniment. In comparison with steel manufacture, the new process has certain special features which add to the cost, but they may be largely offset by such items as ferro-alloys, molds, soaking pit charges, and cropping, which enter into the cost of steel production.

While the concentration of effort in the development was upon the production of quality wrought iron without thought of process involved, it is interesting to note the exact parallelism of the new process to the reactions and accomplishments of hand puddling. Melting, refining, and slag formation involve identical fundamental principles and reactions and need no elaboration. The "opening" or "graining" of the iron as it "comes to nature" has been generally conceded as the special art of the puddler and a stumbling block in the development of mechanical puddlers. It is a misconception that disintegration is the direct result of physical effort of the man or machine; disintegration is the result of degasification on solidification of the iron as its fusion point passes the operating temperature of the furnace when the metal nears the end point in carbon elimination. Effort is necessary primarily in an attempt to bring all portions of the refining mass into the favorable zones of reaction, as contrasted with the unfavorable conditions of relatively cold interiors or furnace bottoms. The physico-chemical forces of reaction are identical; except that in the new process they are more effective and more uniformly executed due to the more favorable operating condition of approaching the reaction or solidification from above with a fully and uniformly refined iron, rather than rising into the solidification range with an irregularly refined metal. The new process may be classed as puddling in the logical interpretation of reactions and accomplishments.

The Future

The Warren operation is serving a useful purpose as a proving ground. Construction is well under way on a new plant being erected by the A. M. Byers Co. at Economy, Pa., in the Pittsburgh district. The Bessemer converters, bottom blown, will be of 10 tons capacity, and the balls produced will be about 2 tons in weight. A more rapid operation will be obtained by a cup-car system of handling, with progressive movement of the cars to the several zones. Initial production will be 600 gross tons per day, with only minor extensions to double or treble this output. Immediate mill equipment will be blooming, plate, bar, and skelp mills; with projected extensions to include blast furnace and coke oven plant and finishing mills. This project should put wrought iron into its proper place in the field of ferrous products, through an expanding market made possible by lowered costs, greater tonnages, and diversification of output.

Metal and Machinery Makers Pay Highest Wages

Employment and wages in the manufacturing industries during 1928, as measured by the National Industrial Conference Board, contained remarkably few fluctuations. The periods of low output in one industry were apparently balanced in large measure by higher activities in others. The general business situation was stable, and wage rates (as expressed in average hourly earnings) are fairly well standardized. Changes affect more the number of hours worked weekly and the number of workers employed than they have the rates paid for labor.

Average hourly earnings of all wage-earners in 25 manufacturing industries reporting was 57c. per hour, with a deviation of ½c. up or down during the year. This is about 230 per cent of the average hourly rate for 1914 (24.5c.). The average weekly earnings also varied but slightly, between $27.09 and $27.76. This shows the average week to be 48 hr., three and a half hours shorter than in 1914. Thus the working week has grown shorter, and computations by means of cost-of-living indexes show that the pay will buy about 1/3 more than the somewhat longer week in July 1914.

Subdividing these average figures, it is found that earnings of skilled male workers tend toward a rate of 65c. per hour. Unskilled men earn 50c. as a maximum, and women's rates approach 40c. per hour. Whereas such women as were employed worked nearly as long as the men in 1914, last year the average week for women was 42½ hr., and for men 48½ hr. Skilled workers have a shorter week than unskilled (1 hr. difference).

Segregating the weekly earnings by industries, it is found that the metal working and producing industries are near the top, having four out of the top six, the other two being in the printing trades.

Industry	Average for All Wage-earners — Hours per Week	Hourly Rate	Weekly Earnings
Iron and steel	54.3	$0.646	$35.13
Automobiles	47.9	0.683	32.67
Heavy machinery	47.7	0.657	31.34
Agricultural implements	49.9	0.625	31.16
Machines and machine tools	49.3	0.608	29.99
Electrical manufacturing	45.9	0.615	28.25
Hardware and small parts	47.5	0.542	25.72

British Develop an Improved Electric Resistor Furnace

An electric resistance furnace developed in England is claimed to have certain marked improvements. It was described by Dr. W. Rosenhain and W. E. Prytherch in a paper before the last meeting of the British Institute of Metals. Higher available working temperatures are claimed for the furnace, up to 1400 deg. C., also durability and freedom from oxidation of the carbon resistor. The heating element of this type of furnace consists of carbon, or graphite, pellets, or short rods placed end to end in a refractory sheathing tube which fits easily over them. Heating occurs by contact resistance. The sheathing tube prevents the access of air sufficiently to avoid any appreciable burning of the carbon.

Leaching Manganese Ore With Ammonia

Bradley Process, Successful in 4-Ton Pilot Plant, Produces High Grade Oxide from Silicious Cuyuna Ore

IN view of the oft-repeated statements that American manganese producers are about to market a concentrated ore, suitable for the production of ferromanganese, the description of the so-called Bradley process appearing in *Engineering and Mining Journal*, June 29 and July 6 is interesting. According to the author, Carl Zapffe, manager of iron ore properties, Northern Pacific Railway Co., the process is the result of more than five years' intensive research by Wilson Bradley, an engineer of Deerwood, Minn., assisted by such well-known men and firms as Dr. Charles A. Doremus, E. P. Mathewson, and H. A. Brassert & Co. Much of the preliminary work was done in the laboratories of John C. Wiarda & Co., Brooklyn, N. Y., and the Dorr Co., Westport, Conn., although the whole process has been verified in a pilot plant with 4 tons daily capacity.

The work was done primarily to find a way to treat the low-grade silicious ores of the Cuyuna district, occurring in great tonnages at the surface. A typical analysis (natural) is

Manganese	13.5 per cent	as MnO_2
Iron	24.8 per cent	as Fe_2O_3
Silica (SiO_2)	22.1 per cent	
Alumina (Al_2O_3)	2.2 per cent	
Lime (CaO)	0.9 per cent	
Combined water	8.0 per cent	
Moisture	10.0 per cent	

Going on the assumption that some chemical method would be necessary to separate the metallic oxides, a number of solvents were tried. It was finally found that ammonium sulphate would take MnO and FeO into solution rapidly. It was also found that roasting the ore in a reducing atmosphere at low temperature will reduce 90 per cent of the MnO_2 to MnO, and very little of the Fe_2O_3 to FeO. The manganese sulphate in the filtered solution is then precipitated by ammonia gas, which action simultaneously regenerates the solvent, ammonium sulphate. The precipitated manganese oxide is dried and sintered, ready for smelting.

Mr. Zapffe estimates the operating figures for a plant (already designed) to produce 50 tons of manganese sinter per day. Ore would be crushed wet in ball mills to 65 mesh, the pulp thickened and filtered, and the filter cake dried. This fine ore would then be roasted in a rotary furnace at 750 deg. Fahr. The furnace atmosphere would contain CO_2 and CO in the relationship of 16 and 20 per cent. Extra time or higher temperature increases the proportion of iron oxide reduced to FeO; most of the iron after roasting is in the form of the magnetic oxide Fe_3O_4, insoluble in this process.

The roasted ore is then leached in counterflow digestors containing 16 times its weight of 10 per cent ammonium sulphate solution (temperature is not stated). Free ammonia is produced here, according to the following equation:

$$MnO + (NH_4)_2SO_4 = MnSO_4 + 2NH_3 + H_2O$$

A correct amount of the pulp is withdrawn continuously, filtered and the liquor sent to a precipitating tower, where it meets the ammonia gas piped over from the digestor. This gas precipitates the manganese and regenerates the ammonium sulphate solution, thus:

$$Mn\ SO_4 + 2NH_3 + 2H_2O = (NH_4)_2\ SO_4 + Mn\ (OH)_2$$

The manganese hydrate is deflocculated by an air jet, settled, washed free of sulphur, and filtered. After drying the granular product is mixed with a little fine coke and sintered.

It is possible that the tailings, which contain magnetic iron oxide, can be passed through a magnetic concentrator, and the concentrate sintered into a useful iron ore.

Mr. Zapffe says that 5.2 tons of Cuyuna ore will be required to make one ton of manganese sinter of the following composition:

Manganese	67.3 per cent
Iron	4.8 per cent
SiO_2	2.7 per cent
Phosphorus	0.01 per cent
Alumina	0.35 per cent
Magnesia	0.16 per cent
Carbon	0.25 per cent
Sulphur	0.01 per cent

1.5 tons of iron ore sinter and 1.3 tons of waste will also be produced. About 150,000 cu. ft. of blast furnace gas (or its equivalent) will be required to reduce 5 tons of ore, and 80,000 cu. ft. more for drying, evaporation, and miscellaneous purposes. For each ton of sinter, 20 lb. of fresh ammonium sulphate and 7000 gal. of water will be needed to replace losses; also 20 kw-hr. of electric current for grinding, pumping and lights. A plant making 50 tons of sinter daily can be operated by 10 men per shift, plus a foreman and a chemist. Estimated cost per ton of the product is not published.

A letter from A. J. Boynton, vice-president, H. A. Brassert & Co., states "Our study of the technology involved has extended over a period of a year or more. We believe the process to be technically correct and practically controllable. The apparatus required is standard in the metallurgy of the higher metals, and is obtainable from firms of high commercial and engineering standing. We regard the process as experimental only with respect to adjustment of detail of construction and operation."

High-Elastic Steel Popular with British Shipbuilders

Experience with high-strength structural steel for ships' hulls has been so gratifying, according to F. G. Martin, metallurgist for the Liverpool shipping concern, Alfred Holt & Co., that it is now wholly a matter of balancing initial cost of the vessel with its increased earning capacity. A reduction of 10 per cent of the dead weight has been effected in more than one instance, said Mr. Martin, speaking before the West of Scotland Iron and Steel Institute. Several vessels are under order in which about half of the total weight of the steel will be a high-elastic limit mild steel. Another steel, known as the "33-38-ton material," had been used in small amount, but experience with it has necessarily been short and limited.

Using Ram-Up-Cores for Castings

Method of Making Automotive Pistons and Large Bracketed Pieces—Ram-Up Chaplet Cores

BY PAUL R. RAMP*

MOLDING automotive pistons is often done in the same manner as for pulleys. In such cases the pattern consists of a plain ring or pot, the proper diameter inside and outside. Before the core is rammed up the ram-up-core is dropped into the ring in the same manner as the core was dropped into the pattern in Fig. 6. [First section of article.] This ram-up-core forms the connecting rod bosses, brackets and ribs that are part of a piston.

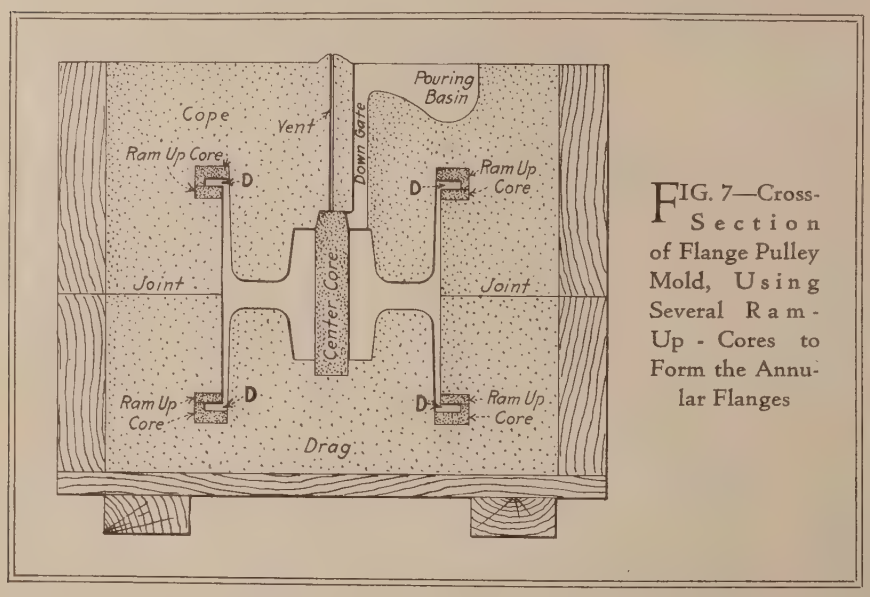


FIG. 7—Cross-Section of Flange Pulley Mold, Using Several Ram-Up-Cores to Form the Annular Flanges

Another illustration of the use of ram-up-cores in the molding of a flange pulley is in Fig. 7, a cross-section of a flange pulley mold. To make a casting of this kind without ram-up-cores, it would be necessary to make the mold in a three-part flask. Or the part of the mold between the flanges might be formed with two ring cores; one to be hung in the cope part of the mold and the other to be placed in the drag part. Another method would be to have the flange section of the pattern loose, and to draw the loose section out and cover the flange part of the mold with a covering core.

An objection to the three-part flask for making this mold is the additional labor required to ram up one more section of flask. The objection to using ring cores between the two flanges is the danger there is of misplaced cores. There is additional cost in making these cores, as they must be large enough to have sufficient bearing on a print that is wide enough to support them and hold them in their proper place. In addition to this, there is always danger of these ring cores being misplaced, and reducing the thickness of metal on the face of the pulley or similar casting.

The use of loose-flange patterns and covering cores to form these flanges is an unsatisfactory plan, as there is always danger of the covering core getting broken while the sand is being rammed over it. Although this may not occur, it is decidedly hard to be sure there is no loose sand in the flanges. Considerable trouble is experienced also in ramming the loose-flange patterns out of line with the main pattern.

Fig. 7 is a plan of using ram-up-cores to form the flanges, which are indicated by *DDDD*. These ram-up-cores consist of two light ring cores, which usually are pasted together before they are used. One part of these two cores fits snugly around the outside diameter of the pulley rim pattern, and the upper section of the ring core rests on the upper edge of the pulley rim pattern. This plan holds the core in its proper place, and also prevents loose sand from working into the part of the ram-up-core that forms the flanges, while the mold is being rammed.

In making molds of this kind, often the part of the mold which forms the highest point in the cope side is rammed too hard or is not properly vented. As a result a blowhole occurs on the edge of the rim pulley wheel. When ram-up-cores are used they form the outer edge of the rim as well as the flange, and there is no danger of hard ramming causing a blowhole at this point. So the ram-up-cores in this case not only simplify the molding method but protect the high points against hard ramming.

In Fig. 8 is a cross-section of a loam mold for a 10-ft. generator support casting, in which are several brackets. Instead of using brick and loam to form these brackets, ram-up-cores were placed in their proper position and the wall was built around them. There is nothing unusual about this, but it is another illustration of the varied use to which ram-up-cores may be put. If these brackets had been formed of brick and loam, it would have required more labor to make the mold and greater care to finish it, and would have increased the danger of the casting cracking when cooling.

Ram-up-cores are used extensively in loam molding in places where nozzles and projection flanges and other

*Superintendent of foundry and pattern shop, Newport News Shipbuilding & Dry Dock Co., Newport News, Va. The first section on this article appeared in our issue of June 6, page 1549.

irregularities occur which are difficult to make with loam and brick. These ram-up-cores are generally underdried, as they receive a second drying when the mold is placed in the oven.

In many cases the arms and hub of large pulleys are formed by the use of ram-up-cores and the arms and hubs of large flywheels are made in this manner. Brackets, bearings and bosses on automobile crankcases are generally formed with ram-up-cores. They have a prominent place in all production work. The advantage of a ram-up-core over a core placed in a core print is the space is necessary also on account of the button which is to be formed around the stem of the chaplet. The operation is to place the stem chaplet in the core box, place the loose blocks in their place so that they hold the stem chaplet in position, ram the core box full of sand, rap and draw the core box off the core, draw out the loose blocks *BB* and the core is made.

At upper right of Fig. 9 is a cross-section of such a small ram-up chaplet core. The chaplet is shown in position extending through the center of the button. The large view in Fig. 9 is a cross-section of a pipe pattern

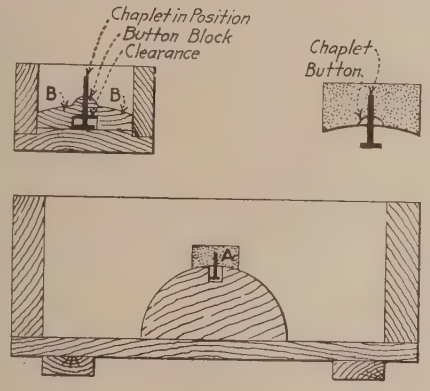

FIG. 9 — Drag Flask (Above) Ready to Ram, with Ram-Up Chaplet Core in Position on Pattern. Detail at left is cross-section of ram-up chaplet core box; at right, cross section of ram-up chaplet core

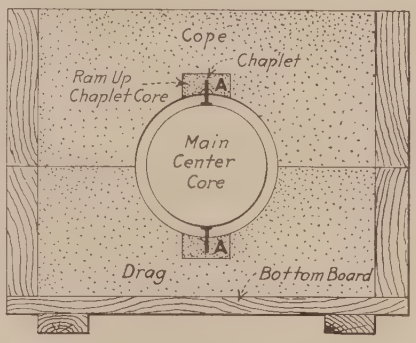
FIG. 10—Cross-Section of Pipe Mold in Which Ram-Up Chaplet Cores Are Used (at Right)



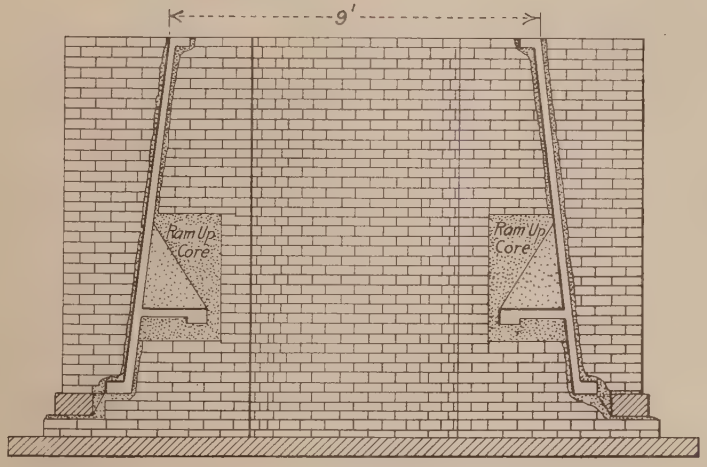


FIG. 8—Cross-Section of Mold Made in Loam to Produce a Generator Support Casting 10 Ft. in Diameter at Bottom and 9 Ft. at Top (at Left)

absence of fins, of variation of metal, and of misplaced cores. They also avoid deformed cores, because seldom can a deformed core be used if it is a ram-up-core, as it will not fit properly into or against the pattern, whereas a core that is placed in a print can be used and the deformity is not discovered until after the casting is cleaned.

Ram-up Chaplet Cores

Another type of ram-up-core is the ram-up chaplet core, which has considerable use. In Fig. 9 (upper left) is a cross-section of a core box used to make a ram-up chaplet core for a small pipe. The small stem chaplet, which in many cases can be an ordinary wire nail with a large head, is shown in position. This chaplet is held in place by the loose blocks in the bottom of the core box, indicated by *BB*.

The clearance space in these two blocks is necessary, to make it possible to draw the loose pieces out of the core without disturbing the stem chaplet. This clearance lying on the molding board, with the drag in place and the ram-up chaplet core *A* in proper position.

It will be noted that a slot is provided in the pipe pattern to allow the stem chaplet to extend into the pattern to the proper depth. This depth represents the thickness of metal we will have between the core and the outside of the mold. The molding operation is to place the pipe pattern in the flask, ram-up chaplet core on the pattern with the chaplet extending into the slot cut out for it, then fill the flask with sand and ram it.

Fig. 10 is a cross-section of a pipe mold complete ready for pouring, with the main core being held in position by the use of ram-up chaplet cores. This is a case where the chaplets are placed in the mold before it is rammed up. This is an effective method in cases where it is too expensive to place the chaplets after the mold is made, or it is not desirable to use double-headed chaplets. Of course, such cases exist only where the work is very small and light.

Steels at Elevated Temperatures

Their Response to Stress—Development of the "Time-Yield" Factor as Aid to Engineer in Designing Structures

BY DR. W. H. HATFIELD*

IT is proved that steels may be plastically deformed by stresses, imposed over long periods, which would be without measurable effect when imposed over short periods. Clearly, if the designer is to devise plant and machinery which can be safely operated at higher temperatures under diverse influences, the first problem is to determine the value of stress which can be borne indefinitely without plastic deformation.

Steels must have an elastic range, i.e., a range of stress within which they behave as practically elastic bodies. This follows from the fact that they are crystalline aggregates, and it holds good for the crystalline phase irrespective of temperature, or, how would the atoms orientate themselves to the space lattice? It is clear that a stress of a certain magnitude must be applied to destroy the lattice, otherwise it will persist. At low temperatures the order of stress required is relatively high; at high temperatures it is only nominal. When cohesion is overcome plastic deformation results.

Limited by Need for Minute Measurement

Our difficulty today lies in the severe limitation as regards sensitivity of measurement. In our own researches we work to a direct observation of 1/40,000 in. Others claim to be working to a direct observation of 1/1,000,000 in. But it will be quite clear that deformation may, under certain conditions, be proceeding at a rate which is so slow as not to be observed, even with the most delicate measurement, except over the longest periods of time.

This fact gives an opening for the expression of the abstract idea that any metal will be deformed under any stress, given a long enough period of time. It is one of those propositions difficult to establish, and equally difficult to disprove. Nevertheless, on general grounds, the author holds the contrary view, that steels have elastic ranges over the range of temperature in which the engineering world is interested, and, further, that it is our business to know what those ranges are. The point at issue is whether we can, or cannot, give the engineer a factor of safety as regards the time effect in the expectation of life of the part concerned. The answer is in the affirmative.

Helping the Engineer to Design

I have heard the view expressed by turbine engineers that they would be in position to design adequately, with resultant suitable factors of safety, if they had data concerning the stresses below which the rate of creep would not exceed 0.000001 in. per in. per hr.

An extremely valuable summing up of the present position as regards the properties of steels for use in connection with superheated steam has been given by R. G. C. Batson, typical data concerning the limiting creep stress being disclosed in the tables.

These data relate to mild-carbon steels, and Mr. Batson states that, even by increasing the strength of the

*Brown-Firth Research Laboratories, Sheffield, England. This is abstract of a paper read before the West of Scotland Iron and Steel Institute.

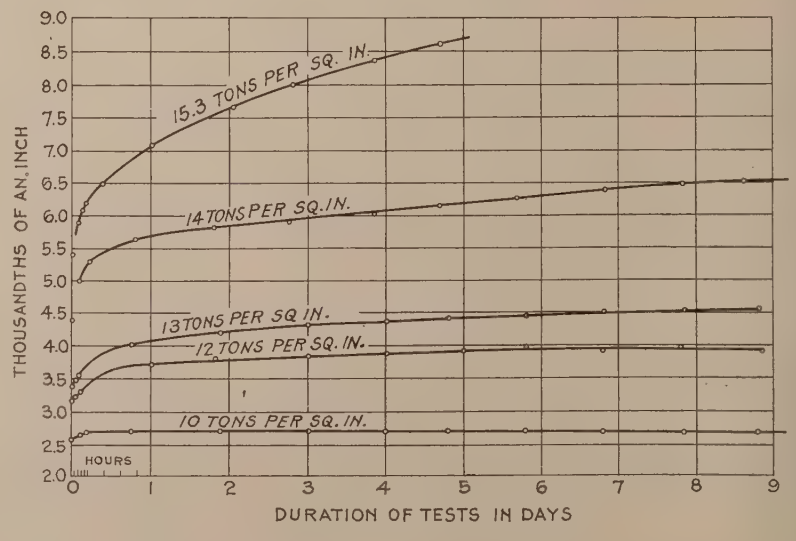

FIG. 1—Tests of 0.42 per cent Carbon Steel at 400 Deg. C. (752 Deg. Fahr.). This steel, of which the limit of proportionality was 7.8 tons per sq. in., had been normalized at 860 deg. C. (1580 deg. Fahr.)

steel by increasing the carbon content, a limiting creep stress exceeding 5 tons per sq. in. cannot be obtained, even with a carbon content of 0.51 per cent, at 500 deg C. The limiting creep stresses stated are the result of work at the National Physical Laboratory.

Limiting creep stress as determined at that laboratory is the stress above which there is a steady, continuous creep of a measurable rate within the accuracy of their measurements. Testpieces are loaded for several months at different values of stress, and the rate of creep to which the pieces settle down is determined. From these rates of creep a curve is drawn from which a close estimate is made of the limiting creep stresses.

Accumulation of Data Is Disappointingly Slow

Four to five months are required to obtain a satisfactory value of limiting creep stress at one temperature. Clearly, therefore, researches having as their object the improvement of steel as regards an increase in the limiting creep stress are severely handicapped, owing to the great time required for discriminating examination of steels of varying composition and diverse heat treatments.

This unsatisfactory position has been dealt with in the Brown-Firth laboratories by arbitrarily deciding the conditions of the standarized test likely to be helpful in this direction. The method adopted consists in discovering, by static loading, the stress within which, at the temperature, stability of dimensions is attained within a period of 24 hr. for a further period of 48 hr., with an extension not exceeding the elastic deformation of 0.5 per cent on the gage length, with limitation as regards measurement for permanence of dimensions of 0.000001 in. per in. per hr.

What the Time-Yield Is

This value I have named the Time-Yield. A single test for a given temperature in search of this value is obtained by this method in three days, and the matter is therefore brought, in point of time, within limits which permit a large number of tests being made in a reasonable period.

Fig. 1 indicates the effect of various loads on the manner of deformation at a given temperature. It gives the resultant curves due to loading 0.42 per cent carbon steel at 400 deg. C. (752 deg. Fahr.) under 15.3, 14, 13, 12 and 10 tons per sq. in. respectively. This graph clearly and definitely demonstrates that the Time-Yield, as herein suggested and determined, is a value which can undoubtedly form a safe basis for design; particularly having in mind that the period over which observation is made, taken in conjunction with the degree of accuracy of measurement, discloses movements of a less order than 0.000001 in. per in. per hr.

Steel for Boiler and Superheater Tubes

Temp., Deg. C.	Temp., Deg. Fahr.	0.10 Per Cent Carbon Steel: Limit of Proportionality (Tons per Sq. In.)	0.10 Per Cent Carbon Steel: Ultimate Tensile Stress (Tons per Sq. In.)	0.10 Per Cent Carbon Steel: Limiting Creep Stress (Tons per Sq. In.)	0.17 Per Cent Carbon Steel: Limit of Proportionality (Tons per Sq. In.)	0.17 Per Cent Carbon Steel: Ultimate Tensile Stress (Tons per Sq. In.)	0.17 Per Cent Carbon Steel: Limiting Creep Stress (Tons per Sq. In.)
400	752	...	...	...	6.5	29.0	13.4
450	842	...	...	...	5.5	24.5	8.5
480	896	4.0	17.0	5.5	5.0	21.5	6.0
500	932	3.3	14.9	3.5	4.8	19.4	4.8
525	977	2.9	13.7	2.0	4.4	17.0	3.5
550	1022	2.5	12.1	1.3	4.0	15.0	2.4
570	1058	2.2	10.5	1.0	3.5	13.0	2.0
600	1112	1.9	8.4	0.6	2.8	11.0	1.2

0.23 Per Cent Carbon Steel for Superheater and Steam Drums

Temp., Deg. C.	Temp., Deg. Fahr.	Limit of Proportionality (Tons per Sq. In.)	Ultimate Tensile Stress (Tons per Sq. In.)	Limiting Creep Stress (Tons per Sq. In.)
400	752	6.3	26.0	13.5
470	878	5.3	18.5	7.0
530	986	4.0 (approx.)	16.4	4.0

It will be seen that, as the stress falls, the speed of deformation lessens, and that of 10 tons per sq. in., after a very small initial deformation, there is no further extension of the testpiece over a period of 9 days. This statement is, of course, governed by the sensitivity of measurement mentioned. But it will be clear to anyone accustomed to such experimental work that, if the stress is dropped to two-thirds of that required to fulfill the definition of the Time-Yield, i.e., no movement exceeding say, 0.000001 in. per in. per hr., we have indeed reached a stress which obviously will not produce measurable deformation within the reasonable life of machines or parts in which we are interested.

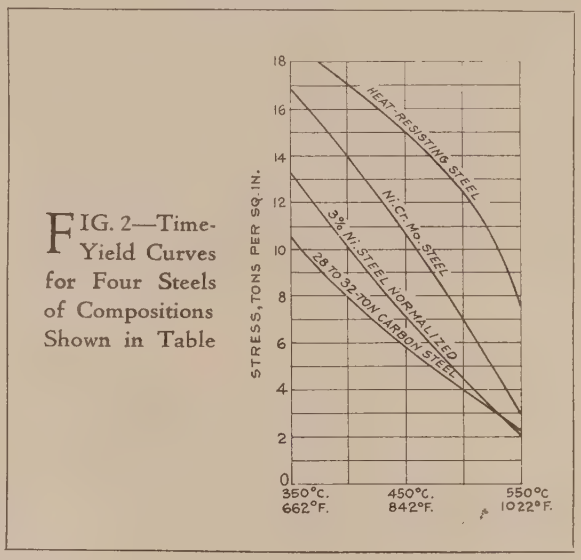

FIG. 2—Time-Yield Curves for Four Steels of Compositions Shown in Table

Data Applying to Specific Cases Vary

It will, of course, be appreciated that figures given apply to a specific analysis of material in a particular condition, and that the values will vary with modifications in analysis and condition. Also it is obvious that stability of dimensions will not be obtained until stability of structure for a given temperature is attained, since modifications in structure may lead to small volume changes which may be confused with changes in dimensions such as we are considering. Again, although it may be held to be a fundamental condition, yet the temperature stated should be attained and maintained; an experimental condition difficult to achieve except when the utmost precautions are taken.

In Fig. 2 will be found the Time-Yield curves for mild steel, nickel steel, nickel-chromium-molybdenum steel, and for a special heat-resisting nickel-chromium-tungsten steel. The details for these steels are given in the table on page 350.

Information at Hand for the Engineer

Fig. 2 contains information of immediate service to the designing engineer. The first curve to note is that of the mild steel, the material at present in use for the production of high-pressure boiler drums. With the increase in temperatures and pressures it has become of the utmost importance to know with certainty the maximum stress which can be imposed *without change of dimensions.*

So important are these drums that welded construction has rightly been displaced in the best practice by single hollow forgings. In spite of protestations to the contrary, welded joints are always more or less unreliable, since the least lapse in technique will result in oxide of iron being

left in the weld and unsoundness not infrequently results from unskillful filling in. Given, however, a single-forging drum and given a knowledge of the Time-Yield of the material for a given temperature, the engineer has his feet on solid ground.

May Stress to Two-Thirds the Limits Shown

As regards this mild steel the Time-Yield value is 7.7 tons per sq. in. at 400 deg. C., 5.7 tons at 450 deg. C., and about 4 tons at 500 deg. C. The deduction is that this steel may be stressed in service with safety to two-thirds the value of the loads stated. It has been the practice of the speaker to apply this over a long period of time as regards the products of the companies with which he is associated, and the whole thing pans out satisfactorily.

Over the range of temperature under discussion the 3 per cent nickel steel gives definitely superior results to the mild steel. Much more improved values are, however, obtained from the nickel-chromium-molybdenum steel, and this material is proving of great utility in several applications at such temperatures. The upper curve is typical of the values to be obtained from the nickel-chromium-tungsten heat-resisting steels.

Composition of Steels in Fig. 2

	C.	Mn.	Si.	Ni.	Cr.	Mo.	W.	Treatment
Mild steel	0.25	0.58	0.11	0.13	....	....	....	Normalized at 900 deg. C.
Nickel steel	0.24	0.55	0.20	3.3	....	....	....	Normalized at 850 deg. C.
Ni. Cr. Mo. steel	0.30	0.57	0.24	2.38	0.61	0.59	....	Oil hardened at 850 deg.; tempered at 620 to 630 deg. C.
Heat-resisting steel	0.50	0.60	0.50	9.4	12.68	....	3.75	Air cooled from 1000 deg. C.

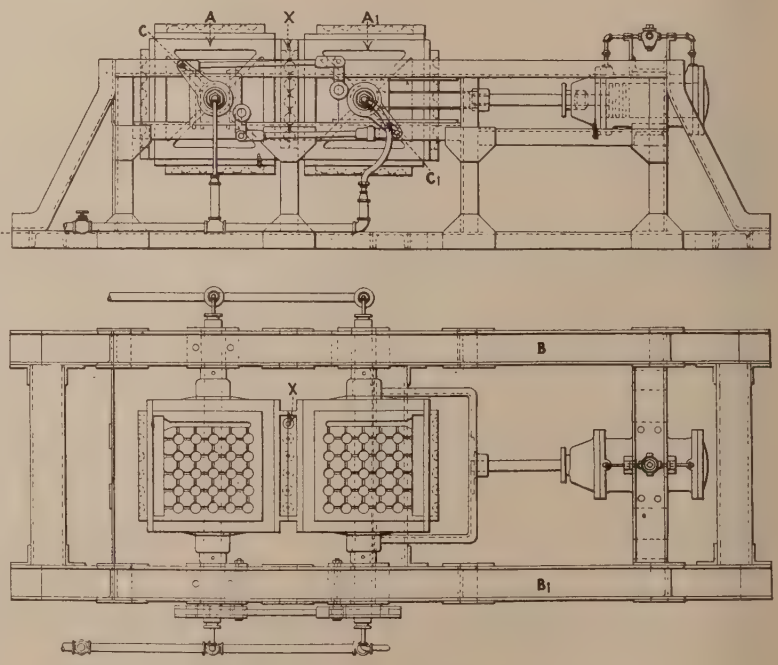
Creep tests and time-yield determinations can be made only over considerable periods and, therefore, the results of ordinary tensile tests at gradually ascending temperatures will be of interest. It must, however, be borne in mind that such figures have a relation, as yet, only incompletely determined as regards the response of the steel to stresses imposed over long periods of time.

Chill Mold for Making Steel Balls

A CASTING machine for chilled steel balls, to be used at mines or fine-grinding plants in isolated places where freight on a manufactured article is excessive, is described in detail by John B. Huttl of Honduras, Central America, in the *Engineering and Mining Journal* for May 18.

As shown by the drawing, it comprises two water-cooled cubical boxes, to four faces of which are bolted square die plates. When a pair of these dies are forced together by the air piston, 25 balls can be cast at one pouring through X. After the metal is chilled the two molds are pulled apart, each mold box turned 90 deg., the group of balls falls to the floor, a new pair of molds is closed, and operations continue.

Mr. Huttl recommends that the molds be milled from gray cast iron; a 21-in. square slab will make a half mold for 25 2-in. balls. Before the first cast is made, the molds should be preheated with a gasoline torch. Rock-drill parts, broken crusher jaws, in fact any steel scrap, is said to make satisfactory raw material, and produce a ball which will stand two or three blows from a steam hammer before breaking.



Permanent Mold for Chilled Steel Balls for Grinding Mills

No mention is made of the furnaces used for melting this steel scrap. A production of 1400 balls per hour has been made with three men—one caster, one cylinder operator, and a third for greasing the molds with spent crank case oil.

A study of the use of the gravity concentration process in the beneficiation of Alabama oolitic iron ores has been made by the United States Bureau of Mines in cooperation with the University of Alabama and the University of Missouri. The self-fluxing iron ores of Alabama are the foundation of the iron and steel industry of that State, says the bureau in a recently issued report. In addition to these deposits of self-fluxing ores, there are seams containing practically the same percentages of iron but too much silica. These ores at present are valueless, but if they could be concentrated by reducing the silica content, the ore reserves of the Birmingham district would be greatly augmented. The low cost of gravity concentration gives this process first rank in the beneficiation of iron ores. For this reason many experimenters have tried to concentrate the Alabama iron ores on tables. In the face of the early failure a new trial has been made and the results have justified the effort.

Michigan as a Steel-Producing State

Importance of Detroit as a Consuming Center Accounts for Construction of Nearby Steel Plants

BY C. E. WRIGHT

DETROIT, Aug. 6.—Steel companies in the Central District, particularly those making sheets and strips, are watching with keen interest the development of Michigan as a steel-producing State.

Ranking fourth in steel consumption among all the States, Michigan is now in seventeenth place in steel production. This will be changed somewhat next year when two new steel plants get into operation.

The new Great Lakes Steel Corporation, which is building a plant at Ecorse, a suburb of Detroit, will start making steel about one year hence. The new sheet plant of the Newton Steel Co. at Monroe, Mich., 30 miles below Detroit, may get started rolling steel sooner.

The Great Lakes plant will have open-hearth capacity and rolling mills sufficient for the annual production of about 400,000 tons of semi-finished and finished steel. Its finished products will be hot-rolled and cold-rolled strip steel, and it will supply the Michigan Steel Corporation, with which it is closely affiliated, with sheet bars. These the Michigan Steel Corporation now obtains from outside sources.

The Newton Steel Co., in its new plant at Monroe, will produce about 125,000 tons of sheets a year, which is approximately the present capacity of its mills at Newton Falls, Ohio.

As the Michigan Steel Corporation is now producing a like amount of sheets at its plant in Detroit, the automobile industry of lower Michigan will soon have a sheet production of a quarter of a million tons right at its front door.

Add to this an annual strip steel output of about 250,000 tons, which the Great Lakes Steel Corporation will be able to turn out, and Michigan will assume a fairly important position as a steel-producing State, not to mention the tonnage produced by the Ford Motor Co. for its own use.

The Detroit Steel Corporation is a contender for a portion of the cold-rolled strip business of the Detroit area, and another new cold-rolled strip producer just organized is the A. J. Bopp Steel Corporation.

These steel-making developments in Michigan raise the question as to whether the trend of new steel capacity will be toward producing steel nearer to its largest consuming centers. The early trend in the development of steel manufacture was to get close to sources of supply. Thus Pittsburgh became a steel center because of cheap coal, while plentiful supplies of ore and coal in Alabama brought about the upbuilding of steel manufacture in that section.

But today freight plays so large a part in steel distribution that low costs on raw materials do not always offset the expense of comparatively long hauls of finished steel.

The present freight rate on finished steel from Pittsburgh to Detroit, for example, is 29c. per 100 lb. This may be reduced to 26.5c. under the new mileage scale ordered by the Interstate Commerce Commission, but even so, it is about $4 a ton above the switching charge which Detroit plants will have to pay in getting steel to automobile manufacturers and other large consumers in Detroit.

Virtually every steel company in the country has a sales office in Detroit. For many companies the district supplies a greater amount of business than any consuming section in the country. What the effect on the competitive situation will be when the new capacity comes into play remains to be seen, but some companies whose plants are in other States are not viewing the outlook with equanimity. The tonnage to be supplied by the new Michigan mills must come out of other companies' tonnage unless there is a sufficient increase in steel consumption in the Detroit district to make up the difference.

A sidelight on the present race for business in Detroit is the considerable increase this year in the tonnage of steel that is being moved here by boat. The savings in freight, as compared with rail hauls, are generally obtained by the buyer, in whole or in part. Small consumers pay about the same for their steel as such buyers do in other districts, but large users are able to draw on Buffalo, Cleveland and Chicago mills for water shipments at lower delivered prices than are possible in many other sections of the country.

Locomotives Under Order Still Large in Number

WASHINGTON, Aug. 6.—Railroad locomotives to the number of 69 were shipped in July as against 78 in June, according to reports received by the Department of Commerce from the principal manufacturing plants. Of the July shipments 42 locomotives were for domestic use, 39 being steam and three being electric units. The 27 locomotives exported were of the steam type.

For the first seven months of the current year 388 locomotives were shipped as against 360 for the corresponding period of last year. Unfilled orders at the end of July of the present year totaled 539 locomotives as against 552 at the end of June. Both these figures were higher than unfilled orders for all of 1928 and the first five months of 1929. Of the locomotives on order at the end of July 490 steam and 18 electric units were for domestic account and 31 were steam locomotives for exportation.

Melting Practice and Other Papers at Metal Congress

Alexander L. Feild, chairman, program committee of the Iron and Steel Division of the American Institute of Mining and Metallurgical Engineers has released the papers to be presented as the division's portion of the program for the National Metal Congress to be held in Cleveland the week of Sept. 9. Sessions will be held on Tuesday, Wednesday and Thursday, the Wednesday morning session being devoted entirely to the subject of ores, while the other sessions will be devoted to melting practice.

The Iron and Steel Division will join with the Institute of Metals Division of the A. I. M. & M. E., which is also presenting a program during National Metal Week, in a dinner to be held at Hotel Cleveland on Tuesday evening, Sept. 10.

Other societies presenting programs during the week besides those mentioned, are the Iron and Steel Division of the American Society of Mechanical Engineers; the American Welding Society and the American Society for Steel Treating.

The papers for the Iron and Steel Division meeting of the mining engineers are as follows:

"Change in Microstructure of iron at the A_3 Transformation Points," by B. A. Rogers, Western Electric Co., Chicago.

"New Development in Wrought Iron Manufacture," by James Aston, Carnegie Institute of Technology, Pittsburgh.

"Viscosity of Blast Furnace Slags," by R. S. McCaffery, University of Wisconsin, Madison, Wis.

"Fluorspar and Its Uses," by Earl Brokenshire, Oglebay, Norton & Co., Cleveland.

"Foreign Iron Ores," by Charles Hart, Delaware River Steel Co., Chester, Pa.

"Iron Ore Sinter," by G. M. Schwartz, University of Minnesota, Minneapolis, Minn.

"Bradley Process for the Beneficiation of Manganiferous Ores," by Carl Zapffe, Northern Pacific Railroad, Brainerd, Minn.

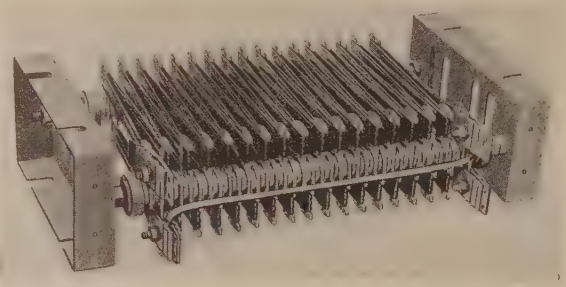
"Diffusion of Iron Oxide from Slag to Metal in the Open-Hearth Process," by C. H. Herty, Jr., United States Bureau of Mines, Pittsburgh.

"Experimental Determination of Equilibrium in the System Carbon-FeO in Molten Iron," by A. B. Kinzel and J. J. Egan, Union Carbide & Carbon Research Laboratories, Long Island City, N. Y.

"Rate of Carbon Drop and Degree of Oxidation of the Metal Bath in Basic Open-Hearth Practice, II," by A. L. Feild, Union Carbide & Carbon Co., New York.

New Resistor Described As Unbreakable

DUR-ristor, a new resistor described as unbreakable, with a continuous resistance element, is announced by Cutler-Hammer, Inc., Milwaukee. Advantages emphasized include vibration-proof and unbreakable, non-corrodible, light of weight and compact.



The Resistance Element Is Continuous and Is Arranged to Permit Expansion and Contraction

The main body of DUR-ristor, the resistance element, consists of two strips of a rust-proof, non-corrodible alloy. They are proportionally ribbed on the sides as well as on the turning edges. A new method of supporting the strips, combined with the ribbing, serves to allow the strips to expand and contract freely during temperature changes. Mica is used for all insulation.

The DUR-ristors, regardless of ampere rating, are of equal size. The thickness of the resistance strip is the only part that varies according to ampere rating.

Improved Wood-Working Machine

INCREASE in power by some 50 per cent, and more convenient arrangement of the dial plate for making angle settings are features of the improved model D "Wonder Worker" wood-working machine built by De Walt Products Corporation, Leola, Pa.

A 5-hp. Motor of New Design Provides More Power with Less Temperature Rise

By means of various attachments, ripping, cross-cutting, dadoing, mitering, beveling and many other operations can be done on the one machine. Fir 4-in. thick is said to be ripped at the rate of 50 lineal ft. per min. Cross cutting of 6-in. material is within the capacity of the machine and the change from cross cutting to ripping may be made instantly without turning off the power.

A two or three phase 5-hp. motor of new design is employed, providing more power at full load, with less temperature rise. The dial plate with degree markings and pitch scale is now directly located in front of the operator and is notched at each 45 deg., which facilitates making adjustments for angle or bevel cutting. A locking device actuated by a convenient hand-lever has been provided for locking the motor quickly and positively in any cutting position, and provision has been made for quick changing of tool attachments. The cutting tool is completely guarded in all positions.

The machine weighs 340 lb. and is portable. It is fitted on a 29 x 59-in. table that can be handled by two men.

Scarfing Tip for Deseaming Billets

TO speed up the scarfing of billets and keep down the cost, the Weldit Acetylene Co., Detroit, offers a scarfing tip for its model S torch. The tip makes a cut such as is indicated in the accompanying reproduction of a photograph, which shows a torch cutting of a seam or surface defect in the steel. The billet so treated is then re-rolled immediately with little or no loss of time or heat.

Another field offered for the scarfing tip is the preparation of plates for electric welding. The plates are placed together in proper position and the scarfing tip passed over the contact edges giving a groove with fresh surfaces ready for the electrically melted bead.

Lincoln "New Kathode" Welding Electrode

A welding electrode, known as the "New Kathode," has been developed by the Lincoln Electric Co., Cleveland, for the arc welding of mild steel and for cast iron repair work. It is manufactured in stock lengths of 14 in. and 24 in. To provide best possible protection, during shipment, the rod is packed in metal containers holding 50 lb. each.

Tapping Set-Up for Radiator Loop Machine

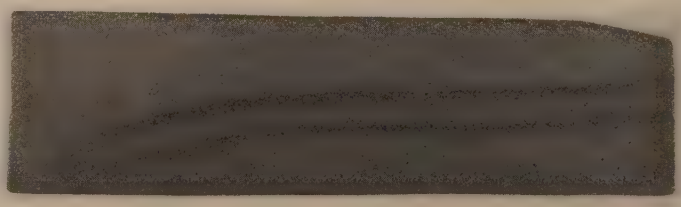
IN THE IRON AGE of June 27, page 1772, a new machine built by the Moline Tool Co., Moline, Ill., was described and illustrated. It is a single-purpose machine for boring, facing and tapping radiator loops. There are four spindles. The machine can be arranged to have all spindles boring and facing, or all facing and tapping, or half boring and half tapping. The illustration previously shown was of the machine as set up for boring and facing.

This same machine, adapted to facing and tapping, bores, taps and faces rough castings in one operation, the cycle being almost identical to that described before.

However, in this instance, the tapping is done by mechanical feed through a screw and nut having the same lead as the tap used for the work. The facing is done hydraulically and the cutters are mounted on the main spindles, while the taps are inserted in small spindles, operating through the center of large spindles, and are adjustable endwise, the same as the facing spindles.

In this latter case, one common drive motor is used, being mounted on the base, driving a common drive shaft through open and closed belts, so as to keep the timing correct.

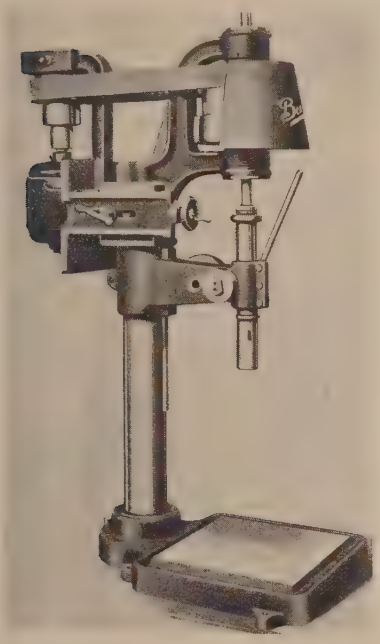
Average production on this operation is 90 loops an hour. The machine can be adjusted to take any loop from 5 in. to 13 in. wide and from 8 in. to 38 in. between centers of holes. The approximate weight of the facing and tapping machine is 18,000 lb.



Scarfing Tip Is Used to Remove Surface Defects of Billets So That Rerolling May be Pursued With Little or No Loss of Heat or Time

New 16-in. Sensitive Drill for Production Work

EQUIPPED with a ½-hp. motor the Buffalo Forge Co.'s, Buffalo, new 16-in. sensitive drilling machine here illustrated has capacity for drilling ⅞-in. holes in cast iron and 9/16-in. holes in steel. With a ⅓-hp. driving motor the capacity is ⅝ in. and 7/16 in. respectively. The drive is through three-step cone pulleys, providing three spindle speeds, 418, 835 and 1725 r.p.m.



Both Bench and Floor-Type Machines Are Made. With a 1725-r.p.m. motor, spindle speeds are 418, 835 and 1725 r.p.m.

In both the bench and floor type machines ball bearings are employed throughout. The head has a travel of 8½ in. and the spindle a travel of 7 in. The pulley and motor support is an iron casting and the column, which is 4 in. in diameter, is made of steel. The outer part of the spindle is guided by a sleeve running in bronze bearings and provided with a ball thrust bearing. Belt adjustment is made by loosening a hand-operated nut on the shifter bracket and turning the handwheel at the left-hand side of the machine. Hand-lever feed is provided on the bench machine and both hand-lever and foot-treadle feeds on the floor type drill. A knurled nut directly back of the feed pinion permits disconnecting the foot treadle at any time; or the foot treadle attachment can be omitted if desired.

The floor type drill has a 12-in. square tilting table and a floor base 21 in. in diameter. The maximum distance from base to spindle is 46 in. and from table to spindle 38 in. The overall height of the machine is 76 in. The bench machine has a 15¾ x 22½-in. base, with a working surface 12¾ in. square. The greatest distance from table to spindle is 28 in. and the overall height of the machine is 48 in. The net weight of the bench drill is 350 lb. and of the floor type machine, 400 lb.

Annealing Furnace with Accelerated Cooling

THE General Electric Co. announces a new electric furnace for annealing alloy steel to obtain variable heating and cooling cycles.

The furnace is lined with lightweight refractories of low thermal capacity. By the use of this type of refractory it is possible for the furnace walls to heat or cool very quickly, serving to give flexibility to the heating and cooling cycles and to increase the furnace economy.

To obtain variation of the cooling period, cooling coils and a ventilating system that can be sealed tight by insulated doors during the heating period are used. The coils may be installed in the sides, bottom or both of the furnace. None of the cooling air enters the furnace chamber. The rate of cooling is varied by varying the amount of air blown through the ventilating system. The ventilation holes are fitted with sand-sealed, insulated covers to prevent heat leakage during the heating cycle. After the work is cooled by the cooling coils below the critical temperature, the covers may be opened and the cooling further accelerated by a flow of air into the bottom vents, through the furnace and out through the top vents. The covers may be opened to any extent by the use of a single control.

Uniform Heating, at Variable Speeds, and Control of Cooling Rate Are Features of This Electric Annealing Furnace

Small Scrap Bundling Press Has Motor Drive

PRODUCTION is markedly increased and denser bundles are made by an improved model small hydraulic scrap bundling machine which has been placed on the market by Samuel H. Garrett, 224 North Thirteenth Street, Philadelphia. The machine is designated as the Tempus No. 5 and is similar to the hand-operated press of the same name described in THE IRON AGE of Feb. 21, except that hand operation is now by means of sprocket and chain instead of by lever, and the hydraulic pump is motor driven instead of hand operated. An automatic starter stops the machine when the power limit is reached, and push button control is provided. The motor has Timken roller bearings packed with grease; other bearings are oiled automatically through hollow steel shafts that are filled from the outside and are protected by dust-proof spring valves.

Motor-Driven Pump Speeds Operation and Makes Possible Denser Bundles

Portable mounting is provided, as before, so that the machine may be moved conveniently to the scrap pile. Bundles 12 in. wide, 20 in. long and from 12 to 18 in. high, may be made, the height, as well as the weight of the bundle, being dependent upon the material. The height to top of the hopper is 40 in., the width 24 in. and the depth, front to back, 16 in. The weight of the new machine is 600 lb.

Metals Section of Safety Council Plans Meeting

The Metals Section of the National Safety Council will hold a meeting in connection with the eighteenth annual congress of the council at the Stevens Hotel, Chicago, Sept. 30 to Oct. 4. The program includes addresses by Dr. Harry Myers, superintendent of personnel, Frigidaire Corporation, Dayton, Ohio; George Seyler, works manager Lunkenheimer Co., Cincinnati; Phillip Stremmel, general superintendent Granite City Steel Co., Granite City, Ill.; H. S. Smith, Union Carbide Co., New York; and J. E. Culliney, safety engineer Bethlehem Steel Corporation, Bethlehem, Pa. F. G. Bennett, safety director Buckeye Steel Castings Co., Columbus, Ohio, and J. M. Woltz, safety director Youngstown Sheet & Tube Co., Youngstown, Ohio, will make reports of the foundry research committee and the safe practices committee, respectively.

At the final session a safety playlet will be presented and the iron and steel safety contest trophy will be awarded. John A. Oartel, chief of saftey bureau Carnegie Steel Co., will show a film illustrating safety kinks in the metals industry.

Pittsburgh Steel Foundry Acquires Sharon Company

The Pittsburgh Steel Foundry Corporation, Pittsburgh, has bought the Sharon Foundry Co., Sharon, Pa., and the Pittsburgh company is expected to issue 30,000 additional shares of common stock to finance the purchase.

The Pittsburgh Steel Foundry Corporation operates a plant at Glassport, Pa., and its products include steel castings, alloy steel castings, finished castings for rolling mill machinery, charging boxes and ingot cars, railroad bolsters and side frames, annealing boxes, and miscellaneous car and machinery castings. The Sharon company, with works at Wheatland, Pa., manufactures castings for steel works and blast furnaces and general machinery castings.

Exports of $1,000,000 a Day in Industrial Machinery

WASHINGTON, Aug. 6.—The upward trend of exports of industrial machinery, under way for the past six years, continues, and for the first half of 1929 their total value was nearly $130,000,000, as compared with $102,000,000 for the corresponding period of 1928, according to L. J. Cochrane, Industrial Machinery Division, Department of Commerce. The movement for the first six months of the present year approximately equaled the volume for the entire year of 1924 and considerably exceeded the volume for either 1922 or 1923.

Mr. Cochrane pointed out that industrial machinery exports are approaching a level of almost $1,000,000 each working day, "obviously a trade of very substantial importance when measured simply in terms of its monetary value, but of even greater importance if we remember the economic significance of machinery and the forces that the employment of this equipment will release in the countries of destination, whether this be highly specialized machinery for advanced industries of Europe or construction and other machinery that may be employed in some of the more backward territories."

New Pricing Basis for Steel Windows

Manufacturers of solid section steel windows have formulated a code of approved practices to be submitted to the Federal Trade Commission through their attorney, Abram F. Myers, formerly of the commission. The code is designed to eliminate unfair methods of competition, and uneconomic trade practices and to cooperate with the United States Department of Commerce in bringing about standardization and elimination of waste.

One of the principles most interesting to contractors is concerned with the elimination of discriminatory prices through publication by each company of its discounts from a standardized list price.

In accordance with this principle, the Detroit Steel Products Co., maker of Fenestra products, has authorized the following discounts as of Aug. 1:

On Engineering Products

Orders listing	*Discount per cent*
$0 to $400	45
$400 to $1,000	50
1,000 to 2,000	50 and 5
2,000 to 3,000	50 and 10
3,000 to 6,000	50 and 15
6,000 to 10,000	50 and 20
10,000 to 20,000	50 and 25
20,000 & Over	50 and 30

On Commodity Products

0 to 300	List
300 to 500	10
500 to 1,000	15
1,000 to 2,000	20
2,000 & Over	25

Imports of Pig Iron Into the United States by Ports of Entry

(In Gross Tons)

Leetonia Furnace to Resume Under Belgian Process

The blast furnace formerly operated by the McKeefrey Iron Co., at Leetonia, Ohio, has been purchased by Morris B. Abrams, Cleveland, who is forming a company to operate the stack. Mr. Abrams says that associated with him will be a Belgian steel maker and a new process will be employed to allow the use of a much larger percentage of scrap than the maximum ordinarily used in blast furnace operation. It is the intention to use 75 per cent scrap and 25 per cent ore.

The McKeefrey furnace, first built in 1866, has been idle for a number of years. Several years ago plans were made for the erection of a steel plant in connection with the furnace, but were abandoned after steel for four 70-ton open-hearth furnaces had been delivered to the site. Mr. Abrams' plans include the building of these furnaces. The company that operates the furnace will be a subsidiary of the Atlas Steel & Supply Co., Cleveland, dealer in scrap, of which company Mr. Abrams is president.

Steel Fabricators to Meet at Biloxi

The next annual convention of the American Institute of Steel Construction, Inc., will be held in Biloxi, Miss., at the Edgewater Gulf Hotel, Nov. 13 to 16 inclusive. The institute has been invited by the German Steel Syndicate (Stahlwerks-Verband) to participate in an international conference on steel construction, to be held at Düsseldorf in August, 1930.

German Rebate on Pig Iron Expected to Be Continued

WASHINGTON, Aug. 6.—The Roheisen Verband, the German pig iron association, is expected to continue granting rebates to German consumers of pig iron for the second half of the present year, according to a report received by the Department of Commerce from Berlin. Under the association's contract with German consumers, the rebates on pig iron used in gray iron and malleable iron castings for export is equal to the difference between the domestic and world market prices. The rebate, which at the present time is fixed at about $1.43 per ton, is given only to those who buy 100 per cent of their requirements through the association.

Civil service examinations for engineers to fill vacancies in the Bureau of Standards, Department of Commerce, have been announced. Applications to the United States Civil Service Commission, Washington, must be made before Sept. 11. The positions to be filled include materials testing engineer and assistant testing engineers.

Europe Looks for September Upturn

Large Autumn Requirements Are Expected, but Steel Prices at Moment Are Weak—American Tin Plate Exports Active

(*By Cable*)

LONDON, ENGLAND, Aug. 6.

IRON and steel markets are under the influence of the holidays and little important change is expected before September. The Cleveland pig iron outlook is bright, as furnace output is well sold and preparations are on foot to relight more furnaces. Autumn requirements are expected to develop on a large scale.

Coke and ore shortage, and high prices are still the crux of the whole position.

Steel is quiet, especially in plates and sheets and rail sections. Mills are moderately active, but new business is slow, though shipbuilding specifications are issued more regularly.

Tin plate is quiet, with a steadier tone on small output. Works are closed for stopweek, which in several cases may be prolonged for two weeks. The quota percentage is expected to be further reduced.

Galvanized sheets are dull, but steadier, as production is restricted. Japan is inquiring for thin black sheets.

Clyde shipbuilding in July amounted to 13 vessels, or 38,000 tons.

Continental iron and steel are practically idle here. Prices generally are easy, but opinion is inclined that values have now touched their lowest.

French output for June was 865,000 metric tons of pig iron and 797,000 tons of steel.

German rolled steel output in June was 986,000 tons.

Polish production in June was: Pig iron, 58,000 metric tons; raw steel, 107,000 tons; rolled steel, 78,000 tons.

Continental Improvement Expected Soon

(*By Radio*)

BERLIN, GERMANY, AUG. 5.

MANY steel mills are beginning to show a decided unwillingness to accept export orders at present prices. The recent weakness in Continental prices is generally believed to be the result of the holiday season and recovery of the market is expected by the end of August.

All syndicate domestic prices are unchanged for this month. The home market is more active and there is an increasing demand for pig iron from foundries, machinery manufacturers and other consumers. Demand for gas and boiler tubes is improving. Except for pig iron, export prices are weaker and the Stahlwerksverband has made a further reduction in prices of bars, beams and bands.

Export Inquiry for Tin Plate Active

NEW YORK, Aug. 6.—Export inquiry for tin plate is active with the Nippon Oil Co. in Japan inquiring for quarterly requirements expected to total about 45,000 base boxes of oil sizes, and the Amtorg Trading Corporation, New York, asking for 60,000 to 75,000 base boxes of tin plate for export to Russia, shipment to begin in September. The Imperial Japanese Army is in the market for its annual requirement of canning tin plate, asking for about 10,000 base boxes, instead of the usual tonnage of 5000 to 7000 base boxes.

German Barbed Wire Sales Steadily Declining

HAMBURG, GERMANY, July 22.—Producers of barbed wire report a decline in consumption of this type of wire for fencing, a trend that has been particularly noticeable this year. Investigation by the mills shows that users apparently prefer galvanized fencing wire, wherever the substitution is possible. A similar trend in demand has been noticed in export business. As producers of barbed wire doubt that much increase would develop from advertising its use in Germany and abroad, it is believed probable that the barbed wire divisions of certain makers in the Ruhr will soon suspend operations. Mills here do not believe that so sharp a recession in barbed wire business will be experienced by American producers, as it is pointed out that the difference in price between barbed wire and galvanized fencing wire is much smaller in the American market than in Europe.

British and Continental European Export prices per gross ton, f.o.b. United Kingdom Ports, Hamburg and Antwerp, with the £ at $4.85

British Prices, f.o.b. United Kingdom Ports

Cleveland No. 3 foundry	£3	12½s.	to	£3	13½s.	$17.58	to	$17.82

Germany Exports Larger Part of Its Steel Output

HAMBURG, GERMANY, July 22.—The percentage of German steel production exported is increasing. Semi-finished steel exports represented 41.33 per cent of output in 1927, 57.37 per cent in 1928 and 51 per cent in the first half of this year. Structural steel exports were 17.6 per cent of production in 1927, 27.02 per cent in 1928 and 41.6 per cent in the first half of 1929. Foreign shipments of steel bars and rods were 19.7 per cent in 1927, 25.19 per cent in 1928 and 39.6 per cent in the first half of this year. Plate exports represented 25.8 per cent of output in 1927, 24.19 per cent in 1928 and 39 per cent in the first half of 1929. Shipments of steel hoops advanced from 19.7 per cent of output in 1927 to 25.02 per cent in 1928 and to 42.8 per cent in the first half of this year.

The proportion of production shipped for export is expected by some mills to show a decline during the second half.

Association of British Tin Producers in Prospect

WASHINGTON, Aug. 6.—Efforts are still being made by a British group to effect more active and centralized control of tin production and prices through the formation of a tin producers' association, according to a report received by the Department of Commerce from London. Actual progress in the organization of a comprehensive association is probably less than would appear to be indicated by some published reports, as there is understood to be considerable opposition. Strong financial interests are reported behind the proposals, however, and the ultimate formation of an association is expected.

It is apparently the opinion of a large section of the trade that, even if the plan should be successful, strict control would be difficult and in any case considerable time would elapse before its effects would be felt to any extent. This opinion, the report says, tends to be confirmed by the existing belief that production still exceeds consumption to a greater degree than is apparent from the available statistics of the industry.

Magnesium Alloy Cheaper Than Aluminum Alloy

HAMBURG, GERMANY, July 22.—Price reductions on Electron (magnesium alloy) have brought it to a lower price level per square meter than aluminum alloy. By way of comparison, the alumium alloy known as Lautal weighs 2.8 kg. per square meter in a No. 20 gage sheet and costs 12.75 m. ($3.03). Electron weighs 1.82 kg. per square meter for a No. 20 gage sheet and costs 11.83 m. ($2.83). These prices compare with 23.75 m. ($5.65) for a square meter of No. 20 gage copper sheet weighing 8.9 kg.

A recent publication of the German aluminum industry in commenting on the increasing use of aluminum and its alloys states that German consumption of copper in the first half of this year was about 20,000 tons less than in the first half of 1928, while consumption of aluminum and its alloys and other non-ferrous metals increased 29,000 tons.

German Koppers Company Has Large Contracts

HAMBURG, GERMANY, July 22.—Recent large foreign contracts for coke oven installations have been booked by the Heinrich Koppers A. G., Essen, which is affiliated with the Koppers Coke Oven Co., Sheffield, England, and the Koppers Co., in the United States. Among these contracts is an order from the Kabushiki Kaisha Asano Zosensho of Kanagawa for an installation of ovens that will be the largest in Japan. The company also has contracts for coke ovens in Czechoslovakia, Austria, Poland, India and Switzerland and, in addition, will modernize the entire coke production of the city of Stockholm, Sweden.

Earnings of Steel Companies Are Large

The Wheeling Steel Corporation reports net profit for the second quarter of $2,342,294, after all charges, equivalent to $4.25 a share on 394,837 shares of common stock. This compares with $1,795,243, or $2.86 a share, in the preceding quarter, and $1,530,125, or $2.19 a share in the second quarter of 1928.

For the second quarter the Pittsburgh Steel Co. had a net profit of $1,422,548, equivalent, after all charges, to $4.89 a share on 253,500 shares of common stock. Its first quarter earnings were $1,333,661, or $4.54 a share.

The American Rolling Mill Co. in the first six months of 1929 reports a surplus of $4,410,177, after interest, Federal taxes and preferred dividend requirements, equal to $3.26 a share on 1,351,379 shares of common stock (par value $25). This compares with surplus, excluding $2,785,918 income from sale of gas rights, of $1,767,001, or $1.55 a share on 1,140,022 shares in the first half of 1928.

Net profits of American Steel Foundries in the first half were $2,802,224, equivalent, after all charges, to $2.59 a share on 993,020 no-par value shares of common stock. In the same period last year net profits were $1,854,741, or $1.71 a share, on 902,745 shares.

In the second quarter the Inland Steel Co. earned a net profit of $3,126,908, after deducting all charges. The company's net profits in the entire year 1928 were $9,334,297.

Net income of Transue & Williams Steel Forging Corporation for the quarter ended June 30 was $137,603, before Federal taxes, equal to $1.37 a share on 100,000 no-par value shares outstanding. This compares with $132,534, or $1.32 a share, in the corresponding quarter of 1928.

In the first half of the year, net earnings of the Columbia Steel Corporation were $716,758, as against $329,938 in the same period last year. This is equivalent to 48c. a share on 1,497,171 shares of common stock, as against 23c. a share in the first six months of 1928 and about 57c. a share on 1,330,623 shares for the full year of 1928.

Imports of Pig Iron Into the United States by Countries of Origin

(In Gross Tons)

	12 Months Ended June	
	1929	1928

British Malaya	275	.....
Total	138,810	147,594

Iowa College Aids Graduates

To assist in solving the problem of securing business positions for engineering graduates, the personnel office of the division of engineering of Iowa State College, Ames, Iowa, published for the senior students a "personnel service leaflet," 3¾ x 6¾ in., punched to fit a standard loose-leaf cover. The leaflet shows a half-tone print of the student and gives his name, course, date of graduation and information regarding his qualifications. These leaflets are being sent to business firms throughout the country.

For use with drum switches mounted in crane cabs and similar places, the General Electric Co. announces a new type of operating mechanism. This mechanism, superseding the rack-and-pinion under-lever type, eliminates the trouble experienced in keeping a perfect line-up between the shaft of the operating mechanism and the drum switch shaft, and makes it possible to inclose the mechanism to keep dirt from the gear lubricant.

Jenison Machinery Co., 58 Fremont Street, San Francisco, has been appointed exclusive representative for northern California and parts of Nevada and Oregon for J. A. Fay & Egan Co., Cincinnati, manufacturer of woodworking machinery.

This Issue in Brief

Apprentice-training class work is carried on after regular work hours. Instructors are employees occupying responsible positions with the company, but certified to by the State Department of Education. One-half their salary as instructors is paid by the company, and one-half by the State. —Page 334.

* * *

Wrought iron made by Aston process discussed by inventor, who says the product is more uniform in quality through controllability of operations and elimination of individualism.—Page 344.

* * *

Defective castings resulting from use of deformed cores are virtually eliminated when ram-up cores are used, as the ram-up core, if deformed, will not fit properly into or against the pattern.—Page 347.

* * *

Creep stress investigation at high temperatures is handicapped by difficulty of getting exact measurement of minute deformations. Deformation may be proceeding at a rate so slow as not to be observed even with the most delicate measurement, except over the longest period of time.—Page 348.

* * *

Almost one million dollars worth of industrial machinery is exported per working day. Although of substantial monetary importance, the economic significance is even greater, considering the forces of employment the equipment will release in the countries to which the machinery is shipped.—Page 354.

* * *

Many machining operations required on master connecting rod for aircraft engine. Forgings are bored, reamed, drilled, milled and ground. Pickling in an alcohol solution containing 5 per cent nitric acid reveals cracks and surface flaws.—Page 337.

New puddleless wrought iron process is performed by pouring Bessemer steel gradually into a "cup" partly filled with iron silicate slag. The boiling action causes the steel to intermingle with the slag, producing a spongy mass of metal. The ball is compacted into a bloom under a hydraulic press.—Page 342.

* * *

Skilled labor problem is solved, partly at least, by apprentice-training course. Ohio machinery builder finds that he has an opportunity to determine at close range the apprentices' ability to fill future positions.—Page 334.

* * *

New process produces manganese sinter from low-grade silicious ore. Ammonia sulphate proves to be an effective solvent. One ton of manganese sinter of 67.3 per cent manganese can be made from 5.2 tons of ore.—Page 345.

* * *

High-strength structural steel reduces deadweight of ships' hulls 10 per cent. High elastic steel is gaining in use in British shipyards. In several vessels on order one-half the total weight of the steel will be high-elastic limit mild steel.—Page 345.

* * *

Ram-up cores cut foundry costs where castings have nozzles, projecting flanges and other irregularities. Advantages over a core placed in a core print are absence of fins, variation of metal and of misplaced cores.—Page 346.

* * *

Is the trend of new steel-producing capacity toward greatest consumption centers rather than toward sources of supply, as formerly? Growing importance of Michigan as a steel-producing State indicates that producers are getting close to customers. Freight today plays a large part in the expense of comparatively long hauls of finished steel.—Page 351.

Valuable information for engineers and designers of machinery and other steel structures is furnished by time-yield method of determining creep stress under high temperatures. Method developed in a British laboratory completes a test in three days.—Page 349.

* * *

Machinery builder now has no difficulty in securing applicants for his apprentice-training course. Several years ago applicants were scarce due to desire for immediate higher wages. Favorable publicity has helped. Vocational departments of local public schools produce the largest proportion of apprentices.—Page 336.

* * *

Lowered production costs of wrought iron, brought about by new process which eliminates hand-puddling, is expected to create expanded market for this metal. New plant will produce at the outset 600 gross tons per day. —Page 344.

* * *

Mergers as a whole do not operate more economically than independent companies. Recent study made by the National Industrial Conference Board revealed that the combined record of mergers over a term of years does not differ much from that of independents.—Page 358.

* * *

Mild steel used for high-pressure boiler drums may be stressed with safety to two-thirds the value of limits developed in British laboratory test. Time-yield value determines the maximum stress which can be imposed without change of dimensions.—Page 349.

* * *

Pig iron average daily output rate for July was 1.5 per cent under June. Average daily production was 122,100 tons, a new high record for July. On Aug. 11 there were 216 furnaces in blast, a loss of 2 for the month.—Page 362.

THE IRON AGE

W. W. MACON
Managing Editor

ESTABLISHED 1855

Still an Uneven Prosperity

EVERY one recognizes that there are varying rates of trade activity at the present time, some lines doing extremely well, others less well, and some rather poorly. It is worth while to inquire what general principles if any are involved. Then there is the particular point that some lines should not be expected to grow as fast as others, and their slower growth should not be held against them.

Turning to the conveniently arranged statistics compiled by the Federal Reserve Board, one finds that petroleum refining and automobile and tire production have been running this year far above the general activity, tobacco and iron and steel somewhat above, and leather and shoes and lumber far below.

There is a lack of perspective in much of the current comment. One of the commonest remarks in business conversations is that building activity is off this year. So it is, from last year; but this longer range and more impressive comparison, taking 1923-4-5 as the base period (which is used in all these Federal Reserve statistics), show that building contracts in the first five months of this year made a greater gain than industrial production, building contracts standing at 123 against 120 for industrial production. We therefore may dismiss building from present consideration, since by a reasonably long range comparison it is doing quite well enough, and study the details of industrial production.

In the first five months of this year industrial production (adjusted for seasonal variation) showed 20 per cent gain over the base period 1923-4-5. Manufacturing did better than mineral production, which is included in the general result, but with a relatively low weighting.

Taking the first five months of the year and comparing individual lines with the general industrial pace, we find the following divergences above and below, which for convenience are arranged in sequence:

Manufacturing

	Per Cent Variation		Per Cent Variation
Petroleum refining	+36	Cement, brick, and glass	+ 7
Automobiles	+30	Paper and printing	+ 5
Rubber tires	+29	Textiles	— 2
Tobacco and manufactures	+12	Food products	—17
Iron and steel	+10	Leather and shoes	—18
Non-ferrous metals	+ 9	Lumber	—30

Mineral Production

Copper	+14	Bituminous coal	—16
Crude petroleum	+13	Anthracite	—20
Lead	— 4	Silver	—20
Zinc	— 7		

Some questions are suggested by the table. Should one expect the output of food products to increase when production of automobiles increases? Food is 17 per cent below the general level of activity; the actual production was precisely the same as in the base period, but there was a trifle less food per capita, as population increased 6 per cent. Substantially the same thing can be said of coal, actual production showing no change. The difference is that one would not expect people to eat more when there is more manufacturing, but would expect the manufacturers to use more coal. This they avoid by utilizing coal more efficiently.

It is an interesting point that, while the increases from the base period in industrial production and in building are substantially the same, cement, brick and glass are 7 per cent above the general industrial average, while lumber is 30 per cent below. We may accept this, at least tentatively, as indicating a permanent swing in the character of materials used in building work, particularly when we observe iron and steel also to be in excess. It is not necessarily a change in choice of material for the same class of building, for there may be, and indeed there is, a change in the choice of building. Year by year, of the total family housing provided, apartments increase in proportion and single dwellings decrease.

Size and Business Success

"EVERYTHING you have is the biggest in the world." This gibe at the American point of view, made in the writer's hearing by a Brazilian student at one of our universities, was telling as well as ironical. There may be need for these reminders that our penchant for big things has its weakness, even though we see it as inseparable from the imagination that created our great business organizations and our justly famed mass production methods.

Faith in size *per se* has real dangers. Many look on the outstanding success of the United States Steel Corporation as final proof of the benefits of broad industrial consolidation, ignoring factors that have made its career exceptional. The popular mind more and more turns to mergers as the short cut to profits. There is an increasing tendency to attribute unusual achievement to large-scale organization and to overlook the human equation.

Industrial organizations, no matter how excellent in scheme, demand more than ever a high quality of directing personnel. Mergers do not guarantee competent management. A recent study of consolidations by the National Industrial Conference Board shows that their combined record over a term of

years does not differ much from that of independent companies. While many merged organizations made high profits and grew in size, many failed and the majority fell short of conspicuous success. Then there is the mammoth Ford company, with ramifications covering the globe, to confute continuously the idea that large-scale industry and consolidation are synonymous.

We are in a time when the public needs more than ever to discriminate in evaluating big things, since popular participation in the securities markets is greater than ever before. To ignore the present ratio of earnings to stock values and to trust in consolidation for future returns is to support the most unsound speculation. Unless this attitude gives way to greater sanity, the swollen volume of stock market transactions, with its attendant strain on credit, may become a real threat to prosperity.

The Supply of Steel Salesmen

TAKING stock of the physical and financial resources of a corporation is a routine matter. It behooves a corporation to take stock also of its personnel resources. The steel industry as a whole needs to take stock of its supply of salesmen, with regard not so much to the quantity or number as to the quality.

Since 1923 the tonnage of steel produced has increased approximately one-third. But for its welfare the industry requires much more than one-third increase in these six years in sales ability or quality, for three principal reasons: 1. The number of orders relative to total tonnage has increased greatly. 2. The variety of products made has increased greatly. 3. Competition has increased greatly.

Is not the requirement in total sales ability practically measured by the continued product of the increase in tonnage and the three other factors? Having one-third increase in tonnage and assuming only one-third increase for each of the other three factors, the continued product is more than a tripling. Has the steel industry tripled the effectiveness or sum total of quality of its selling force in the last six years?

By no means is it a matter of mere number of salesmen. Doubtless many cases would be found of a company increasing the number of salesmen by more than one-third, but increasing the number carries with it the temptation to lower the average quality. It requires more men to cover the ground and the orders are smaller, hence the executive may feel the individual rating need not be so high.

Steel companies have done a great deal in training their salesmen as to both the methods of manufacture and the character of uses of their products. We raise no question here as to whether or not they have done enough. Granting for argument that they have, there remains the final and crucial test of all salesmanship, and that is getting the price. Getting the order is only one part of the transaction, a useless or even injurious part if the price is not right. Have the steel companies that have trained their salesmen in the technique of character and quality of steel given corresponding attention to training them in the technique of getting the price?

It is a well known fact that spells of price cutting do occur in some of the finished steel products, usually leading to lower prices all around. Frequently the executive asserts that the salesman is to blame. He was too eager to get the order; he believed too much of what the buyer said; or he acted without instructions. Who is to blame for that? It is inconceivable that such a blunder should be so frequently made, of the salesman doing something to displease his chief when trying to please him. In the matter of believing what buyers say, it would seem that training in respect to that factor should be considered highly desirable. As to the salesman acting without instructions, nobody will take that seriously.

Accordingly the matter of the sales resources of the steel industry divides itself into two parts—the number and quality of the salesmen and the number and quality of the executives who direct the salesmen. We raise no question as to the ability of individual executives or heads of sales departments, the question being whether there are enough men in authority to manage properly the sales activities of the aggregated producers of steel. It can be said today, as it was said by Mr. Schwab in his first presidential address before the American Iron and Steel Institute, that "the next great move of the steel industry must be the proper and economic distribution and selling of its product."

Synthetic Manganese Ore

ON page 345 is printed a description of the so-called Bradley process for beneficiating the manganese-bearing iron ores of the Cuyuna range, summarized from a much more detailed account recently appearing in *Engineering and Mining Journal*. The first public reference to this process was made at the Cleveland meeting (April, 1927) under the auspices of the American Institute of Mining and Metallurgical Engineers to consider the whole question of manganese supply for the American steel industry. Briefly, the ore must be ground in ball mills and roasted in a reducing atmosphere to make the manganese soluble. The manganese is then leached out with ammonium sulphate solution, the iron and silica filtered off, the manganese precipitated with ammonia gas (thus regenerating the leaching solution) and the manganese hydrate washed, dried and sintered into a high-grade oxide for the furnace.

At first glance the process seems hopelessly complex and expensive. Treatment of ore in a closed system of chemical digesters and precipitators, closed so tightly that ammonia gas will not escape, would seem to have many drawbacks. But it should be remembered that the Calumet & Hecla company in the Lake Superior district has been engaged for many years in the profitable leaching of old tailings with ammonia gas. Thousands of tons a day of this waste material is dredged out of a lake, where it has lain these many years, is ground in ball mills, concentrated in a preliminary way by conventional methods, then leached with ammonia solutions, and a high-grade copper reclaimed. The over-all cost of this cannot be very great, for only about 12 pounds of copper is recovered from each ton of tailing treated. This plant operated when copper was selling for 15 cents a pound, so the total cost must have been below $1.80 per ton.

Similarly it might be noted that the Kennecott

Copper Corporation leaches a mill tailing with ammonia. Approximately 25 pounds of copper is recovered from a ton of tailing and it must cost less than $3.75 per ton to do it.

It might be objected that these costs do not include mining, that the chemical processes have a crushed material delivered to them free of charge. Surface mining and crushing of Cuyuna ores would probably cost about as much as the same operation at Ajo, Ariz. At that place, the New Cornelia Copper Co. steam-shovels an oxidized copper ore, crushes it, leaches it with sulphuric acid, reduces the solution, makes an electrolytic cathode, sells the copper and pays the freight to Eastern seaboard for less than $3.80 per ton. (The company gets only 25 pounds of copper out of a ton of ore.)

Consequently it must be admitted that a well designed plant operating on an economical chemical cycle, where the solvent is regenerated, can handle the raw material for costs on the order of $4 a ton. Assuming that the Bradley process is such a one, and that it takes 5 tons of ore to make one ton of sinter (65 per cent manganese), the operation might cost approximately $20 when done on a large scale. This is close to the price during 1923 to 1927 of 50 per cent foreign ore at our ports, before the payment of the duty of 1 cent per pound of manganese.

Since 65 per cent sinter should command a sizable premium over 50 per cent ore, the financial chances for the proposed process, on the basis of these rough figures, seem bright. Unless, indeed, the miners of Russian and Indian high grade ores reduce their selling prices sharply.

Whether the Bradley process is as simple to operate as the ammonia or acid leaching of copper may be doubted. In the first place it requires a preliminary roast, closely controlled as to time, temperature and gas analysis, so that most of the manganese may be made soluble, without getting too much of the iron simultaneously into solution. In the second place, the final precipitate, manganese hydrate, is a dense flocculate, which settles slowly, and like iron and aluminum hydrates, is very hard to wash clean. Mr. Bradley says that aeration will deflocculate the material. This is to be hoped; otherwise the precipitate will carry off valuable ammonium sulphate solvent and the sinter will run too high in sulphur. If, on the other hand, too much water is used to wash the sulphate out, it must later be evaporated (with costly heat) to recover the chemical solvent.

Another latent source of trouble, which might easily loom bigger than either of the above, is the use of the same reaction to put the manganese into solution that is used later to precipitate it. In other words, it is one of those reversible reactions which works from right to left in one stage and from left to right in the second. Sometimes, however, with fiendish persistence, these work the wrong way, precipitating when they really should be leaching, and vice versa. Practical success with such chemical reactions requires continuously precise control of solution temperatures, concentrations and pressures—a thing not always possible when one of the raw materials varies as much in chemical composition and physical constitution as ore.

Summing up, it may be said that equally intricate hydro-metallurgical operations have long been carried out on a grand scale, using the same sort of equipment which the Bradley process requires, and at a cost which ought to be competitive. However, there seem to be chemical pitfalls which a commercial plant may not be able to avoid—although they appear to have been in the 4-ton pilot plant already operated.

THE IRON AGE desires to congratulate most heartily Wilson Bradley, his assistants and his backers, on the persistence, skill and faith which have brought them thus far toward their goal. If the chemical processes are not too delicate, if the stable ranges in the reversible reactions are sufficiently wide to lend themselves to commercial operations on hundreds of tons a day, the chances of success seem to be bright.

CORRESPONDENCE

British Requirements for Aircraft Tubing Are Exacting

To the Editor: In your July 25 issue the article entitled, "Metals Used in Airplane Making" has been read with a great deal of interest, but I feel that an important oversight was made in the statement: "Those who have European experience cling to a medium carbon seamless steel tube. It was the ordinary seamless tube which succeeded the fuselage of wood and is still used by many British and Continental makers."

The historical portion of the above quotation is probably correct, but present British practice does not use "ordinary seamless tube" in any vital parts of the fuselage. The specification used in places where United States practice employs S.A.E. No. 4130X (chrome molybdenum) is covered by Provisional Air Ministry Aircraft Specifications Number D.T.D. 89A and Number D.T.D. 113, the former covering all round tubes down to and including ½-inch diameter, and the latter all round tubes below ½-inch diameter, and all sizes of non-circular tubes.

The steel covered by these specifications is of the following approximate analysis, being directly quoted from copies of the specifications:

Carbon	not more than 0.30 per cent
Silicon	not more than 0.30 per cent
Sulphur	not more than 0.050 per cent
Phosphorus	not more than 0.050 per cent
Manganese	not more than 1.50 per cent

Specification No. D.T.D. 89A calls for the following physical properties:

Tensile strength before welding, min.	100,800 lb. per sq. in.
Yield stress before welding, min....	89,600 lb. per sq. in.
Tensile strength after welding, min..	67,200 lb. per sq. in.
Yield stress after welding, min.....	56,000 lb. per sq. in.

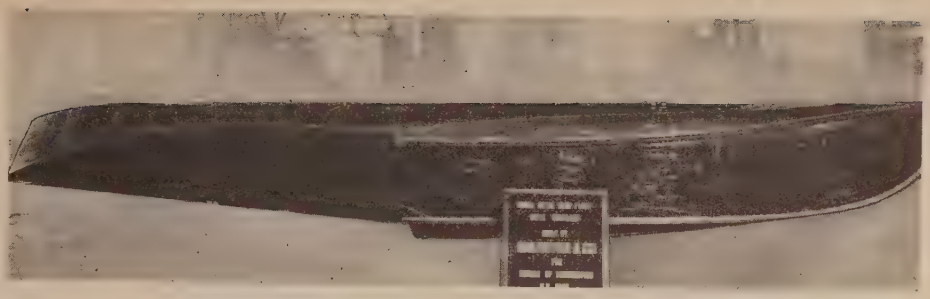
Specification No. D.T.D. 113 calls for the following physical properties:

Tensile strength before welding, min.	78,400 lb. per sq. in.
Yield stress before welding, min.....	67,200 lb. per sq. in.
Tensile strength after welding, min..	67,200 lb. per sq. in.
Yield stress after welding, min.....	56,000 lb. per sq. in.

This contrasts with the S.A.E. 4130X minimum ultimate strength of 55,000 lb. and yield point of 36,000 lb., as mentioned in your publication.

British aircraft engineers and metallurgists with whom I have talked pointed out the much higher yield point required by the British Air Ministry specifications, and also the much higher yield point obtainable by the use

AIRPLANE Float of Monel Metal and Monel Rivets



of this 1.50 per cent manganese tubing. They also claim that with the high manganese tubing there is no tendency to air harden at the weld as is the case with the chrome molybdenum specification, thereby causing brittleness in the joints.

It would seem that in the matter of aircraft tubing the British are more exacting than are our own people; and if these British specifications are of interest to any aircraft engineers we should be glad to supply them.

Metals Used in Airplane Construction

To the Editor: I read with considerable interest the very excellent article "Metals Used in Airplane Making" appearing in THE IRON AGE for July 25. I believe it would be of interest to add to the comprehensive list of metals discussed therein, the following additional metals and general observations:

Stainless steels, particularly of the non-magnetic type, are finding an ever increasing application in aircraft. These are highly desirable not only because of their corrosion resisting properties, but because where earth inductor compasses are installed the non-magnetic feature is highly desirable. They are applicable to all uses to which steel is applied in aircraft, and most recently they have been used for manufacturing airplane ribs by special brazing and welding processes. They are, of course, extensively used in British airship R 101.

Monel metal, 69 per cent nickel, 28 per cent copper, 2 per cent iron and 1 per cent manganese, silicon and carbon, though a heavy metal, combines strength with inherent resistance to corrosion—an important feature. Monel metal floats recently built do not exceed the weight of analogous duralumin floats by 10 per cent. It has been used for many other parts, and while still highly experimental in aeronautical applications, its use is being watched with keen interest.

Copper is used in sheet form for gas and oil tanks, radio bonding, radiator shells, shims and washers, and flashing on wooden hulls and floats. In tube form it is used for gas, oil and water lines, radiator cores and heater coils. For fuel systems it is rapidly regaining favor over the lighter aluminum and duralumin tubing. As wire, it is used for ignition, radio and lighting wires, for bonding and for safety wire. Of the many alloys, brass, bronze, etc., it will perhaps suffice to say that their employment in aircraft is analogous to their use in other products.

In considering the relative merits of materials of construction for aircraft use, the most important factor is the strength-weight ratio. The accompanying table gives the strength-weight ratio of some of the aircraft materials:

STRENGTH-WEIGHT RATIO OF AIRCRAFT MATERIALS

Material	Ultimate Tensile Strength, Lb. per Sq. In.	Specific Gravity	Index T. S. / S. G. x 1000
Music wire (0.01 in. dia.)	400,000	7.85	51.2
Alloy steel (extra high strength)	200,000	7.85	25.6
Magnesium alloy	34,000	1.75	19.4
Duralumin	55,000	2.85	19.3
Balsa wood	(Comp.) 2,200	.12	18.3
Alloy steel (heat treated—generally used)	125,000	7.85	15.9
Monel metal (hard)	127,000	8.8	14.4
Spruce	(Comp.) 4,300	.46	9.8
Monel metal (annealed)	82,000	8.8	9.3
Mild carbon steel (normalized)	55,000	7.85	7.0
Aluminum	18,000	2.7	6.7

Philadelphia.

Concrete Reinforcing Bars Tested

TO find a method of making the cold-bend test of uniform severity for concrete reinforcing bars of all sizes and degrees of hardness, and to find an impact test suitable for detecting brittleness in such bars, a series of tests have been made at the Bureau of Standards.

A standard test for quality of concrete reinforcing bars consists in bending the bars, without heating, through 90 to 180 deg. with a radius of bend equal to one, two or three diameters of the bar. The angle and radius of the bend depend generally upon the size and hardness of the bar. The differences in the angle and radius of the bend required for different types of bars cause differences in the severity of the tests applied to them. Thus the tendency is to suit the specification to what the bars of different grade will meet successfully, rather than to the service demanded of them in bending for use as reinforcement.

In the tests made by the Bureau of Standards, on bars purchased in the open market, it was desired to find out also whether the application of the cold-bend test might impair the tensile strength, although the bar did not fail in the bend test. Cold-bend tension and impact tests were made. The cold-bend tests were made by the standard methods and by means of an improved machine designed and built at the bureau.

Bars that did not break in the cold-bend test were not seriously affected as to strength by the bending. With the special bending machine used, all bars, regardless of their size, appeared to undergo about the same strain when bent through the same angle. The apparent yield point in the bending test was made higher than the yield point determined in direct tension test.

While the impact test used gave an approximate measure of the yield point of the bar, none of the bars broke in the impact test except a few which had been quenched in water from a high temperature.

New July Record in Iron Output

Daily Rate Less Than June by 1808 Tons or 1.5 Per Cent—New Seven Months' Record —Net Loss of Two Furnaces

A NEW record for pig iron production in July was made this year. Complete returns from every furnace show that the output was 122,100 tons per day. The next largest July was 118,656 tons daily in 1923. Compared with June, the July production fell off nearly 1.5 per cent. It was about 2.9 per cent under the record month in May.

Total output in July was 3,785,120 gross tons or 122,100 tons per day for the 31 days, compared with 3,717,225 tons or 123,908 tons per day for the 30 days in June. The June data are revised because telegraphic reports on July 2 were not in all cases complete. The July output shows a loss of 1808 tons per day from June or 1.46 per cent.

A New Seven Months' Record

For the seven months to Aug. 1, the production was 25,426,080 tons, which is a record. The best previous similar period was to Aug. 1, 1923, when the total was 24,519,868 tons. The war record for the first seven months was 21,423,660 tons in the year 1918.

Rate of Operation on Aug. 1

On Aug. 1 there were 216 furnaces blowing with an estimated operating rate of 121,965 tons per day. On July 1, according to revised data, there were 218 furnaces operating with an estimated operating rate of 122,590 tons each day. Only three

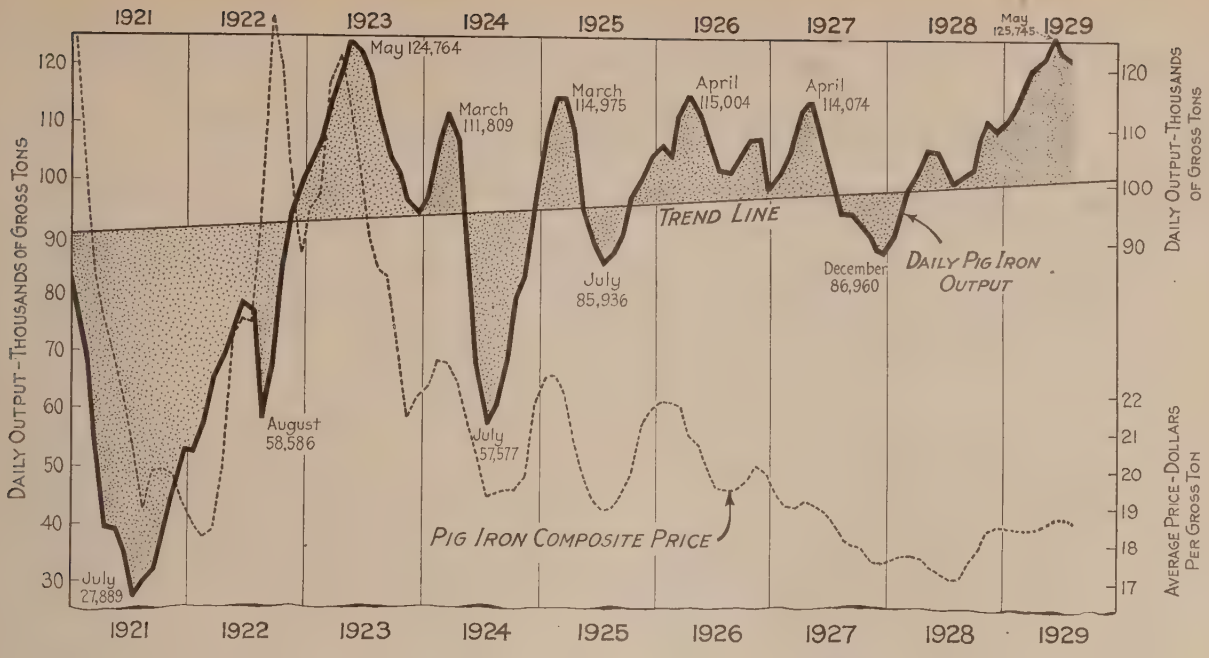
*These totals do not include charcoal pig iron. The 1928 production of this iron was 142,960 gross tons.



Production of Pig Iron in July Represented an Average Output per Furnace Close to 565 Tons

Inclined line represents the gradually increasing theoretical needs of the country, ascertained by a balancing of the ups and downs in production. It shows an average yearly increase in consumption of about 423,000 tons

furnaces were blown in during July while five were shut down.

No furnaces were blown in or blown out by the Steel Corporation last month, but independent steel companies blew in two and shut down three. There was one merchant stack blown in and two were blown out or banked. Thus the month's net loss was one steel-making and one merchant furnace.

Loss in Steel-Making Iron

There was a loss in the production of steel-making iron last month and a slight gain in merchant iron. The loss in steel-making iron was 1959 tons per day from June while the gain in merchant was 141 tons in the daily rate.

Second Largest Ferromanganese Output This Year

Production of ferromanganese at 31,040 tons was smaller than the 33,363 tons made in June, which was a record for many months. The July output was the second largest this year. The spiegeleisen output was normal.

Furnaces Blown In and Out

Only three furnaces were blown in during July: No. 2 Monessen furnace of the Pittsburgh Steel Co. in the Pittsburgh district, the Martins Ferry furnace of the Wheeling Steel Corporation in the Wheeling district, and the Globe furnace in southern Ohio.

Five furnaces were blown out or banked during July: One furnace at the Steelton plant of the Bethlehem Steel Corporation in the Susquehanna Valley, the Colonial furnace in western Pennsylvania, one Ashland furnace of the American Rolling Mill Co. in Kentucky, the Claire furnace in the Shenango Valley, and No. 1 LaBelle furnace of the Wheeling Steel Corporation in the Wheeling district.

Sale of Commonwealth Steel Co. Formally Closed

The sale of the Commonwealth Steel Co., Granite City, Ill., to the General Steel Castings Co., Philadelphia, has been formally closed. Deeds convey the Commonwealth properties to the Philadelphia corporation through an intermediary, John J. Dooher, a Commonwealth employee.

Sales department of Page Steel & Wire Co., Bridgeport, Conn., has been moved from Bridgeport to American Bank Building, Pittsburgh. Sales of chain link fence will be handled by R. T. Teeple, and field fence and general wire products by S. B. Cairns. Welding wire and specialties will be under direction of J. J. Flaherty. W. T. Kyle, general manager of sales, will be located in New York Central Building, 230 Park Avenue, New York.

Iron and Steel Markets

Rate of Pig Iron Production Dips

July Total Shows Gain, But Daily Average Declines 1.46 Per Cent From That of June—Smaller Steel Producers Curtail Operations

PIG iron production in July, at 3,785,120 tons, exceeded that of June by 67,895 tons, and was the third largest monthly total on record, being surpassed only by the figures for May, 1929, and May, 1923. However, the July daily rate of output, 122,100 tons, ranks fifth, having been exceeded by the months mentioned and by June, 1923, and June, 1929. The decline from the previous month, this year, was 1808 tons, or 1.46 per cent. The loss was entirely in steel making pig iron, the rate for merchant iron having shown a slight gain.

Pig iron production thus far this year, at 25,426,080 tons, has established a new seven months' record, surpassing the previous high mark, for the corresponding period in 1923, by nearly 4 per cent.

Continued high output this month is indicated by the rate at which the 216 furnaces in blast were operating on Aug. 1, namely 121,965 tons a day, or only 135 tons below the actual average production through July.

August production of steel seems to be pointed toward a decline of possibly 5 or 10 per cent from the recent high rate. Thus far makers of a wide range of products have been able to allocate tonnage among their various finishing departments in such a manner as to utilize their full ingot capacity, and there are indications that replenishment of reserve stocks of semi-finished steel will be a factor in sustaining their output through the remainder of the month. Such a move would place them in a position to take advantage of improved business in September and, at the same time, would permit them to continue to reap the economies accruing from peak operations.

Actual reductions in steel output to date have been confined to smaller companies specializing in a few finished products. Shifts in demand are less serious for producers making a diversity of finished materials, since a decline in business in one direction is frequently offset by a gain in another. The Steel Corporation, for example, continues to operate at virtually 100 per cent of capacity and its total backlog is still large.

Unquestionably buyers are ordering at closer range than earlier in the year. In fact, Pittsburgh reports that business in hot-rolled strip, tin plate, and cold-finished and alloy steel bars is again on a hand-to-mouth basis. This change in buying practice does not necessarily presage any marked change in operations or in the volume of consumption. Moreover, extended deliveries are still the rule on some of the heavier products, notably on plates, and in the Chicago district, favored by steel pipe and railroad car business, mill commitments seem headed for another period of expansion. The week's steel specifications at Chicago were the largest since late in April.

Railroad buying is featured by the placing of 30,000 tons of rails by the New York, New Haven & Hartford. The Chicago, Milwaukee, St. Paul & Pacific has entered the market for 1000 gondola cars, and the Pacific Fruit Express, for 500 refrigerator cars, raising the total of pending inquiries to 5000 cars, of which 4500 are freight and 500 passenger cars. The Pennsylvania Railroad will open bids Aug. 16 on 29,000 tons of plates, shapes and bars. Two Lake boats, placed by the Steel Corporation, call for 10,000 tons of plates and shapes.

Automobile production this month, judging by the announced schedules of motor car plants, will be larger than in July, but it is not expected to get back into full swing before October.

Fabricated steel awards, totaling 34,000 tons, are on a par with those of the previous week, and fresh inquiries aggregate 35,000 tons. The amount of pending work in the East is estimated as the largest on record.

Prices on wire nails have generally declined to $2.55 a keg, Pittsburgh or Cleveland, a recession of $3 a ton from the recent quotation of $2.70. Barbed wire has gone down in sympathy with nails, and in the New York district, plain wire has been sold at $2.40 a 100 lb., Pittsburgh, a concession of $2 a ton. On galvanized sheets 3.50c. a lb., Pittsburgh, is now the recognized market, a reduction of $2 a ton, and irregularities are reported on blue annealed and black sheets. On the other hand, several makers of cold-rolled strip have announced advances of $2 a ton to 2.85c. a lb., Cleveland or Pittsburgh.

Pig iron buying is not particularly active, but furnace shipments to foundries are keeping up at a good rate, with increased demand from makers of heating equipment tending to offset, in part, the reduced requirements of the automotive industry. Southern producers have sold 35,000 tons in the St. Louis district in the past month, but an eastern Pennsylvania steel plant which recently bought a barge load of Alabama iron, has divided an order for 18,000 tons of basic among nearby furnaces.

Domestic sales of copper, amounting to 30,000 tons for the week, were the largest since mid-March. Foreign orders for 12,000 tons were the best in several months. Consumers have been forced to come into the market after failing to break the price, which has remained at 18c., delivered Connecticut Valley.

THE IRON AGE pig iron composite price is again where it was two weeks ago, having advanced 4c. to $18.42 a gross ton. The finished steel composite remains at 2.412c. a lb.

On export business there are frequent variations from the above prices. Also, in domestic business, there is at times a range of prices on various products, as shown in our market reports on other pages.

Pittsburgh

Demand on Most Products Declining Gradually and Smaller Companies Curtailing Operations—Some Price Weakness

PITTSBURGH, Aug. 6.—As the steel industry enters August, it becomes more and more evident that if operations are maintained at the recent high rate throughout this month it will be principally because the larger integrated companies wish to replenish reserve stocks of steel, which have been reduced to a minimum during the last two or three months.

Smaller companies in this and nearby districts have taken out open-hearths in the last week and further intrenchment is indicated by the slowing down of finishing mills. In spite of this the largest interests in the district are maintaining recent high operating rates and at present plan no curtailment during August. This may be partially explained by the fact that the makers of a wide range of products are able to utilize their full output by a careful allocation of tonnage. On the other hand, it is much more likely that a part of the August output of semi-finished steel will be used in building up reserve stocks of this material. This plan would allow steel makers to continue to profit by high and consequently economic operations during a short period of slightly reduced demand and would also place them in an advantageous position in the case of improved business during September.

Specifications on most products are still declining gradually. Notable exceptions are sheets and plates, while a better demand for cold-rolled strip has recently developed. Backlogs are dwindling and tonnage currently released is not sufficient to sustain present rolling schedules in some departments. In hot-rolled strip, tin plate, and cold-finished and alloy steel bars business has already been reduced to a hand-to-mouth basis, and operating schedules have been tapering slightly for some time. As this tapering began from a capacity rate, the total loss in production has had only a negligible effect on the district's total steel output.

Slightly lower schedules in the heavier products, such as bars and shapes, would have a much greater influence and the completion of rail rollings in the next few weeks will release additional steel tonnage for use elsewhere. Pipe operations show improvement and consistent pushing of plate capacity has not resulted in much better deliveries.

Price weakness persists in some lines despite a firmer stand on the part of leading makers. A price of 3.50c., Pittsburgh, on galvanized sheets, which was formerly made only to jobbers, is now becoming more common on other business. Other grades of sheets show a somewhat firmer tendency and concessions on cold-rolled strip are no longer reported. Following several weeks of continued weakness, wire nails are now quotable at $2 under recent levels. Barbed wire is similarly lower, but manufacturers' wire is holding at recent levels with the help of a rather strong demand.

Pig Iron.—Buyers in this district are still placing occasional small orders for iron to carry them through

August, and no additional activity is expected before September. The last month of the quarter, however, will find consumers with little if any iron on contract, and substantial tonnages are expected to be placed at that time for consumption during the closing months of the year. The fact that foundry operations during the last quarter are still a matter of considerable conjecture has prompted buyers to take a rather cautious stand, and there is nothing in the present situation which indicates any advance in price. It is also unlikely that there will be any shortage of iron at that time. Furnace stocks are now at probably the low point of the year, but present shipments are no longer keeping pace with production at a number of furnaces. Malleable foundries in this district are more active than others and some sellers are picking up a fair tonnage of this grade in small orders. Foundry iron shipments are probably not so heavy as they were a month ago, but there has been no check in the movement of basic iron to steel plants and steel foundries. Prices are unchanged, with foundry and basic at $18.50, Valley, and malleable and Bessemer at $19. The local furnace is quoting prices 50c. higher on all these grades. The Cherry Valley furnace of the Davison Coke & Iron Co. was blown in on Aug. 5.

Prices per gross ton, f.o.b. Valley furnace:

Basic	$18.50
Bessemer	19.00
Gray forge	18.00
No. 2 foundry	18.50
No. 3 foundry	18.00
Malleable	19.00
Low phos., copper free	27.00

Freight rate to Pittsburgh or Cleveland district, $1.76.

Prices per gross ton, f.o.b. Pittsburgh district furnace:

Basic	$19.00
No. 2 foundry	19.00
No. 3 foundry	18.50
Malleable	19.50

Freight rates to points in Pittsburgh district range from 63c. to $1.13.

Semi-Finished Steel.—Billet and blooming mills in this territory are still being operated at close to capacity and raw steel is not being accumulated at any point in the district. However, the supply is now well adjusted to the demands of finishing mills, and consuming departments are no longer having the difficulties which they experienced earlier in the year of having sufficient steel from a tonnage standpoint, but not of the proper specifications. Increasing pipe operations are keeping up the demand for Bessemer steel and although production is not so high as it was two months ago, when substitutions for open-hearth steel were frequent, the output is entirely in line with the correspondingly high open-hearth production. Sales of small tonnages of billets, slabs and sheet bars are being made at $35, Pittsburgh or Youngstown, and although a few large buyers of billets and slabs are reported to have been able to extend their second quarter contracts into this quarter without an advance in price, no recent transactions have been made at less than the quoted market. Wire rods are not quite so active as they were a month ago, but are going to makers of manufacturers' wire at an undiminished rate. The price is well established at $42, Pittsburgh or Cleveland. Skelp is unchanged at 1.85c. to 1.90c. per lb., Pittsburgh, and occasional spot sales are being made.

Bars, Shapes and Plates.—Current demand for plates shows no recession from the high rate which has prevailed for several months and ability to make shipments continues to be the deciding factor in the placing of business. None of the mills in this district is able to make shipment on any sizable tonnage in less than six weeks. Demand from nearby consumers is all that could be expected and regular customers of local mills are generally being taken care of. It is likely that much of the prospective business for which delivery is so urgent comes from other districts and is quite likely offered to several mills in an effort to get prompt shipments. This might give the market a misleading aspect, but it cannot be denied that the bulk of the business in this district is based upon the immediate needs of consumers and is going directly into consumption. Bars and shapes are moving fairly well, but August business is expected to show a slight decline from July. This will be true in spite of the fact that current specifications have changed little in the last few weeks, but backlogs as of July 31 were not so large as they were on the first of the month. No large structural projects have come out in the last week, but there is still a comfortable volume of work in prospect and large fabricating shops have considerable backlogs. Prices are holding at 1.95c., Pittsburgh, on bars, shapes and plates.

Wire Products.—Shipments of manufacturers' wire during July were ahead of June with some makers, and generally showed an increase over July of last year. The first days of the new month brought little change in the volume of specifications, although there are indications that the automobile industry will take less material in August than in preceding months. Agricultural wire products are quiet and weakness in barbed wire is recognized in lower prices. Galvanized barbed wire is now quotable at 3.20c. to 3.30c. per lb., Pittsburgh, with mills holding to the higher figure on small orders. Shading of wire nail prices, long prevalent in the Ohio River territory, has also become more common in the immediate Pittsburgh district, and although mills still quote a base price of $2.65 per keg, the actual market is better represented by a range of $2.55 to $2.65. Galvanized and cement coated nails and staples are also correspondingly weaker.

Tubular Goods.—No large lettings have been reported last week, but prospective projects are being watched carefully by local mills, with early action anticipated on at least one large pipe line. Oil country demand is holding at recent levels and the recent agreement to hold up drilling operations in the Kettleman Hills field of California until 1931 is expected to have a favorable influence on the oil industry. Demand from the automobile industry for mechanical tubing has declined, but a resumption is expected in a few weeks. Other users of mechanical tubing have not reduced their specifications and boiler tubes are moderately active.

Sheets.—The sheet market shows no further weakness except on galvanized

The Iron Age Composite Prices

Finished Steel

No. 28, f.o.b. Pittsburgh	4.10c.

Long Ternes

No. 24, 8-lb. coating, f.o.b. mill	4.00c.

Vitreous Enameling Stock

No. 24, f.o.b. Pittsburgh	3.90c.

Tin Plate

	Per Base Box
Standard cokes, f.o.b. P'gh district mills	$5.35
Standard cokes, f.o.b. Gary	5.45

Terne Plate

(*F.o.b. Morgantown or Pittsburgh*)
(Per Package, 20 x 28 in.)

8-lb. coating I.C.	$11.20
15-lb. coating I.C.	14.00
20-lb. coating I.C.	15.30
25-lb. coating I.C.	$16.70
30-lb. coating I.C.	17.75
40-lb. coating I.C.	19.85

Alloy Steel Bars

(F.o.b. makers' mill)

Alloy Quality Bar Base, 2.65c. to 2.75c. per Lb.

S.A.E. Series Numbers		Alloy Differential
2000	(½% Nickel)	0.25
2100	(1½% Nickel)	0.55
2300	(3½% Nickel)	1.50
2500	(5% Nickel)	2.25
3100	Nickel Chromium	0.55
3200	Nickel Chromium	1.35
3300	Nickel Chromium	3.80
3400	Nickel Chromium	3.20
4100	Chromium Molybdenum (0.15 to 0.25 Molybdenum)	0.50
4100	Chromium Molybdenum (0.25 to 0.40 Molybdenum)	0.70
4600	Nickel Molybdenum (0.20 to 0.30 Molybdenum, 1.25 to 1.75 Nickel)	1.05
5100	Chromium Steel (0.60 to 0.90 Chromium)	0.35
5100	Chromium Steel (0.80 to 1.10 Chromium)	0.45
5100	Chromium Spring Steel	0.20
6100	Chromium Vanadium Bars	1.20
6100	Chromium Vanadium Spring Steel	0.95
9250	Silicon Manganese Spring Steel (flats)	0.25
	Rounds and squares	0.50
	Chromium Nickel Vanadium	1.50
	Carbon Vanadium	0.95

Above prices are for hot rolled steel bars, forging quality. The ordinary differential for cold-drawn bars is ¾c. per lb. higher. For billets 4 x 4 to 10 x 10 in., the price for a gross ton is the net price for bars of the same analysis.

Billets under 4 x 4 in. carry the steel bar base. Slabs with a sectional area of 16 in. or over carry the billet price. Slabs with sectional area of less than 16 in. or less than 2½ in. thick, regardless of sectional area, take the bar price.

Rails

	Per Gross Ton
Standard, f.o.b. mill	$43.00
Light (from billets), f.o.b. mill	36.00
Light (from rail steel), f.o.b. mill	34.00
Light (from billets), f.o.b. Ch'go mill	36.00

Track Equipment

	Base per 100 Lb.
Spikes, ⅜ in. and larger	$2.80
Spikes, ½ in. and smaller	2.80
Spikes, boat and barge	3.00
Tie plate, steel	2.15
Angle bars	$2.75
Track bolts, to steam railroads	$3.80 to 4.00
Track bolts, to jobbers, all sizes, per 100 count	70 per cent off list

Welded Pipe

Base Discounts, f.o.b. Pittsburgh District and Lorain, Ohio, Mills

Butt Weld

Steel Inches	Black	Galv.	Iron Inches	Black	Galv.
⅛	45	19½	¼ and ⅜	+11	+36
¼ to ⅜	51	25½	½	23	5
½	56	42½	¾	28	11
¾	60	48½	1 and 1¼	31	15
1 to 3	62	50½	1½ and 2	35	18

Lap Weld

2	55	43½	2	23	9
2½ to 6	59	47½	2½ to 3½	28	13
7 and 8	56	43½	4 to 6	30	17
9 and 10	54	42½	7 and 8	29	16
11 and 12	53	40½	9 to 12	26	11

Butt Weld, extra strong, plain ends

⅛	41	24½	¼ and ⅜	+13	+48
¼ to ⅜	47	30½	½	23	7
½	53	42½	¾	28	12
¾	58	47½	1 to 2	34	18
1 to 1½	60	49½			
2 to 3	61	50½			

Lap Weld, extra strong, plain ends

2	53	42½	½	29	13
2½ to 4	57	46½	2½ to 4	34	20
4½ to 6	56	45½	4½ to 6	33	19
7 to 8	52	39½	7 and 8	31	17
9 and 10	45	32½	9 to 12	21	8
11 and 12	44	31½			

On carloads the above discounts on steel pipe are increased on block by one point, with supplementary discount of 5%, and on galvanized by 1½ points, with supplementary discount of 5%. On iron pipe, both black and galvanized, the above discounts are increased to jobbers by one point with supplementary discounts of 5 and 2½%.

Note.—Chicago district mills have a base two points less than the above discounts. Chicago delivered base is 2½ points less. Freight is figured from Pittsburgh, Lorain, Ohio, and Chicago district mills, the billing being from the point producing the lowest price to destination.

Boiler Tubes

Base Discounts, f.o.b. Pittsburgh

Steel		Charcoal Iron	
2 in. and 2¼ in.	40	1½ in.	1
2½ in.—2¾ in.	48	1¾ in.	8
3 in.	54	2 in.—2¼ in.	13
3¼ in.—3¾ in.	56	2½ in.—2¾ in.	16
4 in.	59	3 in.	17
4½ in. to 6 in.	48	3¼ in. to 3½ in.	18
		4 in.	20
		4½ in.	21

On lots of a carload or more, the above base discounts are subject to a preferential of two fives on steel and of 10 per cent on charcoal iron tubes. Smaller quantities are subject to the following modifications from the base discounts:

Lap Welded Steel—Under 10,000 lb., 6 points under base and one five; 10,000 lb. to carload, 4 points under base and two fives. Charcoal Iron—Under 10,000 lb., 2 points under base; 10,000 lb. to carload, base and one five.

Standard Commercial Seamless Boiler Tubes

Cold Drawn

1 in.	63	3 in.	48
1¼ to 1½ in.	55	3¼ to 3½ in.	50
1¾ in.	39	4 in.	53
2 to 2¼ in.	34	4½, 5 and 6 in.	42
2½ to 2¾ in.	42		

Hot Rolled

2 and 2¼ in.	40	3¼ to 3½ in.	56
2½ and 2¾ in.	48	4 in.	59
3 in.	54	4½, 5 and 6 in.	48

Beyond the above base discounts a preferential discount of 5 per cent is allowed on carload lots. On less than carloads to 10,000 lb. base discounts are reduced 4 points with 5 per cent preferential; on less than 10,000 lb., base discounts are reduced 6 points, with no preferential. No extra for lengths up to and including 24 ft. Sizes smaller than 1 in. and lighter than standard gage take mechanical tube list and discounts. Intermediate sizes and gages not listed take price of next larger outside diameter and heavier gage.

Seamless Mechanical Tubing

	Per Cent Off List
Carbon, 0.10% to 0.30%, base (carloads)	55
Carbon, 0.30% to 0.40%, base	50

Plus differentials for lengths over 18 ft. and for commercial exact lengths. Warehouse discounts on small lots are less than the above.

material. Now, however, the 3.50c., Pittsburgh, price to jobbers has been extended to other consumers in many cases. Some mills will not take business at less than 3.60c., and this figure is still representative of the general market. Sales to jobbers at less than 3.50c. are confined to the South, where chaotic price conditions have existed for some time. On black sheets the market seems to have achieved a degree of stability at 2.85c., Pittsburgh, and an advance on fourth-quarter business seems likely. Blue annealed light plates are weak in competition with wide strip, although jobbing mills are so well supplied with business that they are regularly refusing orders at less than 2.20c., Pittsburgh. Shading of the 2.35c., Pittsburgh, price on blue annealed, No. 13 gage, is not reported in this district. Sheet mills in the Pittsburgh, Ohio River and Youngstown districts are generally scheduled at capacity through August and well into September on some finishes. The leading interest has scheduled its mills at 97 per cent of theoretical capacity this week, as against 98 per cent last week, with a scarcely perceptible reduction in backlogs. A strong demand for metal furniture sheets is reported with a price of 4.20c., Pittsburgh, ruling on new business. Shipments of automobile body sheets have declined in the last two weeks and a still greater decrease is expected preparatory to the introduction of new models.

Tin Plate.—The tin plate market shows little change, with current specifications against September tonnage sufficient to maintain mill operations at about 90 per cent of capacity. One or two of the independent companies are at a higher figure. Any change in this situation is expected to be on the side of a decrease, as the tin plate industry operates far enough ahead of consumption to have taken care of the larger requirements of the container manufacturers before the end of the summer.

Strip Steel.—Specifications for cold-rolled strip have been somewhat heavier in the last week and the market has also developed a better tone with regard to price. Mills of several producers are scheduled at close to capacity throughout August and if demand continues to improve larger backlogs will begin to accumulate before the end of the month. No recent concessions from the 2.75c., Pittsburgh or Cleveland, price have been reported and mills are again attempting to get 2.85c. on small tonnages. The hot-rolled strip business continues quiet. Operations are on a hand-to-mouth basis and demand is spotty. Quoted prices are holding, with material 6 in. and narrower at 2c., Pittsburgh, and the wider sizes at 1.90c.

Cold-Finished Steel Bars.—July business was about equal to June with most makers and some of them report a slight improvement in specifications in the last week. Shipments to the automotive industry have declined, but Detroit offices of local companies bear out the impression of the trade that a heavier demand from this source may be expected before the end of the month. Makers of agricultural implements served by Pittsburgh mills have maintained high summer schedules and heavier demand from the automobile industry will offset a seasonal decline from the former channel. Prices are holding satisfactorily at 2.30c., Pittsburgh.

Coal and Coke.—The coke market is still very quiet, with business confined entirely to small lot purchases, which add little to the schedules of ovens. In the Connellsville district beehive production is being maintained at a high rate for this time of the year, but demand is hardly equal to operations, particularly in the case of independent companies. Anticipation of heavy fall business is maintaining the price of furnace coke at $2.75 to $2.85 per net ton, Connellsville. Foundry coke is also quiet and prices are weak. Only the premium brands are bringing the full quoted price. The coal market has not yet felt the beginning of fall demand and shows little improvement.

Old Material.—The scrap market has passed through a week of extreme lethargy, but the situation has developed no justification for lower prices. In fact, short shoveling steel turnings have been sold at $13.50, an advance of 50c. over previous transactions, and machine shop turnings are correspondingly higher. This is a further reflection of the strength in low-priced materials brought about by the high prices of the heavier grades of steel. The Pittsburgh situation is an unusual one, in view of the fact that both heavy melting steel and compressed sheets are equally strong, if not stronger, in the Youngstown district than they are in Pittsburgh. Dealers in Detroit have been paying as high as $15 for compressed sheets for shipment by water to eastern Lake ports. With freight rates to Youngstown and Pittsburgh of approximately $3.50 and $4 a ton, this steel could not be moved here at the price local mills paid for their last tonnages of compressed. Nevertheless, $18.50 remains the top of the market on the basis of actual sales and local consumers show no disposition to pay more. The closing tomorrow of the Pennsylvania Railroad list will probably give the scrap market a more definite position. The week preceding this letting is nearly always a quiet one, and in view of the difference of opinion as to what the current list will bring, there is no justification for changing the present quotation of $18.50 to $19 on heavy melting steel. Some dealers report that heavy melting can be bought at $18 and $18.25 for consumption in this district, but the more common prices seem to range from $18.50 to $18.75. Specialties continue strong with the supply very limited. The monthly list of the Norfolk & Western, which will close on Aug. 9, contains 4400 tons.

Warehouse Prices, f.o.b. Pittsburgh

	Base per Lb.
Plates	3.00c.
Structural shapes	3.00c.
Soft steel bars and small shapes	2.90c.
Reinforcing steel bars	2.75c.
Cold-finished and screw stock—	
Rounds and hexagons	3.60c.

Cupola Grades:	
No. 1 cast	15.00 to 16.00
Rails 3 ft. and under	20.00 to 21.00

Aetna-Standard Company Plans Expansion

YOUNGSTOWN, Aug. 6.—The Aetna-Standard Engineering Co., manufacturer of rolling mill equipment, plans to double its common stock, increasing authorized shares to 200,000 from 100,000. Part of the proceeds of this issue will be used to pay a stock dividend and the rest to provide funds for an expansion program. The company controls important patents in the manufacture of continuous mill equipment for producing sheets, strips and tin plate, and operates plants at Warren, Ohio, and Ellwood City, Pa.

Upset set screws	80, 10 and 5
Milled studs	70

Chicago

Sales Equal to Shipments, Which Are at Full Capacity—Prices on the Whole Steady

CHICAGO, Aug. 6.—Deliveries from Chicago steel mills promise to step forward as specifications for the week now closing total the largest since April 26. New sales are equal to shipments, which continue at full ingot capacity.

There are no outstanding sources of orders this week, both new purchases and releases coming from widely diversified industries and from a broad territory. Computations are complete on steel shipments in July and it has been found that that tonnage exceeded July, 1928, by 35 per cent. Corresponding increases were recorded in sales and specifications. This is significant, inasmuch as the end of April usually reflects a downward trend in the demand for steel, whereas this year ingot capacity has been fully engaged through the late spring and so far this summer.

One of the foremost light automobile manufacturers has reduced production schedules. This is reflected in lighter specifications for alloy steel bars. On the other hand, several makers are increasing the assembly of new models and larger quantities of steel are being used.

The railroad equipment market is on the mend as to fresh inquiries. The Chicago, Milwaukee, St. Paul & Pacific came into the market today for 1000 70-ton gondola cars, and 500 refrigerator cars will be bought by the Pacific Fruit Express.

Prices on the whole are steady. Plates, shapes and bars readily bring 2.05c. a lb., Chicago, and sellers are holding to current quotations on semi-finished steel, the supply of which is not freer than in recent weeks. Weakness continues in nails and jobbers in the local market are getting concessions on wire as well as on galvanized sheets.

Northern foundry iron quotations are steady at $20 a ton. Scrap quotations are unchanged, though sentiment among sellers is that higher prices are near at hand.

Pig Iron.—August shipments of Northern iron are running fully 5 per cent ahead of the rate in July. New sales are more active as many melters are covering for the remainder of the year. Several inquiries ranging from 500 tons to 2000 tons have come from Indiana buyers. It is estimated here that about 35,000 to 40,000 tons of boat iron has reached Chicago this year. This is said to be about equal to the total tonnage received in the entire season of navigation in 1928. Prices for Southern iron remain weak as sellers press to expand its use in this district. An order for Southern basic iron is said to have been duplicated in the St. Louis territory, where it is also reported that not less than 35,000 tons of Southern iron has been sold in the last month.

Prices per gross ton at Chicago:

N'th'n No. 2 fdy., sil. 1.75 to 2.25	$20.00
N'th'n No. 1 fdy., sil. 2.25 to 2.75	20.50
Malleable, not over 2.25 sil.	20.00
High phosphorus	20.00
Lake Super. charcoal, sil. 1.50	27.04
So'th'n No. 2 fdy. (all rail)	$19.51 to 20.51
Low phos., sil. 1 to 2, copper free	29.50
Silvery, sil. 8 per cent	29.79
Bess. ferrosilicon, 14-15 per cent	46.29

Prices are delivered consumers' yards except on Northern foundry, high phosphorus and malleable, which are f.o.b. local furnace, not including an average switching charge of 61c. per gross ton.

Ferroalloys.—A small resale lot of spiegeleisen has been sold in this district at $33 a ton, Hazard, Pa. On the whole this market is quiet, with shipments moving forward in satisfactory volume.

Prices delivered Chicago: 80 per cent ferromanganese, $112.56; 50 per cent ferrosilicon, $83.50 to $88.50; spiegeleisen, 19 to 21 per cent, $40.76.

Structural Material.—Fresh awards total 3500 tons, and new inquiries call for 6000 tons. Two new jobs are in prospect in Chicago, one being for 2500 tons for a chain of garages and the other an unstated tonnage for the 35-story Otis Estate office building. Little is known regarding the extension to the outer drive and the new bridge that is to span the mouth of the Chicago River except that designs are being prepared. The Cuneo Tower project has hit a snag because of opposition to the height of the outer walls up to the first setback. Competition remains keen for going tonnages and price levels are unchanged.

Mill prices on plain material, per lb.: 2.05c. base, Chicago.

Wire Products.—Specifications were heavier than in the previous week, largely because many jobbers are filling in stocks, which had been allowed to dwindle. Quotations on wire to the manufacturing trade, which is taking tonnages at a uniform rate, are steady, but jobbers in Chicago and to the south, notably St. Louis, are getting concessions on both wire and nails. Wire mill operations are holding at 65 per cent of capacity and at that rate stocks are expanding. For the country as a whole crops are reported to be in a better than average condition. Mill prices on wire and wire products are given on page 367.

Cold-Rolled Strips.—Prices are unchanged in a quiet market. Specifications on the whole are lighter, and operations are tending downward from the current rate of 70 per cent of capacity. In the absence of buying, except in small and scattered lots, producers' backlogs are shrinking.

Hot-Rolled Strips.—Operations in this district are near capacity and specifications are fully equal to shipments. Deliveries are at reasonably close range.

Rails and Track Supplies.—Rail mill operations remain steady, with schedules well set for August. Both new orders and fresh inquiries are limited to miscellaneous small lots. Definite word has not yet come from the Northern Pacific, which is expected to inquire for 15,000 tons. New business in track accessories totals 2500 tons. The end of the summer demand for these commodities is in sight and mills look for lighter production schedules at an early date. The light rail market is dull.

Prices f.o.b. mill, per gross ton: Standard section open-hearth and Bess. rails, $43; light rails, rolled from billets, $36. *Per lb.:* Standard railroad spikes, 2.80c.; track bolts with square nuts, 3.80c.; steel tie plates, 2.15c.; angle bars, 2.75c.

Cast Iron Pipe.—The market is more active, although little new business is developing in and near Chicago. The Great Northern is said to have placed 32,000 ft. of 10-in. pipe with an unnamed bidder, and James B. Clow & Sons have been awarded 125 tons of 4 to 24-in. pipe by Grand Rapids, Mich. The American Cast Iron Pipe Co. was successful bidder on a tonnage for Minneapolis. Peoria, Ill., is in the market for 500 tons of pipe and fittings for a sewage disposal plant, and Adrian, Mich., will buy 100 tons of 10 to 16-in. pipe. Several Western railroads have made purchases of small tonnages. Deliveries are prompt and prices are steady at $45.20 to $46.20 a ton, delivered Chicago, for 6-in. and larger diameter.

Prices per net ton, del'd Chicago: Water pipe, 6-in. and over, $45.20 to $46.20; 4-in., $49.20 to $50.20; Class A and gas pipe, $3 extra.

Sheets.—Buying for close-by needs continues brisk, and producers' books are growing at a rapid pace. Hot weather is having a telling effect on output, which for the week did not average above 80 per cent. This condition, plus the tight situation in sheets bars, is resulting in deliveries falling back, especially in the blue annealed product. Promises of shipments of light plates and blue annealed sheets are now beyond 12 weeks, while deliveries of galvanized and black sheets have advanced to a range of four to five weeks. Prices are less stable, with concessions being granted on galvanized sheets to be delivered in the South and Southwest and with local jobbers being able to get better than quoted prices on carloads of the galvanized and black grades. Distribution by the jobbing trade is heavy and this is reflected to the mills in large specifications.

Base prices per lb., deliv'd from mill in Chicago: No. 24 black sheets, 3.10c.; No. 24 galv., 3.85c.; No. 10 blue ann'l'd, 2.35c. Deliv'd prices at other Western points are equal to the freight from Gary, plus the mill prices, which are 5c. per 100 lb. lower than Chicago delivered prices.

Bars.—Both specifications and sales of mild steel bars are well above the weekly average to date this year and deliveries are slowly creeping forward. Forgers in the Chicago district are taking liberal quantities of bars, with their operations continuing near capacity. Pressure for steel by the agri-

cultural implement trade is not so severe as earlier in the year, though shipments from mills are somewhat larger as August gets under way. Specifications for alloy steel bars are lighter, following curtailment of output by one of the foremost makers of light motor cars. Demand from other users remains steady, and spot purchases are active at current quotations. Output averages a trifle above 70 per cent of capacity. Demand for iron bars from the railroads thus far this year has shown marked improvement over that of the first seven months of 1928. Specifications for rail steel bars are equal to production, with local mills on a double turn basis. Mill prices remain firm at 1.95c. a lb., Chicago Heights, and deliveries range from three to four weeks.

Reinforcing Bars.—Contracts for reinforcing bars have been fairly numerous in the last 10 days and, if releases come as expected by the trade, shop operations soon will be lifted above the current range of 60 to 70 per cent. Dealers expect prices to strengthen. This week gives no reflection of such a change, and it could not be made quickly because of outstanding quotations on a long pending list. Close to 450 tons has been ordered for a warehouse in Chicago. A commercial building will take 400 tons and a garage 250 tons. Sub-contractors are taking bids on reinforcing steel for a Jewel Tea Co. building at Barrington, Ill. There is still doubt whether this tonnage will be purchased by the general contractor or by a sub-contractor. Recent awards and new inquiries are given on page 386.

Plates.—Over 7000 tons of tank plates will be required in two orders for oil storage tanks which will be fabricated near Chicago for shipment to the South and to the Southwest. Tank builders in the Chicago district and in the Southwest are busy, with well balanced books, and specifications forwarded by them to local mills are in good volume. Pending tank jobs are in good number and well scattered over a wide territory. Shipments of plates to the Milwaukee pipe manufacturers are heavy. A local fabricator has ordered 1000 tons of plates for pipe and plate work in connection with a new blast furnace which was announced in the spring by the Wisconsin Steel Works. Deliveries on plates are again moving ahead under the influence of heavier specifications. The best promises that are now being made range from seven to eight weeks. The railroad car market is less active from the viewpoint of specifications against old orders, but there is greater promise that fresh purchases are not far in the future. The Pacific Fruit Express is inquiring for 500 refrigerator cars, and it is reported that a Western railroad will soon ask for prices on 1000 freight cars. It is computed here that replacements by private buyers and railroads have barely kept pace with the retirement of cars in the last three years. Many believe that greater efficiency in the use of equipment has not kept up with increases in the volume of freight. The movement of wheat from Kansas is unusually heavy and complaints concerning car service are reported. It is stated that the Santa Fe, Burlington, Chicago & North Western and the Illinois Central are among the Western railroads that may enter the market in the early fall.

Bolts, Nuts and Rivets.—Shipments of these commodities so far in August are running parallel with the rate in July. Specifications in recent days have been heavier, giving encouragement to the trade that demand will gain headway. Farm implement manufacturers are ordering cautiously but at a rate which indicates they are not far from capacity operations.

Coke.—The Chicago by-product foundry coke market is quiet except in the matter of shipments, which show no change from recent weeks.

Old Material.—Brokers are losing none of their bullish attitude, in spite of stiff resistance encountered from buyers. Sellers discount the statement of some large users that stock piles are ample, preferring to believe that many melters are leaning heavily on current shipments. At the moment incoming scrap is ample to meet the needs of buyers. However, there are persistent reports of round tonnages of manufacturers' scrap moving east from Michigan and of railroad scrap that is being diverted from Chicago to other producing centers. A reflection of the brokers' attitude is shown in their willingness to pay railroads as high as $16 a gross ton, delivered, for heavy melting steel, which, as gaged by the last prices paid by consumers, would go against orders at $15.25 a ton. This week a dealer has paid a railroad the equivalent of $19.70 a gross ton, delivered, for a tonnage of rerolling rails. This is $1.20 a ton above the price last paid by a consumer. On the whole, it may be said that brokers' bids for railroad items are 50c. to 75c. a ton above quotations on the last consumer sales.

Warehouse Prices, f.o.b. Chicago

	Base per Lb.
Plates and structural shapes	3.10c.
Soft steel bars	3.00c.
Reinforc'g bars, billet steel	2.15c. to 2.35c.
Reinforc'g bars, rail steel	1.85c. to 1.95c.

Prices deliv'd Chicago district consumers:

	Per Gross Ton
Basic Open-Hearth Grades:	
Heavy melting steel	$14.75 to $15.25
Shoveling steel	14.75 to 15.25
Frogs, switches and guards, cut apart, and misc. rails	16.50 to 17.00
Hydraul. compressed sheets	13.00 to 13.50
Drop forge flashings	10.50 to 11.00
No. 1 busheling	13.00 to 13.50
Forg'd cast and r'l'd steel carwheels	18.50 to 19.00
Railroad tires, charg. box size	18.50 to 19.00
Railroad leaf springs cut apart	18.50 to 19.00
Acid Open-Hearth Grades:	
Steel couplers and knuckles	16.75 to 17.25
Coil springs	19.00 to 19.50
Electric Furnace Grades:	
Axle turnings	14.50 to 15.00
Low phos. punchings	16.50 to 17.00
Low phos. plates, 12 in. and under	16.50 to 17.00
Blast Furnace Grades:	
Axle turnings	10.75 to 11.25
Cast iron borings	9.75 to 10.25
Short shoveling turnings	9.75 to 10.25
Machine shop turnings	7.00 to 7.50
Rolling Mill Grades:	
Iron rails	16.00 to 16.50
Rerolling rails	17.50 to 18.00
Cupola Grades:	
Steel rails less than 3 ft.	17.75 to 18.25
Steel rails less than 2 ft.	18.25 to 18.75
Angle bars, steel	17.00 to 17.50
Cast iron carwheels	14.00 to 14.50
Malleable Grades:	
Railroad	16.75 to 17.25
Agricultural	15.50 to 16.00
Miscellaneous:	
*Relaying rails, 56 to 60 lb.	23.00 to 25.00
*Relaying rails, 65 lb. and heav.	26.00 to 31.00
	Per Net Ton
Rolling Mill Grades:	
Iron angle and splice bars	15.00 to 15.50
Iron arch bars and transoms	21.00 to 21.50
Iron car axles	26.00 to 26.50
Steel car axles	16.50 to 17.00
No. 1 railroad wrought	13.50 to 14.00
No. 2 railroad wrought	13.00 to 13.50
No. 1 busheling	9.00 to 9.50
No. 2 busheling	7.00 to 7.50
Locomotive tires, smooth	14.50 to 15.00
Pipes and flues	10.00 to 10.50
Cupola Grades:	
No. 1 machinery cast	14.50 to 15.00
No. 1 railroad cast	13.75 to 14.25
No. 1 agricultural cast	13.25 to 13.75
Stove plates	12.25 to 12.75
Grate bars	11.75 to 12.25
Brake shoes	10.50 to 11.00

*Relaying rails, including angle bars to match, are quoted f.o.b. dealers' yards.

Advances in Detroit Scrap

DETROIT, Aug. 6.—Curtailed automobile production is reflected in the market on waste material, in that heavy melting and shoveling steel advanced 25c. a ton, long turnings 50c., and hydraulic compressed and flashings, 25c. There have been some sales to mills and furnaces, with the result that the market is strong.

Dealers' buying prices per gross ton, f.o.b. cars, Detroit:

Hvy. melting and shov. steel	$14.25 to $14.75
Borings and short turnings	9.00 to 9.50
Long turnings	8.50 to 9.00
No. 1 machinery cast	12.50 to 13.00
Automobile cast	13.00 to 13.50
Hydraul. comp. sheets	14.00 to 14.50
Stove plate	9.00 to 9.50
New No. 1 busheling	12.50 to 13.00
Old No. 1 busheling	11.00 to 11.50
Sheet clippings	8.75 to 9.25
Flashings	13.00 to 13.50

New York

Record Amount of Structural Steel Work Pending— Pig Iron Prices Are Steadier

NEW YORK, Aug. 6.—Pig iron sales continue in fair volume, totaling 11,000 tons for the week. While buyers are still rather apathetic, sellers are succeeding in booking considerable business by thoroughly canvassing the trade. Prices are tending toward greater strength, with $18, base Buffalo, or the equivalent, more frequently the minimum quotation available on foundry grades. Relatively little Alabama iron is reported sold, but the fact that lower rail-and-steamer rates from Birmingham went into effect Aug. 1 may facilitate sales, particularly of smaller lots. These new rates, which are $5 a ton to Baltimore, $5.25 to Philadelphia, $5.50 to New York and $5.75 to Boston, are distinct from the rail-and-barge rates quoted on shipments via Norfolk, Va. The Eastern Malleable Iron Co., Naugatuck, Conn., is reported to have closed against its inquiry for 5000 tons of malleable. The American Tube & Stamping Co., Bridgeport, Conn., has been feeling out the market on basic and may inquire for as much as 5000 tons.

Prices per gross ton, delivered New York district:

Buffalo No. 2 fdy., sil. 1.75 to 2.25	$22.41 to $22.91
*Buf. No. 2, del'd east. N. J.	20.78 to 21.28
East. Pa. No. 2 fdy., sil. 1.75 to 2.25	20.89 to 22.02
East. Pa. No. 2X fdy., sil. 2.25 to 2.75	21.39 to 22.52

Freight rates: $4.91 from Buffalo, $1.39 to $2.52 from eastern Pennsylvania.

*Price delivered to New Jersey cities having rate of $3.28 a ton from Buffalo.

Warehouse Business.—Total business in July was less than in June, but considerably better than is usual at this season. There is a fair demand for structural material and sheets, but sheet prices, especially galvanized, are still subject to concessions of $1 to $2 a ton, and shading of prices on blue annealed sheets is general, concessions sometimes amounting to $4 and more a ton.

Cast Iron Pipe.—Prices continue irregular, with Northern makers of pressure pipe usually quoting from $32 to $33 per ton, f.o.b. foundry, although $31 a ton has not entirely disappeared. An exporter in New York is about to close on 300 tons of 18-in. water pipe for export to Hayti. The Texas Co., New York, is in the market for about 500 tons of large size pipe for shipment to Texas.

Prices per net ton deliv'd New York: Water pipe, 6-in. and larger, $33.60 to $34.60; 4-in. and 5-in., $36.60 to $37.60; 3-in., $43.60 to $44.60. Class A and gas pipe, $3 extra.

Reinforcing Bars.—Aside from 400 tons of bars for sewer work in the Bronx, awarded to the Kalman Steel Co., orders have consisted of small lots of less than 100 tons each. Seven hundred tons of bars for the Chevrolet assembly plant at Tarrytown, N. Y., are still pending. Prices are firm and unchanged.

Billet steel reinforcing bars in 40, 50 and 60-ft. lengths, 2.05c. per lb., Pittsburgh, and 2.30c. per lb., Pittsburgh warehouse, for cut lengths. Out of New York warehouse, 2.90c. per lb. for lots of 5 tons or more, 3.05c. for lots of 2 to 5 tons and 3.30c. for less than 2 tons, all delivered at job.

Finished Steel.—The contract for 250,000 tons of pipe for a gas pipe line to be built by Henry L. Doherty & Co., New York, has not yet been let, but early action is expected. The pipe line, which is to extend from the Texas Panhandle to communities in the Chicago district, may take as high as 275,000 tons. Structural steel awards in New York and vicinity have been unusually heavy, mostly for apartment houses and office buildings. The largest job, 6000 tons, was for the London Terrace apartments on West Twenty-third Street. Other outstanding bookings included 5000 tons for a telephone building on West Eighteenth Street, 3800 tons for an addition to Hell Gate power house and 2500 tons for New York Central car shops at Harmon, N. Y. The volume of pending work indicates that steel fabricators will be well engaged through the latter part of the year. In fact, fabricators agree that never before has there been so large an amount of inquiries as at present. Sheet steel makers say that buying has held up well, and deliveries range from four to six weeks, depending upon the grade of material. However, prices continue somewhat soft, especially in galvanized sheets, which have been sold to consumers in some cases at 3.50c., Pittsburgh. Large tonnages of galvanized are going into the South for roofing purposes and there concessions of $2 to $4 a ton have been made to obtain business. Black sheets are quoted at 2.85c. to 2.95c., and blue annealed appears firm at 2.25c. for No. 13 gage. Wire goods are weak, with plain wire selling as low as $2.40 per 100 lb., Pittsburgh. Wire nails also are being shaded and can be secured for $2.55 per keg, Pittsburgh, or less. Inquiries for well over 100,000 base boxes of tin plate are a feature of the foreign market. About 75,000 boxes is for delivery to Russia.

Mill prices per lb., deliv'd New York: Soft steel bars, 2.29c.; plates, 2.22½c.; structural shapes, 2.19½c.; bar iron, 2.14c.

Coke.—The market on both furnace and foundry coke continues steady and unchanged, with furnace grade quoted at $2.75 to $2.85 per net ton, Connellsville, and special brands of beehive foundry coke at $4.85 per net ton, ovens. Delivered prices of foundry coke are $8.56 per net ton, delivered to northern New Jersey, Jersey City and Newark and $9.44 to New York or Brooklyn. By-product coke is quoted at $9 to $9.40 a net ton, Newark or Jersey City, and $10.06, New York or Brooklyn.

Old Material.—No. 1 heavy melting steel is being bought at $16.25 per ton, delivered Claymont, Del., and $16.50

No. 2 cast (radiators, cast boilers, etc.)	14.50

Automobile Outlook

The automobile industry, according to *Automotive Industries*, has entered the second week in August with production at a rate which promises to show a total for the month well above that of August last year, when the factories in the United States and Canada turned out 492,543 cars and trucks. Several companies, which either have announced new models or are about to make such announcements, are resuming or contemplating comparatively high production schedules.

New car registrations in Detroit during the last few days in July spurted suddenly forward with the result that the total for the month was brought to a figure well above that of July last year despite less favorable outlook earlier in the month.

Although still quite heavy, new and used car stocks are declining, dealers report. Car stocks reached their peak in April, and have been showing a continued sharp decline since.

Cleveland

Steel Demand Drops Below July Rate, But Mills Have Heavy August Commitments

CLEVELAND, Aug. 6.—Demand for finished steel fell off in the past week, specifications for most products being light. However, July business with most mills was better than in June of this as well as in June of last year. While deliveries have further improved, mills are comfortably filled for August on nearly all products. Steel bars are considerably easier and buyers can now secure fairly prompt shipments. Deliveries on plates are still quite extended. Most of the sheet mills still have good backlogs, although some have nearly caught up on auto-body sheets. Mills are committed for several weeks on hot-rolled strip but some need cold-rolled strip tonnage.

Announced schedules by the automobile manufacturers indicate that the production of motor cars will be somewhat larger this month than in July, owing to the increasing production by two or three makers that have brought out new models. However, this industry is not expected to get back into full swing much before October. The Ford Motor Co. is continuing this month at the same production schedule it maintained in July.

Orders for two lake boats, each requiring 5000 tons of plates and shapes, have been placed by the Pittsburgh Steamship Co., subsidiary of the United States Steel Corporation. One will be built by the Toledo Shipbuilding Co. and the other by the Great Lakes Engineering Works.

Weakness in sheet prices has become more pronounced. On the other hand, some of the cold-rolled strip mills have advanced their price $2 a ton.

Pig Iron.—Sales gained somewhat in the past week, Cleveland interests disposing of 20,000 tons of foundry and malleable iron. Little interest is being taken in the fourth quarter, although a few of the sales were made for delivery extending over the remainder of the year. While shipments during July were slightly better than in June, they were not up to the May record. There has been some increase in the demand by stove and furnace manufacturers, which fact, to some extent, has offset the decrease in the melt by automobile foundries. With the expectation of increased activity by the automotive industry next month some predict that August foundry activities will be at the low point for the year. New inquiry is rather light. Among inquiries is one from a central Indiana melter for 1000 tons of foundry iron. The low price on Southern foundry iron has diverted to Southern furnaces a few lots of iron in southern Ohio. Prices are firm and unchanged at $18.50, Cleveland, for outside delivery, $19 for local delivery and $20, Lake furnace, for Michigan shipment. The market in Buffalo has a firmer tone, and it is claimed that $18 is now the minimum price Buffalo furnaces will quote on foundry iron for Eastern shipment. Pickands, Mather & Co. will blow out its B stack in Toledo Aug. 7 for relining.

Prices per gross ton at Cleveland:

N'th'n fdy., sil. 1.75 to 2.25		$19.50
S'th'n fdy., 1.75 to 2.25....	$20.00 to	20.50
Malleable		19.50
Ohio silvery, 8 per cent...		28.00
Basic Valley furnace.....		18.50
Stand. low phos., Valley..	26.50 to	27.00

Prices except on basic and low phosphorus are delivered Cleveland. Freight rates: 50c. from local furnaces; $3 from Jackson, Ohio; $6 from Birmingham.

Iron Ore.—Another record was broken in shipments of Lake Superior ore during July, when the water movement was 10,670,882 tons, an increase of 1,691,183 tons over the corresponding month last year. The previous high mark for July was in 1918, when shipments were 10,659,203 tons. The record for monthly shipments was made in August, 1926, when the movement was 10,709,260 tons. All records for corresponding months were also broken in April, May and June. The movement by water up to Aug. 1 was 32,910,820 tons, an increase of 9,635,996 tons over last year. This breaks all previous records, the largest movement to Aug. 1 in previous years being made in 1918, when the mines shipped 29,608,933 tons. With the record breaking movement during the first half of the season, shipments this year will probably be considerably heavier than was expected early in the year. Some estimates place the movement for the season at 65,000,000 tons, breaking the record of 1916, when the water movement amounted to 64,734,198 tons.

Semi-Finished Steel.—The leading local producer has caught up on deliveries to an extent that it can now make prompt shipment if desired, although it still has a two weeks' backlog. Specifications on contracts continue to come out in good volume. There is an absence of new inquiry.

Coke.—Foundry coke shipments show some falling off. New demand is very light. Some activity is developing in by-product foundry coke as dealers are starting to purchase for stocks. The price is unchanged at $4.50 per net ton, Ohio ovens, for egg coke. Ohio by-product foundry coke is quoted at $8.25, Painesville, for August shipment.

Strip Steel.—Several makers have advanced the price $2 a ton on cold rolled strip steel to 2.85c., Cleveland and Pittsburgh, and some announce that they will quote this price only to large buyers, asking 2.95c. for small lots. The advance cannot apply to much business during the present quarter, as most consumers are under 2.75c. contracts. Makers claim that

that price leaves too low a margin of profit. Fender stock remains unchanged at 4.25c. for No. 20 gage. Mills are getting a fair volume of specifications, but do not have much backlog. Most producers still have a good tonnage of hot rolled strip on their books and prices are firm at 1.90c., Pittsburgh, for wide strip and 2c. for narrow.

Steel Bars, Plates and Shapes.—Demand for steel bars has decreased considerably, owing largely to the slowing down of the automotive industry. Plates continue to move in good volume to manufacturing plants and tank fabricators. A local mill as well as some other mills is fully committed on plates for four weeks. Specifications for plain structural material from manufacturing plants are fair. The building field is quiet. Prices are steady at 1.90c. to 1.95c., Cleveland, for steel bars and 1.95c., Pittsburgh, for plates and shapes.

Sheets.—Specifications are rather light and most mills have made further reductions in their backlogs. While some mills have only enough orders for auto body sheets to keep them fully engaged for about two weeks most producers are committed through August or a little longer on all grades. An increase in demand is expected next month, as some consumers have already issued September releases. Prices show more of an irregular tendency. Galvanized sheets have been quoted to jobbers at 3.50c., Valley, or equivalent to 3.40c., Pittsburgh. There are reports of shading of common black sheets to 2.75c., Pittsburgh, to barrel manufacturers and concessions to 2.25c. are being made on blue annealed sheets carrying fair extras. Shading to 2.10c. on blue annealed light plates continues.

Wire Products.—Nail prices have become more irregular in some sections with reports of prices of $2.50 per keg or lower and some jobbers are reported to have become a disturbing factor by selling at prices lower than the regular mill prices. Plain wire and galvanized wire for manufacturing purposes are moving in full volume. Wire appears to be holding to regular quotations in this market.

Reinforcing Bars.—Inquiry is not active. The only award of any size during the week was 250 tons for an addition to the plant of the Richman Brothers Co., Cleveland. Prices are somewhat irregular.

Cold Finished Steel Bars.—Demand has slowed down sharply as some consumers have curtailed operations, owing to reduced business from the automotive industry, and others are cutting down their inventories.

Warehouse Business.—While business has been rather light so far this month, demand is about normal for this season. Jobbers are getting a fair volume of diversified orders from machine tool and equipment manufacturers. Business from the building field is rather light. Prices are firm.

Old Material.—Selected heavy melting steel scrap has advanced 50c. a ton, to $16 to $16.25, but the grade used by one Cleveland consumer has not changed. Compressed sheet steel and machine shop turnings have also advanced 50c. a ton. Blast furnace grades are slightly weaker, dealers paying $10.50 to $10.75 for this material. The local market continues very dull, as mills have large stocks and are still restricting shipments. The Valley market is firm. Dealers are paying $18.25 to $18.50 for No. 1 heavy melting steel and $17.50 to $18 for compressed sheet steel for Youngstown delivery.

Prices per gross ton delivered consumers' yards:

Basic Open-Hearth Grades:	
No. 1 heavy melting steel	$15.00 to $15.50
No. 2 heavy melting steel	14.50 to 15.00
Compressed sheet steel	15.00 to 15.50
Light bundled sheet stampings	12.00 to 12.50
Drop forge flashings	13.00 to 13.25
Machine shop turnings	9.50 to 10.00
No. 1 railroad wrought	13.50 to 14.00
No. 2 railroad wrought	16.00 to 16.50
No. 1 busheling	13.25 to 13.75
Pipes and flues	9.00 to 9.50
Steel axle turnings	12.50 to 13.00
Acid Open-Hearth Grades:	
Low phos., forging crops	17.75 to 18.00
Low phos., billet, bloom and slab crops	18.50 to 18.75
Low phos., sheet bar crops	18.00 to 18.50
Low phos., plate scrap	18.00 to 18.50
Blast Furnace Grades:	
Cast iron borings	10.50 to 10.75
Mixed borings and short turnings	10.50 to 10.75
No. 2 busheling	10.50 to 10.75
Cupola Grades:	
No. 1 cast	16.75 to 17.25
Railroad grate bars	11.00 to 12.00
Stove plate	12.00 to 12.50
Rails under 3 ft	18.50 to 19.00
Miscellaneous	
Railroad malleable	18.00 to 18.50
Rails for rolling	16.25 to 16.50

Warehouse Prices, f.o.b. Philadelphia

	Base per Lb.
Plates, ¼-in. and heavier	2.70c.
Plates, ⅜-in.	2.90c.
Structural shapes	2.70c.
Soft steel bars, small shapes, iron bars (except bands)	2.80c.
Round-edge iron	3.50c.
Round-edge steel, iron finished 1½ x 1½ in.	3.50c.
Round-edge steel, planished	4.30c.
Reinforc. steel bars, sq. twisted and deform.	2.60c. to 2.80c.
Cold-fin. steel, rounds and hex	3.60c.
Cold-fin. steel, sq. and flats	4.10c.
Steel hoops	3.55c.
Steel bands, No. 12 to ⅜-in. inclus.	3.30c.
Spring steel	5.00c.

Diam. pat. floor plates—	
¼-in.	5.30c.
⅜-in.	5.50c.
Rails	3.20c.
Swedish iron bars	6.60c.

*For 50 bundles or more; 10 to 49 bun., 4.10c. base; 1 to 9 bun., 4.35c. base.
†For 50 bundles or more: 10 to 49 bun., 4.95c. base; 1 to 9 bun., 5.30c. base.

Philadelphia

Steel Buying Shows Increase—Basic User Contracts With Eastern Pennsylvania Furnaces

PHILADELPHIA, Aug. 6.—The lull in steel buying which appeared toward the end of June shows evidence of having terminated with July and most mills have received an increased volume of specifications on current contracts during the past week. This increase in buying had not been generally expected for another fortnight or more, so that mills are generally beginning to look forward to the remainder of the year with optimism.

The Pennsylvania Railroad will open bids Aug. 16 on 20,000 tons of plates, 6500 tons of bars and 2255 tons of shapes.

A feature of the pig iron market is the purchase of a sizable tonnage of basic by a consumer in this district, all from eastern Pennsylvania furnaces in competition with sellers of Southern iron.

Pig Iron.—Eastern Pennsylvania furnaces are quoting foundry iron at $21 a ton, base, and occasionally shading this by 50c. a ton, when competition is encountered from Birmingham iron. The Lobdell Car Wheel Co., Wilmington, Del., has closed on about 200 tons of foundry iron with an eastern Pennsylvania furnace, although Birmingham sellers competed for the business. The American Brake Shoe & Foundry Co. is inquiring for a carload of foundry iron for its Baltimore plant, and the New York Air Brake Co., Watertown, N. Y., is in the market for a carload of foundry grade. In the past week a Coatesville, Pa., consumer of basic has closed on about 18,000 tons with three eastern Pennsylvania furnaces for delivery in August, September and October. Although the buyer had previously bought a barge cargo of Birmingham basic at a price said to have been $19.13 per ton, delivered, no further contract for Southern iron is reported to have been made by this buyer. The eastern Pennsylvania price is understood, however, to have been less than $20 a ton, delivered.

Prices per gross ton at Philadelphia:

East. Pa. No. 2, 1.75 to 2.25 sil.	$21.26 to $21.76
East. Pa. No. 2X, 2.25 to 2.75 sil.	21.76 to 22.26
East. Pa. No. 1X	22.26 to 22.76
Basic (del'd east. Pa.)	19.75 to 20.25
Gray forge	20.00 to 20.50
Malleable	21.25 to 21.75
Stand. low phos. (f.o.b. N. Y. State furnace)	22.00 to 23.00
Cop. br'g low phos. (f.o.b. furnace)	23.50 to 24.00
Va. No. 2 plain, 1.75 to 2.25 sil.	24.04
Va. No. 2X, 2.25 to 2.75 sil.	24.54

Prices, except as specified otherwise, are deliv'd Philadelphia. Freight rates: 76c. to $1.64 from eastern Pennsylvania furnaces: $4.54 from Virginia furnaces.

Bars.—Mills are maintaining high operating rates and the price is firm at 1.95c., Pittsburgh, or 2.27c. per lb., delivered Philadelphia. The Pennsylvania Railroad will open bids Aug. 16 on 6500 tons of bars.

Reinforcing Bars.—The greater

part of the tonnage of reinforcing bars pending award consists of small lots of considerably less than 100 tons. Competition continues keen and billet steel bars are still quoted at 1.95c. to 2.05c. per lb., Pittsburgh, or 2.27c. to 2.37c., delivered Philadelphia, with the $5 extra for cutting to length sometimes disregarded by the distributer. Rail steel bars are quoted at 1.95c. per lb., Franklin, Pa., or Tonawanda, N. Y., or 2.27c., delivered Philadelphia, with no extra for cutting to length.

Shapes.—Business has begun to increase and mills are in some instances offering two to three weeks' delay in delivery for certain specifications. Fabricators are well engaged and some substantial contracts are pending, including 2200 tons in a building for the Atwater Kent Mfg. Co. and a total of 14,500 tons in two bridges over the Hackensack River for the Pennsylvania Railroad. Prices are unchanged at 1.95c. to 2.05c. per lb., f.o.b. nearest mill to consumer, or 2.01c. to 2.11c., delivered Philadelphia.

Plates.—The past week has brought an increase in the volume of specifications against contracts. The Pennsylvania Railroad opens bids Aug. 16 on 20,000 tons of plates, part of its usual requirements. The price is unchanged at 2.05c. per lb., Coatesville, Pa., or 2.15c. per lb., delivered Philadelphia.

Old Material.—Consumers are receiving deliveries on contracts and, as a rule, show but little interest in making new purchases of scrap. No. 2 heavy melting steel is active with purchasing by brokers to fill contracts. There is also a fair tonnage of No. 1 heavy melting steel moving to consumers at Claymont, Del., and Coatesville, Pa. Cast grades of scrap continue inactive.

Prices per gross ton delivered consumers' yards, Philadelphia district:

No. 1 heavy melting steel	$16.50 to $17.00
Scrap T rails	16.00 to 16.50
No. 2 heavy melting steel	12.50 to 14.50
No. 1 railroad wrought	16.00 to 16.50
Bundled sheets (for steel works)	11.50
Hydraulic compressed, new	14.50 to 15.50
Hydraulic compressed, old	12.00 to 12.50
Machine shop turnings (for steel works)	11.50 to 12.00
Heavy axle turnings (or equiv.)	14.00 to 14.50
Cast borings (for steel works and roll. mill)	11.00 to 11.50
Heavy breakable cast (for steel works)	15.00 to 15.25
Railroad grate bars	12.00 to 12.50
Stove plate (for steel works)	12.00 to 12.50
No. 1 low phos., hvy., 0.04% and under	22.00 to 23.00
Couplers and knuckles	19.50 to 20.50
Rolled steel wheels	19.50 to 20.50
No. 1 blast f'nace scrap	10.50 to 11.00
Wrot. iron and soft steel pipes and tubes (new specific.)	15.00
Shafting	19.00 to 19.50
Steel axles	23.00 to 23.50
No. 1 forge fire	14.00
Cast iron carwheels	16.50 to 17.00
No. 1 cast	16.50 to 17.00
Cast borings (for chem. plant)	14.50
Steel rails for rolling	16.50 to 17.00

Sheets.—Blue annealed sheet prices are firm at 2.35c. per lb., Pittsburgh, or 2.67c., Philadelphia, for No. 13 gage, with light plates, blue annealed, No. 10 gage, at 2.20c., Pittsburgh, or 2.52c., delivered Philadelphia. Automobile manufacturers are showing less activity than a few weeks ago, but are still accepting shipments on contracts. Black and galvanized sheets have settled to 2.85c., Pittsburgh, or 3.17c., delivered Philadelphia, for black, and 3.55c. to 3.60c., Pittsburgh, or 3.87c. to 3.92c., delivered Philadelphia, for galvanized. Some galvanized sheet business was recently closed at 3.50c., Pittsburgh, or 3.82c., delivered Philadelphia, but sellers are beginning to show more firmness and it is doubted that less than 3.55c., Pittsburgh, could be done today. Radio manufacturers are less active in buying sheets, having covered their requirements for the present.

Imports.—In the week ended Aug. 3, ore arrivals at this port consisted of 2500 tons of chrome ore from Portuguese Africa and 36 tons of ferrochrome from Switzerland. The only steel imports were 89 tons of structural shapes from Germany and 6 tons of steel scrap from the United Kingdom.

Welding Society Program Stresses Research

Six technical sessions will be necessary to present the material available at the fall meeting of American Welding Society, held in Cleveland, Sept. 9 to 13, simultaneously with other metallurgical societies. Sessions and headquarters will be at Hotel Statler.

Nine research papers will be presented, three of them dealing with newly discovered non-destructive tests of welds. One of these tests, based on electrical conductivity, is the discovery of Elmer Sperry, well known inventor and president of American Society of Mechanical Engineers. The second involves the use of the stethoscope. The third is an X-ray method.

In addition, three special sessions will be devoted largely to research. A meeting of the Bureau of Welding will deal with a variety of research projects. The meeting of the structural steel welding committee will record advances in that fast-developing field. A special conference of college professors and other research workers will discuss further activities along this line.

Two papers will deal with the welding of boiler tubes and drums, the tubes of mercury boilers, and containers for high pressure. Other subjects covered by technical papers include gas welding of steel buildings, automatic welding of thin sheets, welding of pipe lines, replacement of castings by welding in machine construction, and the welding of copper alloys and high-strength aluminum alloys.

To Increase Capital Stock

YOUNGSTOWN, Aug. 6.—On Aug. 15 a special stockholders' meeting of the Youngstown Sheet & Tube Co. will be held to approve the proposed increase in common capital from 1,000,000 to 2,000,000 shares and a 20 per cent stock dividend, which will require 200,000 shares of the new stock.

Railroad Equipment

Inquiries Pending for More Than 5000 Cars

DESPITE the fact that buying of railroad equipment has been light, manufacturers look for considerable business to be placed in the near future. There are inquiries now pending for about 4500 freight cars and between 500 and 600 passenger cars, most of which is likely to be awarded this month. The Chicago, Milwaukee, St. Paul & Pacific is in the market for 1000 70-ton gondola cars and the Boston & Maine is considering the purchase of a like number of box cars. Details of the week's business follow:

General Chemical Co. has placed an order for 15 75-ton sulphuric acid tank cars and 21 50-ton sulphuric acid tank car tanks with American Car & Foundry Co.

Ann Arbor is inquiring for 100 hopper car bodies.

Chicago, Milwaukee, St. Paul & Pacific is in market for 1000 70-ton gondola cars.

Boston & Maine is considering purchase of 1000 box cars.

Wabash is inquiring for 100 50-ton steel hopper car bodies.

Bessemer & Lake Erie is asking bids on 25 70-ton steel gondola cars.

To Build Steel Plant at Pretoria, South Africa

Pretoria, South Africa, is to have a steel plant of 200,000 tons annual capacity, laid out according to the best American and European practice. It is expected to be complete from coke ovens, blast furnaces and open-hearth furnaces through to the rolling mills. The International Construction Co., Ltd., 56 Kingsway, London, W.C.2, it is understood, has been appointed engineer, working with a committee of four experts representing the steel company, the South African Iron & Steel Industrial Corporation, Ltd.

Tariff Bill Progress

WASHINGTON, Aug. 6.—The past week has developed no definite information as to the revision of the metal schedule of the House tariff bill by the Republican members of the Senate Committee on Finance. Members of the committee will not discuss what was done in connection with their work on the metal schedule, which was completed early last week. Rumors are conflicting and are not considered to be reliable.

Beginning yesterday the majority members are holding night sessions in an effort to have the bill ready to report to the Senate on Aug. 19, the date on which it was proposed that the Senate reconvene, but there is doubt that the bill will be ready by that time, in which event it is likely that reconvening of the Senate will be postponed.

Pacific Coast

Current Bookings Light, But Pipe Lines Will Require 13,000 Tons of Plates—Structural Awards Double Last Year's

SAN FRANCISCO, Aug. 3., (*By Air Mail*).—Awards of iron and steel products on the Pacific Coast this week were the lightest in many weeks, both in the aggregate tonnage and in the number of projects placed. The two outstanding lettings of the week were 3700 tons of plates for the Cedar River Pipe Line, Seattle, placed with the Western Pipe & Steel Co. and 1000 tons of reinforcing bars and wire mesh for a project at Hawthorne, Nev., secured by the Truscon Steel Co. Several pipe line projects in the Northwest, which are up for, or about to come out for, figures, will require close to 13,000 tons of plates.

The trade is exceptionally interested in the report that the United States Steel Corporation has taken a 90-day option on the properties of the Columbia Steel Corporation.

Building construction in July compared favorably with the previous month's aggregate, but fell below that of July, 1928. Permits issued in Los Angeles amounted to $7,942,133. Seattle, Oakland and Portland turned in totals of $1,382,220, $1,273,959 and $1,113,656 respectively.

Pig Iron.—Movement of foundry pig iron is limited to relatively small tonnages. One importer recently unloaded about 500 tons in various Pacific Coast ports. Importations of foreign iron during April, figures for which have just been released, show the smallest tonnage of the year, being less than 500 tons. Prices remain unchanged.

Prices per gross ton at San Francisco:

*Utah basic	$25.00 to $26.00
*Utah fdy., sil. 2.75 to 3.25	25.00 to 26.00
**Indian fdy., sil. 2.75 to 3.25	25.00 to 26.00

*Delivered San Francisco.
**Duty paid, f.o.b. cars San Francisco.

Bars.—Awards of reinforcing steel bars were the lightest in over six weeks. While a fair number of small lettings were noted, calling for lots of from 20 to 40 tons, larger contracts were limited to four projects. In addition to the tonnage mentioned above, the Truscon Steel Co. took 130 tons for a Science Hall in Reno, Nev. Bids were opened this week on 1150 tons for the West Garfield Street bridge. Prices on out-of-stock material in the San Francisco district continue unchanged at 2.30c. a lb., base, on carload lots and up to 2.60c. on smaller tonnages. Los Angeles prices are $2 a ton higher. Merchant bar steel is quoted at 2.35c. a lb., c.i.f.

Plates.—Of special interest to plate mill representatives and fabricators was the announcement that bids would be called for next week on a pipe line at Everett, Wash., calling for close to 10,000 tons. Bids open Aug. 7 on 200 tons of riveted steel pipe for Bremerton, Wash., and on Aug. 8 for 2000 tons for a surge tank and penstock for Tacoma, Wash. The General Petroleum Corporation plans to erect two odd-size 60,000-bbl. tanks in San Pedro, Cal., and these tanks will take a total of 460 tons. Prices appear firm at 2.35c., c.i.f.

Shapes.—Awards of structural steel shapes and plates so far this year are just short of the 200,000-ton mark, while for the same period a year ago less than 100,000 tons had been booked. The only award of importance went to Dyer Brothers and called for 100 tons for a factory addition in San Jose, Cal. Bids were opened this week on 950 tons for the West Garfield Street bridge, Seattle. Other new projects include 2400 tons for a viaduct over the Chicago, Milwaukee, St. Paul & Pacific tracks on Eleventh Street, Tacoma, and 300 tons for the Sommer-Kaufmann store on Market Street, San Francisco. During April consumers in the Los Angeles district imported over 2600 tons of shapes, the largest tonnage in over a year. Plain domestic material remains firm at 2.35c., c.i.f.

Cast Iron Pipe.—For the first time this year cast iron pipe awards were confined to lots of less than 100 tons. Demand is never particularly strong at this time of the year. Pending business does not exceed 3000 tons. Bids open on Aug. 7 for 875 tons of 10 to 24-in. Class B or riveted steel pipe for Bremerton, Wash. Alturas, Cal., will open bids Aug. 15 for 199 tons of 4 to 8-in. Class B pipe. Imports of foreign cast iron pipe during April totaled 1148 tons, compared with 2518 tons for the previous month and 1935 tons for April, 1928. Of this total over 1100 tons came from French makers and was divided between Seattle and Los Angeles users.

Steel Pipe.—Movement of standard steel pipe is holding up well, though confined to unimportant tonnages. The Southern Counties Gas Co., Los Angeles, is asking for bids on the construction of a pipe line from Laguna through San Clemente to San Diego County, and plans to furnish the contractors with 65,000 ft. of 12¾-in. O. D. gas pipe. Tubular imports during April were the lightest in over two years and aggregated 606 tons, compared with 3280 tons for March and 4907 tons for April a year ago.

Coke.—The coke market reflects the same quiet condition noted in the pig iron market, with sales and inquiries, for the most part, involving unimportant tonnages. One large importer of foreign coke has just unloaded 4000 tons of English beehive and by-product coke on the Coast, which was distributed among consumers in Los Angeles, San Francisco, Seattle and Vancouver. English beehive coke is quoted at $16 to $17 a net ton, delivered incoming dock, while by-product material ranges from $12.50 to $13.50 a net ton. During April coke imports totaled 3436 tons, compared with 2624 tons for the preceding month and 3818 tons for April, 1928. Of the total, 2000 tons came from the United Kingdom and 1300 tons from the Netherlands.

Warehouse Prices, f.o.b. San Francisco

	Base per Lb.
Plates and struc. shapes	3.15c.
Soft steel bars	3.15c.
Small angles, ¼-in. and over	3.15c.
Small angles, under ¼-in.	3.55c.
Small channels and tees, ¾-in. to 2¾-in.	3.75c.
Spring steel, ¼-in. and thicker	5.00c.
Black sheets (No. 24)	4.90c.
Blue ann'l'd sheets (No. 10)	3.80c.
Galv. sheets (No. 24)	5.30c.
Struct. rivets, ½-in. and larger	5.65c.
Com. wire nails, base per keg	$3.40
Cement c't'd nails, 100 lb. keg	3.40

Birmingham

Rail-and-Steamer Rates on Pig Iron Go Into Effect—Steel Demand Above Usual Summer Level

BIRMINGHAM, Aug. 6.—Pig iron producers are more optimistic over the market outlook than they have been in several weeks. There has been steady buying for third quarter, and more of the larger melters have covered their requirements. The probable make is estimated to be over 80 per cent sold. Shipments to district consumers have been averaging close to production. One company reports that July shipments exceeded output by a small margin. Present indications are that August shipments will show a gain over those of July. The new combination rail-and-steamer rates to Eastern ports became effective Aug. 1. They are $5 a ton to Baltimore, $5.25 to Philadelphia, $5.50 to New York and $5.75 to Boston, representing reductions ranging from 76c. for the Baltimore rate to $1.16 for the Boston rate. Several important tonnages are under option to these points, but actual shipping orders so far have been few and have involved small tonnages. Southern basic iron is said to have been quoted, under the new transportation rates, at a delivered price that figures back as low as $13, Birmingham. No. 2 foundry continues to be sold at $14.50, Birmingham, though concessions of 50c. a ton are reported in competitive territories. Of the 17 district furnaces active, nine are on foundry, seven on basic and one on recarburizing iron. The Republic Iron & Steel Co. will blow out its No. 1 furnace this month for repairs.

Prices per gross ton, f.o.b. Birmingham dist. furnaces:

No. 2 fdy., 1.75 to 2.25 sil.	$14.50
No. 1 fdy., 2.25 to 2.75 sil.	15.00
Basic	14.50

Finished Steel.—The margin between bookings and shipments continues to diminish slightly, but is still larger than it has been at this season in a number of years past. Despite the decline in inquiries in the past two or three weeks, the volume is sufficient to indicate that the midsummer slump, which usually reaches its lowest point in August, will be much less noticeable than it has been in any previous postwar year. The sheet buying movement that began about the middle of July is still under way. Plates and structural shapes are next in activity. New business in wire product is at the low point of the year, but is better than at this time last year. Shipments of wire products are slower. New bookings of structural steel fabricators during the past week were light. Prospective work, however, includes steel for a 14-story office building addition at Atlanta, an 18-story office building at Birmingham and for the new mills of the Gulf States Steel Co. at Alabama City. New business in reinforcing bars is off slightly. Three open-hearth furnaces were taken off for repairs last week, leaving 19 active out of a total of 23 in the district.

Cast Iron Pipe.—New business in pressure pipe during the past two weeks has been considerably below the average of the few weeks preceding, and unfilled tonnage is being worked off. The project at West Greenville, S. C., requiring about 300 tons, has been awarded to the American Cast Iron Pipe Co. About 12,000 ft. of 10-in. pipe was divided between the American Cast Iron Pipe Co. and the National Cast Iron Pipe Co. Bids will be opened this week for about 15,000 ft. of 6 and 8-in. pipe for Nashville, Tenn. Newton, N. C., will open bids Aug. 13 for 6000 ft. of 8-in. pipe. A project at Gadsden, Ala., to be let Aug. 15, will require about 3000 ft. of 12 to 18-in. pipe. Shipments approximate production, which is estimated to be over 80 per cent of capacity. Prices remain at $37 to $38 a net ton, Birmingham, for 6-in. and larger sizes.

Coke.—The movement of foundry coke under contract compares favorably with that of this time last year. Shipments are steady and operations stable. Prices are unchanged at $5 a net ton, Birmingham.

Old Material.—Inquiries and sales in the steel grades have improved. Specifying on contracts has increased and present shipments are above the July average. Prices for the steel grades are firmer, but unchanged.

Prices per gross ton, deliv'd Birmingham dist. consumers' yards:

Heavy melting steel	$12.50
Scrap steel rails	12.50
Short shoveling turnings	9.00
Cast iron borings	9.00
Stove plate	$11.50 to 12.00
Steel axles	21.00
Iron axles	23.00
No. 1 railroad wrought	10.00 to 10.50
Rails for rolling	14.00 to 15.00
No. 1 cast	13.50
Tramcar wheels	13.00
Cast iron carwheels	12.50 to 13.00
Cast iron borings, chem	13.50 to 14.00

price is becoming established and mills are considering another attempt to get the market back to 2.95c. Youngstown makers confirm the report that galvanized sheets are now being sold to consumers as well as to jobbers at 3.50c., Pittsburgh, although they are holding to 3.60c. in most instances. Wide strip mills in the district are not well occupied, and less favorable market conditions have brought out concessions of $2 and even $4 a ton on heavy-gage blue annealed sheets, which are still quoted at 2.20c., Pittsburgh, for No. 10. On hot-rolled strip, prices are holding well at 1.90c. and 2c., Pittsburgh. The cold-rolled strip market has gained strength and the minimum of 2.75c., Pittsburgh or Cleveland, which wavered recently as the result of sales to Detroit tubing manufacturers at 2.65c., is now better established. In fact, one maker is again quoting 2.85c. on all small orders and has booked some business at that figure. Other prices are holding and, with a marked summer decline in business now definitely averted, mills are disposed to maintain a firm attitude.

The pig iron market is very quiet and, although shipments are keeping up, business being booked from week to week is of small proportions. Five merchant stacks are being operated in the Mahoning and Shenango Valleys, the Cherry Valley furnace of the Davison Coke & Iron Co. having been scheduled to go into blast early this week, offsetting the blowing out of that company's Claire furnace on July 22. It is also reported that the McKeefrey furnace at Leetonia, Ohio, recently bought by the Atlas Steel & Supply Co., Cleveland, may soon be put in operation.

The scrap market shows unusual strength and, with sales of heavy melting steel having been made at $19 and compressed sheets at $18.50, it is quotable on a par with the Pittsburgh market. This is due to the fact that steel companies in the district are taking large tonnages and to a scarcity of the better grades.

Youngstown

August Steel Shipments May Show 5 to 10 Per Cent Decline —September Prospects Bright

YOUNGSTOWN, Aug. 6. — Mahoning Valley steel mills are beginning their sixth month of practically capacity operations, and many departments have had sufficient specifications to schedule the mills fully through August. A slight decrease in the number of open-hearth furnaces in operation has not curtailed the production of crude steel to any great extent, but it is apparent that the capacity of the district is no longer being severely taxed to supply finishing mills, and the present month will probably see a decline of from 5 to 10 per cent in total steel shipments.

In forecasting the future, opinion is practically unanimous in the belief that September will bring an upturn. Large consuming industries in and near the Valley district plan very heavy fall operations, and increasing specifications for sheets, strip and other products used by the automobile industry make an improvement in demand from this channel almost certain. Pipe business has also improved materially in the last two months, and large tonnages now in prospect lead to the belief that the best months of the year are still ahead of that department. One large Valley interest has its lap-weld mill entirely scheduled during August, and although the demand for standard butt-weld pipe has failed to become very active this year, the pipe industry as a whole seems to be entering a period of marked prosperity.

Sheet mills in the district are fully scheduled throughout the present month. On some sizes and finishes of sheets, rollings cannot be accommodated until the middle of September. Strip backlogs are not nearly so heavy and, although one large maker of cold-rolled strip is booked up for at least a month, deliveries on the hot-rolled material can be made in about two weeks. On tin plate, specifications for as long as two weeks' rollings are the exception, the majority of the mills operating on a week-to-week basis. Plate business is exceptionally good, but bars are quiet.

Prices seem to have shown some improvement in the last two weeks. On black sheets the 2.85c., Pittsburgh,

Canada

Pig Iron and Scrap Quiet— Structural Steel Active

TORONTO, ONT., Aug. 6.—While the demand for foundry and malleable pig iron was without special feature during the week, total sales continued in good volume. Some decline in sales was reported by local blast furnace representatives, due chiefly to the civic holiday on Aug. 5, but this is believed to be only a temporary slump. July pig iron sales dropped somewhat below those of June, but were in much larger volume than those of July a year ago. Forward contracting is at a standstill. Melt is holding at its high level, with prospects of being maintained until the end of the year. Production of pig iron remains large,

with seven stacks in blast. Pig iron prices are firm but unchanged.

Prices per gross ton:

Delivered Toronto

No. 1 fdy., sil. 2.25 to 2.75	$24.60
No. 2 fdy., sil. 1.75 to 2.25	24.10
Malleable	24.60

Delivered Montreal

No. 1 fdy., sil. 2.25 to 2.75	$26.00
No. 2 fdy., sil. 1.75 to 2.25	25.50
Malleable	26.00
Basic	24.50

Imported Iron, Montreal Warehouse

Summerlee	$33.50
Carron	33.00

Structural Steel.—Bridge and building construction is increasingly active. Demand is not confined to any one locality, but is general throughout Canada. Several substantial structural steel tonnages were awarded during the week; others will be placed soon.

Old Material.—While there was some improvement in sales during the week, business continues to be affected by the summer holiday season. Current demand is almost entirely of a spot nature, with no forward delivery contracts reported by local dealers. Prices are unchanged.

Dealers' buying prices:

	Per Gross Ton	
	Toronto	Montreal
Heavy melting steel	$10.00	$8.50
Rails, scrap	11.00	9.00
No. 1 wrought	10.00	12.00

Standard carwheels	15.00	....
Malleable scrap	14.00	....

Buffalo

Pig Iron Producers in Stronger Position—Steel Output Undiminished—Advances in Scrap

BUFFALO, Aug. 6.—One Buffalo furnace has announced that it is practically out of the market on pig iron for Eastern delivery for the next 60 days. On the business it is considering, nothing less than $18.50, base, is being quoted, with full differentials. Considerable iron is being booked privately without the sending out of general inquiries. In the last few days a local producer has booked 3000 to 4000 tons in scattered lots of 100 to 300 tons. Eastern inquiries for 500 tons of foundry and malleable and for 1000 tons of foundry and malleable have been closed here. The Eastern Malleable Iron Co. is in the market for 5000 tons of malleable, following the withdrawal of a previous inquiry. The American Radiator Co. has bought a tonnage of iron for Southern and Middle Western plants and is understood to be no longer in the market. One Buffalo furnace reports being entirely out of stock iron, and another reports that its stock sheet is lower by 4000 tons than it has been any time this year.

Prices per gross ton, f.o.b. furnace:

No. 2 fdy., sil. 1.75 to 2.25	$19.50
No. 2X fdy., sil. 2.25 to 2.75	20.00
No. 1 fdy., sil. 2.75 to 3.25	21.00
Malleable, sil. up to 2.25	20.00
Basic	18.50
Lake Superior charcoal	27.28

Finished Steel.—Operations of steel mills thus far in the third quarter have been at the same pace as during the previous part of the year, and producers see no signs of let-up in the immediate future. The Lackawanna plant of the Bethlehem Steel Co. is operating 22 out of 24 open-hearth furnaces, with the roughing mills on three 8-hr. shifts and the finishing mills on two 10-hr. shifts. The Donner Steel Co. is operating seven out of 10 open-hearth furnaces, and recent alterations make these seven equivalent to eight previously. Most of the mills are on double turn. A considerable volume of reinforcing bars has been booked in small lots. One seller has accumulated about 2000 tons of this type of business during the past week, with most of the orders running under 25 tons. The general contract for the new State office building to be built in Buffalo, has not been awarded, but the low bidder has been announced. This probably will require about 860 tons of fabricated structural steel.

Old Material.—Sales of No. 1 heavy melting steel at $17.50 are reported. Pittsburgh and Youngstown points are understood to be paying $18.50 for No. 1 grade, and outside demand for No. 1, No. 2 heavy melting steel and hydraulic compressed sheets is generally strong, so that very little of this material is coming into this market. Dealers report a marked shortage of No. 1 heavy melting steel. They are offering at high as $14.75 for No. 2 steel on a $15 order placed some time ago. Strong demand exists at Weirton, W. Va., for No. 2 heavy melting steel and dealers are offering $17, delivered Weirton, for this material. No. 1 machinery cast is more active, a number of small sales at $16 being reported. The 2000-ton order for stove plate placed here last week was filled without difficulty, as supplies were heavier than usual. Two other sales of stove plate at $13.50 were reported. One buyer was able to obtain a certain amount of distress stove plate at $13. Sales of knuckles and couplers, coil and leaf springs and rolled steel wheels have been made at $19.50. Sales of cast iron borings at $11.50 are reported, and this commodity seems to be scarce. General production of scrap dropped off in this territory during July.

Warehouse Prices, f.o.b. Buffalo

	Base per Lb.
Plates and struc. shapes	3.40c.
Soft steel bars	3.30c.
Reinforcing bars	2.95c.

Special Grades:	
Chemical borings	12.50 to 13.50

American Puddled Iron Co. to Take Over Warren Plant

YOUNGSTOWN, Aug. 6.—Effective Jan. 1, 1930, the American Puddled Iron Co. will take possession of its plant at Warren, Ohio, which has been under lease for three years to the A. M. Byers Co., Pittsburgh. At this plant, the Byers company has successfully developed the Aston process of producing puddled iron. The American Puddled Iron Co. will continue operations at this property and plans eventually to install sheet mills.

Under the terms of its arrangement with the A. M. Byers Co., the American Puddled Iron Co. is licensed to manufacture iron by the Aston process, and to convert it into any finished product except pipe. The American Puddled Iron Co. also comes into possession of all equipment at the Warren plant that has been used by the Byers company in its operations.

At the start the company will produce wrought iron in such semi-finished forms as sheet bars, muck bars, billets and blooms. Finishing capacity in the form of sheet mills will be installed in due course. The Warren plant has a present capacity of 5000 to 6000 tons of wrought iron per month. It includes a site of 470 acres, served by the Baltimore & Ohio Rail-

road, with connections with the Erie and Pennsylvania; several factory buildings, a 350-ton cupola, a three-high blooming mill and a three-high finishing mill. All of the equipment is electrically operated.

The capital structure of the American Puddled Iron Co. consists of 35,000 shares of $100 par stock, of which 29,154 shares have been issued. No new financing is contemplated for the beginning of operations.

At the end of this year the Byers company will transfer its manufacturing operations from Warren to its new plant at Ambridge, Pa.

The American Puddled Iron Co. is an outgrowth of the Youngstown Steel Co., originally formed by the late E. L. Ford and associates to develop the Ford process of manufacturing puddled iron. Mr. Ford died before his process was perfected for commercial purposes and the Warren plant was subsequently leased to the Byers company.

St. Louis

Pig Iron Sales Improve—Scrap Dealers Continue to Bid Up Prices—Steel Output Sustained

ST. LOUIS, Aug. 6.—Sales of pig iron increased during the week, the volume booked by the St. Louis Gas & Coke Corporation being 5000 tons. Of this, 3800 tons for an Indiana equipment builder, 500 tons for a Quincy, Ill., melter and 400 tons for an Illinois equipment builder, were for shipment over the remainder of 1929, while three orders for 100 tons each were for prompt delivery. There is believed to be a heavy tonnage of iron to be placed for the rest of this quarter, but melters are still postponing action on account of the uncertainty of the price situation. The melt in the district is said to be off on account of hot weather. The local producer has made no change in quoted prices, but is said to be making concessions on high phosphorus iron in competition with the Southern makers.

Prices per gross ton at St. Louis:

No. 2 fdy., sil. 1.75 to 2.25, f.o.b. Granite City, Ill.	$20.00
Malleable, f.o.b. Granite City	20.50
N'th'n No. 2 fdy., deliv'd St. Louis	22.16
Southern No. 2 fdy., deliv'd	18.92
Northern malleable, deliv'd	22.16
Northern basic, deljv'd	22.16

Freight rates: 75c. (average) Granite City to St. Louis; $2.16 from Chicago; $4.42 from Birmingham.

Finished Steel.—Demand for black and galvanized sheets during July was up to that of June, while specifications for blue annealed, tin plate and plates were not as great as in the preceding month, it is reported by the Granite City Steel Co. The company is operating all units as near to capacity as the weather permits. The structural steel trade is quiet. The only new reinforcing bar project pending is McMillan Hospital of the Washington University group, which will require approximately 500 tons.

Coke.—Buying of domestic coke is satisfactory for the season. Foundry grades are said to be a bit easier, because of the lighter melt in the district. Furnace coke is being taken by smelters in the district according to specifications.

Old Material.—Dealers continue to bid up prices, and some items are from 50c. to $1 a ton higher. Buying by the mills is not heavy, but sellers believe that higher prices will prevail. There has been an improvement in the movement of old material into this market, but it was slight. Railroad lists: Pennnsylvania, 55,000 tons; Baltimore & Ohio, 14,000 tons; St. Louis-San Francisco, 20 carloads, and Chicago & Eastern Illinois, nine carloads.

Dealers' buying prices per gross ton, f.o.b. St. Louis district:

No. 1 heavy melting or shoveling steel	$14.00 to $14.50
No. 2 heavy melting or shoveling steel	13.25 to 13.75
No. 1 locomotive tires	15.50 to 16.00
Miscel. stand.-sec. rails including frogs, switches and guards, cut apart	16.75 to 17.25
Railroad springs	18.50 to 19.00
Bundled sheets	10.00 to 10.50
No. 2 railroad wrought	14.00 to 14.50
No. 1 busheling	10.00 to 10.50
Cast iron borings and shoveling turnings	9.50 to 10.00
Iron rails	15.00 to 15.50
Rails for rolling	17.25 to 17.75
Machine shop turnings	9.00 to 9.50
Heavy turnings	10.00 to 10.50
Steel car axles	19.00 to 19.50
Iron car axles	27.50 to 28.00
Wrot. iron bars and trans.	22.00 to 22.50
No. 1 railroad wrought	13.50 to 14.00
Steel rails, less than 3 ft.	19.00 to 19.50
Steel angle bars	14.50 to 14.75
Cast iron carwheels	14.50 to 15.00

Cincinnati

Mill Operations Sustained—Scrap Strong, Pig Iron Dull

CINCINNATI, Aug. 6.—Consumers of pig iron are wary about entering the market for large quantities and are purchasing only enough material to maintain production, thus causing the volume of new business of district furnaces to decline noticeably. Of course, a recession in buying activity is always looked for at this time of the year, but the situation is further complicated by the unsettled condition of the Southern market, which in a few instances has caused Northern furnaces to figure closely to take business. Another factor is the withdrawal of automobile manufacturers from the market, pending the bringing out of new models, but this is expected to disappear in about 30 days. There is no inquiry of note before the trade.

Prices per gross ton, deliv'd Cincinnati:

So. Ohio fdy., sil. 1.75 to 2.25	$19.89 to $20.39
Ala. fdy., sil. 1.75 to 2.75	17.69 to 18.19
Ala. fdy., sil. 2.25 to 2.75	18.19 to 18.69
Tenn. fdy., sil. 1.75 to 2.25	17.69 to 18.19
S'th'n Ohio silvery, 8 per cent	26.89

Freight rates, $1.89 from Ironton and Jackson, Ohio; $3.69 from Birmingham.

Finished Material.—Although the general sheet demand during the past week has been maintained at a high level for midsummer, new business was not abreast of production and district sheet mills reduced backlogs further. Deliveries, however, are still extended and, with the highway and roofing demand increasing, mill operators do not look for much additional improvement in the situation. The leading interest in this district reports that two of its units are booked approximately three months in advance and all other units, except the cold-rolled strip mill, are maintaining capacity production to keep pace with

Warehouse Prices, f.o.b. Cincinnati

	Base per Lb.
Plates and struc. shapes	3.40c.
Bars, soft steel or iron	3.30c.
New billet reinforc. bars	3.15c.
Rail steel reinforc. bars	3.00c.
Hoops	4.05c.
Bands	3.50c.
Cold-fin. rounds and hex. Squares	3.85c. 4.35c.
Black sheets (No. 24)	4.05c.
Galvanized heets (No. 24)	4.90c.
Blue ann'l'd sheets (No. 10)	3.45c.
Structural rivets	3.85c.
Small rivets	65 per cent off list
No. 9 ann'l'd wire, per 100 lb.	$3.00

Cement c't'd nails, base 100 lb. keg	2.85
Chain per 100 lb	8.75
	Net per 100 Ft.
Lap-weld steel boiler tubes, 2-in.	$16.00
4-in.	33.00
Seamless steel boiler tubes, 2-in.	17.00
4-in.	34.00

demand. With a reawakening of the automotive demand the latter part of this month, it is expected that interest in cold-rolled strip again will increase. Improvement in the price situation on galvanized sheets is indicated in reports that concessions heretofore granted by certain mills to Southern roofing manufacturers are being refused.

Coke.—District sellers of by-product foundry coke report that specifications during July were greater than in any month since March, when an acute situation in southern Michigan caused a very heavy demand. Indications for this month, however, are that foundries will ease up on specifications, primarily because of the decrease in automotive demand. New business is still very quiet and, except for a few carloads, no new bookings have been announced.

Old Material.—While the market is still firm, as indicated by the continued steadiness of prices and a further advance of 25c. in heavy melting steel, consumers are not buying old material in large quantities. Mills are taking shipments on old contracts, but as these terminate, new purchases are made only to cover requirements for short periods and in some instances for immediate use. The Norfolk & Western Railway is offering 4300 tons and the Pennsylvania has announced a list of 50,000 tons.

Dealers' buying prices per gross ton, f.o.b. cars, Cincinnati:

Heavy melting steel	$13.75 to $14.25
Scrap rails for melting	14.00 to 14.50
Loose sheet clippings	9.00 to 9.50
Bundled sheets	11.00 to 11.50
Cast iron borings	9.25 to 9.50
Machine shop turnings	8.50 to 8.75
No. 1 busheling	10.50 to 11.00
No. 2 busheling	7.00 to 7.50
Rails for rolling	14.50 to 15.00

No. 1 machinery cast	19.25 to 19.75
No. 1 railroad cast	15.25 to 15.75
Burnt cast	10.25 to 10.75
Stove plate	10.25 to 10.75
Brake shoes	10.25 to 10.75
Agricultural malleable	14.25 to 14.75
Railroad malleable	15.25 to 15.75

Boston

Reduced Sales of Pig Iron—Buffalo Quotations Advance—Scrap Easier on Increasing Supply

BOSTON, Aug. 6.—Pig iron sales the past week dropped off, amounting to less than 5000 tons, contrasted with slightly more than that amount the previous week. They included 1000 tons of low phosphorus to a Massachusetts machinery manufacturer by a furnace east of Buffalo, and the remainder was in small tonnages. Another Massachusetts machinery manufacturer has yet to cover on 1000 tons of No. 2X and No. 1X. No other sizable inquiry is in the market. Buffalo furnace prices unquestionably are firmer than they were a fortnight ago. Numerous small lots of No. 2X iron sold the past week at $18.50 a ton, furnace, and the lowest price offered so far on the 1000-ton open inquiry has been $18. The furnace making that price is on an $18-a-ton base, but in this instance waived the differential on the No. 2X. Iron made east of Buffalo the past week sold at an advance of 25c. to 50c. a ton, in some cases.

Foundry iron prices per gross ton deliv'd to most New England Points:

†Buffalo, sil. 1.75 to 2.25	$22.28 to $22.78
†Buffalo, sil. 2.25 to 2.75	22.78 to 23.28
*Buffalo, sil. 1.75 to 2.25	22.91 to 23.41
*Buffalo, sil. 2.25 to 2.75	22.91 to 23.91
East. Penn., sil. 1.75 to 2.25	23.65
East. Penn., sil. 2.25 to 2.75	24.15
Va., sil. 1.75 to 2.25	25.21
Va., sil. 2.25 to 2.75	25.71
Ala., sil. 1.75 to 2.25	21.41 to 23.27
Ala., sil. 2.25 to 2.75	21.91 to 23.77

Freight rates: $4.91 all rail from Buffalo, and $4.28 rail and water; $3.65 from eastern Pennsylvania; $5.21 all rail from Virginia; $6.91 to $8.77 from Alabama.

*All rail rate.
†Rail and water rate.

Shapes and Plates.—Mills are holding firmly at 1.90c. to 2c. a lb., base, Pittsburgh, on plates and standard shapes and are well booked ahead. Plate deliveries are still uncertain, but specifications on shapes are coming forward on schedule. The New England Structural Co. is the low bidder on 300 tons of steel for the fire station, Bowdoin Square, Boston, but the cost exceeds the appropriation. The aggregate tonnage placed the past week in small fabricating jobs in Boston ran about 800 tons. Competition among fabricators is keen and New York State firms have invaded the New England field, taking jobs of as small as 25 tons.

Reinforcing Steel.—Billet steel bars continue to sell in small tonnages. While competition among sellers is keener than at any previous time this year, they are holding firmly to 2.66½c., base, from stock. The 250 to 300 tons required for the North Station hotel will probably close this week, as well as better than 700 tons for a downtown office building. Rail steel bars are moving in limited amounts at concessions from the general 2.26½c., base, delivered common Boston freight rate points price.

Coke.—Little change is noted in the by-product foundry coke situation. Specifications against last half contracts are holding up well and the price remains at $11 a ton, delivered within a $3.10 freight rate zone.

Old Material.—Old material is coming out more freely and mills are specifying against contracts more liberally. Consequently the general scrap price structure does not appear so strong as heretofore. Sales of No. 1 heavy melting steel at $13 a ton have practically disappeared and $12.75, on cars shipping point is now the recognized top price. Quotations on T rails have dropped noticeably due to increased supplies. One dealer is paying $15 a ton, on cars shipping point for shafting, but the average going price is $14. Steel turnings are off about 10c. a ton. In contrast with the general trend of values, bundled skeleton, forge flashings and blast furnace borings and turnings are doing a little better. A steamer has just finished loading 3300 tons of scrap here for Danzig. Another steamer is due here Aug. 7 to take 1200 to 1400 tons for the same port. The four cranes on the local loading dock heretofore out of commission are working and the next steamer will load quickly.

Buying prices per gross ton, f.o.b. Boston rate shipping points:

No. 1 heavy melting steel	$12.50 to $12.75
Scrap T rails	11.50 to 12.00
Scrap girder rails	11.00 to 11.50
No. 1 railroad wrought	11.00 to 11.50
No. 1 yard wrought	9.00 to 9.50
Machine shop turnings	6.50 to 7.00
Cast iron borings (steel works and rolling mill)	6.50 to 6.60
Bundled skeleton, long	10.00 to 10.50
Forge flashings	10.00 to 10.50
Blast furnace borings and turnings	6.10 to 6.50
Forge scrap	9.00 to 9.25
Shafting	14.00 to 15.00
Steel car axles	18.00 to 19.00
Wrought pipe 1 in. in diameter (over 2 ft. long)	9.75 to 10.00
Rails for rolling	12.50 to 13.00
Cast iron borings, chemical	10.00 to 10.25
Prices per gross ton deliv'd consumers' yards:	
Textile cast	$14.50 to $15.00
No. 1 machinery cast	15.00 to 15.25
No. 2 machinery cast	13.00 to 13.25
Stove plate	11.00 to 11.50
Railroad malleable	18.50 to 19.00

An evening course in Diesel and oil engines has been announced by the Polytechnic Institute, Brooklyn, N. Y. Lectures will be held every Tuesday evening, beginning with the last Tuesday of September. Detailed information may be obtained by addressing the institute, 99 Livingston Street, Brooklyn.

Non-Ferrous Metal Markets

Largest Domestic Copper Sales Since Middle of March

NEW YORK, Aug 6.

Copper.—After an extended period of dullness, copper sales turned sharply upward the past week. Domestic consumers resumed buying on a liberal scale, placing orders for more than 30,000 tons. This constituted the largest week's business since the middle of March. Concurrent with the renewal of activity in the domestic market were substantial bookings abroad, which totaled over 2000 tons daily. Practically all purchases, both domestic and foreign, were for delivery in the next 30 days. The spurt of buying is attributed to the fact that consumers allowed stocks to diminish to the point where immediate requirements demanded the ordering of fresh material. This action on the part of users has broken a deadlock during which attempts were made by them to reduce prices by refraining from buying and thereby forcing producers, hungry for business, to offer inducements in the form of lower quotations. The latest developments are regarded as a victory for producers in their efforts to maintain the market at the present level. Outstanding during the week was the resumption of the solicitation of orders by the primary producers, who lately have been leaving the market to custom smelters. Sellers are convinced that the substantial bookings of the past week do not represent a flurry of buying, but are a forerunner of a steady flow of business from both domestic and foreign consumers during the month of August. Electrolytic copper is firm at 18c., delivered in the Connecticut Valley, and at 18.30c., c.i.f. usual European ports. Lake copper remains at 18c. to 18.12½c., delivered.

Copper Averages.—The average price of Lake copper for July, based on daily quotations in THE IRON AGE, is 18.12½c., delivered New York. The average price of electrolytic copper is 17.75c., refinery, or 18c., delivered in the Connecticut Valley.

Tin.—Despite the scarcity of orders, which totaled only 500 tons in the past week, the Straits tin market has shown surprising steadiness. In addition to the lack of demand on the part of buyers, the week was made even more dull by the fact that Mon-

Rolled Products

Prices on rolled non-ferrous products are unchanged from those prevailing one week ago.

List Prices, Per Lb., f.o.b. Mill

On Copper and Brass Products, Freight up to 75c. per 100 Lb. Allowed on Shipments of 500 Lb. or Over

Sheets—
- High brass ..... 23.25c.
- Copper, hot rolled ..... 26.75c.
- Zinc ..... 10.25c.
- Lead (full sheets) ... 11.00c. to 11.25c.

Seamless Tubes—
- High brass ..... 28.25c.
- Copper ..... 29.25c.

Rods—
- High brass ..... 21.25c.
- Naval brass ..... 24.00c.

Wire—
- Copper ..... 19.87½c.
- High brass ..... 23.75c.

Copper in Rolls ..... 26.75c.
Brazed Brass Tubing ..... 30.87½c.

Aluminum Products in Ton Lots

The carload freight rate is allowed to destinations east of Mississippi River and also to St. Louis on shipments to points west of that river.

- Sheets, 0 to 10 gage, 3 to 30 in. wide ..... 33.00c.
- Tubes, base ..... 42.00c.
- Machine rods ..... 34.00c.

- Lead, bar ..... 9.50c. to 10.00c.
- Antimony, Asiatic ..... 10.50c. to 11.00c.
- Aluminum No. 1 ingots for remelting (guaranteed over 99% pure) ..... 25.00c. to 26.00c.
- Alum. ingots, No. 12 alloy, 24.00c. to 25.00c.
- Babbitt metal, commercial grade, 25.00c. to 35.00c.
- Solder, ½ and ½ ..... 31.00c. to 32.00c.

Metals from Cleveland Warehouse

Delivered Prices, Per Lb.

- Tin, Straits pig ..... 52.25c.
- Tin, bar ..... 54.25c.
- Copper, Lake ..... 19.50c.
- Copper, electrolytic ..... 19.25c.
- Copper, casting ..... 18.75c.
- Zinc, slab ..... 7.75c. to 8.00c.
- Lead, American pig ..... 7.25c. to 7.50c.
- Lead, bar ..... 9.75c.
- Antimony, Asiatic ..... 16.00c.
- Babbitt metal, medium grade ..... 18.75c.
- Babbitt metal, high grade ..... 56.50c.
- Solder, ½ and ½ ..... 31.75c.

Old Metals, Per Lb., New York

Buying prices represent what large dealers are paying for miscellaneous lots from smaller accumulators and selling prices are those charged customers after the metal has been properly prepared for their uses.

	Dealers' Buying Prices	Dealers' Selling Prices
Copper, hvy. crucible	14.75c.	16.00c.
Copper, hvy. and wire	14.50c.	15.75c.
Copper, light and bottoms	12.50c.	13.75c.
Brass, heavy	8.50c.	9.50c.
Brass, light	7.50c.	8.50c.
Hvy. machine composition	12.00c.	13.00c.
No. 1 yel. brass turnings	9.75c.	10.50c.
No. 1 red brass or compos. turnings	11.25c.	12.25c.
Lead, heavy	5.25c.	5.75c.
Lead, tea	4.25c.	5.25c.
Zinc	3.50c.	4.25c.
Sheet aluminum	14.00c.	16.00c.
Cast aluminum	12.25c.	14.25c.

day was a bank holiday in London so that trading activities were suspended there. Practically all buying has been for August and September delivery. Spot Straits tin has fluctuated but little during the week and was quoted today at 47.25c., New York. The London market is firm, but prices have fallen off slightly. Spot standard is quoted at £212 17s. 6d., future standard at £216 17s. 6d. and spot Straits at £216 7s. 6d. The price at Singapore is steady at £220 5s.

Zinc.—Prime Western zinc is firm at 6.80c., East St. Louis, but orders have been confined to from one to two carloads each. Figures published by the American Zinc Institute reveal that zinc stocks increased about 7200 tons during July, a development which has tended somewhat to weaken the market. However, producers declare that several large consumers have allowed stocks to run down materially and that they will have to make sizable purchases the moment that demand for their product picks up.

Lead.—There is a stronger undertone to the market. Consumers have been buying in larger quantities and thereby have added strength to prices. Orders for August delivery have been taken at 6.55c., St. Louis, but producers, at least in some cases, are asking 6.60c. for September delivery. The leading interest continues to quote 6.75c., New York.

Antimony.—Consumers have been purchasing steadily in small lots and spot metal has advanced to 8.75c. with futures selling at 8.62½c., duty paid, New York. Imports of Chinese metal during August are estimated at about 500 tons. Since demand is normally about 800 tons monthly and since only small stocks are in warehouses, there is a strong possibility that prices may advance. In several cases dealers now are trying to get 6.00c. for spot metal.

Nickel.—Ingot nickel is quoted at 35c. a lb., shot nickel at 36c. and cathodes of electrolytic nickel at 35c.

Aluminum.—Virgin metal, 98 to 99 per cent pure, is priced at 23.90c. a lb., delivered.

Non-Ferrous Metals at Chicago

CHICAGO, Aug. 6.—Spot sales are in good volume. Prices are steady except for a small reduction in quotations on zinc. Purchasers of old metals are more numerous than a week ago.

Prices per lb., in carload lots: Lake copper, 18.50c.; tin, 48c.; lead, 6.65c.; zinc, 6.87½c.; in less-than-carload lots, antimony, 9.62½c. On old metals we quote copper wire, crucible shapes and copper clips, 14c.; copper bottoms, 11.50c.; red brass, 11.50c.; yellow brass, 8c.; lead pipe, 4.50c.; zinc, 3.25c.; pewter, No. 1, 24.50c; tin foil, 26c.; block tin, 36c.; aluminum, 12.87½c.; all being dealers' prices for less-than-carload lots.

Bethlehem's Report to Employees

President Grace Attributes Bright Outlook to Worker Relations—Has Made Plans for Revamping Properties

NEVER was the future success of the Bethlehem Steel Corporation better assured than it is today, according to Eugene G. Grace, president, in a statement to the company's employees. Mr. Grace's statement was included in a report to the employees—similar to the company's yearly reports to stockholders—covering the annual conferences which have just been concluded between the management and representatives of the employees.

"I do not hesitate to say," Mr. Grace states, "that this happy outlook is due largely to our persistent adherence to the principle of good management, which recognizes above everything else that a cooperative relationship between employer and employee is essential to the success of any large industrial undertaking.

"The steel industry as a whole is experiencing the greatest demand in its history. Bethlehem has been operating for many months under a demand in excess of its rated capacity. New records are being established in all branches of the business. And because the company more than five years ago undertook a comprehensive program of rebuilding and rounding out its plants, Bethlehem was ready to meet this anticipated demand, not only more economically but also in larger quantities with a complete line of commercial steel products for every one of steel's expanding uses.

"Rising almost from obscurity 25 years ago, Bethlehem today occupies a new position of financial security and commercial leadership. The company's progress has enabled us not only to provide steadier work for our employees than at any time in recent years, but also to resume payment of dividends to our common stockholders after five years' interruption, and to share with them in other ways the company's prosperity. The results which have been accomplished should be especially gratifying to the employees—so many of whom are also stockholders—for the evidence is plain that this achievement means work well done all along the line."

The report points out that the results achieved may be attributed to those activities which are jointly operated by employees and management, namely, employee representation, savings and stock ownership, pensions, relief, accident prevention, home ownership aid, etc. The report adds that weekly earnings of Bethlehem employees are today over 20 per cent higher than the average weekly earnings in 24 major industries.

Plans have been made, it is stated, for further revamping of Bethlehem's properties to enable the company to keep pace with the growing demand for its products.

Obituary

WILLIAM PIGOTT, whose death at Vancouver, July 19, was mentioned in this column last week, was born 69 years ago in New York, but received his school education in Ohio. He went to Seattle in 1895 and had long been a conspicuous figure in steel manufacture, developing the Seattle properties of the Pacific Coast Steel Co., of which he was for years vice-president. He was president of the Pacific Foreign Trade Council in 1925 and 1926 and was a director of the Dexter Horton National Bank of Seattle and a member of India House, New York.

—

JOSEPH E. HUBINGER, president, Eastern Machine Screw Corporation, New Haven, Conn., died at his home in that city July 30, aged 71 years. He was born in Madison, Ind., and went to New Haven in 1882, where he started in business with his brothers.

—

WILLIAM M. C. FOSTER, vice-president and general manager of the Mead Cycle Co., Chicago, died July 31, at his home in Lake Bluff, Ill., aged 53 years.

EDWARD NEWBEGIN, president, Multnomah Iron Works, Portland, Ore., died suddenly July 25, in that city.

—

CHARLES H. SCHRODER, secretary of the Murray Iron Works Co., Burlington, Iowa, for 27 years, died July 29, aged 62 years. He had been connected with the company for 47 years.

—

JOSEPH D. MARKS, Cleveland dealer in iron and steel scrap, died at Battle Creek, Mich., Aug. 1, following an operation, aged 48 years. Several years ago, he, with H. R. Fishel, organized the Fishel & Marks Co. About four years ago, Mr. Marks took over the business and later the company was discontinued. Since that time he had been engaged in business under his own name.

—

N. L. KENREIGH, for 20 years associated with Strong, Carlisle & Hammond Co., Cleveland, in a sales capacity in the northern Ohio territory, died at his home in Ravenna, Ohio, Aug. 1.

PERSONAL

DR. GEORGE B. WATERHOUSE, professor of metallurgy, Massachusetts Institute of Technology, Cambridge, Mass., is spending the greater part of the summer at Sydney, Nova Scotia, and at Montreal, Quebec, at the plants of the Dominion Iron & Steel Co., a subsidiary of the British Empire Steel Corporation, Ltd.

—

E. D. SPICER, superintendent of the refrigeration department of the General Electric Co., has been made assistant manager of the Schenectady works, effective Aug. 1, according to an announcement made by C. C. Chesney, vice-president of manufacturing. Mr. Spicer was graduated from Cornell University in 1912 with the degree of mechanical engineer. He has been with the General Electric Co. since 1924.

—

ALAN KISSOCK, who invented the process for alloying molybdenum with steel by the use of calcium molybdate, has been elected vice-president in charge of production of the Climax-Molybdenum Co., 61 Broadway, New York. He was graduated from the Colorado School of Mines as a mining engineer in 1912, and for three years was engaged in the examination and management of various mines. From 1915 to 1918 he was manager of the Molybdenum Products Co., Tucson, Ariz., and then became president of the Steel Alloys Co., Los Angeles, Cal. During 1922 and 1923 he devoted his time to the examination and management of mines and then associated himself with the Climax Molybdenum Co. in 1924. Since 1924 he devoted himself to the mining and milling of molybdenum ores and to the construction and operation of plants for the production of calcium molybdate. He has also been active in promotional work in connection with the use of molybdenum steels.

—

MATTHEW M. KENNEDY has resigned as chief metallurgist and materials engineer at the United States Navy Yard, Philadelphia, to become associated with Horace C. Knerr, consulting metallurgical engineer, Philadelphia.

—

ROBERT B. MARSHALL has joined the New York sales staff of the Chain Belt Co., Milwaukee.

—

J. C. BINGHAM, heretofore assistant purchasing agent for the Sharples Separator Co., West Chester, Pa., has been appointed purchasing agent, and L. F. ARCHER has been appointed works manager, succeeding S. E. DYKE, resigned.

—

W. H. ARNOLD, formerly assistant sales manager of the Pittsburgh Valve, Foundry & Construction Co., Pittsburgh, has been made general sales manager, succeeding C. A. ANDERSON, JR., who became president of the company on March 1. Mr. Arnold has been identified with the company since 1905.

—

W. J. BECK, for nineteen years director of research of the American Rolling Mill Co., has been appointed assistant to Charles R. Hook, general

W. J. BECK

DR. ANSON HAYES

manager. Mr. Beck will have direct charge of the development in electrical steel sheets for magnetic purposes. He is widely known in this branch of the industry, having joined Armco in 1903. Graduating from Purdue University in 1896, he was for several years an electrical engineer with the Westinghouse Electric & Mfg. Co. He came to the American Rolling Mill Co. as superintendent of the electrical department and in 1910 was appointed director of research.

—

DR. ANSON HAYES has been appointed director of research of the American Rolling Mill Co., Middletown, Ohio. For the past year and a half he has been chief of the chemical division of the Armco research division. He held the chair of physical chemistry at Iowa State College for twelve years and headed that division of the large chemical department of that institution. He also taught graduate courses in thermodynamics and directed research work in the study of factors that influence the stability of iron carbide, particularly in white iron composition suitable for the manufacture of malleable iron. He is a graduate of Drake University, class 1908. His master's degree was taken at Iowa State College, and he received his Ph.D. from the University of Chicago.

—

GEORGE L. GORDON, who has been assistant general manager of sales of the Lukens Steel Co., Coatesville, Pa., has been promoted to general manager of sales, succeeding FRANK H. GORDON, now a vice-president. J. H. MCELHINNEY, assistant general superintendent of the company, has become general superintendent to succeed W. H. WARREN, recently elected vice-president and G. DONALD SPACKMAN, who has been superintendent of the flanging department, has become assistant general superintendent.

—

LEON F. PAYNE, manager of the credit department, Carnegie Steel Co., Pittsburgh, has been elected treasurer of the Oil Well Supply Co., Pittsburgh, succeeding H. H. JAMES, who was recently elected vice-president in charge of manufacturing for the Supply company.

—

R. J. TEEPLE will have charge of chain link fence sales for the Page Steel & Wire Co., following the transfer of the company's general sales department from Bridgeport, Conn., to the American Bank Building, Pittsburgh. S. B. CAIRNS will handle sales of field fence and general wire products, and welding wire and specialties will be handled by J. J. FLAHERTY. W. T. KYLE, general manager of sales for the company will maintain his headquarters at the company's general offices at 230 Park Avenue, New York.

—

CHARLES E. HAUCH has been appointed purchasing agent of the North American Refractories Co., National City Bank Building, Cleveland.

—

E. P. SEDGWICK has been re-elected president of the Chicago Hardware Foundry Co., North Chicago, Ill. Other officers elected were E. B. SHERWIN, secretary; J. W. ELLIS, treasurer; F. J. SHERWIN, vice-president and G. L. BREWSTER, assistant secretary.

—

CHARLES R. BARTON, for the past several years vice-president in charge of the seamless tube mill of Spang, Chalfant & Co., Inc., at Ambridge, Pa., has been made vice-president in charge of all operations of that company.

BOOK REVIEWS

Smelting All Metals

Principles of Metallurgy, by John L. Bray. 568 pages. Ginn & Co., Boston. Price $5.80.

This solid book by the professor of metallurgy at Purdue University has apparently been written to fill the needs of the courses given at that institution. Whether it will be adopted by other colleges will depend upon the time available for such matters. In the opinion of the reviewer, Professor Bray's book is comprehensive enough for a principal text for students in metallurgical engineering; he doubts whether mechanical, civil, electrical and chemical engineers can afford enough time on the matter of winning metals from ores to be able to read 568 pages about it. While undoubtedly all engineers should know much about metals, the available time is more efficiently spent in studying their properties as materials of engineering construction—that is, treating metallurgy and strength of materials as coordinate subjects—and introducing only enough smelting, working and heat treatment to show how the properties of the metals and alloys can be made to vary within useful limits.

The present book follows what may be termed the classical outline, beginning with ores, refractories and fuels, discusses sampling and ore concentration, smelting and refining. A careful reading of the 80-page chapter on copper shows it to be accurate and comprehensive, so concise that many of the implications of the text will escape the student or uninitiated. The most modern practice is discussed, giving space to obsolete and obsolescent methods only where this is necessary to illustrate some phase of present-day operations in America. The chapter ends with a detailed description of two western plants—matter somewhat out of place in a book supposed to be devoted to "principles."

Paging through the rest of the book, the other metals are found to be treated in similar satisfactory manner. The least adequate seems to be a 10-page brief on alloy steels (a section of the chapter on metallography.) Notes on the metallurgy and uses of manganese (page 404) and chromium (page 407) should be amplified and corrected in the next printing.—E. E. T.

German Treatise on Foundry Work

Die metallurgischen und metallographischen Grundlagen des Gusseisens. By K. von Kerpeley. 116 pages, 6½ x 9¾ in. 135 illustrations and 34 tables. Published by Wilhelm Knapp, Halle, (Saale), Germany.

This valuable contribution to the literature of cast iron, is Part VII of a series of books on iron, steel, and nonferrous foundry practice. It has been prepared recently with reference to new metallographic and metallurgical investigations and much of the material is based on test and microscopic examinations of defective castings. Particular attention is paid to the effect of overheating, especially in electric furnaces. There is reference to many hypotheses advanced to account for facts, which have not been definitely accounted for by tests or experience.

While the material is a trifle too technical to be used as a text book or a reference book for the average foundryman, and furthermore is written in a foreign language, that is in one sense the fault of our method of education.

The author discusses the grain of cast iron and the origin of each variety; he treats of the influences of each of the four usual alloying or adulterating elements, singly and in combination; gives a whole chapter to the influence of graphite on the grain; takes up silicon especially in reference to its influence on the graphite, and also shows what nickel, chromium and other elements do to the carbon content and character of the grain. The dependence of the mechanical properties of cast iron on the grain and treatment are also very clearly and exhaustively handled.

The diagrammatic illustrations, especially those in three dimensions, are excellent and instructive; and would be more so if the lettering of some of them were more distinct. (In this particular, American publishers have made us very exacting.)—R. G.

Industrial Economics

Industrials, Their Securities and Organization. By Sterling H. Bunnell. 334 pages. Published by A. W. Shaw Co., Chicago. Price $5.

This book is of interest to two classes of readers, those who are looking for new ideas on industrial management and those who are concerned with the market value of industrial shares. The active administrative officers of manufacturing enterprises, and the more careful investors who take time to study their problems before solving them, will be attracted by the author's presentation. Mr. Bunnell has several messages to deliver on a very broad subject, and his discussions are clear and well supplemented by numerous illustrations gathered from personal observation and experience. The work has much of the comprehensiveness of a text book, but without the usual dryness and formality.

At least four of the twelve chapters are of special interest to the investor as well as the market operator. The author reviews the development, present position and significance of the modern industrial organization. He calls attention to the wide distribution of ownership of industrial shares throughout our ever-increasing army of investors, including both capitalists and wage earners, employers and employees. He traces the important steps in the development of mechanical principles and appliances, and reviews the more recent strides in the efficiency of their application. The subjects of financing, administration, production, marketing, distribution, consumption accounting, development of personnel, plant location, working conditions, and the analysis of balance sheets and earning statements are also reviewed in considerable detail.—H. J. Wolf.

Manufacturing. Edited by Prof. Malcolm Keir. 611 pages, 6 x 9 in. Published by the Ronald Press Co., New York. Price $5.

In view of the three stages in American economics—production as a specialty, then distribution, and now the attempt to equalize these—this book has been prepared by a number of specialists to cover a report upon the principal industries of our country. Chapters follow on American labor, and Labor's industrial problems.

From the very fact that so many authors have had a finger in the literary pie, it is unsatisfactory as a proper study of the problem of manufacturing in general. There is too much historical material—or rather too little concerning the living present, and the future possibilities and

probabilities—after all, these things concern us more than what is called the dead past.

The editor commits the usual error of referring to "labor" when he means "organized labor." The latter constitutes, and always has constituted, but a very small proportion of the labor of this or any other country—in America never more than one fifth of the numbers engaged in work for pay. Another statement, that women's wages have been lower than men's for the same work primarily because the reserve supply has been greater, is not entirely true. Women receive less pay for the added reasons that as a rule they are physically less fitted, they are liable to fluctuations of physical ability, and may not be considered as permanent because they are liable to stop working for pay and take up their more proper occupation as housewives and mothers. They have also, as a rule, from their more mercurial temperament and because less apt to have dependents, a greater percentage of turnover.—R. G.

New Editions of Standard Works

Steel and Its Heat Treatment, by D. K. Bullens. Third edition, rewritten and reset. 564 pages. John Wiley & Sons, Inc., New York. Price $5.

Principles of Metallography, by R. S. Williams and V. O. Homerberg. Second edition. 260 pages. McGraw-Hill Book Co., Inc., New York. Price $3.

It is a good sign when a technical book goes into the second or third edition. Usually the author (and publisher) is glad to have the first edition bought before the book becomes a record of history. When, after a lapse of 10 or 12 years, the demand for the work is sufficient to warrant extensive revision, the subject it treats must be of live interest, and the book appraised favorably by the public.

"Bullens" certainly is well-known to heat treaters. It is the only comprehensive treatise known to the reviewer which talks heat treatment in words the heat treater understands best. Consequently many explanations of practical facts could easily be criticized by the scientist as not conforming exactly to metallurgical theory, but the truth would doubtless be less understandable to the ordinary reader if expressed more precisely.

While hardening, tempering and annealing may all be referred to critical points and heating and cooling rates, not every heat treater has a critical point apparatus. For that reason many specific examples of proper heat treatment programs to give definite properties to steels of certain analyses are undoubtedly consulted frequently by the man at the fire.

New and valuable matter has been added on the proper selection of furnaces and other equipment. It is surprising to find no mention of the McQuaid-Ehn test for normal carburizing steel in the two otherwise comprehensive chapters on case hardening.

Williams and Homerberg's book in metallography is a brief introduction to the science. Much attention is given to the chemical composition and physical constitution of useful alloys, both ferrous and non-ferrous and a table in the appendix lists the composition of many commercial alloys. Emphasis on such phases of the subject, while it undoubtedly widens the audience for the book, makes certain parts of it read more like excursions into metallurgy or engineering materials than metallography. On such excursions lapses in accuracy may be noted, probably because the authors are speaking from hearsay rather than experience.

An idea of the speed at which metallurgy is progressing may be drawn from the fact that in these late editions, the metallography book says on page 161 that "Steels containing one per cent manganese or more cannot be water quenched without danger of cracking," a statement directly contradicted by the recent extensive adoption of medium manganese steels. In Bullen's book there is no mention of nitrogen hardening, nor the ductile stainless irons or high chromium-nickel steels.

Furnace Information for Users

Practical Industrial Furnace Design, by Matthew H. Mawhinney. 318 pages. John Wiley & Sons, Inc. Price $4.

The title of this book is rather misleading, as it contains general information of practical use to engineers and managers who are contemplating the purchase of a new heating furnace, or who are studying the operation of those already installed, rather than detailed information and data to be used by furnace designers in drafting plans for new construction. Consequently the circulation of the book should be far greater than though it were restricted to furnace builders. Any user who desires to get the most for the money he spends on heat treating or baking could peruse this book with profit. It avoids the use of intricate calculations of heat production and transfer; in place of this it endeavors to give diagrams, graphs, or general relationships conveying the same information in more readily understandable manner.

One fact, emphasized at various places in the book, is that much money is often spent to save labor at the furnace, whereas a smaller outlay would save more money in fuel economy. Stated in another way, the author believes that the first place to establish economies is in fuel consumption. A small device to close a door tightly may cost less than $50 to make and install, but save that amount of money every month by keeping heat inside the furnace where it belongs. On the other hand, most equipment for handling hot metal inside a furnace is expensive to install, hard to maintain, and frequently absorbs useful heat in circulating water. Large sums must be saved in labor before it counterbalances the aggregate of these expenses.

New Books Received

Practical Steelmaking. By Walter Lister. Pages 413, 6 x 9 in., illustrated. Published by Instruments Publishing Co., 1117 Wolfendale Street, Pittsburgh.

Foundry Practice. Fourth edition. By R. H. Palmer. Pages 450, 5½ x 8¼ in., illustrated. Published by John Wiley & Sons, Inc., 440 Fourth Avenue, New York. Price, $3.50.

Engineering Drawing. Fourth edition. By Thomas E. French. Pages 466, 6 x 9¼ in., illustrated. Published by McGraw-Hill Book Co., 370 Seventh Avenue, New York. Price, $3.00.

Social Aspects of Industry. By S. Howard Patterson. Pages 539, 6 x 9¼ in., illustrated. Published by McGraw-Hill Book Co. Price $3.00.

Human Nature and Management. By Ordway Tead. Pages 312, 5½ x 8½ in. Published by McGraw-Hill Book Co. Price, $3.50.

Industrial Economics. By Dexter S. Kimball. Pages 312, 6 x 9¼ in., illustrated. Published by McGraw-Hill Book Co. Price $3.00.

Mergers in Industry. Pages 205, 6 x 9¼ in., illustrated. Published by National Industrial Conference Board, Inc., 247 Park Avenue, New York. Price, $3.00.

The American Merchant Marine Problem. Pages 167, 6 x 9¼ in., illustrated. Published by National Industrial Conference Board, Inc. Price, $2.50.

The International Financial Position of the United States. Pages 276, 6 x 9¼ in., illustrated. Published by National Industrial Conference Board, Inc. Price, $5.00.

Fabricated Structural Steel

More Than One-Half of Lettings, Totaling 34,000 Tons, Was for Work in New York

MORE than one-half of the structural steel lettings in the past week, totaling 34,000 tons, was for work in the New York metropolitan area. Included in the New York projects were 6000 tons for an apartment building, 3800 tons for a power house addition and 2550 tons for pier 3 in the North River. Inquiries amounting to 35,000 tons were slightly less than those of the previous week and included 10,000 tons of plates for a pipe line at Everett, Wash., 2500 tons for garages at Chicago and 2500 tons for airports at various locations for the Curtiss Airport Corporation. Awards follow:

BOSTON, 400 tons, Boston Insurance Co. building, to New England Structural Co.

SLATERSVILLE, MASS., 200 tons, power house, to H. B. Smith Co.

DEER LAKE, NEWFOUNDLAND, 135 tons, addition to power house of International Paper Co., to Jones & Laughlin Steel Corporation.

BOSTON & ALBANY RAILROAD, 600 tons, roundhouse at Beacon Park, Mass., to McClintic-Marshall Co.

NEW YORK, NEW HAVEN & HARTFORD RAILROAD, 100 tons, bridge at Canton, Mass., to Boston Bridge Works, Inc.

NEW YORK, NEW HAVEN & HARTFORD RAILROAD, 196 tons, bridge at Port Chester, N. Y., to unnamed bidder.

NEW YORK CENTRAL RAILROAD, 2500 tons, car shops at Harmon, N. Y., to American Bridge Co.

NEW YORK, 2550 tons, Pier 3, North River, to American Bridge Co.

NEW YORK, 3800 tons, addition to Hell Gate power house, to American Bridge Co.

NEW YORK, 200 tons, St. Margaret's School, to McClintic-Marshall Co.

NEW YORK, 1600 tons, apartment building at 1222 Park Avenue, to Paterson Bridge Co.

NEW YORK, 6000 tons, London Terrace apartments on Twenty-Third Street, to Levering & Garrigues Co.

NEW YORK, 1400 tons, apartment building at 104th Street and Central Park West, to Easton Structural Steel Co.

NEW YORK, 815 tons, public schools Nos. 71, 154 and 135, to Easton Structural Steel Co.

NEW YORK, 214 tons, apartment building at 21 East Seventy-Fourth Street, to Easton Structural Steel Co.

NEW YORK, 133 tons, Broadway Exchange Building at 61 Broadway, to Post & McCord, Inc.

JERSEY CITY, N. J., 350 tons, church and rectory, to Mullaney Iron Works.

LOCUST SUMMIT, PA., 260 tons, cleaning plant for Reading Coal Co., to Shoemaker Bridge Co.

OAKMONT, PA., 200 tons, Edgewater Steel Co., to Guibert Steel Co.

PITTSBURGH, 200 tons, Duquesne Slag Products Co., to Pittsburgh Bridge & Iron Works.

STATE OF TENNESSEE, 300 tons, highway bridges, to Virginia Bridge & Iron Co.

IRMO, S. C., 750 tons, hydroelectric power station for Lexington Water Power Co., awarded by W. S. Barstow Co., Reading, Pa., to Belmont Iron Works.

PITTSBURGH, 3000 tons, 20 barges for Basic Barge Line, Inc., to Dravo Contracting Co.

MOUNT VERNON, OHIO, 180 tons, Pittsburgh Plate Glass Co., to Pittsburgh Bridge & Iron Works.

HAMMOND, IND., 800 tons, factory for Lever Brothers Co., to Duffin Iron Co., Chicago.

ROGERS CITY, MICH., 1000 tons, Michigan Lime Stone & Chemical Co., to American Bridge Co.

NORTHERN PACIFIC, 350 tons, viaduct at Superior, Wis., to an unnamed bidder.

CHICAGO, 1000 tons, Edison Electric Appliance Co., to McClintic-Marshall Co.

CHICAGO, 1000 tons, pipe and plate work for Wisconsin Steel Co., to John Mohr & Sons, local.

KANSAS CITY, MO., 700 tons, Hall Building, to Kansas City Structural Steel Co.

SAN JOSE, CAL., 100 tons, factory, to Dyer Brothers.

SEATTLE, 3700 tons plates, Cedar River pipe line, to Western Pipe & Steel Co.

Structural Projects Pending

Inquiries for fabricated steel work include the following:

GOULDS MILL, VT., 200 tons, bridge for Springfield Terminal Railway.

CENTRAL VERMONT RAILROAD, 200 tons, bridge at White River Junction, Vt.

BEVERLY, MASS., 200 tons, bridge.

NASHUA, N. H., 100 tons, office building.

NEW YORK CENTRAL RAILROAD, 300 tons, grade crossing elimination at Forks, N. Y.

NEW YORK, 13,200 tons, section 5, route 108 of subway in Queens, general contract to George H. Flynn, Inc.

NEW YORK, 1675 tons, Lenox Hill hospital.

NEW YORK, 2500 tons, airports at various locations for Curtiss Airport Corporation.

ELIZABETH, N. J., 1725 tons, highway bridge for State Highway Commission.

PENNSYLVANIA RAILROAD, 800 tons, five bridges.

PHILADELPHIA, 650 tons, Germantown Trust Co. building.

PENNSYLVANIA RAILROAD, 14,500 tons, bridges over Hackensack River: for passengers, 10,000 tons; for freight, 4500 tons; Phoenix Bridge Co., low bidder.

STATE OF PENNSYLVANIA, 780 tons, bridge at Connaught Creek, Erie County, 160 tons; viaduct in Northumberland County, 620 tons.

STATE OF NEW JERSEY, 2000 tons, two bridges on route 25; bids open Aug. 12.

ATLANTIC COUNTY, N. J., 500 tons, Dorset Boulevard bascule bridge; bids open Aug. 14.

PHILADELPHIA, 800 tons, bridge for city at Henry Avenue over Reading Railroad.

BUFFALO, 860 tons, State office building; McClintic-Marshall Co. low bidder.

CLEVELAND, 300 tons, Kinsman Road grade elimination bridge for Cleveland Union Terminals Co.

CHICAGO, MILWAUKEE, ST. PAUL & PACIFIC, 2000 tons, car shops at Milwaukee.

MADISON, WIS., 1400 tons: 800 tons for field house and 600 tons for mechanical engineering building.

CHICAGO, 250 tons, Gateway Theater.

CHICAGO, tonnage not stated, 35-story building for Otis Estate, Holabird & Roche, architects.

CHICAGO, 2500 tons, chain of garages.

EAST ST. LOUIS, ILL., 700 tons, mill building for Laclede Steel Co.

BREMERTON, WASH., 200 tons, plates, 10 to 24-in. riveted or cast iron pipe; bids Aug. 7.

EVERETT, WASH., 10,000 tons, plates, pipe line, 44 to 56-in.; bids to be called next week.

TACOMA, WASH., 2000 tons, plates, penstock and surge tank; bids Aug. 8.

TACOMA, 2400 tons, Eleventh Street viaduct over Milwaukee tracks; bids soon.

SAN FRANCISCO, 300 tons, Sommer-Kaufman store; bids being taken.

Reinforcing Steel

Lettings Total Only 2400 Tons and Inquiries Lag

DULLNESS in reinforcing steel is indicated by the fact that awards in the past week totaled only 2400 tons. Fresh inquiries amounted to about 3600 tons, the largest being 1000 tons for a filtration plant at Peoria, Ill. Awards follow:

NEW YORK, 400 tons, sewer work in Bronx, to Kalman Steel Co.

CLEVELAND, 250 tons, factory addition for Richman Brothers Co., to Bourne-Fuller Co.

CHICAGO, 425 tons, warehouse at Orleans and Huron Streets, to Concrete Steel Co.

CHICAGO, 220 tons, building for Cushman Sons, to Concrete Engineering Co.

HAWTHORNE, NEV., 600 tons bars and 400 tons wire mesh, ammunition depot, to Truscon Steel Co.

RENO, NEV., 130 tons, Mackay Science Hall, University of Nevada, to Truscon Steel Co.

BEVERLY HILLS, CAL., 205 tons, bank, Santa Monica Boulevard, to Soule Steel Co.

MONTEREY, CAL., 119 tons, garage, to unnamed bidder.

Reinforcing Bars Pending

Inquiries for reinforcing steel bars include the following:

BOSTON, 700 tons, office building.

CINCINNATI, 300 tons, bridge piers and Union Station approach, for Cincinnati Union Depot Co.

CINCINNATI, 200 tons, new Christ Hospital.

CINCINNATI, 100 to 200 tons, Hamilton County Tuberculosis Hospital.

ARLINGTON HEIGHTS, ILL., 500 tons, filtration plant.

CHICAGO, 250 tons, garage on Clark Street, Fox & Fox, architects.

CHICAGO, 400 tons, commercial building for Zimmerman, Saxe & Zimmerman Co.

PEORIA, ILL., 1000 tons, filtration plant.

ST. LOUIS, 500 tons, McMillan Hospital for Washington University medical group.

The American Rolling Mill Co. will construct a four-hole regenerative soaking pit at its Columbia plant, Butler, Pa. The contract, including stack and additional producer gas flues, has been let to the Rust Engineering Co., Pittsburgh. The National Tube Co., Pittsburgh, will build five continuous Rust recuperative tube reheating furnaces at its Lorain, Ohio, and McKeesport, Pa., works. The furnaces will have a heating capacity in excess of 250 tons of tubes an hour.

Machinery Markets and News of the Works

Tool Buying Well Sustained

August Sales Expected to Be Better Than Normal—General Electric Co. Is Large Purchaser

USUALLY a light month for machine tool sales, August has opened with buying sustained at a fairly high level, although a slight decline in demand is reported from some manufacturing centers.

A slackening in the volume of orders in the Chicago and New England districts has been offset by gains at Cincinnati and by continued liberal bookings at New York and Cleveland.

Machine tool builders are of the opinion that business during August will be better than normal for a midsummer month, although a let-down from the July volume is not unexpected. Shop operations are being carried along at capacity and in most cases unfilled orders are sufficiently large to insure the maintenance of present production schedules well into the fall.

Final reports of July sales reveal that they were only a little if any less than those of June. A Cleveland turret lathe builder states that bookings last month showed an increase of 20 per cent over those of the previous month and were on a parity with those of May, which was a peak month.

General Electric Co. has been a heavy buyer, having purchased tools for its Lynn and Pittsfield plants and for its electric refrigerator manufacturing department. American Locomotive Co. is inquiring for 10 large tools for its Dunkirk, N. Y., plant and the International Harvester Co. probably will begin closing for special machines on its list the coming week.

The Cleveland Union Terminal Co. has contracted for several machines included in its list of 25 tools for which inquiries were made a few weeks ago. The Amtorg Trading Corporation has purchased some tools, including gear-cutting machines, for a tractor plant in Russia and an American builder has sold eight electric drop hammers for Russian delivery.

New York

NEW YORK, Aug. 6.—Machine tool buying continues active with business well distributed. Outstanding among the large buyers is the General Electric Co., Schenectady, which has closed on two milling machines for its turbine department, several tools for its Lynn and Pittsfield, Mass., plants and additional equipment for its refrigerator manufacturing department, including eight presses, a press brake, shaper, cutter grinder, radial drill and engine lathes. Tools are still pending for this division of the company, which is reported producing about 3500 refrigerators a month, while recent sales have been at the rate of about 5500 a month. Westinghouse Electric & Mfg. Co. is also an active buyer for its refrigerator manufacturing plant.

Western Electric Co. still has a number of inquiries out for tools for its Kearny, N. J., plant and American Locomotive Co. is inquiring for more than 10 machines for its Dunkirk plant. Wood Newspaper Machine Corporation, Plainfield, N. J., has closed on several tools, and International Motor Co., Plainfield, has been a small buyer the past week. Among aircraft manufacturers, Sikorsky Aviation Corporation, College Point, N. Y., and Bridgeport, Conn., has closed on three precision bench lathes and Fairchild Aviation Corporation, Farmingdale, N. Y., and Fokker Aircraft Corporation of America, Hasbrouck Heights, N. J., have also been recent buyers.

Plans are being completed by Curtiss Airports Corporation, 27-29 West Fifty-seventh Street, New York, for new airport on 325-acre tract recently acquired at Valley Stream, L. I., replacing former airport at Mineola, L. I., to consist of six hangars, motor repair and equipment shops, airplane repair base, oil storage buildings and other units, to cost over $350,000 with equipment. Complete flying school will be established. Kenneth Franzheim, 345 Madison Avenue, New York, is architect.

United American Metals Corporation, foot of Clay Street, Brooklyn, has plans for a new one and two-story plant, to cost $45,000 with equipment. Gustave Erda, 788 Manhattan Avenue, is architect.

Motor Replacement Parts Corporation, 29 Grove Avenue, Port Richmond, S. I., has leased new building, 30 x 75 ft., now in course of erection on New Street, and will occupy as new mechanical shop. G. C. Marino and Elbert Stewart, Jr., are heads.

Rockland Light & Power Co., Nyack, N. Y., has work under way on a new hydroelectric power plant, to cost over $200,000 including transmission lines, to connect with present system.

Margon & Holder, 29 West Fifty-seventh Street, New York, architects, have filed plans for two-story automobile service, repair and garage building on White Plains Road, to cost about $160,000 with equipment.

Westinghouse Electric & Mfg. Co., 150 Broadway, New York, with main plant at East Pittsburgh, has purchased 22-acre tract in meadow district, Newark, N. J., as site for new Eastern plant. Initial structures will be used primarily for storage and distributing service and are reported to cost more than $500,000. Later it is proposed to erect group of multi-story manufacturing units to cost over $5,000,000 with equipment. It is said that a number of smaller plants will be removed to new location, including factories now at New York and Brooklyn, South Bend, Ind., and Springfield, Ohio.

Royal Show Case Co., 648 Wythe Avenue, Brooklyn, has revised plans for new plant unit, to cost about $50,000 with equipment, for which bids will be asked on general contract early in fall. Murray Klein, 65 Court Street, is architect.

Knickerbocker Ice Co., 41 East Forty-second Street, New York, will soon take bids on general contract for a four-story ice-manufacturing plant, to cost about $100,000 with machinery. C. Leslie Wier is company architect and engineer.

Ford Motor Co., Detroit, has taken title to 35-acre tract at Edgewater, N. J., for new assembling and distributing plant, with power house, to cost over $5,000,000 with equipment. New works will be used primarily for export account and will replace present plant at Kearny, N. J., recently sold to Western Electric Co. Albert Kahn, Inc., Marquette Building, Detroit, is architect and engineer for Ford plant and bids will be asked on general contract from that office about middle of month.

Standard Oil Co. of New Jersey, Inc., 26 Broadway, New York, will erect new storage and distributing plant at Atlantic Highlands, N. J., to cost about $225,000 with equipment.

North Jersey District Water Supply Commission, 24 Commerce Street, Newark, will receive bids until Aug. 20 for motor-generator exciter sets, oil circuit breakers, switchgear and other equipment for electric station at headworks at Wanaque dam, Wanaque, to cost about $100,000; also for electrically-operated centrifugal pumping units of 23 million and 11 million gal. per day capacity, and smaller pumping machinery, with accessories, to cost about $50,000. Morris R. Sherrerd is consulting engineer.

Turner Tanning Machinery Co., 51-53 Commercial Street, Newark, manufacturer of machinery and parts for leather tanneries, has leased building at 27 Haynes Street, totaling about 10,000 sq. ft. floor space, for expansion and will remove to new location. Headquarters are at Peabody, Mass. John Fitzgerald is general manager.

Crew Levick Co., 219 North Broad Street, Philadelphia, refined oils, gasoline, etc., subsidiary of Cities Service Co., 60 Wall Street, New York, has plans for storage and distributing plant at Perth Amboy, N. J., to cost more than $100,000 with equipment.

Groov-Pin Corporation, formerly located 45-22 Thirty-eighth Street, Long Island City, has moved to a larger plant at 47-18 Thirty-seventh Street.

Dur-O-Bilt Metal Corporation, 402-404 West Twenty-fifth Street, New York, has been organized with capital of $20,000 to manufacture metal equipment for restaurants, cafeterias and kitchens.

Hobson, Houghton & Co., Ltd., Sheffield, England, steel manufacturer, has organized Hobson, Houghton & Co., Inc., and has established an agency at 790-794 Greenwich Street, New York, where all transactions in United States will be taken care of. Arthur R. Purdy is president of new company, and Rowland Bramall, secretary-treasurer and manager.

South Atlantic

BALTIMORE, Aug. 5.—Contract has been let by Williamsport Wire Rope Co., Williamsport, Pa., to Jacob Gehron Co., Inc., same city, for one-story branch plant, 100 x 180 ft., in Sparrows Point section, Baltimore, to cost more than $90,000 with equipment. Works will replace temporary plant at same place leased from Bethlehem Steel Co. Facilities will be provided for doubling capacity. G. R. Shepherd is plant manager.

Celanese Corporation of America, Inc., Amcelle, near Cumberland, Md., has plans for three-story solvents recovery unit, to cost $150,000 with machinery. F. T. Small is company engineer.

Republic Service Corporation, 424 Land Title Building, Philadelphia, W. C. Devin, engineer, is concluding purchase of municipal electric light and power plant and system at Radford, Va., for a price of $400,500, and plans extensions, including transmission lines.

Chesapeake & Ohio Railroad Co., Richmond, Va., has awarded general contract to John W. Cowper Co., State Planters' Bank Building, city, for extensions and improvements in engine house and shops at Hinton, W. Va., including coaling station facilities, coal conveying equipment, engine supply building and electric shop, etc., to cost $265,000. Company is also planning expansion in engine house and terminal shops at Elk, W. Va., to cost about $50,000 with equipment. C. W. Johns is chief engineer.

Board of Trustees, University of Maryland, Baltimore, is said to be planning call for bids for three-story addition to engineering building to cost about $100,000 with equipment. Smith & May, Calvert Building, are architects.

R. J. Reynolds Tobacco Co., Winston-Salem, N. C., has plans for a one-story addition to tin foil manufacturing plant, to cost about $40,000 with equipment.

Charlotte Electric Supply Co., Charlotte, N. C., manufacturer of electrical specialties, has plans for new one-story plant, to cost about $24,000 with equipment.

McCleskey Cotton Oil & Peanut Mills, Inc., Americus, Ga., recently organized by L. L. McCleskey, Americus, and associates, has purchased local mill of Farmers' Oil Co., for new plant. Extensions and improvements are planned.

City Council, Atlanta, Ga., has authorized construction of new hangar with shop facilities at Candler Field, to cost about $50,000 with equipment.

Charlottesville Oil Corporation, Charlottesville, Va., has plans for a new oil storage and distributing plant for motor oils, including elevated steel tanks, pumping equipment, etc., to cost about $45,000.

Washington County School Board, Hagerstown, Md., B. J. Grimes, superintendent, is said to be planning installation of manual training department in new two-story high school at Clear Spring, Md., to cost $115,000, for which plans are being drawn by A. J. Klinkhart, Kohler Building, Hagerstown, architect.

Consumers Utility Co., Staunton, Va., has secured gas franchise at Harrisonburg, Va., and is said to be planning new artificial gas plant, to cost about $100,000 with equipment and pipe lines.

Hardwood Dimension Co., Florence, S. C., has awarded general contract to W. A. Cravy & Sons, 1226 Sumter Street, Columbia, S. C., for one-story plant, 120 x 500 ft., to cost about $90,000 of which about one-half will be used for machinery. Majority of equipment will be electrically operated.

Philadelphia

PHILADELPHIA, Aug. 5.—Bids have been asked on general contract by Reading Co., Reading Terminal, Philadelphia, for one-story electric car repair and construction shop, 137 x 325 ft., with lean-to extension, 25 x 119 ft., at Nineteenth Street and Wagner Avenue, Wayne Junction, to cost more than $100,000 with equipment. Clark Dillenback is company architect.

Riter Brothers & Co., Inc., 1022 Race Street, Philadelphia, metals, has leased former two-story storage and distributing plant of General Electric Co., at Frankford Avenue and Palmer Street, for expansion.

Curtis-Martin Newspapers, Inc., Independence Square, Philadelphia, has awarded general contract to Doyle & Co., 1519 Sansom Street, for two-story addition to automobile service, repair and garage building for company trucks and cars, to cost $150,000 with equipment.

Department of Public Works, City Hall, Philadelphia, is arranging bond issue of $1,000,000 for new municipal airport at South Philadelphia, including hangars, repair and reconditioning shops, oil storage building and other units. Project will require about $7,000,000 for completion, and an additional fund of $6,000,000 will be secured later. Alexander Murdoch is director of department.

Elevating, conveying and other mechanical-handling equipment will be installed in new storage and distributing plant to be erected by Frankford Grocery Co., Penn Avenue and Unity Street, Philadelphia, to cost $175,000. W. E. S. Dyer, Land Title Building, is architect and engineer.

General Cold Storage Co., 328 Market Street, Camden, N. J., recently organized with capital of $1,000,000 by J. P. Murray, 4813 Springfield Avenue, Philadelphia, and associates, is said to be planning establishment of ice-manufacturing and cold storage plant, to cost more than $350,000 with machinery. Harry C. Polk, Glenside, Pa., is interested in new company.

Berks Airways, Inc., Reading, Pa., care of E. Hickman, 148 South Fifth Street, architect, has plans for airport near Jacksonwald, including hangars, repair shops and other units, to cost over $300,000 with equipment.

Officials of Capital City Iron & Steel Co., Harrisburg, Pa., affiliated with Harrisburg Pipe & Pipe Bending Works, Inc., have organized Harrisburg Steel Co., to take over and expand present organization. Connection with Harrisburg Pipe & Pipe Bending Works, Inc., will continue as heretofore. New company will be represented by R. Frank Shaffner, Jr.

Thomas B. Lippincott, 11 South Sixteenth Street, Philadelphia, architect, has plans for a three-story automobile service, repair and garage building, to cost about $100,000 with equipment.

Lycoming Mfg. Co., Williamsport, Pa., manufacturer of automobile engines, a subsidiary of Auburn Automobile Co., Auburn, Ind., is completing an addition for production of airplane motors and expects to have unit ready for service early in fall.

Detroit

DETROIT, Aug. 5.—Wolverine Carburetor Co., Jackson, Mich., recently organized by T. G. Atkins, Jackson, and associates, has taken over former local factory of C. J. Mfg. Co., for manufacture of carburetors and kindred equipment.

Standard Tube & Mfg. Co., 2435 Scotten Avenue, Detroit, manufacturer of metal tubular products, is reported planning new factory at Ferndale, Mich., to cost more than $60,000 with equipment.

Michigan Brass & Iron Works, Lansing, Mich., is planning to rebuild part of foundry destroyed by fire July 28.

American Wire Cloth Co., 1432 North Pitcher Street, Kalamazoo, Mich., manufacturer of wire, screens, etc., will erect one-story plant, 40 x 120 ft. in Parchment district, to cost about $35,000 with equipment. Present works will be removed to new location and capacity increased. American Signs Corporation, manufacturer of signs, displays and kindred specialties, will occupy factory to be vacated by American Wire company for expansion; present sign manufacturing plant will be continued as heretofore.

The Crane Market

NEW business in overhead and locomotive cranes is small, but a substantial number of inquiries is in the market, including six overhead cranes for the Board of Transportation, New York, for installation in sub-stations. In the Chicago district, the Rockford Iron Works, Rockford, Ill., is in the market for a 5-ton, 20-ft. span electric traveling crane.

Among recent purchases are:

Walworth Co., Kewanee, Ill., 5-ton, 34-ft. span overhead crane from Shepard Niles Crane & Hoist Corporation.

Auto Specialities Co., St. Joseph, Mich., two 5-ton, overhead cranes from Western builder.

Union Steam Pump Co., Battle Creek, Mich., 40-ton, 60-ft. span overhead crane from unnamed builder.

Chevrolet Motor Co., Flint, Mich., has begun construction of one-story unit, 250 x 375 ft., for metal stamping plant, to cost about $500,000 with equipment.

Michigan Steel Tube Products Co., Hamtramck, Mich., has approved an expansion program to cost $300,000, including new units to develop capacity of about 5,000,000 ft. of electrically welded steel tubing per month, covering primarily tubular products for automobiles.

Baker-Perkins Co., Williamson Street, Saginaw, Mich., manufacturer of special machinery and parts for chemical, food products and other industries, has awarded general contract to Trier Construction Co., 2113 Court Street, for one-story addition, to cost about $55,000 with equipment. Carl Pletscher is president.

Packard Motor Car Co., East Grand Boulevard, Detroit, has plans for a four-story addition, to cost more than $200,000 with equipment. Albert Kahn, Inc., Marquette Building, is architect and engineer. Packard company is completing erection of unit for production of Diesel engines and parts for airplanes to be ready for service by end of month. It will represent an investment of about $500,000.

Stark Pump Co., 17128 Mount Elliott Avenue, Detroit, has been incorporated and will continue manufacture of automatic electric basement drainers, fountain, brine and booster pumps.

New England

BOSTON, Aug. 5.—Bookings by machine tool dealers have declined. Manufacturers, however, have received some good orders from outside points, but report a falling off in demand. A Hartford maker of electric drop hammers has done a substantial business for both foreign and domestic account. It has sold eight hammers, costing about $7,500 each, to the Soviet Government, and is negotiating for additional business. The Spicer Mfg. Co., Toledo, has bought three hammers. It is the general opinion that business will remain comparatively quiet until after the National Machine Tool exhibition next month.

Business in small tools continues in large volume. July sales were the best for any month this year.

Bay State Abrasive Products Co., Westboro, Mass., is taking bids on a one-story plant, 80 x 100 ft.

City of Westfield, Mass., will have plans ready next month for a two-story and basement trade school addition which will require metal working equipment.

Pratt & Whitney Aircraft Co., Hartford, Conn., a unit of United Aircraft Transportation Co., New York, has awarded a contract to Levering & Garrigues, New York, for new plant at East Hartford to manufacture Wasp aircraft engines and parts. Main unit will be one-story, 400 x 1000 ft., with two-story engineering building, entire project to cost about $2,000,000 with equipment. Albert Kahn, Inc., Marquette Building, Detroit, is architect and engineer. Chance Vought Aircraft Corporation, Long Island City, N. Y., another affiliation of parent company, has plans by same architect for new plant near site of Wasp engine works, with one-story main unit, 320 x 672 ft., and several smaller buildings, for production of passenger and commercial aircraft. Project will include an airport with hangars, mechanical shops, etc., and is reported to cost more than $1,500,000 with machinery. Bids will be asked at once on general contract. Boeing Aircraft & Transportation Co., Seattle, another unit of United Aircraft organization, has plans for an Eastern plant at same location in East Hartford, for production of transcontinental airplanes and parts, to cost over $1,000,000 with equipment. It is understood that same architect will prepare plans for this plant.

Board of Education, Central Falls, R. I., is remodeling former city hall for trade school, and will install machine and automobile repair shop, woodworking shop and other departments. It is planned to have school ready for occupancy in fall. Holbert T. Smales is director of vocational education.

Fletcher-Thompson, Inc., 542 Fairfield Avenue, Bridgeport, Conn., architect and engineer, has plans for a two-story automobile service, repair and garage building, 100 x 300 ft., to cost about $185,000 with equipment.

Nash Engineering Co., Wilson Avenue, Norwalk, Conn., manufacturer of air compressors, etc., has filed plans for one-story addition, 30 x 180 ft., to cost about $38,000 with equipment.

Worcester Pressed Steel Co., Barber Avenue, Worcester, Mass., has awarded general contract to Harty & Brown, 25 Hunt Avenue, Boston, for one-story addition, to cost about $40,000 with equipment.

Texas Corporation, 31 St. James Avenue, Boston, has awarded general contract to Simpson Brothers Corporation, 77 Summer Street, for one-story repair shop at oil storage and distributing plant, 100 x 135 ft., to cost about $45,000 with equipment.

Continental Airports, Inc., New Haven, Conn., has acquired 110-acre tract at Milford, Conn., for new airport and has plans for hangars, repair shop, oil storage and other units, entire project to cost more than $175,000 with equipment. Port will be known as Hiram Bingham Field.

Buffalo

BUFFALO, Aug. 5.—Consolidated Aircraft Co., 2050 Elmwood Avenue, Buffalo, has acquired property near Fort Erie, Ont., as site for new plant including parts manufacture and assembling departments, and is said to have plans under way for initial units to cost more than $250,000 with equipment. R. P. Whitman is general manager.

Marcellus Casket Co., Van Rensselaer Street, Syracuse, N. Y., will take bids at once for four-story addition, to cost about $90,000 with equipment. M. L. King, Dennison Building, is architect.

Associated Gas & Electric Co., operating light and power utilities in northern New York, Pennsylvania and New England, is arranging for expansion in different properties, with steel tower transmission lines. A fund of $40,000,000 is being scheduled for work. Executive offices are at 61 Broadway, New York.

William B. Lausterer, 535 Lake View Avenue, Jamestown, N. Y., and associates have organized American Hydraulic Appliance Corporation with capital of $30,000, and plan establishment of new plant at Buffalo for production of hydraulic and other mechanical equipment.

Dahlstrom Metallic Door Co., Buffalo and Second Streets, Jamestown, manufacturer of fireproof doors, sash, etc., has plans for an addition, to cost about $40,000 with equipment. Oliver Johnson, Fenton Building, is architect.

Department of Public Works, City Hall, Rochester, N. Y., Harold W. Baker, commissioner, has plans for hangar with shop and repair facilities at municipal airport, to cost about $35,000 with equipment.

Syracuse Gauge Mfg. Co., Syracuse, N. Y., care of Frank O. Scherr, 102 Stroud Place, recently organized by Mr. Scherr and associates, is said to be planning operation of local factory for manufacture of gages, valves and kindred specialties. Henry Scherr, 1406 Butternut Street, is also interested in organization.

Falk Mill Supply Co., 477 St. Paul Street, Rochester, N. Y., machinery dealer, has purchased plant and equipment of Climax Locomotive Works, builder of locomotives used in lumber camps, mines, mills, etc. This purchase marks opening of new branch of business for Falk company.

Cincinnati

CINCINNATI, Aug. 5.—New business booked by machine tool manufacturers in this territory the last few days in July brought the month's total to a higher level than that of July, 1928, and about on a parity with June of this year. General activity has sustained operations at an unusually high level for this season of the year and the number of unfilled orders is still large. Manufacturers report sufficient bookings to continue capacity production well into the fall. A constant flow of small inquiries also augurs well for a continued steady demand.

Kansas City Southern Railroad has placed an order with a local manufacturer for two large engine lathes.

Contract has been let by Master Electric Co., Dayton, Ohio, manufacturer of electrical equipment, to Huffman Realty Co., Dayton, for one-story addition, to cost $30,000 with equipment.

Board of Education, Portsmouth, Ohio, plans installation of manual training equipment in new two-story and basement junior high school to cost $230,000, for which bids are being asked on general contract. R. Wile, Portsmouth, is architect; William B. Ittner, 911 Locust Street, St. Louis, is consulting architect and engineer.

Harnischfeger Sales Corporation, 269 Union Avenue, Memphis, Tenn., an interest of Harnischfeger Corporation, Milwaukee, has awarded general contract to Memphis Construction Co., 160 Union Avenue, for one-story factory branch, storage and distributing plant, with service division, 40 x 175 ft., to cost about $50,000 with equipment. Hanker & Cairns, 123 South Court Street, Memphis, are architects.

Stumb Motor Co., 1408 Broad Street, Nashville, Tenn., has plans for three-story service, repair and garage building, 102 x 170 ft., to cost about $100,000 with equipment. Warfield & Keeble, Nashville Trust Building, are architects.

Mead Pulp & Paper Co., Chillicothe, Ohio, has plans for an addition for pulp and paperboard manufacture, to cost about $400,000 with machinery. Company engineering department is in charge.

Nashville Warehouse & Elevator Co., Nashville, Tenn., is planning to rebuild part of grain elevator and plant destroyed by fire July 27, with loss reported close to $400,000, including elevating, conveying and other equipment.

City Council, Chattanooga, Tenn., has awarded general contract to Rogers & Leventhal, 826 East Eleventh Street, for

hangar, repair shop and terminal buildings at municipal airport, to cost about $55,000 with equipment. William Crutchfield, First National Bank Building, and Maxwell James, Provident Life Building, are architects.

Milwaukee

MILWAUKEE, Aug. 5.—Production in all metal working plants continues at the high rate of preceding months, and no signs of a summer lull are as yet discernible. Demand from the smaller shops is especially strong. Agricultural implement makers look for a better fall business than that of early summer or spring. Automobile manufacturers, while curtailing current production, are the source of an unusual amount of inquiries. Deliveries show no improvement.

Milwaukee County Park Commission is taking bids for a hangar, 80 x 100 ft., for experimental department of Hamilton Metalplane Co. at Milwaukee County Airport. Charles F. Barndt, 530 Park Street, is general manager of Hamilton company.

Little Wolf Co., New London, Wis., will build dam and hydro electric power plant on Little Wolf River three miles from New London. Dr. W. H. Finney, Clintonville, Wis., is president of company and Frank L. Zaug, New London, secretary.

Janesville Foundry & Machine Co., Janesville, Wis., recently organized by A. W. Schlueter, owner of Schlueter Boiler Works, and Walter Reynolds, Beloit, Wis., has taken over idle foundry of New Doty Mfg. Co., 301 North Main Street and will specialize in gray iron castings.

Marathon Rubber Products Co., Inc., Wausau, Wis., will take bids soon on a one-story addition, 86 x 121 ft.

Sliding Clutch Mfg. Co., 1830 Vliet Street, Milwaukee, has been incorporated to manufacture a sliding clutch, either in its own plant or on a contract basis. Jacob Weisling is president and treasurer.

Moe Brothers Mfg. Co., 113-121 East Clybourn Street, Milwaukee, has been organized to manufacture lighting equipment and kindred products and is now in production.

Pittsburgh

PITTSBURGH, Aug. 5.—Machinery business in this district during July was about equal to June and considerably ahead of July last year. August indicates little decline from the July figure, as local offices are busy preparing estimates on new inquiries, and the Westinghouse Electric & Mfg. Co. and the United States Aluminum Co. are expected to close on a good portion of their extensive lists this month.

Machine tool deliveries are quite extended and many dealers have been unable to quote on considerable business in which they normally would have been interested. For this reason quotations are very firm and manufacturers' representatives are satisfied with the margin of profit now being obtained.

Tidewater Pipe Co., Ltd., Franklin, Pa., a subsidiary of Tidewater Oil Co., 11 Broadway, New York, has purchased plant and property of Emery Mfg. Co., consisting of oil refinery at Franklin, pipe lines, oil storage and distributing plants, and other units. New owner plans expansion. George J. Hanks is president.

Wightman Glass Bottle Co., Parker, Pa., will double former output of plant recently destroyed by fire, and has plans for main one-story unit, 125 x 270 ft. New bottle-making machinery will be installed, all equipment to be electrically operated. It will cost more than $350,000 with equipment. Knox Glass Co., is interested in project.

Presto Electric Roaster Co., Pittsburgh, recently formed with capital of $100,000, is said to be arranging establishment of plant for production of electric heating appliances and kindred equipment. Company is represented by Ivan Bielek, 440 Tenth Avenue, Munhall, Pa., treasurer. S. M. Bielek, 1001 Butler Pike, Etna, Pa., is also interested in new organization.

Board of Education, Borough of Overbrook, Pa., is said to be planning installation of manual training equipment in two-story addition to junior high school, to cost over $175,000. Louis Stevens, Century Building, Pittsburgh, is architect.

Hazel-Atlas Glass Co., Wheeling, W. Va., will make extensions and improvements in power department at plant at Grafton, W. Va., including installation of fuel-saving and handling equipment, to cost about $70,000. G. Wesley Evans is superintendent.

Erie Bolt & Nut Co., Erie, Pa., will erect a one-story building, 50 x 140 ft., for machine shop and additional storage purposes. All materials and machinery have been purchased.

Cleveland

CLEVELAND, Aug. 5.—Machine tool sales held up well during July although dealers' orders declined slightly as compared with June. A local manufacturer of turret lathes reports a 20 per cent gain in business in July over the previous month, its sales lats month equaling the large volume attained in May. Business is well diversified and buying is in small lots, few orders being for more than two or three machines.

The Cleveland Union Terminals Co. has purchased a few of the machines covered by its recent list of 25 tools. The Amtorg Trading Corporation has purchased some equipment, including gear cutting machines for a tractor plant in Russia. It is at present figuring on 30 turret lathes for 1929 delivery. While deliveries of some lines of tools have improved considerbly, other makers are as far behind on shipments as a few weeks ago.

Gogan Machine & Foundry Co., 1440 East Fifty-fifth Street, Cleveland, has awarded contract to J. L. Hunting Co. for an addition, 40 x 72 ft., to cost about $70,000. Company makes heat treating machines used in manufacture of springs and spring forming machinery. Joseph Gogan is president.

Medusa Portland Cement Co., Engineers' Building, Cleveland, is concluding arrangements for controlling interest in Newaygo Portland Cement Co., Newaygo, Mich., and its subsidiary, Manitowoc Portland Cement Co., Manitowoc, Wis. Consolidated interests will operate a group of eight mills with gross annual output of 8,000,000 bbl. Medusa company has plans for another mill at Charlevoi, Mich., with initial capacity of 1,500,000 bbl. annually to cost about $2,500,000 with machinery. J. B. John is president.

McKay Machine Co., Youngstown, manufacturer of metal-working and automotive machinery and parts, has awarded general contract to Emil P. Linberger, 830 Market Street, for one-story addition, to cost about $45,000 with equipment.

Suburban Light & Power Co., Alliance, Ohio, has work under way on an expansion program to cost about $500,000, of which about $350,000 will be used for an addition to local steam-operated electric generating station.

Toledo Grain & Milling Co., Toledo, Ohio, is considering rebuilding part of flour mill destroyed by fire July 28, with loss reported more than $300,000 including machinery.

E. F. Hauserman Co., 6800 Grant Avenue, Cleveland, manufacturer of steel partitions for offices, factories, etc., has plans for a one and two-story addition, to cost more than $50,000 with equipment. George S. Rider Co., Century Building, is architect and engineer.

Akron Air Services, Inc., 975 East Market Street, Akron, Ohio, has awarded general contract to Clemmer & Noah, Inc., 470 East Market Street, for hangar with shop and repair facilities at Fulton Field, to cost about $80,000 with equipment.

Lindsay Wire Weaving Co., 14025 Aspinwall Avenue, Cleveland, has plans for a two-story addition, 50 x 120 ft., to cost about $65,000 with equipment. Bohnard & Parson, Euclid Building, are architects. H. L. Lindsay is president.

Chicago

CHICAGO, Aug. 5.—Lighter demand for machine tools is noted in this district. New orders are widely scattered and individually small. Fresh inquiry, although not large, continues at a steady rate, giving some indication that August sales will be in satisfactory volume. Deliveries remain practically stationary on standard tools and buyers of special equipment are also having difficulty in obtaining deliveries promised.

Steady progress is reported on the special machinery in the International Harvester Co.'s list. It is thought that some orders will be placed next week.

Western Electric Co., Hawthorne Station, Chicago, will build a one-story addition, 95 x 204 ft. to cost $95,000. C. B. Barnes, Hawthorne Station, is architect.

Heating Systems Corporation, Joliet, Ill., has broken ground for first unit of its plant, to cost over $100,000 including equipment.

Martin-Parry Corporation, 2201 South Union Avenue, Chicago, manufacturer of commercial automobile bodies, has leased part of one-story building at 2848 Quinn Street, and will remodel for new assembling works. Present plant will be removed to new location. Headquarters and main plant are at York, Pa.

Iowa Railway & Light Co., Cedar Rapids, Iowa, has awarded a general contract to J. W. Hopp Construction Co., Granby Building, for two-story equipment storage and distributing plant with repair facilities, to cost about $35,000.

City Council, Moline, Ill., is planning establishment of municipal airport to cost about $150,000, with hangars, repair and reconditioning shops and other units. A special aviation commission has been formed to carry out project. R. M.

Benell, City Hall, is city engineer in charge.

Standard Stamping & Perforating Co., 4718 Fifth Avenue, Chicago, manufacturer of metal products, has leased site and building to be erected in Kenwood manufacturing district by Holton, Seelye & Co., 140 South Dearborn Street, to be one story, totaling about 13,000 sq. ft. floor space, to cost about $40,000. Present works will be removed to new location and additional equipment installed.

Taylor Forge & Pipe Co., West Fourteenth Street and Cicero Avenue, Cicero, Ill., has plans for one-story unit, to cost about $45,000 with equipment. Weiss & Niestedt, 53 West Jackson Boulevard, Chicago, are architects.

Traveling ovens, power equipment, conveying and other machinery will be installed in three-story plant to be erected by Cushman Sons, Inc., 1138 Bryn Mawr Avenue, Chicago, to cost $260,000. Michaelson & Rognstad, 3256 Franklin Avenue, are architects.

Faries Mfg. Co., Decatur, Ill., manufacturer of electric fixtures, is erecting a one-story addition, 80 x 240 ft.

Indiana

INDIANAPOLIS, Aug. 5.—City Council, Terre Haute, has authorized a bond issue of $125,000 for establishment of municipal airport, to include hangars, repair shops and other units. It is proposed to purchase present air terminal of Terre Haute Airways, Inc., and expand.

Anaconda Wire & Cable Co., operated by Anaconda Copper Mining Co., 25 Broadway, New York, has purchased three plants and other properties of Marion Insulated Wire & Rubber Co., Marion, manufacturer of rubber-covered wire, cables, etc., and will consolidate. Plants will be continued at present location and production increased.

Bendix Aviation Corporation, South Bend, Ind., operating Bendix Brake Co., and other properties, will take over General Instrument Co., recently organized, and operate as unit of organization. Last noted company has secured Pioneer Instrument Co., Brooklyn, N. Y.; J. P. Marsh Co., Detroit; Paulin System, Inc., Los Angeles, and Tiffany Mfg. Co., Newark, N. J., all manufacturers of aircraft and automotive instruments. Expansion is planned, including addition to plant of Pioneer company to cost about $60,000. Vincent Bendix is chairman of General Instrument Co.; Orvill W. Thompson is president.

Western Oil Co., 310 North Meridian Street, Indianapolis, has filed plans for new oil storage and distributing plant, including machine shop, at Kokomo, reported to cost about $50,000 with equipment.

Bailey Products Corporation, Union City, has been organized to take over business of Bailey Mfg. Co., local, manufacturer of screw and metal products and of couplings for magnetos, generators and water pumps. O. G. Gist is president and G. A. Thomas, manager.

Edwards Iron Works, South Bend, has work under way on an expansion program to cost $300,000. New buildings include main shop, 186 x 325 ft., in which all fabricating will be done, two warehouses, 80 x 562 ft. and 40 x 360 ft., respectively, and a power house.

Lamb Machine Co., Indianapolis, has moved to 1128 West Street, and is in operation.

Gulf States

BIRMINGHAM, Aug. 5.—Plans have been approved by Prest-O-Lite Co., 30 East Forty-second Street, New York, manufacturer of acetylene equipment, welding apparatus, etc., for branch plant at Tampa, Fla., to cost over $90,000 with machinery.

Hurricane Motor Co., Inc., 2103 Walker Street, Houston, Tex., manufacturer of aircraft motors and parts, will soon begin construction of new one-story plant, to cost more than $175,000 with machinery.

Brown Paper Mill Co., Inc., Monroe, La., is disposing of bond issue of $3,000,000, fund to be used for construction of addition to mill for production of kraft papers and kraft paperboard. Work is scheduled for completion in 12 months and will cost about $1,500,000 more than bond issue. George F. Hardy, 309 Broadway, New York, is consulting engineer.

Central Power & Light Co., Frost National Bank Building, San Antonio, Tex., has acquired site at Mercedes, Tex., for a new ice-manufacturing plant, to cost about $175,000 with machinery. Company also plans erection of similar plant at Elsa, Tex., to cost about $85,000.

Gulf Refining Co., Gulf Building, Houston, Tex., has begun construction of oil storage and distributing plant, to consist of five main buildings, pumping station, tanks, 300-ft. dock and other structures, to cost more than $350,000 with equipment. Headquarters are in Frick Annex, Pittsburgh.

Galveston Wharf Co., Galveston, Tex., will issue bonds for $2,245,000, fund to be used for addition to grain elevator, to include elevating, conveying, screening and other equipment for capacity of 5,846,000 bu.

City Council, Abilene, Tex., has plans for hangar, 100 x 100 ft., with shop and mechanical facilities at municipal airport, to cost about $55,000 including equipment. B. Russell Shaw, Arcade Building, St. Louis, is architect.

Charles A. Seward Machine Co., Birmingham, manufacturer of elevating, conveying and kindred machinery, is carrying out an expansion program in transmission equipment division.

Southern Natural Gas Corporation, Monroe, La., has work under way on new pipe line from Monroe and Richland, La., gas fields to Atlanta, Ga., total distance of 421 miles, to furnish natural gas for industries at different points in Georgia. It is scheduled for completion in January, and will cost $20,000,000 with compressor stations and other facilities.

Texas-Louisiana Power Co., Fort Worth, Tex., will build new steam-operated electric power plant at Perryton, Tex., to cost about $80,000 with equipment.

Dallas Airports Utilities Corporation, Dallas, Tex., recently organized, has plans for hangar, 150 x 330 ft., with repair and reconditioning shops, at Love Field, to cost about $75,000 with equipment. Edgar L. Flippen is president.

Board of Education, Lubbock, Tex., is considering installation of manual training department in new three-story high school to cost $600,000, for which plans are being completed by Peters, Strange & Bradshaw, Lubbock, architects.

Yellow Cab Co., Dolorosa Avenue, San Antonio, Tex., has awarded general contract to Allen & Allen, Fredericksburg Road, for one-story service, repair and garage building, 145 x 160 ft., to cost about $100,000 with equipment.

St. Louis

ST. LOUIS, Aug. 5.—Bids are being asked on general contract by Mack International Motor Truck Corporation, 2804 Pine Street, St. Louis, for one-story factory branch, with assembling department, to cost $230,000 with equipment. H. E. Foster, 400 West Madison Street, Chicago, is architect and engineer. Headquarters of company are at 25 Broadway, New York.

City Council, Lees Summit, Mo., has plans for municipal electric light and power house, to cost about $100,000 with machinery. Rollins Engineering Co., Railway Exchange Building, Kansas City, Mo., is engineer.

Board of Education, Topeka, Kan., will install a manual training department in addition to Roosevelt Junior High School, for which plans have been completed by Thomas W. Williamson & Co., Farmers' National Bank Building, architects.

City Council, Little Rock, Ark., has called special election on Aug. 19 to approve bond issue of $200,000 for establishment of municipal airport, including hangars, repair shops, oil storage and other units, for which plans will be drawn at once.

Greenlease-Moore Chevrolet Co., 901 North Broadway, Oklahoma City, Okla., representative for Chevrolet automobile, has awarded general contract to William Lambert Construction Co., 1812 West Sixteenth Street, for service, repair and sales building, to cost about $100,000 with equipment. N. B. Fleming, Commercial Building, is architect.

Air Terminal Corporation, Kansas City, Mo., care of Buckley & Van Brunt, Gloyd Building, architects, has plans for airport terminal at municipal field, including one, two and three-story hangar of circular type, 450 ft. diameter, with repair shops and other divisions, to cost $500,000 with equipment.

Board of Education, Concordia, Kan., is considering installation of manual training equipment in new junior and senior high school to cost about $300,000, for which bids are being asked on general contract until Aug. 20. Proudfoot, Rawson, Souer & Thomas, Hubbell Building, are architects.

Oklahoma Pipe Line Co., Oklahoma City, Okla., a subsidiary of Standard Oil Co. of New Jersey, Inc., 26 Broadway, New York, is planning construction of pipe line from Cushing, Okla., to point near Oklahoma City, about 53 miles, to cost more than $300,000 with booster stations, etc.

Capitol City Steel & Iron Co., Oklahoma City, Okla., has work in progress on a new structural steel fabricating mill, to cost more than $100,000.

Western Automobile Co., Washington Boulevard and Euclid Avenue, St. Louis, has awarded general contract to Shasserre Construction Co., Fullerton Building, for three-story service, repair and sales building, to cost about $100,000 with equipment.

Pacific Coast

SAN FRANCISCO, Aug. 1.—Contract has been let by Paramount Famous-Lasky Corporation, Hollywood, Cal., to Union Engineering Co., Huntington Park, Cal., for a one-story machine shop to cost about $40,000 with equipment.

Standard Rock Co., Builders' Building, Stockton, Cal., is planning installation of rock-crushing plant with conveying, load-

ing and other equipment, to cost over $100,000. A stock issue of about $200,000 will be sold, part of fund to be used for new plant.

Department of Works, San Francisco, has plans for a hydroelectric power plant in connection with Hetch Hetchy water project, at Red Mountain bar, Don Pedro dam of Modesto Valley Water District. Station will be equipped for initial capacity of 25,000 kw., and is reported to cost about $1,000,000 with transmission lines and switching stations. City engineering department, Nelson Eckert, assistant city engineer, in charge.

Calumet & Arizona Mining Co., Douglas, Ariz., has authorized an expansion program at local smelting plant and at mining properties in Bisbee district. At last noted place all mining and surface equipment will be electrified, and new hoists and other machinery installed Project will cost $2,100,000. Headquarters of company are at Calumet, Mich.

Clinton Campbell, Phoenix, Ariz., operating two local brick manufacturing plants, has plans for a third plant to cost about $125,000 with machinery.

Willard Storage Battery Co., East 131st. Street and St. Clair Avenue, Cleveland, manufacturer of electric storage batteries, has purchased property in the Union Pacific industrial district, Los Angeles, 300 x 600 ft., for new plant for Western coast trade. Plans are under way for two initial units, each one story, to cost about $350,000 and $250,000 with equipment, respectively. Other structures will be built later. Entire project will cost about $1,000,000.

Breese Aircraft Corporation, Portland, Ore., recently organized, will take over company of same name with local plant, specializing in production of monoplanes. Plans are under way for general expansion, including establishment of new parts manufacturing and assembling plant near municipal airport on Swan Island where production will be concentrated. New company has arranged for stock issue to total $620,000, large part of proceeds to be used for development noted.

Mountain States Power Co., Tacoma, Wash., has plans for extensions in steam-operated electric power plant on Coos Bay, Marshfield, Ore., to include installation of additional equipment. Extensions will be made in transmission lines in district noted. Entire project will cost over $1,000,000.

Crown-Willamette Paper Co., 248 Battery Street, San Francisco, is beginning work on extensions at mill at Camas, Wash., to include installation of machinery in pulp department and paper-making division, to cost over $3,500,000.

Kreager Heater Corporation, 1821 East Olive Way, Seattle, Wash., is in market for motors, thermostats, transformers and blowers. H. W. Leavitt is vice-president and secretary.

Jacobs & Gile, Portland, Ore., steel jobbers, have let contract to Austin Co., for a warehouse to cost $30,000.

Washing Machine Service Co., 918 West Seventh Place, Los Angeles, manufacturer of parts and accessories for washing machines, has recently been incorporated. William Vogel is president and general manager.

Canada

TORONTO, Aug. 5.—Machine tool sales in July tapered somewhat, compared with previous months this year, but business, as a whole, was better than that of the corresponding month last year. The total volume for the first seven months of this year was well above that of other years since the war. Current demand, while not strong, is holding at a satisfactory summer level. Inquiries are good, and there are indications of some fair sized lists to be issued soon.

Toronto Hydroelectric Commission, Yonge Street, has approved purchase of equipment to cost $1,000,000.

Bell Furniture Co., Southampton, Ont., has started work on the foundations for a $25,000 factory addition, three stories, 60 x 80 ft.

A. G. Spalding & Brothers, of Canada, Ltd., 5 Edward Street, Brantford, Ont., manufacturer of sporting goods, etc., has awarded contract to Schultz Construction Co., 45 Albion Street, for a one-story factory addition, to cost $40,000.

Steel Co. of Canada, Ltd., 525 Dominion Street, Montreal, head office, Hamilton, Ont., has awarded a number of contracts for erection of an addition. Mander & Lucas, 2072 Aulmer Street, have the general contract.

Several contracts have been awarded for plant at Niagara Falls, Ont., for Lionite Abrasive, Ltd., Niagara Falls, N. Y., to cost $150,000.

Canadian Office & School Furniture Co., 1195 King Street, Preston, Ont., has started work on one-story addition, 70 x 93 ft., to cost $40,000.

Foreign

OFFICIALS of Grigsby-Grunow Co., 2038 North Kolmar Avenue, Chicago, manufacturer of radio sets and equipment, have organized Grigsby-Grunow Co., Ltd., to operate in England. Plans are being arranged for construction of a plant near London, to cost more than $350,000 with machinery. B. J. Grigsby is president of parent company.

Russo-Asiatic Consolidated Co., Sydney, Australia, has acquired a controlling interest in Mount Isa Mines Co., in North Queensland section, and is arranging for development of lead and zinc properties. New owner will continue construction program now under way, to include erection of mill and smelter, power plant, mines equipment buildings and other units, to cost over $6,000,000 with machinery.

Spencer Kellogg & Sons, Inc., Niagara Square, Buffalo, manufacturer of linseed and other refined oils, has purchased plant and properties of L. C. Gillespie & Sons, Hankow, China, producers and refiners of chinawood oil. New owner will take over property at once and plans expansion.

American & Foreign Power Co., operated by Electric Bond & Share Co., 2 Rector Street, New York, has purchased property at Mezquital, near Durango, Mexico, and is reported planning a new hydroelectric generating plant, with transmission lines to connect with Durango system and within radius of about 150 miles of that city for power supply to mining properties in district. Entire project will cost about $3,500,000.

Government of Panama, Panama, is arranging fund of about $70,000 under direction of Government Road Board, for extensions and improvements in municipal airport, known as Paitilla Field, to include hangars, repair shops, oil storage and other field units.

Ford Motor Co., Detroit, is said to be planning construction of new assembling plant at Antivaria, Jugoslavia, to cost more than $750,000 with equipment. This will be one of number of plants to be established in Europe including works in Russia and in Germany, each to represent investments of more than $5,000,000.

New Trade Publications

Oxwelding Aluminum and Its Alloys.—Linde Air Products Co., 30 East Forty-second Street, New York. Eight-page pamphlet describing required technique, illustrating many desirable fixtures, and equipment welded of commercial aluminum.

Acid Proof Mastic.—Nukem Products Corporation, Buffalo, N. Y. Folder describing "Basolit," an acid proof material for flowing between joints in brick-lined pickling tanks, and methods of constructing leak-proof tanks.

Arc Welders and Supplies.—General Electric Co., Schenectady, N. Y. Pamphlets GEA-876C, GEA-1009A, and GEA-571C, describing respectively 400-ampere welder driven by alternating current motor, 300-ampere portable welder driven by gas engine, and equipment such as shields, electrode and holders, resistors and reactors.

Welding Wire.—Page Steel & Wire Co., Bridgeport, Conn. Folder entitled "Materials Are Important," but argues proposition that special processing of materials going into wire is necessary to make good wire for welding.

Welding and Cutting Outfits.—International Oxygen Co., Newark, N. J. Folder illustrating outfits designed especially for general automobile work in repair garages.

Nickel in Cast Iron.—International Nickel Co., Inc., 67 Wall Street, New York. Bulletins 201-A and 207 describing methods of making alloy cast iron, and the properties of nickel and nickel-chromium cast irons fitting them for gas and steam engine cylinders, parts to resist pressure, machine tool beds and tables, and intricate castings generally.

Mine and Industrial Locomotives.—Baldwin Locomotive Works, Philadelphia, and Westinghouse Electric & Mfg. Co., East Pittsburgh. Special publication No. 1841, devoted to electric locomotives manufactured in conjunction by the two companies. Illustrations, plans and complete data on locomotives recently placed in service by companies are included with special reference to the transportation problems of small companies.

Pipe Fittings.—Westinghouse Electric & Mfg. Co., East Pittsburgh. Circular 1676-B dealing with fittings for pipe structures with many illustrations. Many new applications for pipe fittings are included, such as racks in industrial establishments, railings, display racks and pipes of all kinds.

Sprayers.—Binks Mfg. Co., Chicago. Bulletin No. 12 describes the use of hand and power sprayers for cold water paints, whitewash, calsomines and insecticides.

Water Wheels.—James Leffel & Co., Springfield, Ohio. A detailed description of a Leffel water wheel, featuring the Leffel outside or exposed type gate operating mechanism, is contained in Bulletin W205.

VOL. 124, No. 7

No Alarm for Industry in Federal Reserve Bank Action

BY VIRGIL JORDAN

THE action of the New York Federal Reserve Bank Aug. 8 is probably far simpler and more consistent in its purpose and effects than are the rather far-fetched and abstruse attempts to explain it. I do not think the large and sudden raise in the discount rate and the equally large cut in the rate on bankers' bills should be regarded as another attempt to scare, break or control the stock market, or to discriminate against it. If the market chose to regard it as such, that tells more about the market's state of mind than it does about the Federal Reserve's.

Reserve System Is Not Specially Interested in Stock Market

As I read the record of Reserve policy and practice in recent years, I do not find that it is specially interested in the stock market at all, or much less that it has been engaged in any sinister strategy to curb it. The Reserve System today is not controlling the money market in any such narrow sense; it is merely responding and adjusting itself to conditions that have arisen through great and far-reaching changes in industry and trade, domestic and international, and the methods of financing them. That, I believe, has been its position and policy ever since 1923.

The changes last Thursday are merely a recognition or symptom of an important fact, which has made many business men uneasy, but which the stock market is determined to ignore. This fact is that money is abnormally high, which means merely that credit is scarce in comparison with the demand for it. This is true the world over. It has been increasingly true in the past two years, and will remain true as far ahead as one can see, unless there should be a radical change in banking policy and business philosophy.

Rediscount Rate Does Not Fully Reflect Money Tightness

The central banks of all important countries (except France) have raised their rates and will raise them further if the present situation persists. Here even a 6 per cent rediscount rate does not fully reflect the tightness of money, for the collateral loan and even the commercial paper rate in the open market are higher than that and will probably remain so.

It is useless to blame the stock market and its enormous demand for credit for this tightness of money, or to hurl epithets like "speculation" or "inflation" at the new methods of financing industry and trade which have given rise to this demand. They have come to stay, and their demands are probably going to be met. The banking system will ultimately have to adjust itself to them. The "inflationists" and "new era" philosophy are in the saddle or trying to get in, in almost all countries as well as here.

¶ On Aug. 8, 1929, the directors of the Federal Reserve Bank of New York unexpectedly advanced the rediscount rate from 5 per cent to 6 per cent and reduced the rate on acceptances from 5¼ to 5⅛ per cent. The securities' market response was first one of alarm. Then bankers appeared to greet the action as a constructive step. As an important item in the whole matter of the relation of high money rates to business activity, THE IRON AGE asked Virgil Jordan to discuss the question for industry.

¶ Responding under a title, "The Federal Reserve Hews to the Line," he supplements in the accompanying article his contribution in THE IRON AGE of May 30, emphasizing that the new methods of financing industry have come to stay and that the central banks, if left alone, will probably adjust themselves to the existing pressure with safety, on the score that credit resources are adequate for considerable industrial expansion. Mr. Jordan, who has been chief economist of the National Industrial Conference Board for upward of nine years, reiterates that the Federal Reserve Bank is not trying to control the money market in any narrow sense.

The central banks, if left alone and free of political influence, will probably be able in time to adjust themselves to this pressure with safety, for the credit resources, especially in this country, are adequate for considerable expansion. But until they do the depressing atmosphere of tension and strain and tightness in the money markets of the world will continue.

Importance of Open Market Credit on General Business Steadily Diminishing

A six per cent rate is not likely permanently to discourage the stock market, nor is the lower bill rate of any special significance as a promise of easier money. Experience has already shown that the discount rate, even when graduated to penalize heavy bank borrowing, affects the rate charged by member banks very little, because the added cost is slight. Its immediate effect on general business depends upon the importance of open market credit in the financing of industry and trade, and this is steadily diminishing, for all types of business except those which are backward in organization or highly seasonal, like agriculture and the scattered, small-scale manufacturing and retail trades.

For this reason the lower rate on bankers' acceptances must be regarded only as a natural concession or adjustment to the special seasonal needs of agriculture, whose production and marketing facilities are as yet relatively poorly organized and which is more and more getting the short end of the credit rope. The development of large, well capitalized marketing organizations or "stabilization corporations," such as has been begun under the stimulus of the Federal Farm Board, may change this materially. In any case, the credit made available through the lower bill rate for this season will quickly liquidate itself as the crops are finally marketed. It will not float about in the money market for speculators to use for very long, and when it is paid off money will continue as tight as ever.

Only Continued High Money Rates Will Force Business Curtailment

We have seen in the past two years that tight money does not necessarily affect business quickly, for reasons which I have pointed out elsewhere. In the long run, however, continued high money rates will force either business expansion or credit policy to give way. The pressure will show itself first in increased costs of government financing, higher taxes and retarded borrowing by agencies compelled to depend upon the bond market. Later, price deflation sets in, slow and chronic. This is already evident in some countries abroad, and even to some extent here, in the persistent refusal of the price level to respond normally to the sustained vigorous business expansion.

British Survey of Present Status of Chromium Plating

CHROMIC acid and chromic sulphate were originally thought to form the essential basis of a chromium depositing solution, but now practice is in favor of sulphuric acid as a substitute for the chromic sulphate, owing to the high purity obtainable in that acid, said G. E. Gardan in a paper entitled "A Survey of the Published Information on Chromium Plating," delivered recently before the Electroplaters' and Depositors' Technical Society at Birmingham, England. Some selections from his address follow:

The concentration of sulphuric acid in the solution has to bear a fixed relationship to the chromic acid content. For average working conditions one part by weight of sulphuric acid is added to every hundred parts of chromic acid. Variation in that proportion causes a reduction of the cathode efficiency, a low concentration of sulphuric acid being particularly detrimental to the deposit, which is covered with a brown film.

Describes a Typical Bath

A typical bath solution contains 40 oz. per imperial gallon of chromic acid, and 0.4 oz. of sulphuric acid. No other added substance is essential for satisfactory working, but it is obvious that chemical changes take place during electrolysis. The most important of these is the reduction of a portion of the hexavalent chromium to the trivalent state. Some workers, therefore, favor deliberate initial production of part of the hexavalent chromium to the trivalent state by chemical or electrochemical means. It is, however, important to limit the concentration of trivalent chromium, for that element reduces the range of current densities for satisfactory deposition.

Chromium plating differs from most other metal deposition processes because of the high current density necessary, the low current efficiency obtained, and the pronounced differences in character of the deposit that results from variations of current density, temperature and composition of the solution. In general, with increasing current density or decreasing temperature, the efficiency increases and the deposit changes from a bluish color, with bright matte surface, to one with a bright lustrous appearance and finally to a dark iridescent deposit, often described as "burnt." The blue matte is too thin to be of commercial value. The bright lustrous deposit is extremely hard and decorative, and needs little or no subsequent polishing. The dark matte, though extremely hard, can be polished by the normal methods. The current density should be kept moderately high (100-300 amps. per sq. ft.)

Some Difficulties of the Process

The nature of the cathode material, and in particular its hydrogen over-voltage, is an important factor in determining not only the initial deposit of chromium but also the ease with which the cathode may be covered with the deposit. In metals of low hydrogen over-voltage, such as iron and steel, the minimum current density at which chromium can be deposited is higher, and the range of current densities in which bright deposits may be produced is both different and more restricted than in the case of metals of high hydrogen over-voltage, such as copper. As nickel has a lower over-voltage than copper, it is not so satisfactory in this respect, but as an undercoat nickel has much to recommend it from a corrosion standpoint and it is now common practice to deposit a layer of this on steel articles prior to chromium plating. Lead anodes of high purity are very satisfactory and the gradually formed insoluble lead chromate has no detrimental action on the bath.

Electro-deposited chromium is distinguished from other metals by its resistance to corrosion, resistance to oxidation at elevated temperature and its extreme hardness and low co-efficient of friction. As deposited, the reflectivity is only 65 per cent, but in contrast with other metals, that figure is permanently maintained. Chromium is unattacked by salt water, ammonia, nitric acid and hydrogen sulphide. Dilute sulphuric and hydrochloric acids only vigorously attack the metal after it has been rendered "active" by cathodic polarization, namely, by contact with zinc in the acid.

CARNEGIE LIBRARY OF ATLANTA

Conveyors for Molding Operations

Large Use of Mechanical Equipment for Handling Materials in Automotive Plant—Feeder Lines for Sand and Other Materials Reduce Labor Costs

CHARGING methods for cupolas in the Oakland foundry at Pontiac, Mich., were covered in THE IRON AGE issue of July 25, page 207. This had to do primarily with the matter of preparing the charge for the cupolas, getting it weighed and transporting it to the place where it was to be used. In the following pages the molding and core-making operations are described, and handling of the castings on cooling conveyors and thence into the cleaning department.

There are seven conveyors for continuous molding and pouring, with room for one additional molding unit. One unit is for cylinder blocks, one for cylinder heads, one for manifolds, one for flywheels, one for gear covers and some other parts, one for transmission cases and one for miscellaneous castings.

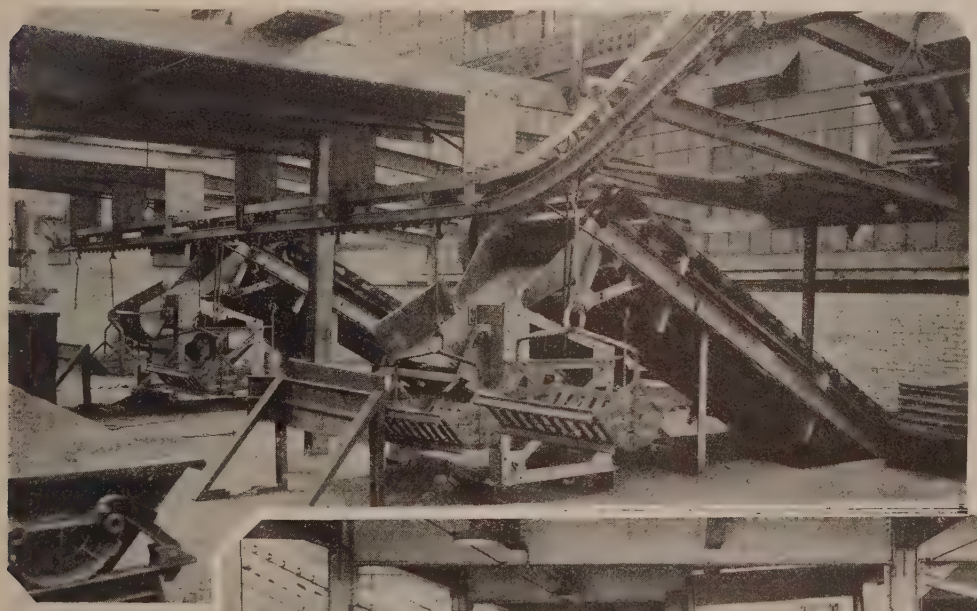
All but the cylinder block mold conveyor, which is 200 ft. long, are 180 ft. in length. The cylinder block conveyor is of the ordinary drag chain type. Cylinder block molds are made on five drag and five cope machines. The drags are handled from the molding machines to the conveyor with jib cranes. The copes and cores are handled with Cleveland Electric tramrails and the pouring done with them. Molds are carried around to a secondary cooling line, which conveys them to the shake-out.

Unusual Construction of Conveyors

Five of the conveyors are of a new roller type. In these the general practice of using conveyor trucks operating on rails is reversed by having rollers on a stationary frame and the mold trays equipped with inverted rails fastened to their bottoms. Thus the rails move on the rollers. The trays are 24 x 54 in. These cover the rollers and driving chain, the latter on the inner side of the frame. It is claimed for this type of conveyor that a smoother action is secured and an accumulation of sand on the rails is prevented. The conveyor for miscellaneous castings is of the sliding type and has smaller trays.

The conveyors are on the usual oval plan, except that that for the cylinder blocks makes a complete circuit. The cooling or return line of each is hooded and provided with an exhaust system for carrying away the smoke and gases.

Copes of cylinder molds are shaken out half-way down



CASTINGS and Sand Are Dropped from the Shake-out Into Tumbling Mills in the Basement. Thence the castings pass on to the conveyors at the left, which carry them out of the foundry and deliver them to the cooling conveyor (Below)

DISCHARGE End of Two of the Conveyors Which Carry the Castings from the Basement. Castings are dumped into baskets hanging from the cooling conveyor (Above)

the return line with a Stoney shake-out bail located at an opening in the cooling hood. Empty flasks are placed on a gravity conveyor and returned to the cope machines. The drag mold and casting move to the end of the conveyor, where a hoist picks the casting from the drag flask and hangs it on to a casting conveyor. As this loading point is at the side of the foundry, the casting is carried a few feet to reach the outside of the building, so that little of the heat and fumes escape from the castings into the foundry. The drag flasks are shoved by a pneumatic pusher on to a shake-out and, after the sand is shaken out, are returned to the molding machines.

Drag molds of all castings except cylinder blocks are dumped over a shake-out and the castings dropped with the sand through an opening in the shake-out to the basement. Here they pass into a tumbling barrel 54 in. in diameter by 10 ft. long, the outer circumference of which is a perforated plate. The sand passes through the perforations and the castings on to an inclined apron conveyor which conveys them outside the foundry, the discharge ends of the six conveyors being in a straight line near the side of the building.

Castings Cooled in Open Air

These conveyors discharge the castings into a hopper which is dumped by an air hoist into a basket that is hooked on to a cooling conveyor located above the discharge end and at right angles to the flight conveyors.

There are four cooling conveyors, from 900 to 1500 ft. long, including the one for cylinder blocks previously referred to. One is for cylinder heads and flywheels, one for manifolds and housings and the third for transmission cases and miscellaneous castings. The baskets of castings are hung on hooks on 4-ft. centers. Cylinder blocks, not carried in baskets, are hung on the hooks. Cylinder blocks are carried on the cooling conveyor approximately 2 hr. and other castings 90 min. for cooling, before they reach the cleaning room, on the same conveyor line.

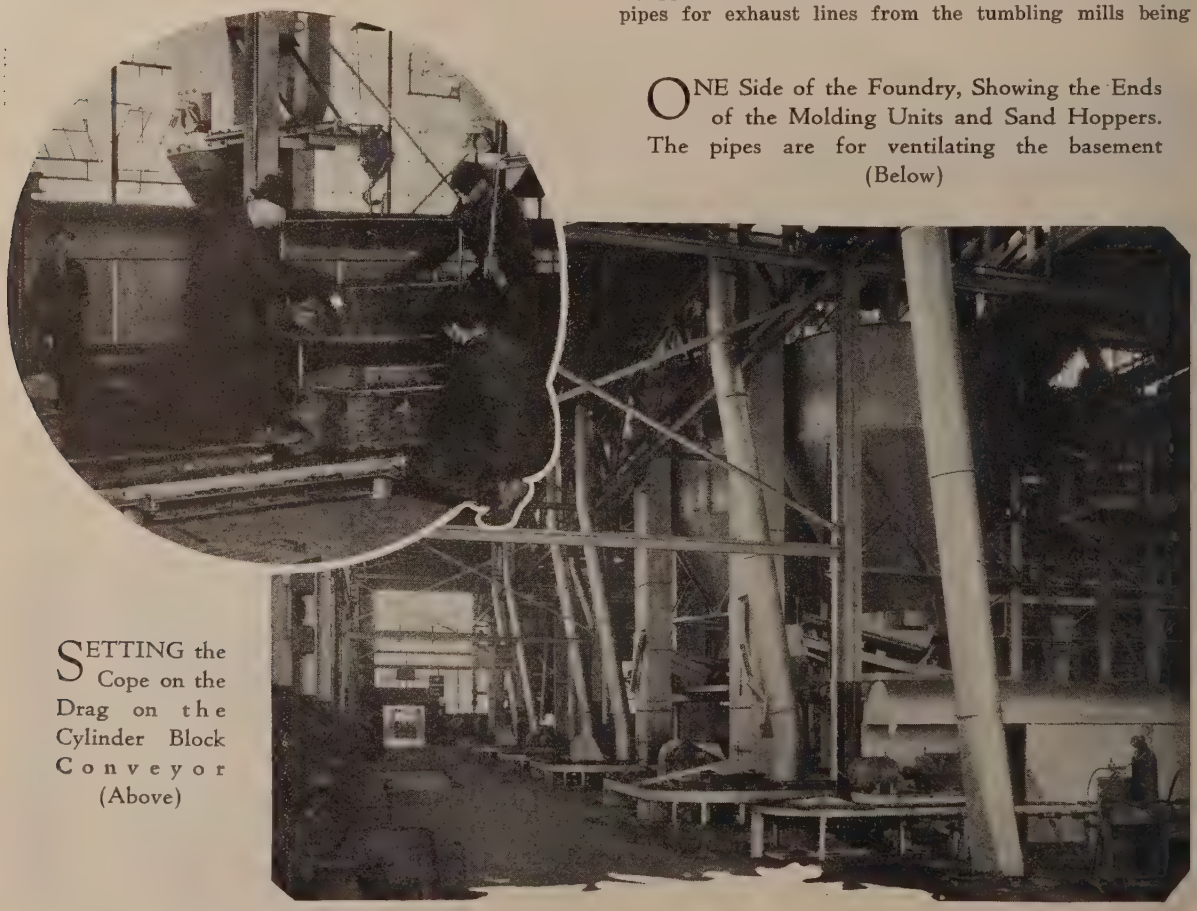
Cylinder blocks move on the conveyor through a detached knock-out building, where they are cleared of sand on a Stoney knock-out machine and are then returned to the conveyor. The molding sand passes through a riddle and the core through a crusher; all the sand goes over a magnetic pulley to take out the metal.

Then the sand is discharged into a pit, where it is made fluid by being mixed with water. The sand and water are kept thoroughly mixed by being agitated by a spray of water. The sand is carried away by a hydraulic pump, being delivered to a dump through a 5-in. line. Dust collected in the cleaning department is handled in the same way, being delivered from the dust arrestor on the roof to the same pit that receives the knock-out sand.

Cylinder blocks, on reaching the cleaning department on the cooling conveyor, pass on the same conveyor through a Pangborn double sand-blast machine. Then they are ground with a swing grinder, tumbled and given a water test. For testing they are placed in a revolving fixture placed on a roller conveyor so that the blocks can be turned over, permitting the testers to see inside the barrels.

The bottoms of the baskets that carry the smaller castings on the cooling conveyors, instead of being flat, turn up at an angle of 90 deg. on each side, making it easy to dump the contents. The castings are dumped into skids, which are handled by electric trucks for the tumbling, chipping and grinding operations. The tumbling equipment consists of 40 Whiting tumbling mills with 36 x 80-in. barrels, motor driven in batteries of six.

The cleaning department is well arranged and equipped. It is entirely free of belts and piping, all pipes for exhaust lines from the tumbling mills being



ONE Side of the Foundry, Showing the Ends of the Molding Units and Sand Hoppers. The pipes are for ventilating the basement (Below)

SETTING the Cope on the Drag on the Cylinder Block Conveyor (Above)

FIXTURE in Which Cylinder Blocks Are Rotated While Being Water-Tested After Final Operations in the Cleaning Department

POURING Flywheels on One of the Mold Conveyors

under the floor. Air drawn through the dust arrestors, after cleaning, is returned to the building during the cold weather. Otherwise, with a large amount of cold air being brought in to replace the heated air removed, it would be difficult to heat the building. Gravity conveyors and electric hoists are provided wherever needed to facilitate the handling of work through the cleaning operations. The tumbling mills are served with electric hoists.

Core Ovens of Vertical Type

Efficiency and saving of space are effected by the arrangement and equipment of the core-making department. This is provided with 16 vertical core ovens 8 ft. 6 in. square and 45 ft. high. These are oil fired and have automatic control, which maintains the temperature at approximately 450 deg. Fahr. On their downward course the cores pass through a cooling chamber and, when they reach the floor level, they are ready for inspection and assembly.

Cores for each oven are supplied by a group of 4 to 12 core-makers, who work around the oven. The core-maker sets his own cores in the oven and takes an empty tray back to his bench to be loaded. This eliminates the use of racks and the provision of aisles. Owing to the use of vertical ovens, it is stated that the core department takes only about one-fourth as much space as otherwise would be required.

A new design of hydraulically operated vertical oven is provided for drying cores after pasting. These are carried on 26 x 42-in. trays which are raised by a cylinder operated by a motor-driven pump. One pump and one motor serve the three ovens of this type. The cylinder located beneath the oven raises the loaded trays 15 in., at the same time pushing up the stack of trays above. When the cylinder descends, a catch holds the trays in position. As each tray reaches the top of the oven it moves automatically over to the opposite or return side of the conveyor. The cores remain in the oven about 25 min. An advantage claimed for this type of oven is that, as the trays do not turn on sprockets at the top or bottom, they can be spaced closer together.

The core sand is delivered to overhead hoppers and distributed on monorails to hoppers above the core-makers' benches. Core sand is prepared in three batch mixers supplied by the Standard Sand & Machine Co. The foundry makes its own sea coal, using a Grindle multi-stage pulverizer for pulverizing the coal. The sand preparation equipment includes two Simpson mills.

Three sand-handling systems serve the molding units: One for the units making cylinder blocks and heads; one for the flywheel and manifold molding units; a third for the transmission cases and miscellaneous castings. Room is provided for a fourth sand-handling system.

Preparing Sand for Various Uses

Sand from the tumbling mills in the basement, which separate the sand and castings, is conveyed on a belt conveyor over a magnetic separator to a bucket elevator that delivers it to a revolving screen above the foundry floor. The screened refuse sand is discharged to boxes on the floor. The good sand from the screen goes to a primary tempering belt and thence to a paddle mixer, which delivers it to a circular storage bin of 100-ton capacity.

A revolving table feeder takes it from this bin to a

second elevator, which delivers it to a final tempering belt. In the first tempering moisture is added to the sand and it is given time to season in the storage bins. After the last tempering the sand is aerated in a squirrel cage type of aerator and then delivered to two flight distributing lines, from which it is automatically delivered to hoppers over the molding machines. Strike-off and spill sand passes from the foundry floor to reciprocating conveyors beneath, which deliver it back into the system. New sand is introduced automatically and uniformly through floor hoppers with revolving plate feeders.

Facing sand for the cylinder block and cylinder head lines is brought from the sand preparation room in trucks, delivered to floor hoppers, elevated and distributed by flight conveyors over the molding units to hoppers over the molding machines, the overhead sand-handling equipment having double flights and compartments, to hold both molding and facing sand.

Sand is stored in concrete bins in the sand storage building, which has a capacity of 450 cars and is served by an overhead crane.

Dimensions of the principal buildings are: Foundry, 247 x 260 ft.; core department, 160 x 247 ft.; cleaning room, 120 x 350 ft.; service building, 60 x 360 ft.; sand storage building, 80 x 225 ft. Adjoining the cupola department is a chemical laboratory in which the heats and raw material are checked. On the second floor of the service building are a pattern shop, pattern storage room, men's lockers and women's rest room.

The foundry was laid out and built under the direction of J. E. Linabury, the foundry manager, being designed and built by the Austin Co. The mold conveyors and those for handling pig iron, scrap and briquettes to the weighing scales were supplied by the Link Belt Co., the cooling conveyors by the Palmer-Bee Co. and the core ovens by the Detroit Sheet Metal Works.

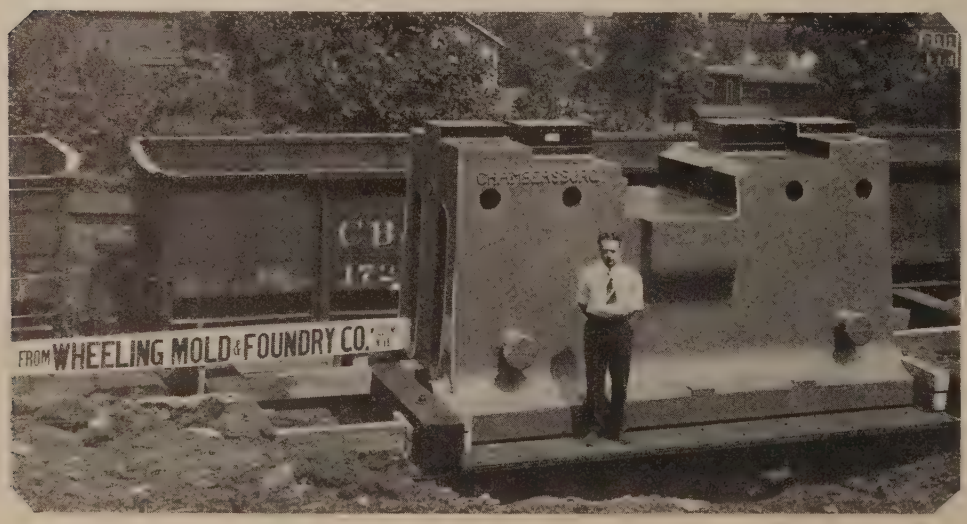
Makes Steel Casting Requiring 360,000 Lb. in the Rough

INCREASES in the forging activities of automobile manufacturers in recent years have led to unusual problems in the making of steam hammer castings and culminated in the casting of an anvil block, pictured in the accompanying illustration, the machined weight of which is 240,000 lb. This casting, which was made by the Wheeling Mold & Foundry Co., Wheeling, W. Va., for a 25,000-lb. drop hammer now being built by the Chambersburg Engineering Co., Chambersburg, Pa., for shipment to an automobile manufacturer in Italy, required unusual care in production because of its size and specifications.

It is of mild steel of the following analysis: Carbon, 0.23 per cent; silicon, 0.30; sulphur, 0.029; phosphorus, 0.034, and manganese, 0.90. The heats from three open-hearth furnaces were required to pour the casting, a total weight of 160 tons. A second heat of 20 tons was required 16 hr. later to take care of shrinkage. In the meantime a furnace was built around the sink head, which was lined with Sil-o-Cel brick and properly fired to delay freezing of the casting proper until all of the steel was available and also to maintain a liquid situation while the steel was cooling in the main body of the casting.

The block was cast with the working face down in a dry sand mold set in the floor, the bottom of the block being level with the floor. Small cores were not considered, owing to the huge volume of metal, but two lightening cores were used successfully in each end. The block was too large to remove from the pit in its entirety and the riser was cut off by means of an oxy-acetylene jet. This cut was 28-in. deep all around the riser, leaving a final core 4-in. in diameter, which was knocked off.

As the crane capacity of the foundry was not large enough to handle a casting of this size, unusual problems of moving had to be met. Temporary trunnions were cast on the ends to facilitate handling in addition to the permanent ones on the sides. The end ones were later removed. In order to move the casting from the pit, ways were built and the block was turned around and skidded on a truck bed on greased skids. It was then moved about the foundry on a 150-ton truck on a turntable. The problem of transferring the casting to the customer also involves difficulties as only one or two railroad cars are large enough to carry it. When the block is prepared for the ocean voyage to Italy, special bulkheads will probably have to be built in the ship's hold to prevent shifting.



THIS Anvil Block, on Car Ready for Shipment, Has the Record - Breaking Weight of 240,000 Lb. It is 156 in. long, 95½ in. high, 84 in. wide at bottom and 55½ in. wide at top

Steel Which Is Sound in Blooming

Precautions Necessary for Best Results—Preferential Range of Temperatures—High Manganese Content

BY JOSEPH R. MILLER*

EVERY mill rolling the regular grades of common carbon steel has made some study of the causes of seams and slivers. It is safe to say that nowhere have these causes been so well and so definitely located that control can be applied with fully successful results. Widely divergent ideas regarding particularly the proper procedure in teeming, handling, charging and heating the ingots have resulted from studies and observations made. The difficulty lies in interpretation of the facts observed and is due to the complexity of the conditions surrounding the entire sequence of operations.

It is not uncommon, therefore, to find that the full burden of the elimination of seams and cracks has been shifted to the steel maker. In such cases it is assumed that if a good quality steel is teemed properly into proper molds other features may be neglected. This applies in a general way; that is, good steel making will lessen the problems of the blooming process.

It applies, however, to such grades of steel as have no peculiar characteristics that involve hot-short qualities at one or another temperature. These latter grades tend, in rolling, to break up into seams and slivers, and steel-making skill does not operate to change the condition. Also, in general, if the sulphur content cannot be kept down the general tendency of the output will be toward greater trouble in that direction and here, too, the steel maker is handicapped.

Assuming a careful practice in steel making and a good soaking pit operation with proper pass design in the blooming mill, there still remains the question of steel compositions and their appropriate rolling temperatures.

Preferential Range of Rolling Temperatures

Everyone is familiar with the fact that ingot iron has a decided preferential range of rolling temperatures. It is a fact, not so well recognized, that the common grades of steel have such preferential temperatures, although to a much less marked degree. However, mostly, the range of unsatisfactory rolling is extended, pushing the most satisfactory range up toward the burning point of the steel. The writer had, at one time, arranged a series of tests to compare different compositions and to bring out the suitable temperature for each.

An electric heating element was placed in refractory in such a manner that special test specimens could be heated while held in the grips of the tensile-testing machine. A thermo-couple gave the temperature. With this apparatus it was possible to break specimens at the various temperatures at which steel might be rolled in the blooming mill. It was found that, when specimens broke off short in the test, poor rolling was observed on that steel at the temperatures so represented; but when specimens necked down to a sharp point, or nearly so, good rolling was observed on that steel at those temperatures. That would be, of course, on the earlier passes in blooming, for, once reduced, the grain refinement begins to strengthen the material.

With this method he also started in 1918 to test samples prepared from such ingots as were found to contain an accidental high manganese content. These usually were observed to roll well. Thus it was determined that open-hearth free cutting steel (added sulphur) would roll much better if the manganese specification, formerly around 0.60 to 0.80 per cent, were raised to about 1¼ per cent.

Rejections Ran High

Rejections on the old grade ran very high on blooms for bars for cold-drawing purposes, or for machining—somewhere around 20 per cent average. And often half the blooms would have to be diverted. With manganese specified at about 1¼ per cent these rejections dropped to 2 to 5 per cent. Earlier production was sold under a trade name, and was found suitable for free cutting and case hardening purposes.

Thus a grade of steel which formerly was a source of great annoyance and loss in rejections was changed to one that was easily prepared and without serious losses. The idea that raising the manganese content would induce a brittleness and hardness was shown by test to be erroneous, for such brittleness was not encountered to any extent until the composition was well up around 2 per cent manganese. Steel made with 1¼ to 1½ per cent manganese was found to be free cutting and tough; also it case hardened satisfactorily. The first of open-hearth screw steel with this higher manganese was made in 1925, and was used with success.

It would be difficult to favor, in blooming, a preferential temperature. However, by careful heating an approach can be made to the best temperature conditions, and particularly where it is best to start rolling at very high temperatures. It is possible, however, to make composition changes, like that mentioned, improving the rolling qualities without changing the utility of the product.

Steel Clean of Oxides Rolls Better

Of course, if the sulphur is low, and the steel comes through clean of oxides without excessive deoxidation, it will roll better. Some claim for certain chemical mixtures that through their use unusually tough metal is produced; and it is sure that, if the materials used in a heat of steel bring it out clean without the excessive use of aluminum and silicon, the metal will roll better, even in spite of the sulphur.

The problem of making steel which is free from seams and slivers lies between excessive care in handling and rolling the ingots after teeming, and the production of a tough metal that will roll without great care. In tonnage operations the latter is preferred, because it allows greater production from the blooming mill. In making special grades which do not in their nature roll well,

*Pittsburgh.

then special attention must be given the ingots after teeming, as there is no other way out of it.

There are special shapes of ingots intended to favor a certain amount of hot work before any strain is put on the ingot skin. These do some good, and they simulate the fluted forging ingot. However, no precautions will produce a result as successful as that attained when a tough composition of well made steel can be used.

Forging Seamless Steel Drums

Difficulties Encountered in Expanding a Thin-Walled Tube—Ends of Various Shapes Closed by Different Methods—Limitations in Accuracy

BY CAPT. RONALD BENSON*

PRODUCTION of large drums is similar to the production of gun tubes. The first requirement is a hollow billet. This is prepared by trepanning the core from the center of an ingot, which may or may not have had a preliminary cogging, and cutting off the scrap ends. The hole is usually smaller than the interior of the drum for reasons of economy.

The hole is next opened out by expanding, or "becking," to the size needed. The length of forging which can be becked varies with the plant, and the diameter of the becking bar, and is usually between 10 and 16 ft. The next process therefore will be forging on a mandrel of the required diameter, so as to increase the length while reducing the wall thickness.

Producing the Hollow Tube

The two chief difficulties are the rapid loss of heat and the action known to forgemen as "bellying."

The length of time during which forging can be carried on after each reheating varies inversely with the diameter of the mandrel, and directly with the wall thickness—e.g., with a 36-in. mandrel, working from a billet roughed down to 60-in. diameter, the forging of a tube with a 4-in. wall could be carried on for only something between 60 and 70 min. If a tube with a 6-in. wall were being made, forging could go on for 90 or 100 min.

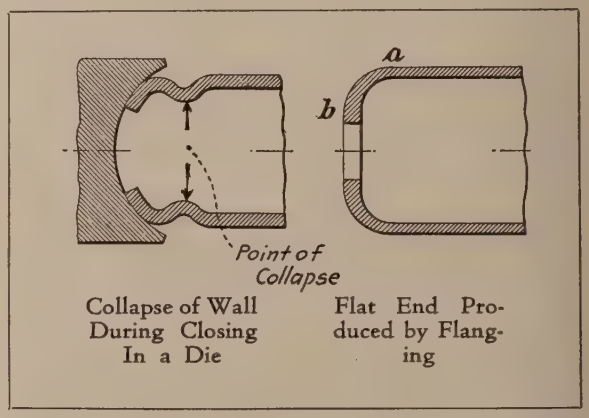
Such rapid cooling may be reduced by heating the mandrel. A good working rule is that if the mandrel does not change color it is safe to proceed. The most economical method of keeping the mandrel temperature as high as this is to forge two tubes concurrently on the same mandrel, one being forged while the other is being re-heated. Or a hollow mandrel may be used. If a central hole one-half the radius is removed, the volume of mandrel tending to chill the forging is reduced 25 per cent.

The other chief difficulty, known as bellying, is the flow of squeezed metal in a circumferential, as opposed to a longitudinal direction. It is greatly intensified in thin tubes, and is almost absent in thick-walled tubes, forged on small mandrels. The ideal tools would have narrow circumferential faces in contact with the forging, so that all the flow would be at right angles to these faces, i.e., in a longitudinal direction. If the face of the tools is too narrow, however, a very large number of squeezes is needed to produce a true cylindrical surface. As a compromise, curved tools with narrow faces and beveled sides are used. With such tools the tubes produced are so close to the mandrel that "fast mandrels" are occasionally encountered. A few squeezes with flat tools always loosen the mandrel.

Machining the Inner Bore

The machining allowance varies with the furnace and time of heating, but a rough rule is to allow 1 in. on all surfaces in addition to mandrel taper allowance.

There seems to be no reason why boiler drums should not be accepted with a black forged finish outside—in fact, tubes of this nature have been supplied—but it is necessary to specify a tolerance of approximately ½ in. in the thickness of wall. The interior cannot readily be produced sufficiently free from scale to obviate machining.



Collapse of Wall During Closing In a Die

Flat End Produced by Flanging

It is usually expedient to bore a straight hole through from end to end, and subsequently to close both ends. Or one end can be closed before machining, leaving one end open for machining purposes, to be closed subsequently. Designs usually call for a thicker wall on the closed end than on the shell—allowance must be made for this.

Closing the Ends

There are three possible ways of closing the ends of the drums:

(1) By pressing the end of the forging into a die, as in shell bottling.
(2) By flanging or bending over.
(3) By swaging, the process being similar to the work of the toggle presses sometimes used for closing shells and gas cylinders.

The first method is quick and simple for closing ends where the proportionate reduction in diameter is small, but tubes of the kind described would be closed to approximately one-third the original diameter. It is therefore

*Vickers-Armstrong, Ltd., Abstracted from *Engineer*, April 19, 1929.

quite impossible to carry out such a closing in a single-operation die, because the pressure required is greater than the walls of the parallel portion can support. Even if only the length of tube exactly sufficient to form the closed end were heated, collapse would take place in the parallel portion where it just enters the die, as shown by the sketch. Yet this portion at least must be heated to enable closing in a single operation.

In practice, a large number of dies of varying angles have to be used, the work done in each die being small, and the expense is too great. The closed ends so made are, however, very well formed and evenly stressed in closing.

Closing the End by Flanging Method

The second method of closing is by bending over, or flanging. The open ended tube is bored, and rough machined outside. The portion which it is intended to bend over is rough machined for concentricity only, and extra thickness is left on it to suit the design required. The end to be produced is approximately as shown in the sketch. The length of parallel tube required to make the end from *a* to *b* can be determined only by experiment.

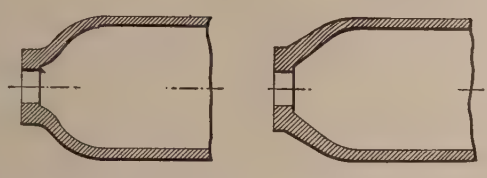
The usual process is to support the drum from below, prevent it from kicking back, and bend a small portion of the periphery downward at the top by pressing on it with a suitable tool. The tube is then rotated slightly, and another portion of the end bent over, so that by the time the tube has been completely rotated the end has been flanged over somewhat, and the opening in the end reduced. Successive applications of pressure must be small and uniform, or an irregular and crinkled surface of the flat end may be produced. It is not possible to close the end completely by this method.

Swaging the End

The third method of closing is by swaging. The process is essentially a series of small compressions of the walls of the tube in two places.

The effect of one squeeze, with the tube in the position shown, is to thicken the wall at *a* and *b* and to reduce the portion of the tube which is being worked upon to an ellipse, the major axis of which is the original diameter, the minor axis being reduced by the amount which the press has traveled. If now the tube be rotated, and a series of squeezes be applied, the ultimate result is that the wall is thickened and the diameter decreased.

There is a tendency for the portion of the tube which is being worked upon to increase in length. The ratio of circumferential flow to longitudinal flow depends upon the design of the tools and the method of manipulation; with



Swaged Ends, Spherical or Conical, with Spigot

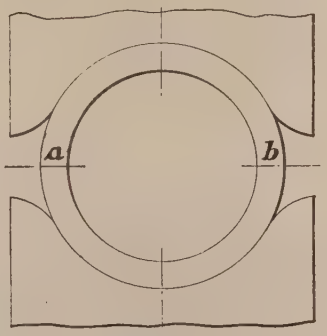
unsuitable tools the wall thickness may even be less after the diameter has been reduced than it was before.

This ratio, however, must be known. Also, the longitudinal extension of the dome portion must be allowed for, so that the drum shall be of the correct length when closing is completed. It is usual to allow a tolerance of 1 in. on the overall length, and it has been found possible to work within this tolerance for a drum 45 ft. long.

Special tools are needed to shape the domed end of the drum unless a considerable amount of machining is to be done on the exterior after closing.

It is not practicable to produce a drum with a flat or slightly dished end by this method. The easiest shapes are either hemispherical or conical, with a protruding spigot which is machined inside to form a seat for the manhole cover, the length of spigot desirable being 3 in. to 4 in. with a 4-ft. drum.

The wall thickness of the domed end can be increased to any desired amount. In fact, the thicker domes are



Swaging Tools

slightly easier to produce, so the designer can call for an end which he is sure is much stronger than any other part of the boiler.

Seamless vessels intended for oil cracking, with a 2-ft. bore, have been produced with one end swaged down till the only trace of the original bore was a small line which did not extend beyond a circle 2-in. diameter, and the ends were closed, after boring, by a screwed plug only 3-in. diameter.

Sheffield University Opens Cold-Working Steel Laboratory

A NEW laboratory for research on cold-working of steel was opened on July 6 at Sheffield University, Sheffield, England, as the consequence of a gift from the Worshipful Co. of Ironmongers of London. This company has made a grant of £800 a year for seven years to endow a fellowship and two scholarships in the cold-working of steel. Through the Cutlers' Co. of Hallamshire, firms connected with the cold-working industry have presented the university with the necessary plant.

The laboratory will be attached to the metallurgical and engineering departments of the university and will be controlled by the professors of those subjects, assisted by a committee on which the Ironmongers' Co., Cutlers' Co. and the industry will be represented, as well as the university. Drawing, rolling and pressing are among the processes on which research work will be done.

The mechanical equipment of the laboratory includes a wire and bar drawing plant constructed by George Crossley, Ltd., Cleckheaton. Having a two-speed gear and variable-speed motor, wire drawing speeds of from 28 to 360 ft. a min. may be obtained, and wires can be drawn of all sizes up to ⅝ in. in diameter and rods up to 1 in. diameter.

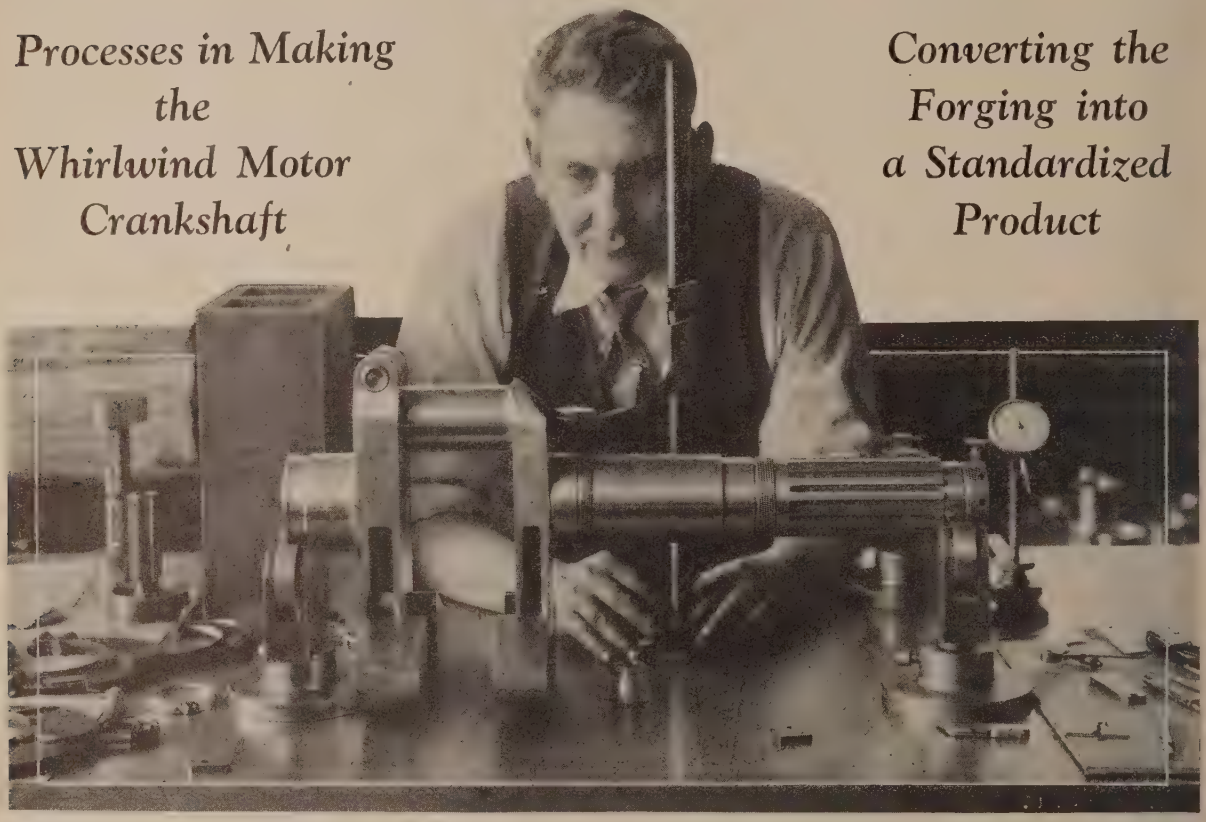
The rolling mill plant has been constructed by W. H. A. Robertson & Co., Ltd., Bedford. It has hardened steel rolls, 10 in. diameter and 10 in. face, and is fitted with two-speed gear box and variable-speed motor, giving a range of rolling speeds from 60 to 300 ft. a min. The motor is capable of developing from 50 hp. at 570 r.p.m. to 120 hp. at 1260 r.p.m.

Machining the Wright Crankshaft

BY FAY LEONE FAUROTE*

Processes in Making the Whirlwind Motor Crankshaft

Converting the Forging into a Standardized Product



FOR the Wright Whirlwind crankshaft, steel forgings are purchased from an outside vendor. These are first heat treated, then inspected for flaws or defects and stamped with a serial number. Spots are ground for the hardness test. The forgings are then inspected for hardness and delivered to rough stores.

Preparatory to machining the crankshaft forging, the shaft end and pin end are cut off and both ends centered. The shaft side of the cheek is then faced, chamfered and turned to outside diameters. The cheek faces are next rough milled, and the outside diameter and cheek are rough ground. The crankpin is then centered, turned and faced. The cheek faces are rough milled on the pin side, after which the pin is finish turned and faced, and the chamfers and groove are formed. The next operation is to rough grind the pin and form the radius. The cheek edges are rough milled, and the serial number is then re-stamped.

Next the crankpin is drilled, rough and finish counterbored, chamfered, rough and finish reamed and tapped. The radius on cheeks is milled, also the radius on long end of cheeks and the angle on cheek. A 1⅜-in hole 1¼-in. deep is then drilled and gun-drilled through. The end is next counterbored, bored, reamed and faced, the taper is rough and finish reamed, and the whole is chamfered.

INDICATING Trueness and Checking for Alinement on Crankshaft of J-6 Series "Whirlwind" Engine

The slot on side of cheek is then milled, and the operation is repeated for the opposite slot, bringing the two slots into alinement. A ⅛-in. x 45-deg. chamfer is milled on each side of both slots. The web in slot is rough milled, and the sides of slots are then finish milled.

The next operation is to drill four holes through both sides of cheeks. The alinement hole is then drilled through the center of cheek. Burrs are removed and the slots are filed to gage.

Next the crankpin side of cheek is faced and the shoulder and radius are formed. After this the crankpin side of cheek is milled, the cheek is faced, the outside diameters finish turned, and the undercuts chamfered and formed. A hole for screw is then drilled, counterbored and tapped. A ¼-in. hole is drilled through the crankpin wall at a 30-deg. angle, reamed and chamfered; and another ¼-in. hole is drilled through the bottom wall of the crankpin at a 40-deg. angle.

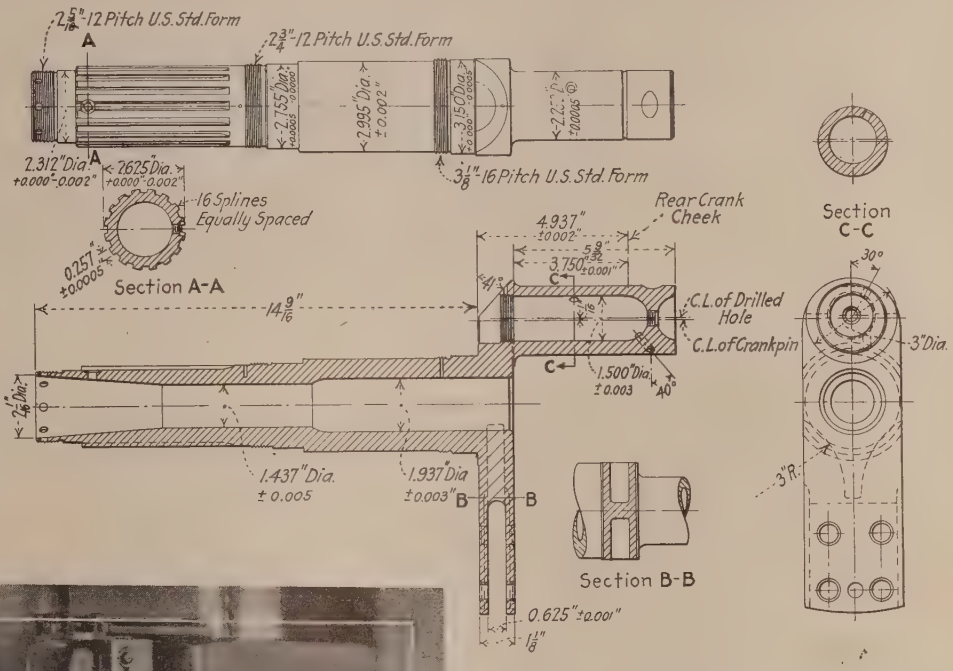
The crankshaft next goes to a plain grinder, where the shaft side of cheek is finish ground and the radius formed. The outside diameters are also finish ground.

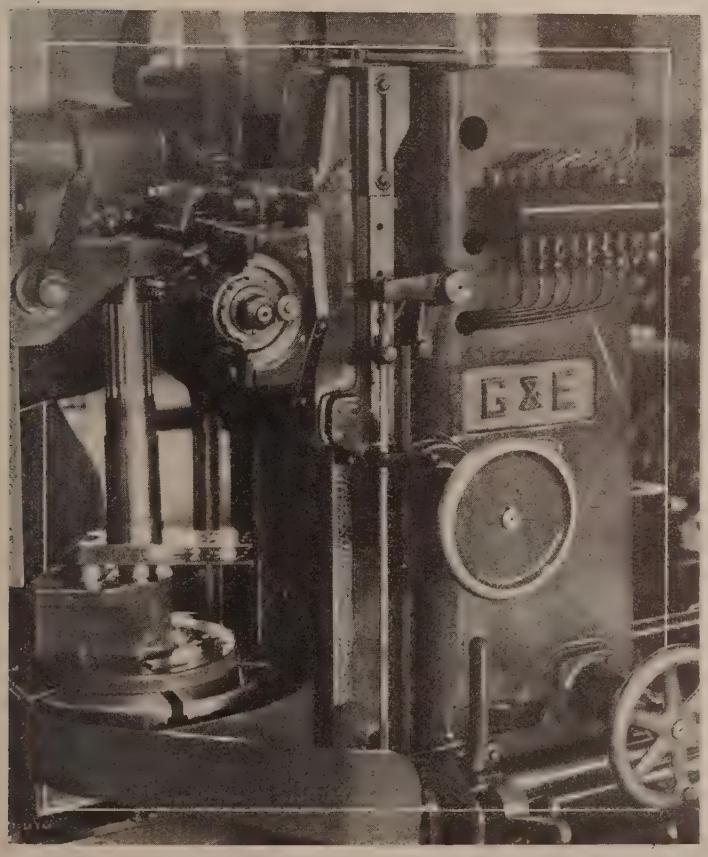
* Mechanical engineer, New York. This is one of a series of articles describing the machining of the chief parts of the new Wright Whirlwind aeronautical engine. The first article appeared in THE IRON AGE of July 18, page 148.

The next operation is to mill a 3⅛-in.—16P thread on the shaft, near the cheek; then a 2¾-in.—12P thread, about halfway to the end; then a 2-5/16-in.—12P thread at the outer end.

After the cheeks have been ground on both sides, the splines are finish hobbed and burred to gage. The crankpin side of cheek is ground and the radius formed; after which the crankpin is finish ground and the collar ground. Radii are then drilled and formed and the crankpin end is chamfered. A radius is then bored in the crankpin, these two "radii" forming the spherical or cup-shaped surfaces inside the crankpin.

THESE Drawings of the Crankshaft Give Some Idea of the Dimensional Exactions of Manufacture





MILLING Crankshaft for Propeller Hub on Gould & Eberhardt Hobbing Machine

Eight holes, equally spaced and 17/64-in. diameter, are drilled through the thread end of the shaft. Burrs are removed, sharp edges broken, and the holes tapped. The end of the crankshaft is then faced to remove center mark.

Finally, the radii are polished and the crankpin lapped. The crankshaft is washed in gasoline, inspected and delivered to finished stock.

Open-pit methods of mining, by which coal or ore is mined from the surface by the use of steam or electric shovels has been developed to a point where approximately 19,000,000 tons of coal, 24,000,000 tons of copper ore, 32,000,000 tons of iron ore, 150,000 tons of bauxite, and 2,700,000 tons of pebble phosphate are mined annually in the United States in this manner. These quantities total 78,000,000 tons, and, according to the Department of Commerce, at least four times that amount of overburden is stripped to expose these minerals for mining. The power shovels used in the stripping operations range in dipper capacity from 3 to 12 cu. yd., weigh 125 to 850 tons, and may cost $100,000 or more.

A list of 1000 American books, pamphlets and publications on various phases of international business has been compiled by National Foreign Trade Council, New York. Of these, 170 have been marked as those currently in use by active foreign traders. A five-foot shelf of 40 books has also been selected by a consulting committee.

Using Electricity for Galvanizing

Accurate Control and Uniformity of Temperature, Assured by Electric Heat, Lower Costs of Hot Galvanizing

BY R. M. CHERRY*

ELECTRIC heat has been successfully applied to hot galvanizing for various types of products, such as wire, structural steel shapes, castings, and sheet metal parts and pails.

The temperature required for hot galvanizing ranges in most cases from 825 to 900 deg. Fahr., depending upon the class of work. Occasionally temperatures as high as 1000 deg. Fahr. may be used, as in the case of galvanizing light wire mesh. The life of the tank, amount of dross formed, fuel consumption, and quality of product are largely dependent upon accurate control of the desired temperature and upon uniform temperature throughout the tank.

The accompanying curves illustrate the influence of these two factors. They show the relative solubility of iron in zinc at various temperatures and show that the analysis of the steel used for the tank has some effect on the rate of solubility. For the usual temperature range for galvanizing (825 to 900 deg. Fahr.), the rate of solubility is practically constant and the analysis of the steel has but little effect. If the temperature is permitted to reach, say, 950 deg. Fahr. at any part of the tank, the rate of solubility may be as high as 20 times that at 850 deg.

In the case of fuel-fired tanks, the heat source consists of one or more hot spots which are evened out by the circulation of hot gases. Naturally, when the heat source consists of such high temperature spots, there is danger of local over-heating of the tank. This explains the reason for so many failures of fuel-fired tanks at one or more localized sections, while the remainder of the tank may be in good condition.

*Industrial heating engineering department, General Electric Co.

Temperature of Heat Source Low

When electric heat is used, the temperature of the heat source (heating element) is relatively low—approximately 150 deg. Fahr. above the chamber temperature. The heat is applied uniformly throughout the heating chamber, there being no hot spots. Moreover, electric heat readily lends itself to easy automatic control. For very accurate temperature control, a two-point temperature control instrument is used with a thermo-couple inside the tank set at the desired temperature and a thermo-

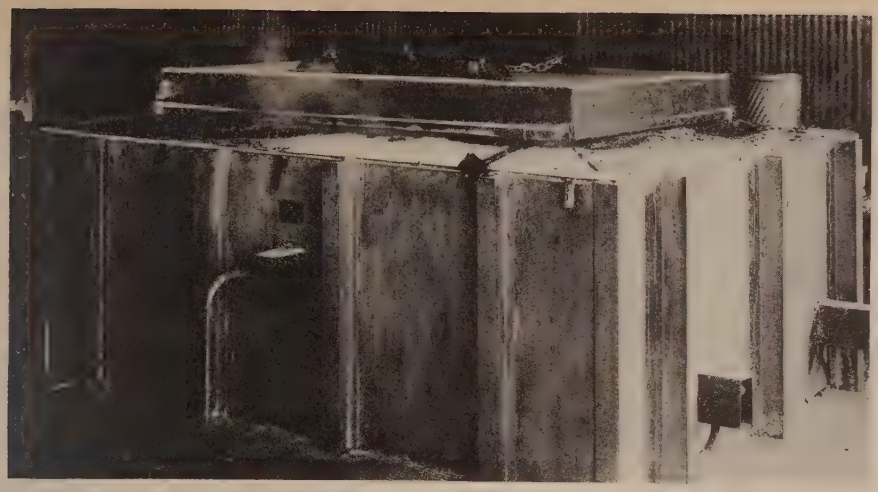
STRUCTURAL Steel and Cast Iron Parts Are Galvanized in the Plant of the Delta Star Electric Co., Chicago, in a Tank 36 in. Wide Inside, 36 in. Deep and 15 Ft. Long. It is rated at 194 kw., taking 220-volt 3-phase 60-cycle current



FOR Galvanizing Transmission Line Parts, the Southern California Edison Co., Los Angeles, Uses a 70-kw. 220-Volt Electrically Heated Tank, 5 Ft. Long, 3 Ft. Wide and 3 Ft. Deep

couple in the heating chamber set for the required temperature gradient.

Accurate control of the temperature and uniform temperature throughout the tank insure maximum life for the tank and a minimum amount of dross. The increased tank life, lower dross, and elimination of firing labor result in a substantial reduction in the cost of galvanizing.

In many cases the major portion of the heat for a month's operation is used for maintaining temperature or for supplying stand-by losses. In a fuel-fired tank, the heat losses consist of those through the walls, those from surface of zinc and those carried out by the gases.

In the case of the electrically-heated tank the stand-by losses are those through well-insulated walls and the loss from the surface of the zinc, there being no stock losses. Since the walls are well insulated, the largest source of heat loss is that from the surface of the zinc. Since the area of that surface has a large effect on the amount of heat required, the size of the tank should be given careful consideration before an installation is made. For stand-by periods, a well-insulated cover should be used.

A tank failure usually starts with a slow leak. If this is detected, the tank can be emptied and replaced without damage to the brickwork. In the case of electrically-heated tanks, one or more alarm signal devices are placed in the heating chamber below the tank to detect any leak that may occur.

The device consists of two heat-resisting wires, about ¼-in. apart, connected to an alarm bell. The brickwork underneath the tank is so shaped as to accumulate zinc at one or more points where the devices are located. The molten zinc closes the electric alarm bell circuit, thereby warning the operator.

The power consumption of three sizes of electrically-heated tanks operating continuously, as determined by actual tests, is given in the following tables. The figures include the heat required to melt the make-up zinc.

No. 1 Tank—Inside dimensions 30 in. wide, 36 in. deep, 6 ft. long, rated 90 kw., 220 volts, three phase. Galvanizing miscellaneous steel parts at 850 deg. Fahr.

Lb. of Steel Galvanized Per Hr.	Lb. Galvanized Per Kwhr.	Kwhr. Per Ton Galvanized	Cost of Power Per Ton at 1c. Per Kwhr.
500	10.6	188	1.88
1,000	15.6	128	1.28
1,500	18.5	108	1.08

No. 2 Tank—Inside dimensions 36 in. wide, 36 in. deep, 15 ft. long, rated 198 kw., 220 volts, three phase. Galvanizing structural steel parts at 850 deg. Fahr.

2,000	13.5	148	1.48
3,000	16.6	121	1.21
4,000	18.5	108	1.08

No. 3 Tank—Inside dimensions 22 in. wide, 48 in. deep, 30 ft. 6 in. long, rated 405 kw., 220 volts, three phase. Galvanizing structural steel parts.

4,000	15.3	130	1.30
6,900	18.4	109	1.09
8,000	20.4	98	0.98

It is easy to calculate accurately the electric power consumption for a galvanizing tank or for any other heating process, since the efficiency of the generation of electric heat is 100 per cent. A complete cost analysis should include the maintenance of all equipment, dross loss, labor, fuel and power consumption and working condition and quality of product.

THE Walter Bates Steel Corporation, Gary, Ind., for Galvanizing Structural Steel Parts, Has an Electric Galvanizing Tank 22 In. Wide, 4 Ft. Deep and 30 Ft. 6 In. Long, Rated at 405 kw. at 220 Volts 3-phase Current

Aluminum Foundry Makes Use

WHAT strides are being made in the use of aluminum sand castings is well shown in a year-old foundry of the Aluminum Co. of America at Fairfield, Conn. Established to take care of Eastern needs particularly, its size, being about 4 acres in extent of floor space, indicates the volume that has developed, in the quest for markets among industries, by emphasis not only on the item of lightness but, through alloying other elements with aluminum, on the availability of intricate castings meeting special physical characteristics. The plant is an outgrowth of one built in Fairfield about 1906. This became the property of the Aluminum Co. of America, and a year ago across from the old plant the new foundry that is the subject of the accompanying illustrations was built.

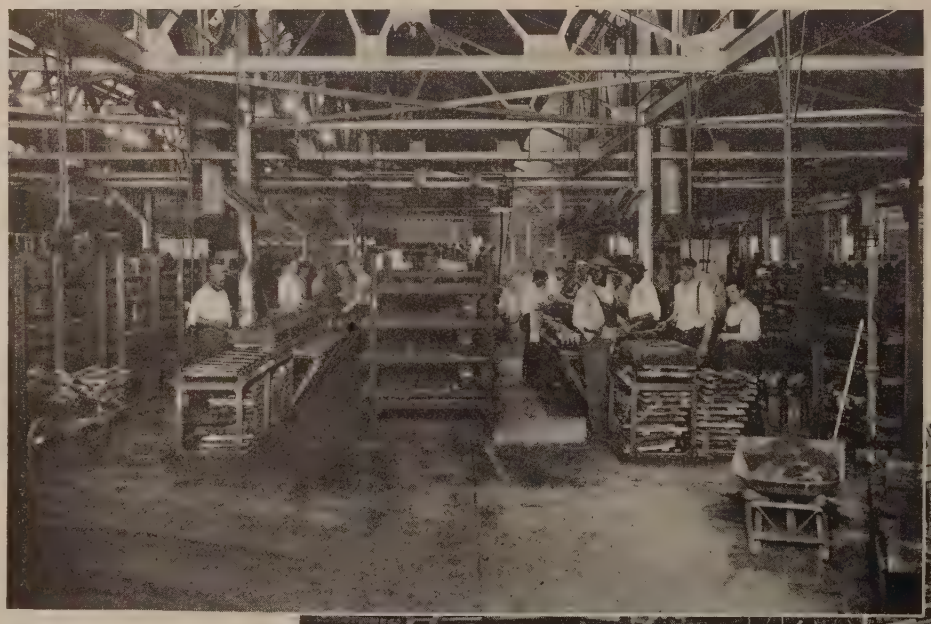
Aircraft and automobiles provide a large outlet but the plant is essentially a jobbing foundry with a few large companies supplying orders which held to make for mass production methods. What is especially noteworthy, however, are these features:

The plant has an X-ray equipment which is constantly in use searching for hidden defects as a means of improving practice and incidentally offering facilities for research which undoubtedly sooner or later will redound to the benefit of the industry as a whole.

Physical, chemical and photomicrographic laboratories form a main part of the plant in that tests are regularly made of samples of the castings of all heats. In conjunction with the X-ray investigation, the foundry is a fact-finding institution of great possibilities.

Pyrometry as a working tool has been made of paramount importance. It is depended on implicitly in the melting of all mixes, in controlling the pouring operations, in the operation of core ovens and, of course, in the heat-treating work.

Working areas are unusually light and airy, advantage having been taken in the design of building to secure facilities that are now available and go to make modern factories pleasant working places.



MANY of the Castings of Intricate Shape Are Made in Dry Sand Molds. They are assembled on roller tables and poured right in the core room, which is immediately adjacent to the bench and floor molding rooms

IN the Bench Molding Room, Each Bench Machine Is Backed Up Against a Low Concrete Wall and Is Separated from Its Neighbors by Another Low Wall

# of X-Ray Equipment

Jobbing Plant of Aluminum Co. of America at Fairfield, Conn., Is Also 100 Per Cent Under Pyrometric Control

From an exterior point of view the plant is a pleasing, impressive institution, and in decoration, fixtures and furnishings, a successful effort has been made to show numerous possible applications of aluminum products. The office building of Old Connecticut brick is flanked on each side by wing walls in which are inserted cast aluminum signs with the name of the company and its subsidiary, the United States Aluminum Co., which operates this plant. The main entrance steps have aluminum hand rails. A fence and gates of aluminum alloy inclose the property and to serve as a test of corrosion resistance have not been painted.

All the hardware, which is of Colonial design, is made of an aluminum alloy, this metal being used also for the interior mechanism of the locks, with the sole exception of the springs. All the electrical fixtures, including a large cast hanging lantern in the entrance hall, as well as two others on either side of the front door, are made of the same metal. The stairs to the second floor have aluminum treads, as well as rails. Aluminum furniture has been used, and aluminum paint on all exterior and interior trim.

The foundry itself is entered through the melting room, which is 190 ft. long, 70 ft. wide and 33 ft. high. Practically one end of this room opens up by means of rolling doors so that the men in effect are working substantially out of doors.

Melting is done by fuel oil. To each pot furnace is attached a pyrometer, and on the inner side of the room is a large elevated control chamber, where two men are always stationed, checking the temperatures of the metal in the furnaces at all times, to see not only that it is not overheated, but also that the temperatures established by the engineers are maintained. Loud annunciator bells ring as each furnace is ready to be ladled out, an illuminated number overhead on the wall indicating the furnace number.

Adjoining the melting room are the bench and floor

IN the Trimming Room Are Compressed Air Chipping and Other Tools and, as Shown Along the Far Side, a Battery of Grinding Wheels. The compressed air lines and special saddles for holding the work are shown

THE Dry Sand Molds, as They Are Progressively Built Up by the Insertion of Various Cores, Are Moved Along a Roller Table to a Pouring Space Adjacent to Which Are Located Electric Holding Furnaces

molding rooms, 60 x 150 ft. and 95 x 250 ft. respectively. The floor molding department is served by seven 1-ton, one 3-ton and one 5-ton cranes; has a monitor type roof with glass sides in the monitors, as well as large windows in the sidewalls.

The roof over the bench molding room is of sawtooth construction, and here each bench machine is backed up against a low concrete wall, and is separated from its neighbors by another low wall, which is topped by a 12-in. steel channel, making an unusually clean layout. Placed throughout both of these departments are pyrometers, so that all castings are poured at the correct temperature. Technical assistants are on duty at all times to see not only that temperatures of melting and pouring are as specified, but also that the rate of pouring is correct.

On one side of the bench foundry are rows of concrete bins where both molding and core sand are received from the cars on the company's private siding and delivered by electric truck to the molding floors.

The core room is immediately adjacent to both these rooms and is 110 x 150 ft. in plan. Here is a battery of seven oil-fired two-rack ovens, with one smaller tray oven. Pyrometers are attached to each oven and a check kept of them at all times. An additional battery of ovens is now being installed.

Many castings, on account of their intricate shape, are made entirely in dry sand molds. These are poured right in the core room. The metal which is melted in the melting room is transferred to electric holding furnaces in the core room. The transfer is made at as low a temperature as feasible and the temperature is brought up to pouring temperature in these holding furnaces, thus preventing any soaking at elevated temperatures.

In this department some of the molds, as for airplane cylinders, are assembled as respects their various cores by passage along a roller table. The cores are inserted from station to station along the roller table, jigs being employed for accurate setting and the mud paste used in setting is dried by hand torches. The particular casting mentioned has a full fin outside air cooling surface and requires in the molding a generous use of wires for molding sand support. At the end of the roller table the mold is ready for the pouring. The freshly poured mold is carried to a point near the shaking-out room, where it is allowed to cool in its sand a matter of two days.

The shakeout or knockout room, where the core sand and wires are removed from the castings, partly by vibrating air tools, is next to the cleaning room. Here, in addition to the standard equipment seen in similar establishments, are rows of benches, where operators, using rotary files, finish the rough cleaning of the castings before they are sand-blasted. In cleaning the spaces between the closely set ribs or fins of the airplane cylinder castings, the rotary files are driven by flexible shafting in flexible tubes easily handled by the operators. The rake of the cutting teeth of these files or milling cutters, which are of various shapes to accommodate the needs of the case, is such that the softer aluminum has no great tendency to pile up or clog up the file.

The inspection room, 80 x 100 ft., has besides the regular inspection benches tanks for pressure testing, accurate layout tables, and all the tools needed for the close inspection demanded on account of the accurate dimensional as well as physical and chemical specifications of the product of the foundry.

An overhead monorail runs along one side of this room. Beneath it are placed in baskets the castings that are to be

INSPECTION Includes Extensive Calipering of Wall Thicknesses, Hammer Tapping on All Surfaces at All Accessible for Discovering Hollowness by Sound (in Such Castings as Those of Rolls-Royce Engines Shown) and Hydrostatic Tests

THE Heat-Treating Equipment Includes Electric Furnaces and Quenching Tanks Here Shown Covered

THE X-Ray Equipment Has Been Used to Penetrate Thickness of Over 10 In. The interior view of the room, which is lead lined, shows an x-ray examination in progress of an airplane cylinder, while at the left of the entrance door may be seen the control apparatus in the ante-room

heat treated. A traveling crane takes these baskets to the heat treating room. Here one electric furnace has been running for some time, while another and larger one, 12 ft. long, 6 ft. high and 6 ft. wide, will soon be installed. In this room also are the steam aging tanks as well as the quenching tanks likewise pyrometrically controlled.

After heat treatment, the castings are returned to the inspection room for final inspection, whence they are taken to the adjacent room for shipment by railroad through one of the six doors which open on the private siding, or by motor truck through the two large doors on the end.

The laboratories of the plant cover chemical and physical work and photo-microscopic studies, but also the X-ray department, where a check is kept on the castings being made to insure soundness and freedom from hidden defects. Test specimens from every heat poured are analyzed and test bars are pulled. A check is likewise made on all incoming raw material.

The foundry has also wash and locker rooms, which include individual shower baths. The employees come and go through the bright and airy locker room and this fact has its effect, it is believed, upon their doing their share in keeping the foundry clean.

The pattern vault is a large building, 35 x 80 ft., fireproof, of vault construction, arranged so that the temperature is controlled at all times to keep the 5000 patterns arranged on the floors and racks under substantially ideal conditions. Immediately adjoining this is a carpenter and maintenance building, for the building of flasks and the proper maintenance of patterns and equipment.

Rust-Proofing Steel and Aluminum Aircraft Parts

ANODIC oxidation is a process for the protection of the surface of aluminum and its alloys by the formation of an adhered film of oxide on the surface.

Of the materials used on the British airship R-101, only two are aluminum alloys, viz., the aluminum-silicon alloy die castings and the duralumin in form of sections, close jointed tubes, solid drawn tubes, stampings, rivets and screw-machine parts.

The aluminum-silicon alloy as die cast has such excellent resistance to corrosion that anodic oxidation is unnecessary. All the duralumin parts, from tiny rivets to solid drawn tubes 2¾ in. diameter and 30 ft. long, however, have been given a film of oxide and a coating of lanoline. The operation of the process requires the closest control of

(1) Loading of the plant for current density. This varies with
  (a) The composition of the alloy
  (b) The state of the surface, i.e., whether machined, stamped and pickled or rolled
(2) Rate of voltage rise
(3) The duration of the "soak" at the "film forming voltage" (40 volts)
(4) Concentration of the electrolyte (chromic acid) in the bath

This process has proved an invaluable inspection agent in dealing with duralumin parts. The process of anodic oxidation, by exercising selective attack on faulty places, reveals at once localities of flaw or segregation which were masked to ordinary inspection.

Steel members of the airship R-101, which are not made of stainless steel, are treated by a rust-proofing process which is best described as closely controlled Sherardising.

Uniform results can be obtained by this well-known process only by close control of

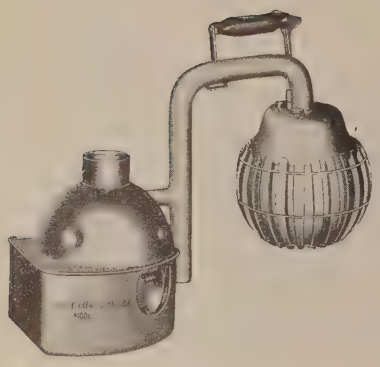
(1) Density of loading of work into the drums
(2) Composition, within close limits, of the mixture of zinc and zinc oxide dust
(3) Rate of increase of temperature
(4) The maximum temperature and the time of soak at maximum temperature

It has been found possible to control the thickness of coating within very close limits, so that it is safe to count upon an increase in dimensions due to the addition of a coating of thickness always lying between 0.0003 and 0.0006 in.

It has been established to the satisfaction of Boulton & Paul, the makers of this airship, that this rust-proofing is superior to electro deposition of zinc. The coat, it is emphasized, is well alloyed to the steel and is non-porous to the ordinary tests, and the ferroxyl test modified to suit the special requirements.

The process, properly and closely controlled, is an eminently satisfactory one, and among the many thousands of steel stampings and tubes which have been treated, the rejected parts sent back for re-treatment have not totalled a hundred.

Gas-Fired Ice Box



Simplified Domestic Refrigerator Unit Made of Sheet Metal and Tubing, Welded into Closed System, Tested at 600 Lb. Per Square Inch

BY J. B. NEALEY*

SIMPLIFICATION in design and mass production are the great forces that are putting the erstwhile luxuries of the rich into the hands of everyone. The brief history of mechanical refrigeration may be taken as an example. First the electric refrigerator appeared and attained wide popularity. Then came the gas refrigerator, made in one piece and without movable parts. Now we have the "poor man's refrigerator" known as the Icyball. It is as simple as a tea kettle, and it utilizes the cook stove to keep a food compartment cold.

This bizarre result is effected by the same principles of alternate evaporation and condensation of a volatile liquid, described in detail in THE IRON AGE for Feb. 2, 1928, when applied to a gas refrigerator. In the more expensive varieties there described, this circulation of the refrigerant was constant, and the unit could be built permanently into a cabinet. In the simpler variety now to be described the action is intermittent—the housewife puts the 35-lb. unit on her stove for a short time in the morning, then replaces it in the refrigerator. The cost of gas for each heating is less than two cents, and for the next 24 hours the Icyball will freeze ice cubes, desserts or salads, in addition to keeping the food compartment cold and dry.

The Icyball consists of two round chambers connected with a length of bent pipe, and equipped with a handle by which to carry it about.

The ball with the fins is called the hot ball and the other the cold ball. These two with their connecting tube are tightly sealed so that the ammonia solution contained inside cannot escape. The device is a product of the laboratories of the Crosley Radio Corporation, Cincinnati, and is being manufactured in a separate plant of this concern.

To start operation, the unit is lifted from the cabinet and stood in such a position that all of the liquid drains into the hot ball. The hot ball is then placed over a

*American Gas Association.

Unit Complete Except for Minor Attachments Is Galvanized in Gas-Fired Zinc Bath

burner of the kitchen stove, and the cold ball into an adjoining pail of cold water for about 90 min. This separates the ammonia gas from the solution, the former being driven into the cold ball, where it condenses. A little whistle blows when the evaporating process nears completion. Then the hot ball is cooled in the pail of water, the liquid ammonia in the cold ball commences to evaporate, it quickly drops to zero or below, and the unit is ready to replace in the refrigerator cabinet.

A separate unit known as a "stabilizer" keeps the cabinet cold while the Icyball is on the stove. This consists merely of a small sealed tank, containing about 14 lb. of glycerin solution, with a depression in the top in which the cold ball rests.

Unit Made of Welded Stampings

The manufacture of the Icyball progresses in a straight line; most of the handling of parts and subassemblies is done by continuous traveling or gravity conveyors.

Each of the balls is made of two hemispheres (steel stampings made in a single press operation) welded together with an oxy-acetylene flame. One ball is 10 in. diameter and the other 9½ in., while the connecting tube is 1¾ in. seamless steel tubing. The steam dome to make a liquid seal on the top of the hot ball is also a steel stamping with a bottom diameter of 7 in.

In the manufacturing department, gas welding stations are ranged alongside gravity conveyors, one main conveyor for each ball. Operators are specialists, welding one seam or attaching one part. Where these two conveyor lines meet, the balls are welded to the connecting tube and the unit passed along to the hydraulic test. A large acetylene generator for the oxy-acetylene welding has been erected in a fireproof room adjacent to the assembly lines; gas is piped through the plants at low pressure and each blowpipe outlet is protected by a hydraulic back-pressure valve.

Oxygen is furnished in individual cylinders, each with a regulator so that pressure can be adjusted appropriate for the thickness of the metal being welded.

The hydraulic test is so arranged that five units are connected to a header at one time and all are subjected to 600 lb. pressure. The strength of the welds and materials having thus been checked, the units are then tested with 200 pounds of air pressure to locate any pin hole leaks. Pressure in the system when in a refrigerator cabinet is about 20 lb. per sq. in.; during the heating period the temperature goes up to 300 deg. Fahr., and pressure to 230 lb., before the whistle blows.

To improve the radiation rate of the hot ball a number of fins made of strip steel stampings are spaced about it and clamped securely in a jig while binding them on with wire. The units are then conveyed to the galvanizing department.

Finish in Zinc Coat and Aluminum Paint

They are pickled and washed in a series of large vats. Galvanizing is then done in three boiler steel tanks five feet long, three feet wide and 30 in. deep. A 3-in. space between brick setting and tank allows the circulation of heat, the gas flames impinging on the bottom. Automatic controls maintain the temperature at 850 deg. Fahr. plus or minus five degrees. From 1½ to 1¾ lb. of zinc is used on each unit; the zinc coating also acts to solder on the fins, and to prepare other surfaces for soldering by hand.

An overhead monorail system serves the galvanizing department. The figure shows a fixture whereby the units are forced into the molten zinc. The half of the zinc bath in the foreground is covered with three inches of sal ammoniac flux. After the unit has been immersed about 90 sec. it is pushed along, still immersed, to the other end of the tank where there is no flux, and removed.

Units are next moved by conveyor to a battery of drill presses where openings for safety devices are made. All

Various Parts, Stamped or Bent from Strip or Tubing, Are Assembled in Simple Work-Holding Devices and Welded with Oxy-Acetylene Blowpipes

Part of Test Floor—Several Hundred Starting Units, Each One a Gas Plate and Water Pail, Required to Keep Pace with Production

fixtures are then soldered on, and the unit tested under 300-lb. pressure.

Ammonia Charged in Separate Room

A weighed amount of ammonia is next charged. This is done in a separate room, through a system of special piping leading from vacuum pumps and ammonia reservoirs. The aqua-ammonia is mixed in four high-pressure tanks, which are located on a floor above. While two of the tanks are draining, the other two are being refilled.

As soon as the units have been charged they are taken by conveyor to the second floor where each one is put through a complete test cycle, including heating and placing them in test boxes for 24 hr. in a room where a constant temperature of 90 deg. F. is automatically maintained. The units are then sprayed with aluminum paint, packed and dropped to the shipping department through chutes.

European Irons for Enamelware

AN article by Engineer A. Muller published in *La Revue de Fonderie Moderne* (June 10, 1929) gives some details regarding the production of iron destined for the manufacture of enamelware. As a rule these manufacturers do not attempt an exact chemical composition for the castings, and consequently the majority of them do not possess analytical laboratories. They endeavor to produce iron which is fluid, soft, easy to work, and, above all, free from defects while in the oven.

Iron Containing No Free Carbon Enamels Satisfactorily

Frequently insufficient attention is given to the physical reactions which take place between the iron and the enamel. These two materials differ widely in their characteristic properties, and often the faults which arise with one are attributed to the other. Thus, an iron containing no free carbon may be enameled satisfactorily, and without a preparatory coating; carbon plays an important part in reducing the oxides contained in the enamel—it causes the enamel to become transparent, uneven, and otherwise defective. Oxide of zinc is particularly affected by graphitic carbon; therefore certain enamels cannot be applied directly to the iron, and necessitate a preliminary coat.

Great care is therefore taken to make sure that the carbon is not excessive; 3.6 per cent is a satisfactory proportion, and 3.7 per cent is the limit. For the same reason the use of carbonaceous material, such as charcoal, is avoided in the molding materials. For thin castings phosphorus should not be less than 0.6 per cent nor more than 0.9 per cent; if phosphorus is too high the metal becomes so brittle that trouble is likely to occur during baking. An excess of phosphorus may be overcome by an increase in silicon, but the latter should not exceed 3.25 per cent. Sulphur is probably the most dangerous element, as beyond 0.09 per cent it causes the iron to be hard and brittle. The interplay of the various common elements, the one balancing the other, is illustrated by the following analyses, any of which will make satisfactory pieces intended for enameling:

Sulphur	0.07	0.08	0.09	0.10
Silicon	2.3	2.4	2.5	2.6
Total carbon ...	3.72	3.7	3.65	3.6
Graphitic carbon..	3.26	3.27	3.28	3.29
Manganese	0 6	0.7	0.8	0.9
Phosphorus	0.9	0.8	0.7	0.6

Castings must not remain too long in the sand as small stains of rust may thus be produced, and although almost imperceptible, they reduce the quality and adherence of the enamel.

Trade Practice Meetings of 62 Industries

Pamphlet Covering Conferences Published By Trade Commission—Codes Reflect Rising Standards

WASHINGTON, Aug. 13.—The Federal Trade Commission is having a pamphlet on trade practice conferences printed and is seeking the cooperation of trade associations and other organizations for its distribution. Copies will be available at 25c. each, from the Superintendent of Documents, Washington.

The pamphlet will cover 52 conferences. Since it went to press, however, 16 additional conferences have been held, making a total of 68. The number of industries affected is 62, some having held conferences twice. Rules have been issued in all but four or five instances, and between 25 and 30 applications for conferences are pending. The industries cover a wide range with a huge total capitalization, doing business under standards upon which they voluntarily agreed and which they set up in cooperation with the commission. That they are living up to the codes established is evidenced by the fact, pointed out to THE IRON AGE by M. Markham Flannery, director of the Trade Practice Division, that less than one dozen cease and desist orders were issued for the violation of the 400 rules promulgated by the commission. He expressed the view that the outstanding result of the conferences has been to put business on an equal basis, fair to all alike, including the consumer.

"These conferences," said Mr. Flannery, "mean big savings to industry, the Government and the people by settling in groups many cases which under former practice would have had to be settled individually. Also they have placed industry and business in a friendly attitude rather than in an attitude of antagonism."

It is the opinion of Mr. Flannery that a remarkable transformation has come over business within the past decade, and that this has been emphasized in trade practice conferences. The point was made by Mr. Flannery that business and industry are anxious to operate on high standards, and, when assured that codes may be set up that place each unit on a fair comparative level, they take action to do away with undesirable practices. The growing number of conferences and of affected industries is held to support this view. Previous to the setting up of the Trade Practice Division in June, 1926, the commission held only two or three conferences a year. Now the average is more than 20 each year, and it is rising. In May of the present year there were six conferences, in June, 11, and in September there will be perhaps eight or 10, none being held during July and the present month, owing to the fact that the commission is not in session.

The first trade practice conference was held in 1919, and concerned the creamery industry of the West, developing from an investigation under the old system of individual complaints and bringing about cooperation instead of hostility. It is estimated that the elimination of some practices by the creamery industry, such as providing free service, has saved it millions of dollars. Industries in the iron and steel and metalworking lines, it is claimed, also have saved large sums as the result of codes they have adopted under the trade practice rules. There are two sets of rules, Group I and Group II. The former condemn practices that are plainly illegal. Group II rules cover practices that may or may not be illegal. The commission gives no opinion one way or the other regarding such rules, but accepts them as expressions of the trade concerned. The legality or illegality of such rules can be determined only after investigation of individual cases. Some of the practices condemned under Group II rules are, on the other hand, manifestly legal, but are held by those participating in the conferences to be undesirable.

Reinforcing Institute Meeting

The Concrete Reinforcing Steel Institute will hold its next semi-annual meeting Sept. 30 to Oct. 2, at the Wawasee Hotel, Wawasee, Ind. The opening session will be held Monday evening, Sept. 30. The Wednesday morning session will be devoted primarily to the subject of concrete rib floor construction.

New Indiana Company Takes Over Two Plants

Properties of the Chrobaltic Tool Co. and of the Sheet Steel Products Co., both located at Michigan City, Ind., have been taken over by the Michiana Products Corporation of the same city, recently organized. This new company will continue the business and enlarge the facilities of the two absorbed companies. The present operating and sales organizations will be maintained with the exception that R. O. Gill has resigned to engage in a new business.

The Chrobaltic division of the new company will continue to manufacture heat and acid-resisting alloy castings and other stainless materials. An additional foundry was recently completed and the engineering department increased. The Sheet Steel Products division will continue to manufacture the Hall Winslow line of oil filters and air cleaners for truck, tractor, aeroplane and automobile engines, as well as pressed metal parts, tanks, equipment, etc., in standard special analyses and corrosive-resisting materials.

O. M. Carry is president of the Michiana Products Corporation with offices in Chicago, and W. B. Sullivan is vice-president and general manager, located at the plants in Michigan City.

Sheet Steel Used in Making Electric Portable Tools

The use of sheet steel stampings in the manufacture of electric portable tools is described in the current issue of "Making Markets," published by the Sheet Steel Trade Extension Committee. Speed Way Mfg. Co., Cicero, Ill., has found that tools fabricated with sheet steel casings are more compact than those made of other materials. Sixteen-gage sheets are used for heavy-duty tools and 22-gage for light-duty. The strength of steel makes the tools especially serviceable where rough handling is involved.

Plant Visitations During Metal Congress

An extensive plant inspection program has been arranged for the National Metal Congress to be held in Cleveland the week of Sept. 9, under the auspices of the American Society for Steel Treating. The schedule provides for a majority of the plant inspections in the mornings, so that the afternoons will be free to attend the National Metal Exposition at which over 250 exhibitors will occupy 80,000 sq. ft. in Cleveland's Public Auditorium. Plant inspections are scheduled as follows:

National Tool Co.
Lamson & Sessions Co.
Otis Steel Co.
Case School of Applied Science.
Industrial Brownhoist Corporation.
Columbia Axle Co.
Lakeside Steel Improvement Co.
White Motor Co.
Warner & Swasey Co.
Burdett Oxygen Co. of Cleveland.
Joseph T. Ryerson & Sons, Inc.
Lincoln Electric Co.
Vlchek Tool Co.
Gears and Forgings, Inc.
Eaton Axle & Spring Co., bumper division.
Ferro Machine & Foundry Co.
National Malleable & Steel Castings Co.
American Steel & Wire Co., Cuyahoga Works.
Nela Park.
National Acme Co.
Hupp Motor Car Corporation.
Great Lakes Aircraft Corporation.
Cleveland Tractor Co.

Wheel Plant in Mexico

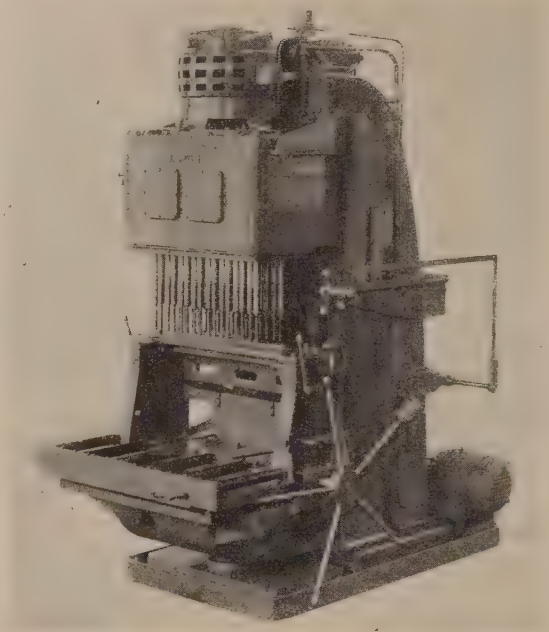
Construction of a plant for the production of wheels for railroad, street car and mining use has been completed by the Monterrey Iron & Steel Co., Monterrey, Mexico, and operations will begin in the next month. Contracts for wheels have been closed with Mexican railroads.

Multiple-Spindle Machine for Valve Holes

THE valve hole drilling, reaming, counterboring and spot facing machine illustrated, built recently by the Defiance Machine Works, Defiance, Ohio, is equipped with Oilgear hydraulic feed and a fixed-center direct-motor-driven head. The head is furnished with different numbers of spindles to suit requirements. All spindles are made of heat-treated alloy steel and are equipped with heat-treated helical gears. Wherever possible ball thrust bearings are employed. The heads are entirely inclosed and furnished with forced feed lubrication.

Oilgear feed permits close adjustment of feed rates to suit requirements and provides rapid traverse movement both to and from the work. The table of the machine is adjustable and has screw jack supports for overhang. It extends beyond the front of the machine and is fitted with rollers to connect it with conveyor tables for passing the blocks from one machine to another. The column is a heavy cored casting; it supports the Oilgear cylinders and also incloses the weights that counterbalance the heads. Fixtures, built to suit requirements, may be rigid or of sliding type with bushing plates and hardened jig eyes.

A 15 to 20-hp. 1200-r.p.m. motor is recommended for driving the head and a 2-hp. 900-r.p.m. motor for driving the Oilgear hydraulic pump. The floor space occupied by the machine is 64 x 108 in. The net weight is 18,500 lb.



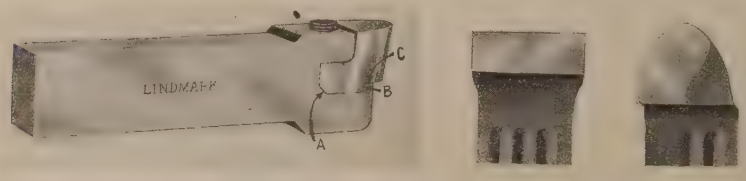
THE Fixed-Center Head Can Be Furnished with Spindles to Suit Requirements in Drilling, Reaming, Counterboring and Spot Facing Valve Holes in Automobile and Tractor Cylinder Blocks. Feed is by means of Oil-gear mechanism

Tool Holder for Large Lathes and Planers

RIGID support and convenient interchangeability of tool bits are features of the Lindmark tool-holder illustrated, which is being supplied by the Apex Tool Co., 50 Remer Avenue, Bridgeport, Conn., for use on boring mills, planers and heavy-duty lathes.

The tool bit has a broad bearing in the holder and is locked firmly in place by tightening the socket set screw, which causes the bit to slide over the beveled surface *A* of the holder, lock against the shoulder *B* and make contact with the forward part of the holder at *C*. The support is thus extended close to the cutting edge, most of the cutting strain being transmitted to the holder at *C*, and very little to the set-screw. It is stated that because of the firm support provided, which is claimed to approach that of a solid tool, Stellite tool bits may be used without danger of breakage. The grooves in the tool bits permit offsetting, to compensate for wear of the cutting edges. The bits may be removed conveniently for regrinding and replaced in exactly the same position without removing the holder from the machine.

The holder is a chrome-nickel steel drop forging, heat-treated to provide maximum toughness. It is stocked in two sizes, 1 x 1¼ x 6 in. and 1¼ x 1½ x 8 in., respectively, and in five styles: Straight, right and left-hand 45-deg. offset; and right and left-hand 90-deg. offset. High-speed steel tool bits are made in two sizes and in the following seven styles: Square nose, right and left-hand hog nose, right and left-hand side facing, and right and left-hand roughing. The Stellite bits, cast special for use in these holders, are furnished in right and left-hand hog nose and right and left-hand roughing styles only. Gooseneck and other type planer holders in 1-in. and 1¼-in. widths can be furnished on order.



With the Support Close to the Cutting Edge, Stellite Bits May Be Used. Grooves, shown in the square and hognose bits above, permit offsetting to compensate for wear

Combination Vise Equipped with Steel Slide

A COMBINATION pipe vise having a steel slide has been added to the line of the Simplex Tool Co., Woonsocket, R. I. The steel slide eliminates the possibility of breakage just back of the front jaw, and is particularly desirable for this type of vise the jaw of which is extra high.

The Steel Slide Eliminates Breakage Back of the Front Jaw

The pipe jaws are made of hardened tool steel and are reversible. The jaw inserts are also made of hardened steel and are fastened with screws and doweled to prevent loosening. The nut in the back jaw through which the operating screw goes is made of malleable iron, and is designed to eliminate lifting up at the back and so prevent breakage of this part. It is extra long and has two front supports, one above the other.

The property of the Penn-Seaboard Steel Corporation, New Castle, Del., is to be sold following a petition of the receivers of the corporation, Alexander F. Crighton and William P. Barba, provided creditors show no reason prior to Sept. 4 that such a sale should not be held.

Improved Nut and Screw Driving Machine

SPEED of operation, as compared to hand methods, and uniform tightening to predetermined standards are features of an improved model of the Reynolds nut driving machine which has been placed on the market by the Baush Machine Tool Co., Springfield, Mass.

Nuts and Cap Screws Are Driven Rapidly to Predetermined Tightness. Control is by foot lever

The machine was formerly built by the Metalwood Mfg. Co., Detroit, and was described in THE IRON AGE of Dec. 8, 1927. It has two spindles, one of which is mounted in a slide that is adjustable crossways of the column to permit varying the spindle center distance from 2 1/16 to 6 in., to suit the piece being assembled. A detachable socket wrench at the lower end of each spindle holds the nuts or cap screws through magnetic windings. The driving operation is controlled by foot lever and the tightness of the nuts or screws is determined by the adjustment of a rheostat. When the nuts or screws are driven to the predetermined tightness, the clutch circuit is caused to open automatically, which, when the foot lever is released, permits the work to be withdrawn from the wrenches. The arrangement is such that if one nut begins to tighten before the other, the leading nut will be slowed down until both nuts are equally tight.

Substitution of a centrifugal mechanism for making and breaking the magnetic clutch circuit through a mercury switch in place of the epicyclic mechanism previously employed is a major improvement. The electric circuit has been simplified and a more substantial switch provided. A direct current generator can be supplied where direct current is not otherwise available.

Small Part Heat-Treating Furnace

A NEW electric furnace for heat treating small parts is announced by the General Electric Co. It is of the mesh-belt conveyor type, and the automatic feed and discharge effects the labor savings.

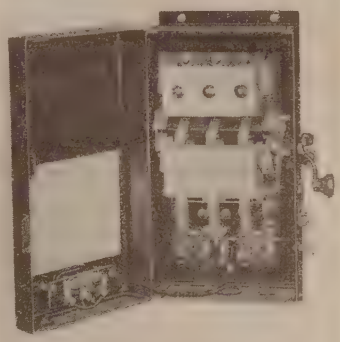
The furnace is about 8 ft. long, 4 ft. wide and 4½ ft. high overall. A small heat-insulated housing is provided for the feed end of the belt to prevent unnecessary losses. The principal feature of the furnace is the mesh-belt conveyor, made of heat-resisting alloy. The mesh belt is carried over two drums of the heat-resisting alloy, one of which is driven by motor.

The furnace can be adjusted for various speeds and temperatures, and an adjustable opening at the feed end accommodates work of different dimensions. After heat treating the work is discharged into a chute which may carry it to a box. quenching bath or some other subsequent process. To start the furnace in operation, the control is set for the desired temperature, and the speed is adjusted. The furnace will handle up to 300 lb. per hour, in shapes up to 2 x 16 in. overall.

AUTOMATIC Feed and Discharge Is a Feature of This Mesh-Belt Conveyor Type Electric Furnace. Both belt speed and temperature are adjustable and opening at the feed end may be of size to suit the work

New Automatic Motor Starter

SAVINGS in wiring costs are among the advantages claimed for a new combination automatic starter which is being manufactured by the Square D Co., Detroit, in three capacities and six types. Across-the-line starters up to 30 hp., 220 volts and 50 hp., 440 and 550 volts, two or three-phase, are employed, the starter being mounted with the motor circuit switch in one cabinet. The motor circuit switch acts not only as a disconnecting switch but is also capable of opening the circuit while the motor is under load.



An Across-the-Line Starter and Motor Circuit Switch Are Mounted in the Same Cabinet

To facilitate obtaining accurate working load data, the starter is arranged that a test jack may be inserted in the motor circuit while the motor is running. This test jack is put through openings in the door of the cabinet and is held firmly between the jaws of the switch by spring tension. The device may be provided with fuse blocks between the motor circuit switch and the starter, if desired.

Sixteen stoves are to be installed at the Lackawanna plant of the Bethlehem Steel Co. by the American Heat Economy Bureau Inc., Pittsburgh.

Holding Company to Be Dominant in Coke

New England Corporation Formed by Koppers Interests—Controls Many Properties

THE Koppers interests, Pittsburgh, have filed with the Massachusetts Commissioner of Corporations a voluntary trust, the Eastern Gas & Fuel Associates, with Charles A. Coolidge, Jr., and Paul C. Cabot, both of Boston, and Thomas J. Michie, Jr., Pittsburgh, included in the trustees. Headquarters will be in Boston.

Under the declaration, trustees are given broad powers. In addition to the investment trust with respect to securities, the trustees have the power to manufacture, produce, purchase, mine and otherwise acquire, hold, own, use, sell and otherwise dispose of and deal in gas, coke, oil, tar, chemicals, iron, steel and other metals.

Authorized shares in this voluntary trust, which may be issued from time to time at the discretion of the trustees, include 250,000 shares of prior preference, $100 par stock, paying 4½ per cent cumulative dividends; 1,000,000 shares of $100 par preferred, paying not more than 7 per cent in dividends; and 2,000,000 shares of no-par common stock. The prior preference stock, in the case of liquidation, is entitled to $105 per share, and the preferred stock $115.

The Koppers interests already have in operation a modern coke-making plant at New Haven, Conn., and are a factor in the Connecticut gas and coke field. Although no official announcement has been made by the Koppers interests, Boston banks report that they have acquired control of the Massachusetts Gas Companies, embracing the Mystic Iron Works, coal properties in the South, coke ovens located at Everett, Mass., steamships and valuable franchises in and about Boston as to the distribution of gas.

Assuming that the Koppers interests have acquired the Massachusetts Gas Companies, it is generally conceded that, with valuable properties in northern New York State, and with the acquisition of gas and lighting properties south of Boston, they will have a dominant position in the New England gas and coke market, except in the Providence, R. I., district.

Increases in Western Rate Revision

Examiners' Report Recommends New Class for Iron and Steel Products in Western Trunk Line Territory

WASHINGTON, Aug. 13.—Freight charges on iron and steel products moving on class rates in Western Trunk Line territory will be increased if the Interstate Commerce Commission adopts the recommendations submitted to it by William L. Koebel and Peter C. Paulson, examiners, in what is known as the Hoch-Smith Western class rate investigation. The proposals of the examiners do not affect commodity rates.

The proposed report, which was made public on Wednesday of last week, recommended that a new class be created for iron and steel articles in Western Trunk Line territory. At present, iron and steel products, when moving on class rates, are rated fifth class, which is about 40 per cent of first class. The examiners proposed that special treatment be given to iron and steel products to the extent of having set up for them a class (not designated by name or number) equal to 32.5 per cent of the first class scale that they recommend for application to the territory affected. The minimum carload would remain at 36,000 lb.

When the new scale in the Western Trunk Line territory goes into effect by the commission's decision, it will be of such a character as to fit in with the new rates on iron and steel in Official Classification territory, which are to become effective Oct. 20 as the result of the commission's decision in the Hoch-Smith Eastern iron and steel investigation. The result will be a revised system of iron and steel rates from the Atlantic Coast to the Rocky Mountains. Since iron and steel rates were revised in the Consolidated Southwestern cases in 1928 and in the Southeast in Southern Class Rates case in 1927, only the Pacific Coast territory is left for treatment.

Western Trunk Line territory, roughly, may be described as extending west from Lake Michigan and the Mississippi River to the Rocky Mountains and north from and including Kansas and northern Missouri to the Canadian border.

The revision covers class rates between points in Western Trunk Line territory and between points in that territory, on the one hand, and points in the entire country east of the Mississippi River and Lake Michigan, on the other. It also includes rates over the Lake-and-rail routes between Western Trunk Line territory and the East. Western Trunk Line territory, for the purpose of applying the rates recommended by the examiners, would be divided into three parts or zones. The lowest rated zone includes, roughly, that part of the territory east of the Missouri River and what is known as the Sioux Falls-Twin Cities-Duluth line. The intermediate zone lies to the west and includes most of eastern Kansas, southeastern Nebraska and the area east of a line from Sioux City, Iowa, through Mitchell and Aberdeen, S. D., and Fargo and Grand Forks, N. D., to Duluth. The highest rated zone includes that part of the territory west and north of the intermediate zone. It covers the Rocky Mountain part of the territory.

For application between points in the lowest rated zone the examiners recommended that a distance scale of rates nearly 83 per cent of the scale prescribed for Oklahoma and other Southwestern States in the Consolidated Southwestern cases. The scale recommended for the intermediate zone is the same as the Kansas-Missouri scale prescribed for southwestern Missouri and eastern Kansas in that case. The highest scale is identical with the Southwestern scale. For application between points in different zones the examiners recommended that the lower or lowest scale be applied for the entire distance, plus differentials for the distances in the higher rated zones. The measure and progression of the scales are briefly indicated by the first class rates below:

Miles	Scale I	Scale II	Scale III
5	32	33	36
100	66	73	79
200	91	101	109
300	109	124	133
400	127	146	157
500	142	162	174
800	187	211	227
900	198	223	240
1,500	264	296	318

In a statement concerning their work, the examiners said that "while the proposed basis would effect many reductions from the present rates, increases would predominate."

"The measure of the increase," continued the examiners, "is substantially greater in the lowest rated zone than in the others. The basis is designed with relation to adjustment in adjoining territories, but is also intended to give Western Trunk Line respondents (railroads) some additional revenues, which, it is believed, their financial condition warrants."

The method for ascertaining the rates to be applied is complicated whenever traffic is to be hauled from without Western Trunk Line territory to a point within it. For example, Chicago is in Illinois Freight Association territory. A shipment of iron and steel from that point to Denver would require the ascertainment of the distance the traffic moves in Illinois Freight Association territory and the distances it moves within each of the three zones into which Western Trunk Line territory would be divided. Distances would have to be computed by way of the shortest routes over which the traffic could be moved without transfer of lading.

Luntz Iron & Steel Co., Canton, Ohio, has announced the opening of a branch office at 320 Citizens National Bank Building, Kokomo, Ind., to do a general business in old materials. F. I. Kilcline is in charge.

British Plan Group Organizations

Negotiations Cover Heavy Industry—German Mills Laying Off Men—Tightening in Foreign Ores for American Market

(*By Cable*)

LONDON, ENGLAND, Aug. 12.

WITH the Cleveland holiday week in progress, new business in pig iron is small, but makers are preparing to increase their output. Four additional furnaces are expected to blow in on the Northeast coast during September, and, meanwhile, furnaces are well booked with tonnage.

Hematite iron prices are firmer, but occasionally show some irregularity. About 950 tons of special quality Hematite was shipped last week to the United States.

Finished steel is quiet because of the holidays. There is a fair domestic demand, but overseas business is meager. Some makers are still well booked ahead, and all are expecting an early revival.

Continental markets continue dull, but the belief is growing that an improvement is likely in the near future.

Tin plate inquiry is expanding, and with a good demand for deliveries up to the end of the year, makers have adopted a firmer attitude, and most mills are now quoting 18s. 6d. ($4.48) per base box, f.o.b. works port. Home demand is fair and some export sales have been effected.

Galvanized sheet business is slightly better, although Indian demand is still small. Far Eastern demand for black sheets has improved, and business is active in both the light and medium gages.

In an interview on his eighty-first birthday, Sir Arthur Dorman, Dorman, Long & Co., said: "British manufacturers realized that cooperation and united organization are essential if they were to maintain their position. Hence negotiations for unification of the heavy steel industry have been instituted. Preliminary efforts have met with fair success, and there is the probability that in the near future the British iron and steel industry will be organized into groups."

Armstrong Whitworth & Co. have booked orders for two Norwegian 9000-ton tank ships.

German activity is slackening, and the Vereinigte Stahlwerke A. G. is laying off shifts at Hoerde and the Deutsche Edelstahl Werke is to discharge another 500 men at Bochum. German mills are reported to have booked large tonnages of rolled steel for Holland and some important Russian contracts for ship plates. South Africa has placed an order for a tonnage of rails with Polish works, which are now competing keenly with the International Rail Makers Association.

British Pig Iron Buoyant—Steel Exports Fair

LONDON, ENGLAND, Aug. 1,—The iron and steel business here is affected by the holiday season, and improvement is not expected until early fall. Pig iron producers are optimistic and look for a heavy demand from domestic consumers, which will necessitate blowing in additional furnaces. It is expected that by September there will be 50 of a total of 95 furnaces in blast in the Cleveland district. Meanwhile, Cleveland producers have no iron available for delivery before October, and the only supplies available for prompt shipment are in the hands of merchants. Pig iron production costs have increased steadily throughout the year and no reduction is expected, as foreign ore is advancing. High iron ore prices, however, are encouraging the resumption of operations at domestic mines, but the coke shortage continues acute.

Excessive capacity is still a feature of the steel market. Domestic demand for heavy steel products has been active and is expected to increase, in view of important projects in prospect, such as bridge construction, road building and new power plants. Steel mills are still experiencing difficulty in regaining export markets and are represented in a delegation that has gone to South America to study the possibility of developing trade in certain special products.

Business with the Far East is irregular, especially with China, where buying has been affected adversely by the recent political developments. In Japan the rapidly increasing output of Japanese steel mills is curtailing imports. Through the steel makers' export committee, however, some fair shipyard contracts have been negotiated with Japan and also with Canadian buyers. Continental competition is not so keen as it was some time ago, but may again become an important factor as a result of the recent decline in the prices of European sellers.

British and Continental European Export prices per gross ton, f.o.b. United Kingdom Ports, Hamburg and Antwerp, with the £ at $4.85

British Prices, f.o.b. United Kingdom Ports

Cleveland No. 3 foundry	£3	12½s.	to	£3	13½s.	$17.58	to	$17.82

Foreign Iron Ore Prices High

Swedish, Algerian and Spanish Mines Offer Extended Deliveries or Do Not Quote—Japanese Seek Supplies

NEW YORK, Aug. 13.—European demand for iron ore is at the highest peak since the war. Germany and Great Britain have been especially large buyers, and the leading foreign iron ore producers have booked a record tonnage in the first half of this year. North African, Swedish and Spanish mines are under contract for the greater part of their production next year and well into 1931, and are showing little interest in additional business, even at advanced prices. North African mines are either out of the market temporarily or are asking up to 12½c. per unit, c.i.f Atlantic port, with delivery long delayed. Swedish sellers are in most cases not interested in quoting. At these prices sales to consumers in the United States are practically impossible. While the condition of the iron ore market is attributed to a generally heavy demand from European consumers, Germany and Great Britain have been by far the largest buyers, contracting many months ahead. The London office of a large ore selling company, which controls North African mines, has taken contracts for about five times as much tonnage in the first half of the year as in the same period in 1928.

Faced with an inadequate supply of iron ore from the usual leading sources, Japanese consumers are apparently embarrassed. Recently Japanese furnaces have been depending largely upon purchases of iron ore in the Philippines and the Straits Settlements. Some cargoes of Whyalla manganiferous iron ore from the Broken Hill Proprietary Co. properties in Australia have arrived at Baltimore, and the Japanese, willing to pay slight premiums for high-grade ores, are apparently interested in importing from the same mines. However, the total tonnage of this ore available, it is said, is not very large.

The foreign fluorspar market is also strong. Prices have advanced in $19 per net ton, duty paid, Atlantic port, and sellers are unable to offer shipment before the end of November, or early in December. Some of the foreign producers have notified their agents not to accept any business without first consulting them.

European Car Builders' Syndicate Proposed

BERLIN, GERMANY, July 27.—Plans to form a syndicate of European railroad car builders have been modified to include car shops in Czechoslovakia, which are already members of a national association. Other producing countries which have been requested to become members include Austria, Hungary, Italy and Sweden. The aim of the association will be to control competition so as to permit profitable prices.

Despite the recent bank syndicate credit of 100,000,000 m. ($23,800,000) to finance orders of the Railroad Corporation placed with German builders, 90 per cent of which are members of the Wagenbauvereinigung (car builders association), the industry in Germany is depressed. Just prior to the war, Germany had 46 car building plants, which were booking orders averaging 370,000,000 m. a year, or based on post-war values, 500,000,000 m. ($119,000,000) a year. In 1924 there were 69 builders in Germany, but orders aggregated only 155,000,000 m. ($36,890,000). As a result of mergers and liquidations in the past few years, only 30 plants remained when the Railroad Corporation, last year, made a quota agreement with the association. Since then, eight of these have suspended operations.

In addition to the Wagenbauvereinigung, which handles orders from the Railroad Corporation, car builders in Germany have the Deutsche Wagenbau-Industrie (DEUWI), which handles agreements with the street car and other private companies and municipalities. Despite these agreements and associations, the depression of the business is such that it is considered likely that more mergers will be necessary and possibly some liquidations.

Germany Reduces Export Prices to Meet Belgium

BERLIN, GERMANY, July 27.—In the past week the volume of foreign orders has decreased and export prices of steel products have declined. Recently Continental business has been dominated by Belgian mills, which are reported to have diminishing backlogs. The holiday season has influenced the steel market and Far Eastern consumers have been inactive since the beginning of the dispute between Russia and China. With Belgium a keen competitor for new business, the German Stahlwerksverband has again cut its export prices, f.o.b. Antwerp, but even with this reduction, Belgian prices on steel bars are 1s. to 1s. 6d. (24c. to 35c.) a ton lower.

The difference between German and "world market" prices is still considerable. Prices established for August by the Ingot Steel Syndicate, for the purpose of calculating rebates to consumers manufacturing for export, show billets at 119 m. ($28.32) per ton in the domestic market and 108 m. ($25.70) per ton for export; slabs at 124 m. ($29.51) per ton in the domestic market and 108 m. ($25.70) per ton for export and bands at 165 m. per ton (1.75c. per lb.) in the domestic market and 124 m. per ton (1.31c. per lb.) in the export market.

Shipbuilding shows no improvement. In the second quarter of 1929 only 272,444 gross tons of shipping was under construction, compared with 406,000 tons in the first quarter. This decline is attributed to the approaching completion of the construction programs of the leading shipping companies. By mergers and liquidation of certain companies, shipbuilding capacity has been reduced to 650,000 tons, but even with this total there is but little prospect of full operation.

German Automobile Builders Want Higher Tariff

BERLIN, GERMANY, July 27.—The automobile industry continues to urge an increase in the tariff on motor cars to reduce American competition. The duties, which have been automatically reduced since 1925, reached their lowest point in July, 1928. It is claimed by German producers that the United States is driving all competitors out of the German market.

Statistics cited by producers show that in 1924, 19.8 per cent of the motor cars imported were from the United States, 24.5 per cent from France, 19.5 per cent from Austria and 7.6 per cent from Italy. In the first five months of this year, 85.1 per cent of the imports were from the United States, 5.5 per cent from France, 6 per cent from Italy, and 2.1 per cent from Austria. An association of German automobile consumers has been formed, the members of which pledge themselves to "unqualified preference for German cars."

Poland Retains Free List on Machinery

WARSAW, POLAND, July 29.—The Government has continued the free list on imports of machinery for industrial expansion until Dec. 31. Machinery for other purposes, when the machines are not yet produced in Poland, will be admitted at 25 per cent of the established duty. This reduction is also effective until the end of the year. The wire and wire nail industry is expanding rapidly, and, a mill that began operations in July was equipped with 150 wire nail machines, bought in Germany.

Turks to Build Steel Plant

HAMBURG, GERMANY, Aug. 1.—Plans for a Turkish Government steel plant provide for two blast furnaces of 500 tons daily capacity, four 100-ton open-hearth furnaces and bar, rod, shape and wire rod mills. Located near Angora, the plant will have a large supply of iron ore near at hand, but coal will be imported. Further details will be available in September, when bids will be asked on the plant and equipment.

New Record for Half Year Pig Iron

January-June Data Given in Detail on Opposite Page—Exceed Both Halves of 1928

OUTPUT of pig iron and ferroalloys for the first half of this year was the largest for any half-year on record. At 21,820,060 gross tons, it exceeded the previous half-year record of 21,016,475 tons, January to June, 1923, by 803,585 tons. The production to July 1, this year, was also larger than for either half of 1928. It was 3,133,758 tons larger than the first half of 1928, or nearly 17 per cent. Production of ferroalloys was larger than that for either half of last year.

Of the total output of pig iron and ferroalloys, 16,857,189 tons, or 78.7 per cent, was for makers' own use. In the first half of 1928 this percentage was 79.2. Of the total output of foundry pig iron, 1,958,718 tons, or 91.5 per cent, was made for sale. About 53 per cent of the ferromanganese and spiegeleisen was made for makers' own use. This proportion was 58 per cent last year. Again this year the ferromanganese output is not given separately from that of spiegeleisen.

Separate tables on the following page give coke pig iron, charcoal pig iron and ferroalloy production. Compiled by the American Iron and Steel Institute.

High-Speed Machine Threads Pipe Automatically

MILWAUKEE, Aug. 12.—A machine that is declared to be a mechanical marvel of the "giant hand" type and which will automatically thread and handle 600 pieces of pipe an hour was given its final test at West Allis, Wis., Aug. 5, before engineers from some of the largest pipe manufacturing plants in the United States. The machine was designed by Frank M. Davis, Davis & Thompson Co., West Allis, for the Youngstown Sheet & Tube Co. Engineers who saw the demonstration included F. H. Whitman and A. A. Jacel, A. O. Smith Corporation, Milwaukee, with others from the Globe Steel Tubes Co., Milwaukee, the National Tube Co. and Spang Chalfant Co., Pittsburgh.

The machine, which weighs about 25 tons, is 35 ft. long by 8 ft. wide and 7 ft. high. From the time that the pipe is picked up by the conveyor line until it is gripped by the chain and toggle clamping device, threaded and discharged, the operation is automatic and controlled by one man. It was demonstrated as a machine that with one man would do the work of ten or more present machines, each operated by two men. It will cut threads on steel pipe up to 4 in. in diameter.

Dallas Brass & Copper Co. To Build New Units

Three new building units to cost approximately $500,000 will be erected by the Dallas Brass & Copper Co., Chicago. They will consist of a large addition to the brass mill, a building to house the carpenter shop, and a building for the engineering department and machine shop.

The Dallas company, founded in 1907, erected a three-story plant at 820 Orleans Street in 1920, which housed a battery of mills to produce brass and copper strips and sheets. Five years later 12 acres were purchased at Sixty-sixth Street and Grand Avenue, where the first units of the present rolling mills were constructed. Later additional acreage was purchased on which a modern casting shop and complete brass and copper mills are now located. It is here that the new units will be erected. The Orleans plant is now largely devoted to general offices and departments which fabricate brass and copper products and lockseam tubing.

Iron and Steel Plants Draw Little on Foreign Labor

WASHINGTON, Aug. 13.—The limited extent to which the iron and steel industry of the United States now draws upon foreign skilled labor is indicated by the fact that during the fiscal year ended June, 1929, only 1440 immigrants were engaged by the industry. For the previous fiscal year, the total was 1857. These totals become smaller when the number of iron and steel workers emigrating from the United States is taken into account, those departing in the fiscal year 1929 having been 164 as against 326 in the previous fiscal year. Machinists coming to the United States totaled 1629 in the fiscal year 1929, as compared with 2032 in the previous fiscal year, while the numbers emigrating were 472 and 632, respectively.

COMING MEETINGS

August

Society of Automotive Engineers. Aug. 26 to 28. Joint meeting with Aeronautic Chamber of Commerce of the United States, Hotel Hollenden, Cleveland. C. F. Clarkson, 29 West Thirty-ninth Street, New York, general manager.

Conference on Human Relations in Industry. Aug. 28 to Sept. 1. Annual meeting under auspices of National Council of Y. M. C. A., Silver Bay, Lake George, N. Y.

September

Lake Superior Mining Institute. Sept. 6 and 7. Annual meeting, Houghton Club, Houghton, Mich. A. J. Yungbluth, Ishpeming, Mich., secretary.

American Manganese Producers' Association. Sept. 9 and 10. Annual meeting, Mayflower Hotel, Washington. Harold A. Pumpelly, Metropolitan Bank Building, Washington, secretary.

American Society for Steel Treating. Sept. 9 to 13. National metals congress and exposition, Hotel Cleveland and Public Auditorium, Cleveland. W. H. Eisenman, 7016 Euclid Avenue, Cleveland, secretary.

American Institute of Mining and Metallurgical Engineers. Sept. 9 to 13. Annual meeting of Institute of metals and iron and steel divisions, Hotel Cleveland, Cleveland. H. Foster Bain, 29 West Thirty-ninth Street, New York, secretary.

American Society of Mechanical Engineers. Sept. 11 to 13. Iron and steel division, Hotel Hollenden, Cleveland. Calvin W. Rice, 29 West Thirty-ninth Street, New York, secretary.

American Welding Society. Sept. 9 to 12. Fall meeting, Hotel Statler, Cleveland. M. M. Kelly, 33 West Thirty-ninth Street, New York, secretary.

Institute of Metals (British). Sept. 9 to 12. Fall meeting, Düsseldorf, Germany. G. Shaw Scott, 36 Victoria Street, London, S. W. 1, England, secretary.

Iron and Steel Institute (British). Sept. 10 to 13. Fall meeting, Newcastle-on-Tyne, England. George C. Lloyd, 28 Victoria Street, London, S. W. 1, England, secretary.

American Railway Tool Foremen's Association. Sept. 11 to 13. Annual convention, Hotel Sherman, Chicago. F. A. Armstrong, 546 West Monroe Street, Chicago, secretary.

Ohio Foundries Association. Sept. 15. Annual meeting, three-day trip on Ohio River steamer from Cincinnati to Ashland, Ky. E. F. Scott, Cleveland, secretary-manager.

American Electrochemical Society. Sept. 19 to 21. Fall meeting, William Penn Hotel, Pittsburgh. Colin G. Fink, Columbia University, New York, secretary.

American Refractories Institute. Sept. 24 and 25. Fall meeting with Refractories Division of the American Ceramic Society, Deshler-Wallick Hotel, Columbus, Ohio. Dorothy A. Texter, Oliver Building, secretary.

Concrete Reinforcing Steel Institute. Sept. 30 to Oct. 2. Semi-annual meeting, Wawasee Hotel, Wawasee, Ind. M. A. Beeman, 2112 Tribune Tower, Chicago, secretary.

National Industrial Advertisers' Association. Sept. 30 to Oct. 2. Eighth annual convention, Gibson Hotel, Cincinnati. Benjamin H. Miller, 420 Lexington Avenue, New York, secretary.

National Machine Tool Builders' Association. Sept. 30 to Oct. 4. Second machine tool exposition, Public Auditorium, Cleveland. E. F. DuBrul, 617 Vine Street, Cleveland, manager.

National Safety Council. Sept. 30 to Oct. 4. Eighteenth annual congress, Stevens Hotel, Chicago. W. H. Cameron, 108 East Ohio Street, Chicago, managing director.

This Issue in Brief

Eliminates hot spots in galvanizing tanks by using electric heat. Tests reveal that solubility of the steel in the tank increases sharply at temperatures above 900 deg. Fahr. Thus the uniformity of electric heat lengthens the life of tank.—Page 404.

* * *

Rapid loss of heat is a difficult problem in forging seamless steel drums. Cooling rate may be reduced by heating the mandrel. Heat loss may be cut still further by employing a hollow mandrel. —Page 400.

* * *

Aluminum foundry uses X-ray to find hidden defects. Testing laboratories form a part of the plant itself, as analyses are regularly made of test bars drawn from each heat.—Page 406.

* * *

Flaws in duralumin parts are revealed by anodic oxidation process. Surface defects which would otherwise be unnoticed are exposed when oxide film is applied. The film is primarily designed to guard parts against corrosion.—Page 409.

* * *

Iron castings to be enameled should not contain over 3.7 per cent carbon. Otherwise the carbon content may cause the enamel to become transparent, uneven, and defective in other respects.—Page 412.

* * *

To improve rolling qualities of open-hearth free-cutting steel, increase the manganese content. The steel rolls much better with manganese about 1.25 per cent, rather than the usual 0.60 to 0.80 per cent.—Page 399.

* * *

Cooling conveyors carrying castings have baskets with bottoms turned up at an angle of 90 deg. on each side. This makes it easier to dump the contents.—Page 396.

Reduces rejections of blooms for cold-drawing bars from 20 per cent to less than 5 per cent by increasing manganese content to 1.25 per cent. The opinion that higher manganese content would induce brittleness and hardness was found to be erroneous.—Page 399.

* * *

Galvanizing dross reduced to a minimum by accurate control of temperature and by uniform temperature throughout the tank. This is made possible by use of electric heat. Lower galvanizing costs result from lower dross, longer tank life, and elimination of firing labor.—Page 404.

* * *

Solution of making steel which is free from seams and slivers lies between excessive care in handling and rolling the ingots after teeming, and the production of a tough metal that will roll without great care. In tonnage operations the latter is preferred, because it allows greater blooming mill production.—Page 399.

* * *

Saves 75 per cent of floor space by using vertical core ovens. Chevrolet core-making department has 16 vertical ovens 45 ft. high. Coremaker sets his own cores in the oven, taking out an empty tray. This eliminates the use of racks and the provision of aisles.—Page 397.

* * *

Airplane engine crankshafts are serial-stamped before and after machining. The steel forging is first heat treated, then inspected for flaws and stamped with a serial number. Spots are ground for hardness test. After rough milling the cheek edges, the serial number is re-stamped. —Page 402.

Sherardizes aircraft steel parts to prevent rusting. British aircraft builders believe sherardizing to be superior to rustproofing by electro deposition of zinc. —Page 409.

* * *

Waste molding sand is economically removed by mixing with water. A hydraulic pump, connecting with a 5-in. line, delivers the sand to a dump.—Page 396.

* * *

Galvanizing tank failures are reported to operator by alarm signal. Brick work underneath the tank is shaped so that leaking zinc will accumulate and sound alarm by closing circuit of two heat-resisting wires.—Page 405.

* * *

Sudden raise in discount rate will not force business curtailment, says economist. Tight money does not necessarily affect business quickly. In the long run, however, continued high money rates will force either business expansion or credit policy to give way.—Page 393.

* * *

Chromium plating practice favors sulphuric acid as a substitute for chromic sulphate, owing to high purity obtainable, says English metallurgist. The concentration of sulphuric acid in the solution has to bear a fixed relationship to the chromic acid content.—Page 394.

* * *

"Poor man's refrigerator," heated on gas stove, freezes cubes for 24 hours on two cents worth of gas. Freezing unit, after heating on gas stove, is placed in refrigerator. Units, made of welded stampings, are now in quantity production.—Page 410.

ESTABLISHED 1855

Mergers and the "American System"

PRESIDENT HOOVER gave much prominence in his campaign speeches to the "American system." In stressing the importance of individual initiative and private enterprise, he struck a sympathetic chord in a people not far removed from pioneer days. One of our most cherished beliefs is that American progress has been chiefly due to the absence of frozen social classes and to the energizing force of ambition in all ranks of life.

How has the American system fared since its distinguished exponent took office? If invasion of business by the Government is made the test, it can be said that there has been little change. If all factors that influence the economic independence of the individual are considered, the answer is quite different. The trend toward business consolidations has become more pronounced. While the resulting corporate organizations are in private hands, the individual's freedom of action is being further circumscribed. In food products, for example, mergers of manufacturing companies are being tied up with nation-wide chain store organizations, with the logical outcome—if the scheme should be developed to finality—of cutting off independent retailers from sources of supply and depriving ultimate consumers of choice in buying.

Strange to say, the general public is as firmly convinced of the merit of consolidations as it was certain of their menacing character two decades ago. It sees in large-scale business the road to efficiency and the answer to increased competition. Promoters have capitalized the belief, floating the stock issues of mergers of all descriptions and incidentally reaping a harvest.

It is not to be gainsaid that consolidations appear to be justified in certain fields—for instance, in the production of rolled steel—but by no means are they always sound and economic. It must also be borne in mind that promoters are sometimes guilty of sharp practice. Profits claimed for consolidations are not always to be taken at face value; they may be obtained temporarily—and until stock is unloaded on the public—by cutting off so many necessary items of expense as to do irreparable injury.

If for the sake of argument it be granted that all consolidations are to survive, even those milked dry by promoters, the social implications of such a result would still be serious. Large-scale business demands large-scale financing, of which relatively few banking houses are capable. Thus it is not hard to envisage a great network of mammoth organizations controlled by a small group. That would be a far cry from the American system. It would reduce the mass of the population to cogs in a big business machine; it would provide little more stimulus to initiative than state socialism.

Fortunately so sweeping a change in our economic structure is not an early prospect. While size in business is a compelling factor in some directions, management will always be a more decisive influence. In the last analysis men rather than systems determine the destinies of industrial and commercial enterprises. Our greatest business successes have been traceable to executive ability of the first order. One need mention only Ford, Carnegie, Gary, DuPont and Rockefeller. Mergers may cause still more concern to champions of the American system before the trend of our economic development becomes clearly defined. Yet it may be confidently predicted that in the future, as in the past, many large businesses will retrograde and many small businesses will prosper and grow great.

Mounting Steel Records

IN the latter part of last year the steel industry began making new records covering 12-month periods. Production is now running so far above that of a year ago that a fresh reference to the subject is justified each month. In THE IRON AGE of July 11, it was noted that steel ingot production in 311 working days through last June totaled 54,675,000 tons. Now we find that production in the 12 months, 311 working days, through July was approximately 55,570,000 tons. Nearly 900,000 tons was added to the record of 12 consecutive months in a single month's time, and this month is altogether likely to add half a million tons more, making the 12-month total, September to August inclusive, fully 56,000,000 tons.

Prior to last year the largest output for 12 consecutive months was 47,000,000 tons, in the 12 months through May, 1927. The gain over that in the 12-month period just ended is 18.2 per cent, in 26 months, which represents a rate of increase of 8 per cent per annum. Contrasted with that annual increase are annual rates of 2 per cent from 1920 to 1923 and 3 per cent from 1923 to 1928.

Chances are that production will now taper off somewhat from last month's rate, but should next December be 13 per cent under July it would still equal December, 1928. When such a decrease would still leave a heavy production it must be considered a possibility, but there is ground for concern as to the influence it might have upon the minds of sellers, anxious to preserve the low average costs per ton that have been made lately by exceptionally heavy output.

Some of the influences that have brought about the 18 per cent increase from the 12 months through May, 1927, to the 12 months through July, 1929, are visible. Comparing the same 12-month periods, automobile production—cars and trucks in the United States and Canada—increased from 4,289,700 to approximately 5,800,000, or by 35 per cent. Fabricated structural steel shipments increased from 3,009,150 tons to approximately 3,400,000 tons, or by 13 per cent. Production of line pipe made a large increase. The increase in production of agricultural implements has been substantial.

The changes have not all been gains, however. Probably there has been a slight decrease in rails, and comparing these precise periods there may have been a slight decrease in freight car building. As the visible increases do not cover the total steel increase it is clear that there have been large gains in other lines of steel consumption not here considered.

Traits of the Prize-Winners

EDISON'S competitive examination for testing the brains of picked high school boys has acted much like Lindbergh's flight of May, 1927, as a stimulus to young manhood all over the country. Also, both the West Orange examinations and the Paris flight have demonstrated that, whatever the oncoming generation is casting away that the preceding one set store by, the two are not far apart in the standards they set up for prize-winners. Traits that have been admired in Lindbergh and young Huston, the winner of the Edison scholarship, are old-fashioned ones that have given Coolidge and Hoover so strong a hold on the people—common sense, a certain reserve, ability in any situation to do what the circumstances require, and a marked preference for knowing and doing over declaring. Popular approval of this last trait is encouraging when there is so much touting of "self-expression" and the go-getter salesman is to so many people the symbol of success.

Some of the Edison questions, especially the one asking how one marooned on an island and without tools would move a three-ton boulder so many feet horizontally and vertically, recall the scholarship established at Worcester Polytechnic Institute last year. It was to be awarded to the entering freshman who had shown the greatest amount of Yankee ingenuity; and at once it had to be determined what constitutes "Yankee ingenuity." Various definitions came from professors and practical men, but none was more fit than that of Frederick W. Shibley, New York, who identified it with "the inherent ability to solve a knotty problem in a simple and ingenious way, to accomplish a difficult mechanical job without employing the customary tools."

Mr. Shibley's definition recalls what the late James Gayley used to ask for when, as vice-president of the United States Steel Corporation, he advised the deans of various technical schools along in the spring of the year that the corporation was interested in prospective graduates who had shown special promise. In describing the type of men sought he wrote that scholarship, of course, was expected, but he was not looking for grinds. Rather he wanted the man who had in himself resources for overcoming unexpected difficulties; one who, if he met with a breakdown in taking a load of grain from the farm to town could make a tie-up of fence-rail and harness take the place of the broken wheel and with no outside help get the load to the mill.

More Copper to Come from Africa

DEVELOPMENT of the important copper properties in Central Africa continues apace. Large and very rich deposits of oxide ores have been mined for some years at Katanga, in the Belgian Congo, and the mines, smelters and refining plants are now operated according to the most modern practices. Yet, as we have heretofore pointed out, many factors have conspired to prevent a rapid expansion in the output of these bonanzas. If such a mine as the Star of the Congo could be opened in Montana or Arizona, its influence on world production and on the copper market would be almost immediate. But Katanga is in Central Africa; the haul is nearly 1800 miles by rail to port, and 9000 miles more by ship to any important customer. This isolation means not only expense in exporting the product to market, but also great expense for importing the necessary equipment, technicians and supplies. Furthermore, the African savage is not a particularly efficient workman, and the labor turnover is large. Lastly, coal and coke are 500 miles away.

These statements are not made to belittle the economic importance of the deposits in the Belgian Congo, but to cite some of the tremendous difficulties which have already been surmounted, and which have operated to restrict the production. Some of them will always be a brake on production; some are being eliminated, at least in part. For instance, a railroad is being built from Katanga to the west coast; 840 miles of the 1170 is already finished, with a motor truck road spanning the gaps. This new outlet will save 600 miles rail and 2600 miles of sea transport and correspondingly reduce time and expense of getting in and getting out.

A serious metallurgical difficulty at Katanga is the fact that practically all the ore is oxidized; little sulphide exists. This handicap will also be removed in the near future, for just across the boundary in Rhodesia great bodies of medium grade copper sulphides have been found. These can be mixed with the rich oxides and smelted to a matte (a more economical proceeding than reducing oxide direct to impure copper), and the sulphur can also be converted into sulphuric acid for leaching and refining purposes.

Under the circumstances, therefore, one can expect operations in the Belgian Congo to expand within the next few years, producing more copper and getting it to the market with more profit.

These new discoveries in Rhodesia are of great interest in themselves, beside the influence they will exert on operations at Katanga. Systematic prospecting of a region approximately 100 miles in diameter has brought to light five deposits, in which surface trenching and diamond drilling have proved up at least 75,000,000 tons of ore containing 3.5 per cent copper, with 200,000,000 tons additional classed as "probable ore." The ore is all within a few hundred feet of

the surface, in thick beds, easily mined. Prominent American engineers have been retained to design mills and smelters. It is estimated that Roan Antelope, one of the early discoveries, will be producing copper early in 1931, and in 1932 will put out 30,000,000 pounds of copper, at a cost slightly over 8 cents a pound. This is only one of five.

What these vast ore reserves and additions to smelting capacity will mean to the price and consumption of red metal needs no lengthy expounding. A mining region rivalling Arizona will be built up in Central Africa during the next decade. The relative amount of world's copper coming from this new center will steadily increase, at the expense of high-cost producers in the United States and elsewhere. It will be a powerful influence to keep the price of copper down to a moderate figure; and uses and consumption will continue to expand in the degree that the price is reduced. Cheaper copper means more used.

Chances of Coal Trade Betterment

SEVEN years ago occurred the great bituminous coal strike, bringing to general attention the fact that the coal trade was in an uneconomical position and quite lacking in efficiency to help itself and serve the public. The cry was "too many mines and too many miners" and the United States Coal Commission was set up to ascertain all the facts. This it did in thorough manner, but nothing happened at Washington. The coal trade was left to economic laws which every one recognized would work quite mercilessly to many if not all in the industry.

The fact that seven years have passed without the coal industry becoming righted does not prove that substantial improvement is impossible. Things have been slowly happening, without apparent result, but a great deal had to occur if the remedy were to be found. There are chances now that the coal trade is on the verge of an improvement, hardly a large one but one that would be very welcome considering the very poor position it has been in over so many years.

Quite a number of mines have disappeared from the practical reckoning and would not be brought into the producing ranks by any moderate upturn in prices obtainable. In number of miners there has been a large decrease. The Pittsburgh district is particularly a case in point, for in its union days it had altogether too many miners, and many men were brought in during the operation of changing the district to a non-union status. About two months ago opinions began to be expressed that miners were not plentiful in the district, while now there are definite reports that really good miners, men able to get out the tonnage and familiar with the mining laws, are actually scarce, that some large producers would like to have more good miners than they can secure. Many men have drifted into other occupations, this movement being facilitated by the general industrial and building activity.

The recent course of coal production indicates a heavy demand, although there has been no stocking and movement of domestic coal has not yet reached proportions that would count. Production in the last few months has been well above 1928, far above 1927, and only a trifle below 1926. It is true that after July 1 production in 1926 rose sharply, under stocking against the expected union suspension of April 1, 1927, showing a large leeway in available capacity; but three years later appearances are that the supply of miners is not nearly so large.

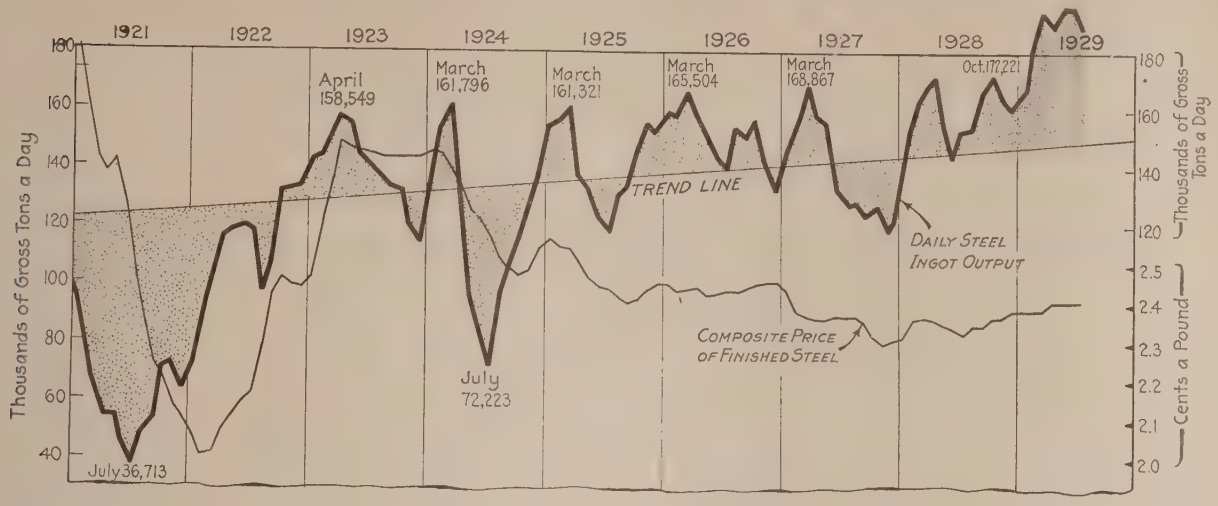
The human element may prove to be quite a factor. There has been a buyers' market in coal for so long that conditions are set for a possible reversal of buyers' policy. The very fact of conditions having so long been strongly in favor of buyers would make a firm, not to say a strong, coal market quite impressive. Selling of coal has appeared to be very difficult, and really has been, but the proportion of total production thus forced upon an unwilling market has not been large, producers in general having a large trade that takes care of itself.

Chicago Uses Steel Armoring to Obtain Longer Wearing Street Surface

CHICAGO has installed a section of Pavegard 10 ft. wide and 120 ft. long at the corner of Michigan Avenue and Randolph Street, one of its busiest corners, to obtain longer wearing surface at this point where the traffic burden is exceptionally heavy. This section has to withstand the stopping impact every 24 hr. of 1600 buses and 67,000 other vehicles which pass the corner in the course of a day.

Pavegard is made of steel strips which, when placed on edge, form a regular pattern or mesh. The accompanying illustration shows the method of assembling Pavegard. The tie-rods hold the strips together in a solid web or mesh, strips being alternately staggered at joints to preserve the continuity of the mat. In the Chicago installation, Pavegard has a 3-in. mesh, the bars being 1¼ in. deep. This was assembled on a concrete base, to which was added a binder of tar and gravel. The Pavegard was then asphalted in with topping and rolled, as is customary with this kind of pavement. Pavegard, which is manufactured by the Blaw-Knox Co., Pittsburgh, is characterized as a "steel armoring" for roads, streets and other lanes of traffic subjected to unusual wear.

Ingot Production in July Declined 4.7 Per Cent from the Record-Breaking Daily Rate of May. The trend line shows a normal growth of about 1,013,000 tons a year. Prices in July were 3 per cent better than at midyear of 1928



Largest July in Steel Ingot Production

Output Slightly More Than Previous Six Months Average—Year So Far 18 Per Cent Ahead of 1928

PRODUCTION of steel ingots in July declined from that of June, but it was the largest for any July. It was slightly ahead of the average of the preceding six months. It brought the year to date 18.2 per cent above the corresponding seven months of 1928.

At 4,838,093 gross tons for all companies, the decline from June was 43,277 tons, or less than 1 per cent. On a daily rate basis at 186,080 tons, the July rate was 9222 tons, or 4.7 per cent, under the record high of May. Output of July, 1928, the previous high July, was 3,805,598 tons, or more than 1,000,000 tons below July, 1929.

Open-hearth production in July fell off 1.7 per cent from that of June. Bessemer output, however, increased 4.4 per cent over June, but is still under May. However, in both May and July, the Bessemer output was 14.2 per cent of the total reported.

These data relate to open-hearth and Bessemer ingots only, because electric and crucible steel ingots are not now reported monthly by the institute. In 1928 ingots of these two types of steel amounted to 460,208 tons. This figures out to an average of about 1480 tons a day. Some such total would have to be added to each of the recent daily averages to obtain the total quantity of steel ingots made by American furnaces.

Particulars for the past 19 months are shown in the table. The diagram traces the course of ingot production and finished steel prices over the past eight years and seven months.

PRODUCTION OF OPEN-HEARTH AND BESSEMER STEEL INGOTS
(GROSS TONS)

1928 Months	Reported by Companies Which Made 94.51 Per Cent of the Steel Ingots in 1928		Calculated Monthly Output All Companies	No. of Working Days	Approximate Daily Output All Companies

Iron and Steel Employment Rose in June

WASHINGTON, Aug. 13.—While employment in manufacturing industries in June declined 0.4 per cent and the payroll totals fell off 1.9 per cent as compared with May, employment in 206 iron and steel establishments rose to 286,815 from 286,103, a gain of 0.2 per cent while the weekly payroll declined 1.8 per cent to $9,415,266, from $9,590,202, according to the Bureau of Labor Statistics, Department of Labor. With the monthly average for 1926 equaling 100, the bureau's weighted index of employment in manufacturing industries for June, 1929, was 98.8 as compared with 99.2 for May and 93.1 for June, 1928. The weighted index of payroll totals for June of the present year was 102.8 as compared with 104.8 for May and 94.2 for June of last year.

Iron and Steel Markets

Steel Output Continues to Taper

Production Shows Further Slight Decline as Mill Backlogs Undergo Seasonal Reduction—Alabama Pig Iron Sold at $12.50

SEASONAL curtailment is making itself felt in the steel industry, but thus far the chief effects have been a decline in backlogs and a shortening of deliveries. Production has shown little reduction and the downward trend is not marked.

With the two largest steel producers still operating at close to rated ingot capacity, most of the loss in output is accounted for by other mills. In the Greater Pittsburgh district the total falling off since the first of the month is estimated at 5 per cent, and similar recessions are reported in some other centers. Chicago, on the other hand, reflecting an unusual demand for plates for pipe manufacture, continues to produce steel at a capacity rate.

The return to hand-to-mouth buying, heretofore mainly evident in lighter rolled products, is being more widely felt. At Pittsburgh, deliveries on shapes and bars can now be made in two or three weeks. This change is not necessarily of great significance. The experience of the industry in recent years is ample proof that a high rate of output can be maintained without heavy forward obligations. Undoubtedly the vacation season, now at its height, is also a factor in delaying purchasing programs.

The growth of miscellaneous uses for mill products has made it more difficult to gage the trend of steel consumption. At the same time the wide diversification of demand makes for a more even flow of business, with increased consumption in some directions tending to neutralize declines in others.

Among new outlets for steel the most outstanding in its stabilizing influence is the manufacture of pipe for gas and oil lines. This factor has been most important at Chicago, where steel bookings for the week were the sixth largest so far this year.

While the sharply reduced requirements of the automobile industry, the largest single consuming group, are not to be overlooked, Cleveland reports an upturn in specifications from a number of motor car makers who are bringing out new models. Whether this can be taken as an augury of general recovery in automotive demand is uncertain, in view of the large stocks of used cars reported in dealers' hands.

Railroads placed 75 per cent of the fabricated steel work awarded during the week, which totaled 43,000 tons. Outstanding transactions were 14,500 tons for two Pennsylvania Railroad bridges across the Hackensack River in New Jersey and 9400 tons for a New York subway section. Fresh inquiries call for 42,000 tons, of which 16,000 tons is for railroad and highway bridges.

The railroad equipment market is also more active, with new inquiries out for 1300 freight cars.

Rail production, now at 75 per cent at Chicago—an unusually high rate for August—will shortly undergo a seasonal reduction, which, however, is expected to be the last downward revision of schedules before the fall buying movement sets in. Seasonal curtailment in tin plate output is also looked for.

Aside from the more general prevalence of $2.40, Pittsburgh or Cleveland, on plain wire, steel prices have undergone no further change. The sharp gain in profits that has accompanied peak production is recognized, however, as a temptation to press for tonnage to the detriment of price stability.

Pig iron demand has improved at St. Louis, with buying of 25,000 tons of basic grade, and in the New York district, with sales of 22,000 tons. Foundry melt is well sustained except in the South, where the reduced operations of cast iron pipe makers are a factor, and in the Central West, where the declining requirements of the automotive industry are felt. Shipments from some northern Ohio blast furnaces are running 15 to 20 per cent under those of July.

Aggressive selling of Alabama iron has further accentuated competition in Northern markets. Southern foundry iron is now being freely quoted at $13, Birmingham, for deliveries in the Chicago district, and that price has been shaded 50c. a ton in one large transaction. The attention of Southern producers has also been turned to Europe, following the receipt of inquiries for pig iron for shipment to Italy.

Heavy melting scrap at Pittsburgh has advanced 50c. a ton on a large sale to a consumer. In face of this evidence of strength, shipments have been held up by two users and rejections are more frequent.

Steel ingot production in July, at 4,838,093 tons, was a record for that month, exceeding the previous July peak, last year, by more than 1,000,000 tons. The daily rate for July, at 186,080 tons, represented a decline of 4.7 per cent from the record rate of May, but was slightly higher than the average for the preceding six months. Output for the first seven months of the year was 18 per cent larger than for the corresponding period in 1928.

THE IRON AGE composite price for finished steel declined to 2.398c. a lb., from 2.412c., the figure at which it has held since March. The pig iron composite remains for the second week at $18.42 a gross ton.

A Comparison of Prices

Market Prices at Date, and One Week, One Month and One Year Previous, Advances Over Past Week in Heavy Type, Declines in Italics

Pittsburgh

Notable Activity in Plates, Sheets and Cold-Rolled Strip —Advances in Scrap

PITTSBURGH, Aug. 13.—Steel operations in this and nearby districts have not declined materially in the last week and the total falling off since the first of the month probably does not amount to 5 per cent. As the industry entered August running at an average of about 95 per cent of capacity, such a decline amounts to very little when applied to aggregate production of steel. However, the tendency toward curtailment is continuing and there is no longer any doubt of the fact that the long delayed period of summer retrenchment is beginning. It is equally true that the curtailment is much less pronounced than usual and that the steel industry is in a much more prosperous condition than it ordinarily is at this time of the year.

The volume of specifications so far this month seems to be less than July, although notable exceptions are plates, sheets and cold-rolled strip. The leading sheet maker has received shipping orders in August at a higher rate than during July and one or two leading independents report similar activity. Other companies have felt the slump in automotive demand more severely and the Ford Motor Co. is the only one of the larger motor car builders which has not reduced its steel requirements. One or two important automobile makers are now getting into production on new models, but the steel industry as a whole is not feeling any appreciable increase in the requirements of this important consuming channel. The notable thing about steel demand at this time is its wide diversification and sustained strength in the face of declining requirements by the largest consuming industry.

Sheet mills in the district have at least a month's operations scheduled and the same is now true of cold-rolled strip, for which demand seems to have improved in the last two weeks. This has resulted in stronger prices and the market is again quotable at 2.75c. to 2.85c., Pittsburgh. Sheet prices are not quotably weaker, and although the market is still soft, some makers are taking a firmer stand on prices. Wire nails are weak, but in this district this softness has not extended to wire products. In other lines prices are holding at the quoted levels.

Sales of billets, slabs and sheet bars have been made at $35, Pittsburgh, and although mills have contract business on their books at lower figures for billets and slabs, the market on spot tonnages is not less than $35.

The pig iron market is dull, sales being confined almost entirely to small tonnages for immediate shipments. Contract shipments are not so heavy as they were in July and some stacks are beginning to build up stocks again.

The scrap market has developed added strength in the last week, a large tonnage of No. 1 heavy melting steel having been sold at $19.50. This is an advance of 50c. a ton over recent levels and strength is also reflected in other grades of scrap.

Pig Iron.—Buying is at a standstill with the exception of small tonnages, usually required for immediate shipment. A few lots of basic iron have been sold since the first of the month,

but no purchases of more than 1000 tons have been reported. Large users of basic iron have sufficient tonnage on contract to last them for several weeks, and fill-in orders are few and far between. Shipments are keeping up fairly well but are not as heavy as they were last month. The dullness of the market is beginning to be reflected in growing furnace stocks, and in no case are local or Valley stacks building up their backlogs. Howeyer, it seems fairly certain that large tonnages of iron will be placed in September for delivery during the closing months of the year, particularly if foundry activity is accelerated by that time. The price situation is the brightest spot in the market, with all quotations apparently holding. Basic and foundry iron are being sold regularly in small lots at $18.50, Valley, and malleable and Bessemer are unchanged at $19. The local Pittsburgh furnace is quoting prices 50c. above these levels.

Prices per gross ton, f.o.b. Valley furnace:

Basic	$18.50
Bessemer	19.00
Gray forge	18.00
No. 2 foundry	18.50
No. 3 foundry	18.00
Malleable	19.00
Low phos., copper free	27.00

Freight rate to Pittsburgh or Cleveland district, $1.76.

Prices per gross ton, f.o.b. Pittsburgh district furnace:

Basic	$19.00
No. 2 foundry	19.00
No. 3 foundry	18.50
Malleable	19.50

Freight rates to points in Pittsburgh district range from 63c. to $1.13.

Semi-Finished Steel.—Production of crude steel has not declined very much in this district, but the requirements of non-integrated finishing mills are not as large as they were, and larger companies are having their first opportunity in several months to build up their reserves of this material. It is probable that open-hearth production will not fall far below recent levels during August, as the taking out of a few furnaces by the smaller companies does not seriously affect the total output of the district, particularly when this output is at such high levels. Spot sales of semi-finished steel are not frequent, but the larger consumers are getting steel regularly on contract, in some cases at the same prices which prevailed during the second quarter. However, the $35, Pittsburgh or Youngstown, quotation seems to be holding on current small tonnages and if there have been contract renewals on billets and slabs at a lower figure the transactions have been made very quietly. On sheet bars the contract price was not changed, having remained at $35. Shipments of wire rods are holding up fairly well, although a few consumers who make products going largely to the automotive industry are not quite so active. The price is well established at $42, Pittsburgh or Cleveland.

Bars, Shapes and Plates.—The heavy hot-rolled products are still accounting for the high production schedules in many mills, but shipping orders on bars and shapes have declined to a point where an improvement in business will soon be necessary if this condition is to be continued. Most mills can make deliveries on bars and shapes in two or three weeks. Demand for bars is rather well diversified and the requirements of cold-finishing departments show no further curtailment. Structural awards in the district are not heavy, but a fair amount of bridge work is being placed from time to time and 1300 tons of steel was recently taken for an addition to the United States Aluminum plant at New Kensington, Pa. Considerable prospective work, which has not reached the stage of definite inquiry, is before the trade, and with the large fabricating shops in the district operating at a high rate, the outlook is generally favorable. Plate business is still exceeding all expectations and current shipping orders allow mills little opportunity to improve on deliveries. However, consumers are more farsighted than they were earlier in the year in making known their requirements and the pressure for deliveries is abating to some extent. Prices seem to be holding on the general run of business, the quotation on bars, shapes and plates being 1.95c., Pittsburgh.

Rails and Track Supplies.—The market is now without sizable inquiries, although the New York, New Haven & Hartford has not fully closed against its recent inquiry for accessories. Specifications are gradually tapering off, but supplementary purchases are being made from time to time and the market is not entirely devoid of activity. Prices are generally satisfactory, although the $36, Pittsburgh, price on light rails from billets is occasionally being shaded $2 a ton to meet the competition of the rerolled product.

Bolts, Nuts and Rivets.—Demand is keeping up unusually well for this time of the year and the industry is probably operating at about 60 per cent of capacity. Railroad car builders in the district are still taking large tonnages, although the railroads themselves have become less active as buyers. Demand from the jobbing industry is keeping up. Prices are well established at 70 per cent off list for bolts and nuts and $3.10 per 100 lb., Pittsburgh, for large rivets.

Wire Products. — Shipments of manufacturers wire show little if any decline from July levels and are considerably ahead of the usual average for this time of the year. Present specifications indicate little curtailment in the near future. On plain wire for manufacturing purposes prices are holding at 2.50c. to 2.60c., Pittsburgh. Reports of shading these quotations on wire for jobbers are not confirmed in this district. The nail market is unchanged, with prices weak and demand quiet. On the general run of business the ruling quotations range from $2.55 to $2.65 per keg.

Tubular Goods.—Lap-weld mills in this and the Valley district are now fairly well scheduled for several weeks and the position of seamless units is even better. No large pipe line awards have been reported during the last week, but the largest of these projects, a line running into Chicago from the Texas Panhandle, is expected to be placed this month. Other large prospective jobs seem to be in a rather indefinite state. Specifications for mechanical tubing have

	Rounds and squares	0.50
	Chromium Nickel Vanadium	1.50
	Carbon Vanadium	0.95

Above prices are for hot rolled steel bars, forging quality. The ordinary differential for cold-drawn bars is ¾c. per lb. higher. For billets 4 x 4 to 10 x 10 in., the price for a gross ton is the net price for bars of the same analysis.

Billets under 4 x 4 in. carry the steel bar base. Slabs with a sectional area of 16 in. or over carry the billet price. Slabs with sectional area of less than 16 in. or less than 2½ in. thick, regardless of sectional area, take the bar price.

Rails

	Per Gross Ton
Standard, f.o.b. mill	$43.00
Light (from billets), f.o.b. mill	36.00
Light (from rail steel), f.o.b. mill	34.00
Light (from billets), f.o.b. Ch'go mill	36.00

Track Equipment

	Base per 100 Lb.
Spikes, ⅝ in. and larger	$2.80
Spikes, ½ in. and smaller	2.80
Spikes, boat and barge	3.00
Tie plate, steel	2.15
Angle bars	$2.75
Track bolts, to steam railroads	$3.80 to 4.00
Track bolts, to jobbers, all sizes, per 100 count	70 per cent off list

Welded Pipe

Base Discounts, f.o.b. Pittsburgh District and Lorain, Ohio, Mills

Butt Weld

2	53	42½	½	29	13
2½ to 4	57	46½	2½ to 4	34	20
4½ to 6	56	45½	4½ to 6	33	19
7 to 8	52	39½	7 and 8	31	17
9 and 10	45	32½	9 to 12	21	8
11 and 12	44	31½			

On carloads the above discounts on steel pipe are increased on block by one point, with supplementary discount of 5%, and on galvanized by 1½ points, with supplementary discount of 5%. On iron pipe, both black and galvanized, the above discounts are increased to jobbers by one point with supplementary discounts of 5 and 2½%.

Note.—Chicago district mills have a base two points less than the above discounts. Chicago delivered base is 2½ points less. Freight is figured from Pittsburgh, Lorain, Ohio, and Chicago district mills, the billing being from the point producing the lowest price to destination.

Boiler Tubes

Base Discounts, f.o.b. Pittsburgh

Steel		Charcoal Iron	
2 in. and 2¼ in.	40	1½ in.	1
2½ in.—2¾ in.	48	1¾ in.	8
3 in.	54	2 in.—2¼ in.	13
3¼ in.—3¾ in.	56	2½ in.—2¾ in.	16
4 in.	59	3 in.	17
4½ in. to 6 in.	48	3¼ in. to 3½ in.	18
		4 in.	20
		4½ in.	21

On lots of a carload or more, the above base discounts are subject to a preferential of two fives on steel and of 10 per cent on charcoal iron tubes. Smaller quantities are subject to the following modifications from the base discounts:

Lap Welded Steel—Under 10,000 lb., 6 points under base and one five; 10,000 lb. to carload, 4 points under base and two fives. Charcoal Iron—Under 10,000 lb., 2 points under base; 10,000 lb. to carload, base and one five.

Standard Commercial Seamless Boiler Tubes

Cold Drawn

1 in.	63	3 in.	48
1¼ to 1½ in.	55	3½ to 3½ in.	50
1¾ in.	39	4 in.	53
2 to 2¼ in.	34	4½, 5 and 6 in.	42
2½ to 2¾ in.	42		

Hot Rolled

2 and 2¼ in.	40	3¼ to 3½ in.	56
2½ and 2¾ in.	48	4 in.	59
3 in.	54	4½, 5 and 6 in.	48

Beyond the above base discounts a preferential discount of 5 per cent is allowed on carload lots. On less than carloads to 10,000 lb., base discounts are reduced 4 points with 5 per cent preferential; on less than 10,000 lb., base discounts are reduced 6 points, with no preferential. No extra for lengths up to and including 24 ft. Sizes smaller than 1 in. and lighter than standard gage take mechanical tube list and discounts. Intermediate sizes and gages not listed take price of next larger outside diameter and heavier gage.

Seamless Mechanical Tubing

	Per Cent Off List
Carbon, 0.10% to 0.30%, base (carloads)	55
Carbon, 0.30% to 0.40%, base	50

Plus differentials for lengths over 18 ft. and for commercial exact lengths. Warehouse discounts on small lots are less than the above.

fallen off slightly in recent weeks on account of a lighter demand from the automobile industry. Boiler tubes are moving steadily.

Sheets.—Reports of current sheet demand are mixed. While at least one large producer has had shipping orders thus far in August slightly ahead of the daily average during July, a number of others report declines in specifications. The Ford Motor Co. seems to be the only large automobile maker which has not reduced its requirements in recent weeks, although one or two large interests are now getting into production on new models. However, demand is diversified and mills generally have sufficiently large backlogs on most of the finishes to assure a high rate of production for a month or more. On the blue annealed product delivery promises are extended for six or eight weeks. Some makers of automobile body sheets have caught up on their commitments and are able to make comparatively prompt shipments. The leading interest is operating its sheet mills at about 96 per cent of capacity and the larger independents average from 90 to 95 per cent. Prices have not achieved stability, but the tendency toward weakness is not so pronounced as it was two or three weeks ago. The galvanized product is quotable at 3.50c. to 3.60c., Pittsburgh, and black at 2.85c. Lower figures are reported occasionally, but are not common enough to be representative of the market. Light plates are unchanged at 2.10c. to 2.20c., the lower figure representing the competition of wide strip mills which are occasionally making even lower quotations. No deviations from the 2.35c., Pittsburgh, price on blue annealed sheets, No. 13 gage, are reported in this district. Tin mill black plate is still quotable at 2.90c. to 3c., Pittsburgh.

Tin Plate.—The market is exceedingly quiet, but week to week business is still sufficient to justify a high rate of operation. The leading interest is running its mills at about 86 per cent of capacity and at least two of the larger independents are at a somewhat higher rate. However, future prospects are not particularly good and the decline in container manufacturers' requirements which is to be expected at this time of the year will hardly be delayed much longer. Crop reports are mixed and tin plate makers are wondering whether the somewhat exaggerated estimates made by the canning companies on some crops will be offset by improvement in other lines.

Strip Steel.—Hot-rolled strip mills are in need of business and the light demand of recent weeks is beginning to be reflected in decreased operations. Specifications continue to decline and expected improvement from the automobile industry has not yet made itself felt. On the cold-rolled product, however, demand is considerably better and shows indications of continued improvement. Some makers have their mills scheduled for several weeks at close to capacity and shipments are more extended than they were a month ago. Cold-rolled strip prices are also continuing the recent tendency toward firmness. The market is again quotable at 2.75c. to 2.85c., Pittsburgh, as mills are again taking small tonnages at the higher price. On hot-rolled recent quotations are holding.

Cold-Finished Steel Bars.—This market is rather quiet, but demand is keeping up fairly well. Shipments can be made in about two weeks, with longer periods occasionally required for special sizes. With the exception of the automobile industry, there has been little decline in the requirements of the more important consuming lines and stocks of jobbers as well as makers are low. The price is holding at 2.30c., Pittsburgh.

Coal and Coke.—Production of furnace coke in the Connellsville district has declined slightly during the last week and the number of ovens in operation has dropped under the 3000 mark for the first time since early summer. Steel companies which were forced to supplement their own coke production by purchases in the open market at the time of heavy spring and early summer activity are now holding up shipments and further curtailment in the Connellsville region will probably be necessary to adjust supply to demand. Prices are holding at $2.75 to $2.85 per ton, Connellsville, with quotations 10c. to 15c higher asked for future delivery. The foundry coke market is dull with little buying and reduced shipments. Prices are soft on all except the premium grades which are firm at $4.85, ovens. Coal production is slightly higher in the West Virginia and Kentucky fields, and to a lesser extent in Ohio and western Pennsylvania. Prices are still badly demoralized.

Warehouse Prices, f.o.b. Pittsburgh

	Base per Lb.
Plates	3.00c.

Wire, galv. soft, base per 100 lb.	3.00 to 3.10
Common wire nails, per keg	2.90 to 3.00
Cement coated nails, per keg	3.05

Old Material.—The scrap market has justified the strength of recent weeks, and No. 1 heavy melting steel is now quotable at $19 to $19.50 on the basis of a sale of several thousand tons to a Pittsburgh district consumer at the latter quotation. Hydraulic compressed sheets are also slightly stronger, small sales having been made at $18.60 to $18.75, representing an advance of 25c. over recent levels. This material is exceptionally scarce just now. The strength of the heavy melting steel market is also reflected in the high prices reported on the recent railroad lists, as a Youngstown dealer is said to have paid $19.75 for the Baltimore & Ohio list to be shipped to a consumer in a nearby district. The Pennsylvania list apparently did not bring quite this much, but went at a figure which fully justifies the strength of the market. Good steel is apparently very hard to pick up in this district, and with most mills demanding the highest quality product, railroad steel is practically governing present market prices. Other grades of steel are also stronger. Short shoveling steel turnings have been sold at $14 and perhaps higher, and machine shop turnings have advanced 50c. to a range of $13 to $13.50. Similar advances have been made in rails and also in specialties. In spite of the strength of the market, a number of bearish factors are at work. Holdups are in effect at at least two points and rejections are more frequent, particularly on grades of scrap which have been advancing most rapidly in the last few weeks. A number of large consumers are not buying, and the market is sustained by the high prices paid by two or three mills which are operating at capacity and requiring heavy shipments of scrap.

Prices per gross ton delivered consumers' yards in Pittsburgh and points taking the Pittsburgh district freight rate:

Basic Open-Hearth Grades:	
No. 1 heavy melting steel	$19.00 to $19.50
No. 2 heavy melting steel	16.50 to 17.00
Scrap rails	18.50 to 19.00
Compressed sheet steel	18.50 to 18.75
Bundled sheets, sides and ends	17.00 to 17.50

Milled studs	70

Chicago

Specifications and Shipments in Balance—Plate Business, Partly for Pipe, Notably Heavy

CHICAGO, Aug. 13.—New orders for plates have again come to the fore to bring total sales of finished steel for the week to the sixth largest so far this year. Purchases of other steel commodities were also in good volume, this being especially true of bars. Pipe making accounts for the bulk of the plate tonnage, which is coming at an opportune time—midway between the third and fourth quarters.

Current specifications are fully equal to shipments and steel mill output remains at capacity. Mill stocks of cold iron are unusually small and scrap is playing an important role in ingot production.

Chicago rail mills will adjust schedules downward in the next ten days. Orders at hand, however, will sustain the then current operations until such time as producers can reasonably expect additional business for immediate rolling.

The Northern Pacific has ordered 300 flat cars and the Central of Georgia will buy 500 box cars. Evidence is stronger that additional purchases are to be made in the early fall.

Agricultural implement manufacturers are holding to a steady pace in production and they look forward with confidence, anticipating that high prices for farm products will sustain the farmers' buying power.

Little can be said of the structural market other than it is proving more active than had been anticipated by the trade. Current lettings are in fair volume, affording shops steady operations but no opportunity to build satisfying backlogs.

The iron and steel price structure is unaltered from a week ago. Quotations on the heavy tonnage commodities are steady while less certainty can be given to prices for wire and sheet mill products. Deliveries are improving, not so much on the score of lighter specifications but on account of the greater ease with which semi-finished steel can be allotted to finishing departments. With the change in this situation, local mills are again taking interest in small and miscellaneous tonnages, often fitting them into current rollings and so giving prompt deliveries.

Ferroalloys. — Shipments of these commodities remain in good volume but new buying is dull. Spiegeleisen is quoted $32 to $34 a ton, Hazard, Pa., and ferromanganese at $105 a ton, seaboard.

Prices delivered Chicago: 80 per cent ferromanganese, $112.56; 50 per cent ferrosilicon, $83.50 to $88.50; spiegeleisen, 19 to 21 per cent, $40.76.

Pig Iron. — Chicago prices for Northern foundry iron are firm at $20 a ton, local furnaces. New buying is in good volume, as melters continue to seek tonnages for delivery over the remainder of the year. A user in South Bend, Ind., will buy 1500 tons. Shipments are running a shade higher than in July. Relining of an Iroquois furnace has been set back and it is estimated now that this stack cannot be blown in before Sept. 1. Unexpected repairs have become necessary to the Federal furnace A and it was taken out of service Aug. 13 to be out until the first of the month. Merchant furnaces now in blast include two Iroquois, one Federal and Zenith stack at Duluth. The silvery market is quiet, as is also the charcoal iron market. Prices for Southern iron are weak.

Prices per gross ton at Chicago:

N'th'n No. 2 fdy., sil. 1.75 to 2.25	$20.00
N'th'n No. 1 fdy., sil. 2.25 to 2.75	20.50
Malleable, not over 2.25 sil.	20.00
High phosphorus	20.00
Lake Super. charcoal, sil. 1.50	27.04
So'th'n No. 2 fdy. (all rail)	$19.01 to 20.01
Low phos., sil. 1 to 2, copper free	29.50
Silvery, sil. 8 per cent	29.79
Bess. ferrosilicon, 14-15 per cent	46.29

Prices are delivered consumers' yards except on Northern foundry, high phosphorus and malleable, which are f.o.b. local furnace, not including an average switching charge of 61c. per gross ton.

Structural Material. — Awards for the week total close to 5000 tons and fresh inquiry more than makes up the tonnage withdrawn from the pending lists. The Chicago, Milwaukee, St. Paul & Pacific has ordered 2000 tons for new car shops at Milwaukee and 1200 tons for grade elimination work. J. B. French & Co. has the general contract for a 31-story garage for Chicago and about 3000 tons of steel will be needed for a power-house at Powerton, Ill. On the whole, structural shops are operating not far from a normal summer rate. Their backlogs are not large but the inflow of new business is ample to hold output at a steady rate. Shops have had little opportunity to build up stocks of steel and are dependent on mill deliveries for their needs.

Mill prices on plain material, per lb.: 2.05c. base, Chicago.

Bars. — Current specifications for mild steel bars are fully equal to shipments and local mills continue to produce at capacity. Demand from automobile and parts makers is steady, with some indication, according to the local trade, that improvement is not far in the future. Price reductions in some lines of automobiles are stimulating sales. On the other hand, some dealers find sales slow and the used car problem a serious one. Agricultural implement manufacturers hold to a steady rate of output and look forward to the future with confidence. There is a general feeling that notwithstanding small crops the higher prices obtained for them will sustain the farmers' buying power and assure an active fall demand for farm machinery. The alloy steel bar market shows little change from a week ago. Spot buying is in fair size and specifications are in such volume that deliveries still range three to four weeks. There is a substantial demand for iron bars, part of which is no doubt brought about by the delivery situation in mild steel bars, these being two products which can be interchanged in many instances. Specifications for rail steel bars are a shade above shipments and deliveries range three to four weeks. The bed industry holds to a high rate of output and barn equipment manufacturers are enjoying a good mid-summer business. Interest in fence posts foretells the end of the summer lull in demand for this commodity.

Wire Products.—New orders for wire and nails are larger at the new levels of prices. August shipments continue to average larger than a year ago and wire mills are holding to a production rate of 65 per cent of capacity. Output still overbalances shipments, affording producers an excellent opportunity to round out stocks which they believe will be needed for the fall trade. Automobile manufacturers are taking steady quantities of wire. Jobbers from most parts of the country report a good summer demand except for woven wire fencing and steel posts.

Cold-Rolled Strip. — Specifications are in smaller total volume and barely support output at the new rate of 65 per cent of capacity. Producers' backlogs are large but the consumption of cold-rolled strips is undergoing a gradual decline. Prices are steady at 2.75c. to 2.85c. a lb., Cleveland, or 3.05c. to 3.15c. a lb., delivered Chicago.

Rails and Track Supplies.—Local rail mills, now producing at 75 per cent of capacity, will revise their schedules downward in the next ten days, but it is expected that this will be the last reduction necessary before fall purchases. There is some promise that a substantial tonnage will soon be bought for delivery this year. The Northern Pacific, which is in need of 15,000 tons, has not yet made definite inquiry. The light rail market is inactive. New purchases and fresh inquiry for track fastenings are the lowest in many weeks.

Prices f.o.b. mill, per gross ton: Standard section open-hearth and Bess. rails, $43; light rails, rolled from billets, $36. *Per lb.:* Standard railroad spikes, 2.80c.; track bolts with square nuts, 3.80c.; steel tie plates, 2.15c.; angle bars, 2.75c.

Cast Iron Pipe.—This market shows some improvement from the viewpoint of a larger volume of orders from contractors. Public inquiries and lettings are few and far between, with no indication now that conditions will improve in the immediate future. Warren Township, Mich., is reported to have placed 100,000 ft. of 6 and 8-in. pipe with the American Cast Iron Pipe Co., and Castlewood, S. D., has

awarded 10,000 ft. of 4 and 6-in. pipe to the McWane Cast Iron Pipe Co. The United States pipe company has taken 90,000 ft. of 6 and 8-in. pipe for Hamilton County, Ohio, and Simmons & Co., Bloomington, Ill., are low bidders at Peoria, Ill., where 500 tons of pipe and fittings will be needed for a sewage disposal plant.

Prices per net ton, del'd Chicago: Water pipe, 6-in. and over, $45.20 to $46.20; 4-in., $49.20 to $50.20; Class A and gas pipe, $3 extra.

Sheets.—New business remains at a high level, with prices generally stable, with the exception of quotations on the galvanized commodity. Local producers expect to open fourth-quarter books in about two weeks. Light tank makers entered small specifications this week, while locker manufacturers are taking sheets in quantities which indicate capacity output. Shipments to the jobbing trade are lighter, a condition not unusual in the late summer.

Base prices per lb., deliv'd from mill in Chicago: No. 24 black sheets, 3.10c.; No. 24 galv., 3.65c. to 3.75c.; No. 10 blue ann'l'd, 2.35c. Deliv'd prices at other Western points are equal to the freight from Gary, plus the mill prices, which are 5c. per 100 lb. lower than Chicago delivered prices.

Plates.—Prospects for additional railroad car business are good. Inquiries definitely in the market call for over 20,000 tons of steel exclusive of wheels and axles. The Chicago & North Western is asking for prices on 150 tram cars and will revive an old proposition involving 1000 to 2500 freight cars. The Santa Fe will take bids on 200 underframes and, according to reports, will buy cars in the early fall. The Southern lines of the Southern Pacific are said to be near the point of asking for prices. Although car orders were large in the first half of this year, the railroads have not benefited from these purchases to the extent that they had expected. Car shops, starting with small organizations, found the labor problem a serious one. Mill deliveries through the spring and to midsummer further retarded car building programs, with the net result that deliveries from shops have been slower than anticipated. Movement of grain in the Missouri Valley States and the demand for cars for bulk loading of materials is placing a strain on the supply of box cars suitable for grain loading and on the supply of gondola type of cars. Two users of oil storage tanks have placed orders that aggregate 4000 tons. The tanks will be fabricated in Chicago shops and shipped to the West and the Southwest. Fresh inquiry is for not less than 7000 tons, on which local shops are bidding. Pending business now totals over 12,000 tons. Oil storage tank business this year has been much more uniform than it was in 1928. On the whole the demand for plates is heavy and in the aggregate sales of finished steel during the week plate tonnage looms large. Deliveries cover a wide range. Plates in some specifications cannot be had in less than nine to 12 weeks. The average on miscellaneous lots is six to eight weeks. Producers east of Chicago promise shipments in two to three weeks. More satisfactory allotment of semi-finished steel to finishing departments is enabling local mills to take odd lots and to give good deliveries when orders fit into rolling schedules.

Reinforcing Bars.—Awards during the week totaled close to 1500 tons, including 800 tons for a local office building and 450 tons for a Chicago public school. Fresh inquiries are light. The pending list still holds much promise in the way of tonnage, but on most of this business the quotations made are too low to permit satisfactory profits. Efforts to get better prices have not borne fruit. Most shops have small backlogs, and their need for business is proving an obstacle to price betterment. New contracts and fresh inquiries are given on page 442.

Bolts, Nuts and Rivets.—Railroads are again taking sizable quantities of these commodities. There is a fair demand for large rivets but specifications for light rivets are in small volume. Operations remain at 65 per cent of capacity and producers' stocks are growing.

Coke. — Shipments of by-product foundry coke continue to hold a small lead over the rate in July. Spot sales are scarce and prices are holding at $8 a net ton, local ovens.

Old Material.—The Chicago scrap market is marking time, while consumers and sellers wage a contest over the subject of prices. Brokers continue to buy at prices that are 50c. to 75c. above those obtained on the most recent sales. Some of this tonnage is going against old orders but much of it will not be on track for some time, giving scrap dealers a span of time in which they hope to build up the price structure. In view of several weeks in which brokers have consistently paid higher prices no more accurate statement can be made of the local market than that quotations are nominal. The available supply of cast iron borings is diminishing, as Michigan production moves East and output in northern Wisconsin is shipped to steel mills to the North. The Nickel Plate has closed a small list.

Prices deliv'd Chicago district consumers:

Per Gross Ton

Basic Open-Hearth Grades:	
Heavy melting steel	$15.00 to $15.50
Shoveling steel	15.00 to 15.50
Frogs, switches and guards, cut apart, and misc. rails	16.75 to 17.25
Hydraul. compressed sheets	13.50 to 14.00
Drop forge flashings	10.50 to 11.00
No. 1 busheling	13.25 to 13.75
Forg'd cast and r'l'd steel carwheels	18.75 to 19.25
Railroad tires, charg. box size	18.75 to 19.25
Railroad leaf springs cut apart	18.75 to 19.25
Acid Open-Hearth Grades:	
Steel couplers and knuckles	17.00 to 17.50
Coil springs	19.00 to 19.50
Electric Furnace Grades:	
Axle turnings	14.50 to 15.00
Low phos. punchings	16.75 to 17.25
Low phos. plates, 12 in. and under	16.75 to 17.25
Blast Furnace Grades:	
Axle turnings	10.75 to 11.25
Cast iron borings	10.25 to 10.75
Short shoveling turnings	10.25 to 10.75
Machine shop turnings	7.00 to 7.50
Rolling Mill Grades:	
Iron rails	16.00 to 16.50
Rerolling rails	17.75 to 18.25
Cupola Grades:	
Steel rails less than 3 ft.	17.75 to 18.25
Steel rails less than 2 ft.	18.25 to 18.75
Angle bars, steel	17.00 to 17.50
Cast iron carwheels	14.00 to 14.50
Malleable Grades:	
Railroad	17.00 to 17.50
Agricultural	15.50 to 16.00
Miscellaneous:	
*Relaying rails, 56 to 60 lb.	23.00 to 25.00
*Relaying rails, 65 lb. and heav.	26.00 to 31.00

Per Net Ton

Rolling Mill Grades:	
Iron angle and splice bars	15.00 to 15.50
Iron arch bars and transoms	21.00 to 21.50
Iron car axles	26.00 to 26.50
Steel car axles	17.00 to 17.50
No. 1 railroad wrought	14.00 to 14.50
No. 2 railroad wrought	13.50 to 14.00
No. 1 busheling	9.00 to 9.50
No. 2 busheling	7.00 to 7.50
Locomotive tires, smooth	14.50 to 15.00
Pipes and flues	10.00 to 10.50
Cupola Grades:	
No. 1 machinery cast	14.50 to 15.00
No. 1 railroad cast	13.75 to 14.25
No. 1 agricultural cast	13.25 to 13.75
Stove plates	12.25 to 12.75
Grate bars	11.75 to 12.25
Brake shoes	10.50 to 11.00

*Relaying rails, including angle bars to match, are quoted f.o.b. dealers' yards.

Warehouse Prices, f.o.b. Chicago

	Base per Lb.
Plates and structural shapes	3.10c.
Soft steel bars	3.00c.
Reinforc'g bars, billet steel	2.15c. to 2.35c.
Reinforc'g bars, rail steel	1.85c. to 1.95c.
Cold-fin. steel bars and shafting—	
Rounds and hexagons	3.60c.
Flats and squares	4.10c.
Bands ($\frac{1}{8}$ in. in Nos. 10 and 12 gages)	3.20c.

Cement c't'd nails, base per keg	3.20

New Blooming Mill at Cleveland

A new 32-in. reversing blooming mill will be added to the equipment of the Corrigan, McKinney Steel Co., Cleveland, to increase its semi-finished steel capacity. This will be used for the rolling of small billets. The contract for the mill, with tables and transfers, has been placed with the Mesta Machine Co., Pittsburgh. The mill will be driven by a 4000-hp. reversing motor, contract for which, together with a 3300-kw. flywheel generator set, has been placed with the General Electric Co.

New York

Pig Iron Competition Keener—Steel Bookings Continue Ahead of Those a Year Ago

NEW YORK, Aug. 13.—Pig iron demand has improved, notwithstanding the vacation season. Sales in this district during the week totaled about 14,000 tons, and in addition, considerable tonnage was bought here for delivery in other territories. Close to 7000 tons is under active inquiry. Shipments from furnaces are going forward against contracts without interruption, and melt is not only sustained, but is expected to increase. Manufacturers of radiators are running at a better rate, although still short of their operations a year ago, and other makers of heating equipment look for an increase in their production schedules before October. Both Alabama and eastern Pennsylvania producers have become more important factors in this market. Several thousand tons of Southern iron have been sold in this territory in the past fortnight. The new rate of $5.50 a ton to New York by rail and steamship through Savannah, Ga., has the advantage over the rail and barge rate via Norfolk, Va., of permitting smaller individual shipments, since free lighterage is allowed to any point in New York harbor on lots of 200 tons or over. Quotations at Birmingham range from $14 for No. 2 plain foundry to $13 for basic. Prices on eastern Pennsylvania foundry grade for delivery in this district range from $19 to $19.50, base, furnace. Buffalo foundry iron is still available at $17.50, base, furnace, with some orders bringing $18. The Crompton & Knowles Loom Works, Providence, R. I., and Worcester, Mass., has bought 1000 tons, and the Thatcher Co., Newark, N. J., has closed against its inquiry for 500 tons of foundry. The American Radiator Co. has placed about half of the 16,000 tons to be bought for its Western plants. The New York Air Brake Co. is in the market for 950 tons of foundry and malleable for its Watertown, N. Y., plant.

Prices per gross ton, delivered New York district:

Buffalo No. 2 fdy., sil. 1.75 to 2.25	$22.41 to $22.91
*Buf. No. 2, del'd east. N. J.	20.78 to 21.28
East. Pa. No. 2 fdy., sil. 1.75 to 2.25	20.39 to 21.52
East. Pa. No. 2X fdy., sil. 2.25 to 2.75	20.89 to 22.02

Freight rates: $4.91 from Buffalo, $1.39 to $2.52 from eastern Pennsylvania.

*Price delivered to New Jersey cities having rate of $3.28 a ton from Buffalo.

Fluorspar. — Foreign mines are heavily committed, but importers still have considerable gravel spar to sell and quotations as low as $18.25 a net ton, duty paid, are current.

Warehouse Business.—Buying is fair, but at the present rate August will not exceed July business totals and may be a smaller month. Structural steel business is limited to small lots and sheets are only moderately active. Prices are being maintained except for concessions of $1 to $2 a ton on black, galvanized and blue annealed sheets.

Cast Iron Pipe.—Current business in pressure pipe is limited to small lots purchased by private companies. The Middlesex Water Co., Perth Amboy, N. J., has awarded six miles of 20-in. water pipe to the Warren Foundry & Pipe Co. and the Public Works Engineering Corporation, New York, has closed on about 250 tons of 16-in., Class B water pipe for Champaign, Ill., with the National Cast Iron Pipe Co. Prices continue irregular, ranging from $31 to $33 a ton, f.o.b. northern foundry.

Prices per net ton deliv'd New York: Water pipe, 6-in. and larger, $33.60 to $34.60; 4-in. and 5-in., $36.60 to $37.60; 3-in., $43.60 to $44.60. Class A and gas pipe, $3 extra.

Finished Steel.—There has been some slowing down in buying, largely on account of the vacation season. However, bookings are considerably ahead of those in the corresponding period of 1928. Mills are running at capacity to relieve the pressure for shipments. Structural shapes are firm and unchanged at 2.29½c. delivered New York, on small lots and at 2.24½c. on the general run of business. The minimum for the largest orders is 2.19½c. Plates range from 2.22½c. to 2.32½c. Much interest continues to center in structural steel, the activities of which are being maintained at a high level. Lettings in the New York metropolitan district during July were 57,775 tons, as against 46,899 tons in June and 70,000 tons in July of last year, according to the Structural Steel Board of Trade. These figures do not include bridges, subway work and the like. The largest structural award of the week was 14,500 tons for two Pennsylvania Railroad bridges across the Hackensack River in New Jersey. Ten thousand tons for the passenger bridge went to the American Bridge Co. and 4500 tons for the freight bridge to the Phoenix Bridge Co. The McClintic-Marshall Co. will supply 9400 tons for route 106, section 6, of the New York subway. Fresh inquiries include 6000 tons for a building for the Farmers Loan & Trust Co., the general contract for which has been let to the George A. Fuller Co. No action has been taken on 20,600 tons for two subway sections in New York. Demand for sheet steel has subsided somewhat, thus allowing mills to catch up with back orders. The price situation has not altered, with galvanized selling at 3.50c., Pittsburgh, to both jobbers and consumers. The wire goods market is still weak and wire nails are quoted at from $2.50 to $2.55 a keg, Pittsburgh. Plain wire can be bought at $2.40 a 100 lb., Pittsburgh.

Mill prices per lb., deliv'd New York: Soft steel bars, 2.29c.; plates, 2.22½c.; structural shapes, 2.19½c.; bar iron, 2.14c.

Reinforcing Bars.—Igoe Brothers will furnish 600 tons of bars for a building for the Packard Motor Car

Co. at Newark, N. J. For route 106, section 6, of the New York subway, 270 tons has been awarded to the McClintic-Marshall Co., while Carroll-McCreary Co., Inc., will supply 300 tons for a building at 40 Wall Street, New York. Action is expected shortly on 500 tons for an extension of the boardwalk at Rockaway Beach, N. Y. Prices are steady and unchanged.

Billet steel reinforcing bars in 40, 50 and 60-ft. lengths, 2.05c. per lb., Pittsburgh, and 2.30c. per lb., Pittsburgh warehouse, for cut lengths. Out of New York warehouse, 2.90c. per lb. for lots of 5 tons or more, 3.05c. for lots of 2 to 5 tons and 3.30c. for less than 2 tons, all delivered at job.

Coke.—Buying is light and prices are unchanged at $2.75 per net ton, Connellsville, for standard furnace coke, and $4.85 per net ton, ovens, for special grades of beehive foundry coke. Delivered prices of foundry coke are $8.56 per net ton, delivered to northern New Jersey, Jersey City and Newark, and $9.44 to New York or Brooklyn. By-product coke is quoted at $9 to $9.40 a net ton, Newark or Jersey City, and $10.06, New York or Brooklyn.

Old Material.—Except for active buying of No. 1 and No. 2 heavy melting steel by brokers filling contracts the market is rather inactive. No. 1 heavy melting steel is quoted at $16 per ton, delivered Bethlehem, Pa.; $16.25, delivered Claymont, Del., and $16.50 delivered Coatesville, Pa. No. 2 steel is being bought at $11.75 to $12 a ton, delivered Pottsville, Pa., $13.50 a ton, delivered Harrisburg, Pa., and $14 to $14.25 a ton, delivered Conshohocken, Pa. Cast scrap continues quiet with brokers offering about $14.50 a ton, delivered to Florence, N. J., or to Harrisburg, Pa.

Dealers' buying prices per gross ton, f.o.b. New York:

No. 1 heavy melting steel	$12.75 to	$13.35
Heavy melting steel (yard)	8.00 to	9.75
No. 1 hvy. breakable cast.	10.75 to	11.75
Stove plate (steel works).	8.00 to	8.25
Locomotive grate bars....	8.25 to	8.75
Machine shop turnings....	7.75 to	8.00
Short shoveling turnings..	7.75 to	8.00
Cast borings (blast furn. or steel works).....	7.00 to	7.75
Mixed borings and turnings	6.75 to	7.75
Steel car axles.....	19.50 to	20.00
Iron car axles.....	24.00 to	25.00
Iron and steel pipe (1 in. dia., not under 2 ft. long)		10.75
Forge fire	9.75 to	10.25
No. 1 railroad wrought...	12.00 to	12.50
No. 1 yard wrought, long..	11.00 to	11.50
Rails for rolling.....	13.25 to	13.75
Cast iron carwheels.....	12.50 to	13.00
Stove plate (foundry)....	8.00 to	8.50
Malleable cast (railroad).	14.00 to	14.50
Cast borings (chemical)..	10.00 to	10.50

Prices per gross ton, deliv'd local foundries:

No. 1 machry. cast.....	$17.00
No. 1 hvy. cast (columns, bldg. materials, etc.), cupola size.....	15.00
No. 2 cast (radiators, cast boilers, etc.)	14.50

Cleveland

Steel Demand Keeps Up in Surprising Volume—Pig Iron Sales Total 15,000 Tons

CLEVELAND, Aug. 13.—While some slowing down is reported among consuming industries, steel business is holding up well for August, the volume being about the same as during July. Specifications received by a few of the mills increased somewhat during the week owing to the release of orders by some of the automobile manufacturers for steel bars, auto body sheets and hot and cold-rolled strip steel. Most automobile companies outside of the Ford Motor Co. are now operating at considerably reduced schedules, but some are planning to increase production shortly on new models. Stocks of old cars are reported to be rather large and until these are materially reduced some of the motor car manufacturers will probably go rather slowly in making new models. Automobile rim and tire manufacturers, which have continued heavy operations, are now slowing down. Some of the automobile companies have sent inquiries to stamping plants for parts for the fourth quarter.

Deliveries on steel bars, plates and shapes show little change but are improving on sheets and on strip steel. Some of the continuous strip mills need tonnage and the same is true of some of the mills making cold-rolled strip and auto body sheets.

Outside of some weakness in wire, there is little change in the price situation.

Pig Iron.—The market was quieter the past week than during the previous few weeks. Sales by Cleveland interests in foundry and malleable iron amounted to 15,000 tons. The business included many small lots for early shipment. While some foundries are buying to cover for the remainder of the year, few that already have enough iron under contract to carry them through the third quarter are as yet showing any interest in the fourth quarter. There has been quite a slowing down in shipments this month to consumers in most fields, including the automotive industry. With some furnaces the decrease has been 15 to 20 per cent, as compared with the same period in July. Steel making grades are inactive. Lake furnace prices are firm and unchanged. Cleveland furnaces quote foundry and malleable iron at $18.50 furnace for outside shipment, and $19 for local delivery. In Michigan both grades are quoted at $20 furnace.

Prices per gross ton at Cleveland:

N'th'n fdy., sil. 1.75 to 2.25		$19.50
S'th'n fdy., 1.75 to 2.25....	$20.00 to	20.50
Malleable		19.50
Ohio silvery, 8 per cent...		28.00
Basic Valley furnace.....		18.50
Stand. low phos., Valley..	26.50 to	27.00

Prices except on basic and low phosphorus are delivered Cleveland. Freight rates: 50c. from local furnaces; $3 from Jackson, Ohio; $6 from Birmingham.

Iron Ore.—One 5000-ton lot of Lake Superior ore was sold in the week and a moderate amount of small lot business is in prospect from furnaces that because of continued good operations, will need additional ore to carry them through the winter. As most of the ore is going directly to the furnaces, the amount on docks has increased but slightly since the opening of navigation. The dock balance on Aug. 1 was 4,452,100 tons, as compared with 5,385,007 tons on the same date a year ago, according to the monthly report of the Lake Superior Iron Ore Association. Receipts at Lake Erie docks during July were 7,509,408 tons, and for the season until Aug. 1, 22,438,384 tons, as compared with 15,124,977 tons for the same period last year. Shipments from Lake Erie docks during July were 5,385,652 tons, and for the season until Aug. 1 were 17,182,569 tons, as against 11,410,116 tons up to Aug. 1, last year. Receipts until Aug. 1 at other parts, including South Chicago, Gary, and Indiana Harbor, were 8,845,556 tons, as compared with 6,791,432 tons up to Aug. 1, last year.

Semi-finished Steel.—Specifications for sheet bars, billets and slabs are holding up to recent volume, being sufficient to keep the leading local producer operating at 100 per cent of capacity, with full commitment for two weeks. As consumers are covered with contracts, there is no new inquiry.

Strip Steel.—Specifications for both hot and cold-rolled strip during the past week gained with some of the mills, coming from automobile companies that are bringing out new models. Some mills need tonnage in wide hot-rolled strip but are comfortably filled with orders for narrow material, while others are caught up with deliveries on narrow strip but are well supplied with orders for wide material. Cold-rolled strip can still be bought at 2.75c., Cleveland or Pittsburgh, although several mills are now asking 2.85c. As nearly all consumers are covered with contracts, the higher price cannot apply to much business before the fourth quarter.

Bolts, Nuts and Rivets.—Specifications for bolts and nuts are fair, being about the same since Aug. 1 as during the corresponding period of July. Business in the fore part of July showed quite a gain over the same period in June. Prices are firm. There is the usual seasonal decline in the demand for large rivets. Some

Warehouse Prices, f.o.b. Cleveland

	Base per Lb.
Plates and struc. shapes.....	3.00c.
Soft steel bars.....	3.00c.

*Net base, including boxing and cutting to length.

effort is being made, but apparently without success, to secure concessions from the regular $3.10 per 100 lb. price for large rivets.

Steel Bars, Plates and Shapes.—Specifications for steel bars received by the leading local producer increased from the automobile and agricultural implement industries the past week and other mills report a fair volume of business. Deliveries can be had in two or three weeks. Structural shapes continue to move fairly well. With considerable building work pending, conditions are brighter in that field. The Maumee River bridge, Toledo, for which bids have been taken, will require 7000 tons and a bank and office building in Akron, 5000 tons. The inquiry is out for the jail courts building, Cleveland, which will take 2000 tons. The demand for plates continues active. Orders include 700 tons taken by a Cleveland mill for locomotive works. Prices are firm at 1.90c. to 1.95c., Cleveland, for steel bars and 1.95c., Pittsburgh, for plates and shapes.

Sheets.—Specifications for good sized lots of automobile sheets were placed during the week by some of the Michigan automobile companies that are bringing out new models. However, business generally is light and mills continue to reduce their backlogs. Some mills are committed for several weeks on auto body sheets and others are in need of tonnage. Mills have enough black sheet business to maintain good operations for four weeks, but some need orders for blue annealed sheets. Enameling stock continues in good demand. Prices appear well stabilized at recent quotations. Black sheets are firm at 2.85c., Pittsburgh, and galvanized sheets range from 3.50c. to 3.60c. Less is heard than recently of shading from the 2.35c. price on blue annealed.

Warehouse Business.—The volume of business is holding up well for this season. One jobber reports a gain over July and another a slight falling off. Prices are firm.

Wire Products.—Prices on wire have become irregular. Plain wire is being quoted to jobbers at 2.40c., Cleveland, and the same price is being named on manufacturing wire for delivery in the Ohio territory outside of Cleveland. The weakness in nails continues. While definite prices seem to have about disappeared, $2.50 per keg seems to represent the market.

Coke.—By-product coke for domestic use is moving in good volume at $4.50 per net ton, Ohio ovens, for egg size. Foundry coke is quiet. Ohio by-product foundry coke is unchanged at $8.25 Painesville, for August shipment. Prices on premium brands of Connellsville foundry coke are unchanged.

Old Material.—A Cleveland consumer purchased a moderate tonnage of selected heavy melting steel scrap in the week at around $17 and dealers are offering $16.75 for this grade, indicating a slightly firmer market. Unselected material is unchanged at $15.50 to $16. Machine shop turnings are firmer and cast scrap is higher. Short shoveling turnings have brought $11.75 for small lots. In the Valley district prices are easier on steel making scrap. Dealers who recently paid up to $18.50 for No. 1 heavy melting steel for Youngstown delivery are now offering only $18 for that grade and $17.50 for compressed sheet steel scrap, as compared with a recent price of $18 or higher. Blast furnace scrap is unchanged.

Prices per gross ton delivered consumers' yards:

Basic Open-Hearth Grades:	
No. 1 heavy melting steel	$15.00 to $15.50
No. 2 heavy melting steel	14.50 to 15.00
Compressed sheet steel	15.00 to 15.50
Light bundled sheet stampings	12.00 to 12.50
Drop forge flashings	13.00 to 13.25
Machine shop turnings	9.75 to 10.25
Short shoveling turnings	11.50 to 11.75
No. 1 railroad wrought	13.50 to 14.00
No. 2 railroad wrought	16.00 to 16.50
No. 1 busheling	13.25 to 13.75
Pipes and flues	9.00 to 9.50
Steel axle turnings	12.50 to 13.00
Acid Open-Hearth Grades:	
Low phos., forging crops	17.75 to 18.00
Low phos., billet, bloom and slab crops	18.50 to 18.75
Low phos., sheet bar crops	18.00 to 18.50
Low phos., plate scrap	18.00 to 18.50
Blast Furnace Grades:	
Cast iron borings	10.50 to 10.75
Mixed borings and short turnings	10.50 to 10.75
No. 2 busheling	10.50 to 10.75
Cupola Grades:	
No. 1 cast	17.50 to 18.00
Railroad grate bars	11.00 to 12.00
Stove plate	12.00 to 12.50
Rails under 3 ft	18.50 to 19.00
Miscellaneous	
Railroad malleable	18.00 to 18.50
Rails for rolling	16.25 to 16.50

Philadelphia

Plate and Shape Orders Good, But Bars and Sheets Are Quiet—Pig Iron Unchanged

PHILADELPHIA, Aug. 13.—Specifications on plate contracts continue in fair volume and shape mills are booking about the same tonnage as last month, but deliveries are no longer extended. Steel bars and black and galvanized sheets are quiet, but mills are maintaining a high rate of operation despite a considerable reduction in the unfilled tonnages on their books. Pig iron is quiet, but prices are maintained with only occasional concessions by eastern Pennsylvania furnaces, despite continued competition from Birmingham iron. Heavy melting steel prices are strong, but other grades are inactive.

Pig Iron.—Eastern Pennsylvania furnaces are making an effort to maintain foundry iron at a minimum of $21 a ton and concessions to $20.50 a ton are becoming less common, although Birmingham foundry iron is offered at $14 a ton, furnace, with a rail and water freight rate via Savannah, Ga., of $5.25 a ton, loaded on cars Philadelphia. Most foundry consumers have sufficient iron in stock or due on contracts to maintain their present schedules of production and have not yet begun to inquire for the last quarter. Basic iron is quiet since the purchase of about 18,000 tons by a Coatesville, Pa., consumer, but Birmingham furnaces are still actively seeking basic business in eastern Pennsylvania. The New York Air Brake Co., Watertown, N. Y., is inquiring for 950 tons of malleable and the General Electric Co., Schenectady, N. Y., is in the market for 500 tons of foundry iron.

Prices per gross ton at Philadelphia:

East. Pa. No. 2, 1.75 to 2.25 sil.	$21.26 to $21.76
East. Pa. No. 2X, 2.25 to 2.75 sil.	21.76 to 22.26
East. Pa. No. 1X	22.26 to 22.76
Basic (del'd east. Pa.)	19.75 to 20.25
Gray forge	20.00 to 20.50
Malleable	21.25 to 21.75
Stand. low phos. (f.o.b. N. Y. State furnace)	22.00 to 23.00
Cop. br'g low phos. (f.o.b. furnace)	23.50 to 24.00
Va. No. 2 plain, 1.75 to 2.25 sil.	24.04
Va. No. 2X, 2.25 to 2.75 sil.	24.54

Prices, except as specified otherwise, are deliv'd Philadelphia. Freight rates: 76c. to $1.64 from eastern Pennsylvania furnaces: $4.54 from Virginia furnaces.

Bars.—The lull in the automobile industry is curtailing the tonnage of bars moving to consumers, but mills still have a fair backlog of business and the price is firm at 1.95c., Pittsburgh, or 2.27c., delivered Philadelphia.

Reinforcing Bars.—A substantial tonnage is required for current small reinforced concrete projects, but not much new business has appeared recently. Billet steel bars are still quoted at 1.95c. to 2.05c. per lb., Pittsburgh, or 2.27c. to 2.37c., delivered Philadelphia, with the $5 extra for cutting to length sometimes disregarded by the distributer. Rail steel bars are quoted at 1.95c., Franklin, Pa., or Tonawanda, N. Y., or 2.27c., delivered Philadelphia, with no extra for cutting to length.

Shapes.—Although building projects have declined considerably, the tonnage of structural steel in demand continues heavy, with an unusually large volume of bridge building requirements. Two bridges for the Pennsylvania Railroad over the Hackensack River totaling 14,500 tons and about 500 tons in other small bridges for the same railroad have been awarded to eastern Pennsylvania fabricating shops. Shape prices are unchanged at 1.95c. to 2.05c., f.o.b. nearest mill to consumer, or 2.01c. to 2.11c., delivered Philadelphia.

Plates.—Mills are maintaining a good rate of operation and in some instances specifications against contracts are coming in so well that mills expect August business to be slightly larger than July, unless buying declines toward the end of the month. The price is firm at 2.05c. per lb., Coatesville, or 2.15c., delivered Philadelphia.

Sheets.—Consumers are generally covered for immediate requirements and contract specifications are light. Blue annealed sheet demand continues moderately active and prices are unchanged at 2.35c., Pittsburgh, or 2.67c., delivered Philadelphia for No. 13 gage. Light plates, blue annealed, No. 10 gage, are 2.20c. Pittsburgh, or 2.52c., delivered Philadelphia. Black sheets are quiet and the price unchanged at 2.85c., Pittsburgh, or 3.17c., delivered Philadelphia. Galvanized sheets are quoted at 3.60c., Pittsburgh, or 3.92c., delivered Philadelphia, with occasional concessions of $1 a ton on desirable business. The Pennsylvania Railroad opens bids tomorrow on 400 tons of blue annealed, 300 tons of black and 100 tons of galvanized sheets.

Imports.—In the week ended Aug. 10, a total of 1747 tons of pig iron arrived at this port, of which 1000 tons was from the United Kingdom and 747 tons from British India. Ore imports consisted of 6000 tons of manganese ore from Brazil and 122 tons of chrome ore from Portuguese Africa. Steel imports were 129 tons of structural shapes from Belgium and 26 tons from France, 50 tons of steel bars from Germany and 14 tons of steel bands and 350 tons of skelp iron from France. A total of 47 tons of steel scrap was received from the United Kingdom.

Old Material.—Most grades of cast scrap show a slight undertone of weakness, except for an advance of 25c. a ton in cast borings on the basis of a sale to an eastern Pennsylvania merchant furnace at $11.75 a ton. Heavy melting steel prices are firm and a Phoenixville, Pa., mill, which normally buys No. 2 heavy melting steel, closed last week on a small tonnage of No. 1 heavy melting steel at $17 a ton, delivered. This is the third eastern Pennsylvania consumer of No. 2 steel, which has bought a small tonnage of No. 1 grade in the past few months.

Prices per gross ton delivered consumers' yards, Philadelphia district:

No. 1 heavy melting steel	$16.50 to $17.00
Scrap T rails	16.00 to 16.50
No. 2 heavy melting steel	12.50 to 14.50
No. 1 railroad wrought	16.00 to 16.50
Bundled sheets (for steel works)	11.50
Hydraulic compressed, new	14.50 to 15.50
Hydraulic compressed, old	12.00 to 12.50
Machine shop turnings (for steel works)	11.50 to 12.00
Heavy axle turnings (or equiv.)	14.00 to 14.50
Cast borings (for steel works and roll. mill)	11.00 to 11.75
Heavy breakable cast (for steel works)	15.00
Railroad grate bars	12.00 to 12.50
Stove plate (for steel works)	12.00 to 12.50
No. 1 low phos., hvy., 0.04% and under	22.00 to 23.00
Couplers and knuckles	19.50 to 20.50
Rolled steel wheels	19.50 to 20.50
No. 1 blast f'nace scrap	10.50 to 11.00
Wrot. iron and soft steel pipes and tubes (new specific.)	15.00
Shafting	19.00 to 19.50
Steel axles	23.00 to 23.50
No. 1 forge fire	14.00
Cast iron carwheels	16.50 to 16.75
No. 1 cast	16.50 to 17.00
Cast borings (for chem. plant)	14.50
Steel rails for rolling	16.50 to 17.00

Acquires Company Making Electric-Weld Tubes

The Fretz-Moon Co., Butler, Pa., maker of electrically welded steel tubing in small sizes, has been acquired by interests identified with the Republic Iron & Steel Co., Youngstown, and Spang, Chalfant & Co., Inc., Pittsburgh. Changes in management will be made, but the company will continue to be operated as an independent unit.

Negotiating for Georgian Manganese Ore

A report from Moscow via London is that the United States Steel Corporation is negotiating to buy 80,000 to 150,000 tons of manganese ore annually for the next five years from the Georgian Manganese Trust, a semi-official Soviet organization which has controlled the property since W. A. Harriman & Co. gave up their lease. Confirmation or denial of the report could not be obtained prior to going to press.

Hudson Valley Furnace and Coke Plant Sold

Directors of Hudson Valley Coke & Products Corporation, Troy, N. Y., have recommended to stockholders the sale of the company's properties and assets to the Niagara Hudson Power Corporation, the transaction to be ratified at a special stockholders' meeting on Sept. 10. Under the terms of the sale the new owner will assume the mortgage and other indebtedness of the corporation and will pay in cash $39 for each share of Hudson Valley preferred stock outstanding and $1 for each share of common, or a total of $2,117,908 in excess of the corporation's indebtedness. Preferred stockholders are given the option of taking a cash settlement or 1⅓ shares of Niagara Hudson common stock.

The Hudson Valley Coke & Products Corporation was incorporated in New York in 1924, and two years later completed construction of a blast furnace and 55 by-product coke ovens at Troy. The corporation supplies gas under 20-yr. contracts to public utility companies furnishing all of the gas used in Albany, Schenectady, Troy and other small communities in the Albany district. The corporation has outstanding $5,000,000 of 8 per cent preferred stock and has 157,908 no par common shares outstanding of an authorized issue of 200,000 shares. It is estimated that about $7,000,000 is invested in property and plant equipment.

It is understood that the operating personnel of the Hudson Valley corporation will remain unchanged. Whether the blast furnace, which has been idle since October, 1927, will resume operations soon has not yet been determined.

Steel Corporation's July Orders Decrease

There was a decrease of 168,733 tons in the unfilled orders of the United States Steel Corporation at the end of July. This is the third successive month in which decreases have been registered. In June the decline was 47,257 tons, and in May, 123,596 tons. For five months previous to May increases were the rule. A year ago there was a decrease for July of 66,082 tons. The table gives the data for the last 19 months:

	1929	1928
Jan. 31	4,109,487	4,275,947
Feb. 28	4,144,341	4,398,189
Mar. 31	4,410,718	4,335,206
Apr. 30	4,427,763	3,872,133
May 31	4,304,167	3,416,822
June 30	4,256,910	3,637,009
July 31	4,088,177	3,570,927
Aug. 31	.....	3,624,043
Sept. 30	.....	3,698,368
Oct. 31	.....	3,751,030
Nov. 30	.....	3,673,000
Dec. 31	.....	3,976,712

Pittsburgh and Riverside Forging Merger

The Pittsburgh Forging Co., Pittsburgh, with plant at Coraopolis, Pa., maker of automobile and railroad forgings, will be merged with the Riverside Forge & Machine Co., Jackson, Mich., maker of automobile forgings, subject to the approval of stockholders of both companies. Edwin Hodge, Jr., president of the Pittsburgh company, is also president of the Riverside company, having succeeded George Wilkins, who remains as treasurer and a director of the Riverside Company.

General Bronze Co. Expands

The General Bronze Co., Pittsburgh, manufacturer of copper, bronze and brass castings, has completed installation of new machinery, including a boring mill, drill press, lathe, milling machines and grinding machine. Contract has been placed for a centrifugal molding machine. In addition, the melting capacity of the plant is being doubled by the installation of new furnaces.

Pacific Coast

Steel Business Quiet—Bids Opened on 2000 Tons of Plates for Penstock at Tacoma

SAN FRANCISCO, Aug. 10 (*By Air Mail*).—Business in iron and steel products on the Pacific Coast this week was by no means active. Reinforcing bars moved better than any other product and, while the aggregate tonnage was not especially heavy, numerous projects were placed. Plate fabricators are interested in the outcome of the opening of bids this week on 2000 tons for a penstock at Tacoma, Wash., and on 200 tons for a pipe line at Bremerton, Wash. Prices, generally, are holding well to the levels established some time ago.

Pig Iron.—Pig iron buying continues to be confined to tonnages for immediate needs, and no large sales or inquiries were reported. Quotations are unchanged.

Prices per gross ton at San Francisco:

*Utah basic	$25.00 to $26.00
*Utah fdy., sil. 2.75 to 3.25	25.00 to 26.00
**Indian fdy., sil. 2.75 to 3.25	25.00 to 26.00

*Delivered San Francisco.
**Duty paid, f.o.b. cars San Francisco.

Bars.—Outstanding among reinforcing steel bar awards this week were 600 tons for the Shell Oil Building, San Francisco, and 400 tons for a warehouse for the American Can Co., San Francisco, both placed with the Soule Steel Co. The W. S. Wetenhall Co., booked 175 tons for an abattior in the same city. Included among the new inquiries are 630 tons for a printing plant in San Francisco and 150 tons for a theater in Stockton, Cal. In the San Francisco district 2.20c. a lb., base, continues to apply on out-of-stock lots by the carload, while 2.60c., base, applies on smaller quantities. In Los Angeles, 2.30c. a lb., base, is being quoted on carload quantities and 2.70c., base, on smaller tonnages. Demand for merchant bar material is confined to small lots composed of many sizes. Mill prices on this class of steel continue firm at 2.35c., c.i.f., Coast ports.

Plates.—Bookings this week were confined to lots of less than 100 tons, and no new inquiries of importance appeared. Bids were opened on 2000 tons for a penstock and surge tank at Tacoma, Wash., and on 200 tons for a riveted steel pipe line at Bremerton, Wash. Prices appear to be firm at 2.35c., c.i.f., Coast ports.

Shapes.—Only three projects calling for over 100 tons of structural shapes were placed during the week. The largest award was 257 tons for reclamation work at Boise, Idaho. Bids open Aug. 19 on 8000 tons for the St. John's bridge at Portland, Ore. Bids were opened this week on 700 tons of sheet piling for the Alki Street sea wall, Seattle. While a number of new projects are contemplated, new inquiries all called for lots of less than 100 tons each. Plain material is firm at 2.35c. a lb., c.i.f., Coast ports.

Cast Iron Pipe.—Demand is light, as is usual at this time of the year, and only one award in excess of 100 tons was reported. The Griffith Co. secured 217 tons of 6 to 12-in. Class B pipe for the improvement of Atlantic Street, Long Beach, Cal. Bids were opened this week on 875 tons of 10 to 24-in. Class B pipe for Bremerton, Wash. Anaheim, Cal., will open bids Aug. 22 for 377 tons of 6 to 10-in. Class B pipe. On Aug. 12, San Diego, Cal., will open bids for 144 tons of 4 and 6-in. Class B pipe for the improvement of Plata Avenue and on 201 tons of 4 and 6-in. Class C pipe for the improvement of El Prado Avenue. Bids will be opened Aug. 26 for 112 tons of 4 to 8-in. Class B Pipe for the improvement of Estrelle Street, San Diego.

Coke.—Movement of coke reflects the quiet condition noted in the pig iron market, and both sales and inquiries this week involved small lots for immediate shipment.

Birmingham

Pig Iron Inquiries Received From Italy—Shipments From Furnaces Improve—Cast Pipe Backlogs Shrink

BIRMINGHAM, Aug. 13.—Furnace interests report a good volume of pig iron shipments, following gradual improvement since the first of August. More iron is moving to district foundries, as well as to outside territories, and stock will be reduced if the present rate of deliveries continues. District requirements for the third quarter are about covered. More iron is under contract now than there was at this stage in either of the two preceding quarters. Furnace interests are continuing to press for business in competitive territories, although only few orders of any consequence have been booked so far. Additional trial orders in small lots, however, are being received from time to time. Two or three inquiries have been received for iron to be shipped to Italy, but there have been no active negotiations for sales to that country. Prices for No. 2 foundry remain at $14.50 Birmingham, for the district, while in competitive territories concessions of 50c. a ton are frequently reported. Nine furnaces are on foundry, seven on basic and one on recarburizing iron.

Prices per gross ton, f.o.b. Birmingham dist. furnaces:

No. 2 fdy., 1.75 to 2.25 sil.	$14.50
No. 1 fdy., 2.25 to 2.75 sil.	15.00
Basic	14.50

Finished Steel.—Bookings in roofing sheets are declining. New business in bars, plates, shapes and railroad accessories continues at a rate unequalled for the season in this district. Though inquiries are not so heavy as they were 30 days ago, they indicate that August tonnage will be far above the average. Production of these products continues at close to 90 per cent of capacity. Barring an increase in bookings, rail mill operations will be suspended for a few weeks this fall. The usual summer lull is being felt in wire products, though it is not so marked as in preceding years. Prices are fairly steady except on galvanized sheets. New business in structural steel is slow to develop. Pending tonnage includes a few important projects to be placed within the next four weeks. The total number of active open-hearth furnaces remains at 19.

Cast Iron Pipe.—Pressure pipe manufacturers have reduced backlogs during the past two or three weeks because of a decline in new business. Operations since late July, however, have been at the highest rate of the year. Inquiries are becoming more spotty, and very little prospective tonnage developed during the week. Pending tonnage for August includes 6000 ft. of 8-in. pipe for Newton, N. C., to be let Aug. 13; 3000 ft. of 12 to 18-in. pipe for Gadsden, Ala., to be let Aug. 15, and 4 miles of 8 to 12-in. pipe for Hollywood, Fla., to be awarded Aug. 15. The base price continues at $37 to $38 a net ton, Birmingham, for 6-in. and larger pipe.

Old Material.—The improvement in demand for steel grades that began developing about two weeks ago is the only favorable feature in the dull market. Shipments of steel grades are reported slightly better than in July. Prices are unchanged.

Coke.—The movement of foundry coke continues favorable, and little surplus coke is accumulating. Foundry coke remains at $5 a net ton, Birmingham.

Prices per gross ton, deliv'd Birmingham dist. consumers' yards:

Heavy melting steel	$12.50
Scrap steel rails	12.50
Short shoveling turnings	9.00
Cast iron borings	9.00
Stove plate	$11.50 to 12.00
Steel axles	21.00
Iron axles	23.00
No. 1 railroad wrought	10.00 to 10.50
Rails for rolling	14.00 to 15.00
No. 1 cast	13.50
Tramcar wheels	13.00
Cast iron carwheels	12.50 to 13.00
Cast iron borings, chem.	13.50 to 14.00

Wagner Electric Corporation, St. Louis, has moved its Cleveland service station and branch sales office to a new building at 3756 Carnegie Avenue.

Boston

Southern Iron Selling at Low Delivered Prices—Billet Steel Reinforcing Bars Weaker

BOSTON, Aug. 13.—Because of the new rail and water rates from Birmingham and other Southern points to the New England seaboard, Southern iron is selling at unusually low delivered prices. A Cape Cod district melter has bought No 1X at $22.35 a ton, delivered; two central Massachusetts foundries have purchased No. 2X at $21.75 and another has closed at $21.15, delivered. A number of other orders are reported within the range of $21.15 and $21.75, delivered, for No. 2X. Such sales were made on a rail and water rate from Birmingham to New England seaboard of $5.75 a ton, as against the old rail and water rate of $6.91, and the all-rail rate of $9.61. The prices at furnace were $14.50 a ton, base, and less. The amount of iron sold is small, however, and because the supply at prevailing prices is reported limited, Buffalo and other Northern furnaces have not attempted to meet the Southern iron market, quoting $18 a ton, base, Buffalo, or its equivalent. One Buffalo stack, heretofore credited with making low prices, has practically withdrawn from the market for the remainder of 1929. A Worcester, Mass., textile machinery manufacturer has still to cover on 1000 tons of No. 2X and No. 1X. No other sizable inquiries are in the market.

Foundry iron prices per gross ton deliv'd to most New England points:

†Buffalo, sil. 1.75 to 2.25	$22.28 to $22.78
†Buffalo, sil. 2.25 to 2.75	22.78 to 23.28
*Buffalo, sil. 1.75 to 2.25	22.91 to 23.41
*Buffalo, sil. 2.25 to 2.75	22.91 to 23.91
East. Penn., sil. 1.75 to 2.25	22.65 to 23.15
East. Penn., sil. 2.25 to 2.75	23.15 to 23.65
Va., sil. 1.75 to 2.25	25.21
Va., sil. 2.25 to 2.75	25.71
*Ala., sil. 1.75 to 2.25	23.61
*Ala., sil. 2.25 to 2.75	24.11
†Ala., sil. 1.75 to 2.25	20.25
†Ala., sil. 2.25 to 2.75	20.75

Freight rates: $4.91 all rail from Buffalo, and $4.28 rail and water; $3.65 all rail from eastern Pennsylvania; $5.21 all rail from Virginia; $9.61 all rail from Alabama and $5.75 rail and water from Alabama to New England seaboard.
*All rail rate.
†Rail and water rate.

Imports.—Imports of pig iron at Boston in July totaled 950 tons, all from India. Receipts of ore consisted of 10,560 tons of Newfoundland and 12,700 tons of Bona, a total of 23,260 tons.

Fabricated Steel.—Most of the awards made during the week were for bridge work. With the exception of the Congress Street, Boston, bridge, requiring more than 1000 tons of steel, there is no prospective business of importance in the market. Competition among fabricators for small jobs, of which there are many, is keen and profits on such work are steadily declining.

Reinforcing Steel.—Sellers of billet steel bars are generally quoting 2.66½c. a lb., base, on lots of 100 tons and larger for shipment from stock, but buyers have succeeded in securing some concessions. Sales of the week included 250 tons for a local roundhouse for the Boston & Albany Railroad and 150 tons for a Boston & Maine Railroad roundhouse. A Boston & Maine hotel, 250 tons, and a Boston office building, 700 tons, are still pending. The rail steel bar market continues inactive, current business being in small tonnages. The open price of 2.26½c. a lb., base, delivered common Boston freight rate points, is being shaded.

Coke.—A seasonal letdown in by-product foundry coke specifications is reported; yet ovens are shipping more than they did a year ago. Prices remain at $11 a ton, delivered within a $3.10 freight-rate zone.

Old Material.—A better demand for steel turnings and forge flashings has stiffened prices, but the old material market in general appears less firm that heretofore, owing to a noticeable letdown in shipments. The decline in activity is attributed to a desire among buyers and dealers to await the outcome of the Pennsylvania Railroad scrap offerings. Because of the scarcity of desirable kinds of scrap the trade expects no serious setback in prices unless consumers should cease buying for a protracted spell.

Buying prices per gross ton, f.o.b. Boston rate shipping points:

No. 1 heavy melting steel	$12.50 to $12.75
Scrap T rails	11.50 to 12.00
Scrap girder rails	10.50 to 11.25
No. 1 railroad wrought	11.00 to 11.50
No. 1 yard wrought	9.00 to 9.50
Machine shop turnings	7.00 to 7.50
Cast iron borings (steel works and rolling mill)	6.50 to 6.60
Bundled skeleton, long	10.00 to 10.50
Forge flashings	10.50 to 10.75
Blast furnace borings and turnings	6.10 to 6.50
Forge scrap	9.00 to 9.25
Shafting	14.00 to 15.00
Steel car axles	18.00 to 19.00
Wrought pipe 1 in. in diameter (over 2 ft. long)	9.75 to 10.00
Rails for rolling	12.50 to 13.00
Cast iron borings, chemical	10.00 to 10.25
Prices per gross ton deliv'd consumers' yards:	
Textile cast	$14.50 to $15.00
No. 1 machinery cast	15.00 to 15.25
No. 2 machinery cast	13.00 to 13.25
Stove plate	11.00 to 11.50
Railroad malleable	18.50 to 19.00

Buffalo

Steel Demand Below Average of Last Three Months—Advances in Scrap

BUFFALO, Aug. 13.—Consumers continue to buy sparingly, most contracts being limited to those upon which delivery will be completed in 30 days or less. Sellers claim increased strength in prices, with the district base at $19.50 on No. 2 plain foundry and $20 on malleable. In the East, shading of these prices does not exceed $1 a ton except on the largest inquiry, on which as low as $18 furnace is available from Buffalo producers. An inquiry for 1500 tons of malleable iron was the only new lot of consequence listed this week as new inquiry. Sales during the past ten days have been confined to lots of 500 tons and less. There are 14 furnaces in blast in the district. Shipments are not absorbing entire production of merchant stacks.

Prices per gross ton, f.o.b. furnace:

No. 2 fdy., sil. 1.75 to 2.25	$19.50
No. 2X fdy., sil. 2.25 to 2.75	20.00
No. 1 fdy., sil. 2.75 to 3.25	21.00
Malleable, sil. up to 2.25	20.00
Basic	18.50
Lake Superior charcoal	27.28

Finished Material.—Demand is less vigorous than its average during the past three months. Bar sales in particular have declined to some extent, with the number and size of orders showing reductions. Reinforcing bar demand is very good, and plates are moving freely. Sales of sheets have largely held their own, although price declines in black are noted, as compared with peaks of the second quarter. Several large pipe tonnages are about to be placed in this district, while fabricators also have a good late third quarter in sight. Prices are holding within $2 of the high point of the year with shading confined largely to the most attractive lots. Warehouses have shown a slight decline in their volume of busi-

Com. wire nails, base per keg	$3.60
Black wire, base per 100 lb.	3.75

ness this month. Open-hearth operation shows a drop this week with 31 furnaces making steel and six idle. Finishing mill schedules are practically unchanged, however.

Old Material.—Small lots of No. 1 heavy melting steel have been sold to district consumers at $18. Additional tonnage is wanted by consumers, but scarcity of supplies is making dealers cautious in booking orders. Dealers offer **$14.75 for No.** 2 steel for Bethlehem. Demand for short steel rails has improved. Sales slightly above $19.50 are reported, like prices having been paid for knuckles and couplers, also coil and leaf springs. There is a much better market for machine shop turnings, which have advanced as much as $1 a ton from July quotations. Mixed borings and turnings for blast furnace use are selling freely. Stove plate deliveries are heavy, although no new contracts are noted. There is a fair market for No. 1 cast, with $16 the price offered by consumers. Dealers say not only their own stocks but those of steel works have been reduced steadily and are much below the average for periods of operation comparable to that now general throughout the Buffalo district.

Prices per gross ton, f.o.b. Buffalo consumers' plants:

Basic Open-Hearth Grades:	
No. 1 heavy melting steel	$18.50 to $19.00
No. 2 heavy melting steel	14.75 to 15.00
Scrap rails	16.50 to 17.00
Hydraul. comp. sheets	14.50 to 14.75
Hand bundled sheets	12.00 to 12.50
Drop forge flashings	14.25 to 14.50
No. 1 busheling	15.50 to 16.50
Hvy. steel axle turnings	14.00 to 14.50
Machine shop turnings	8.50 to 9.00
No. 1 railroad wrought	13.00 to 13.50
Acid Open-Hearth Grades:	
Knuckles and couplers	19.50 to 19.75
Coil and leaf springs	19.00 to 19.50
Rolled steel wheels	19.00 to 19.50
Low phos. billet and bloom ends	20.00 to 20.50
Electric Furnace Grades:	
Short shov. steel turnings	12.00 to 12.50
Blast Furnace Grades:	
Short mixed borings and turnings	11.00 to 11.50
Cast iron borings	10.50 to 11.00
No. 2 busheling	10.00 to 10.50

Agricultural	18.00 to 18.50
Special Grades:	
Chemical borings	12.50 to 13.50

St. Louis

Three Sales of Basic Pig Iron Total 25,000 Tons—Dealer-Buying Causes Further Advances in Scrap

ST. LOUIS, Aug. 13. — Three large consumers of basic pig iron came into the market last week for their requirements for the remainder of the year, and placed 25,000 tons with the St. Louis Gas & Coke Corporation. Two East Side melters bought 10,000 tons each, and an equipment builder in Illinois, 5000 tons. The Granite City producer also sold 1000 tons to a local jobbing foundry for the remainder of the year, 250 tons to an Illinois stove manufacturer for August and September delivery, 250 tons to a local engine builder and 100 tons to an Oklahoma melter for prompt shipment. Melters are still disturbed over the Southern price situation. The local producer announces it has made no change in its quoted prices, but is making concessions on high phosphorus iron where it encounters Southern competition.

Prices per gross ton at St. Louis:

No. 2 fdy., sil. 1.75 to 2.25, f.o.b. Granite City, Ill.	$20.00
Malleable, f.o.b. Granite City	20.50
N'th'n No. 2 fdy., deliv'd St. Louis	22.16
Southern No. 2 fdy., deliv'd	18.92
Northern malleable, deliv'd	22.16
Northern basic, deliv'd	22.16

Freight rates: 75c. (average) Granite City to St. Louis; $2.16 from Chicago; $4.42 from Birmingham.

Coke.—Furnace coke is moving well, but there has been a slight let-up in the demand for foundry coke. Buying of domestic coke by dealers is expected to show some activity this month.

Finished Steel.—The Granite City Steel Co. reports that all operations are virtually on a 100 per cent basis. There has been an improvement in specifications for galvanized sheets, while there has been a slight falling off in specifications for plates. The price situation generally is firm, except in the South, where concessions on galvanized sheets have been reported. Structural fabricators find business quiet, with only small tonnages being let.

Old Material.—The market is in the hands of dealers, who continue to pay advances in prices in order to stimulate shipments to cover contracts. There is said to be a considerable short interest in the trade. While consumers are pressing dealers for shipments against contracts, they are not placing much new business. No. 1 heavy melting steel is up 50c. and No. 2 grade is 25c. higher. Railroad lists: Atchison, Topeka & Santa Fe, 5883 tons; Wabash, 3060 tons; Southern Pacific, 2595 tons; Louisville & Nashville, 2270 tons; Pere Marquette, 1585 tons; Missouri-Kansas-Texas, 1500 tons; Nickel Plate, 34 carloads; Mobile & Ohio, 28 carloads; Chicago & Eastern Illinois, 18 carloads.

Dealers' buying prices per gross ton, f.o.b. St. Louis district:

No. 1 heavy melting or shoveling steel	$14.50 to $15.00
No. 2 heavy melting or shoveling steel	13.50 to 14.00
No. 1 locomotive tires	15.50 to 16.00
Miscel. stand.-sec. rails including frogs, switches and guards, cut apart	16.75 to 17.25
Railroad springs	18.50 to 19.00
Bundled sheets	10.00 to 10.50

Large Structural Projects Up for Bids—Scrap More Active

TORONTO, ONT., Aug. 13.—The undertone of the pig iron market is improving. Inquiries are more numerous and many appear to be of the kind that will soon turn into actual sales. Small-tonnage spot orders predominate, but weekly sales totals are gaining. The daily iron melt is almost at capacity. Pig iron prices are firm but unchanged.

Prices per gross ton:

Delivered Toronto	
No. 1 fdy., sil. 2.25 to 2.75	$24.60
No. 2 fdy., sil. 1.75 to 2.25	24.10
Malleable	24.60
Delivered Montreal	
No. 1 fdy., sil. 2.25 to 2.75	$26.00
No. 2 fdy., sil. 1.75 to 2.25	25.50
Malleable	26.00
Basic	24.50
Imported Iron, Montreal Warehouse	
Summerlee	$33.50
Carron	33.00

Structural Steel.—While most fabricated steel awards of the week were in lots of 1000 tons, several orders pending for early closing call for 6000 and 8000 tons. Approximately 3500 tons of steel will be required for a 12-story building to be erected at Montreal, for the Montreal Star Co. Between 5000 and 6000 tons of steel will be needed for a bridge to be erected over the St. Jacques River for the Department of Public Highways, Quebec, Que., while in addition other large tonnages are in prospect for early closing. The Halifax-Dartmouth Bridge Co., Ltd., Halifax, N. S., has been formed, and proposes to build a steel bridge across Halifax Harbor. The center span will be 960 ft. long.

Old Material.—The market is passing out of the summer slump. New inquiries and orders are reported in better volume and activity on a par with that of May and June is looked for. Consuming plants as a whole are busy and their scrap requirements are steadily expanding. Mills, however, are well taken care of to the end of this quarter, except for fill-in supplies. The demand for steel scrap is spotty in Toronto, but is holding at a good level in the Montreal district. Prices are unchanged.

Dealers' buying prices:

	Per Gross Ton	
	Toronto	Montreal

Cincinnati

Demand for Roofing Sheets Gains—Scrap Buoyant

CINCINNATI, Aug. 13.—Local sellers of pig iron are unable to report any sizable sales for the week, and furnaces, which heretofore have reported good bookings each week, received only small orders, generally for carload lots. Except for an inquiry from the Anderson Stove Co., Anderson, Ind., for 500 to 1000 tons of either Northern or Southern iron, there is no sizable tonnage before the trade.

Prices per gross ton, deliv'd Cincinnati:

So. Ohio fdy., sil. 1.75 to 2.25	$19.89 to $20.39
Ala. fdy., sil. 1.75 to 2.75	17.69 to 18.19
Ala. fdy., sil. 2.25 to 2.75	18.19 to 18.69
Tenn. fdy., sil. 1.75 to 2.25	17.69 to 18.19
S'th'n Ohio silvery, 8 per cent	26.89

Freight rates, $1.89 from Ironton and Jackson, Ohio; $3.69 from Birmingham.

Finished Material.—Increasing demand for highway and roofing sheets caused the bookings of district sheet mills to exceed production during the past week and accordingly backlogs were expanded slightly. This gain in demand, combined with the heavy specifications from manufacturers of electrical devices, metal furniture and similar products, has offset the recession in automotive demand in all lines except high-finished sheets and cold-rolled strip. In these latter two products, district mills report that prompt deliveries can be made, but that in other lines shipments are still well extended. The price situation on galvanized sheets is showing improvement and it is believed that few, if any, further concessions will be encountered. The slackening of building operations here has noticeably affected structural steel demand, and fabricators report that their market is dull.

Coke.—Specifications on by-product foundry coke are heavier. District oven representatives state that, should coke continue to be taken on contract at the present rate, the total amount moved in August will be about equal to the July tonnage, which was the largest since March. New business continues to be quiet and, except for occasional spot shipments, fresh bookings are negligible.

Old Material.—With mill production continuing at a good rate and the better grades of scrap becoming increasingly scarce, the market here is firmer than at any time within the last four months. In fact, dealers continue to bid higher for heavy melting steel and similar grades, but even more attractive prices fail to bring out sufficient material to cover commitments. This situation has reduced yard stocks noticeably and the only accumulation of scrap on hand is in the cast iron grades. Accordingly, further price increases of 25c. a ton have been made on heavy melting steel and No. 2 railroad wrought, and the spread on cast iron borings has been broadened by making the top quotation $9.75, while No. 1 machinery cast is down 25c.

Dealers' buying prices per gross ton, f.o.b. cars, Cincinnati:

Heavy melting steel	$14.00 to $14.50
Scrap rails for melting	14.00 to 14.50
Loose sheet clippings	9.00 to 9.50
Bundled sheets	11.00 to 11.50
Cast iron borings	9.25 to 9.75
Machine shop turnings	8.50 to 8.75
No. 1 busheling	10.50 to 11.00
No. 2 busheling	7.00 to 7.50
Rails for rolling	14.50 to 15.00
No. 1 locomotive tires	14.25 to 14.75
No. 2 railroad wrought	14.00 to 14.50
Short rails	18.50 to 19.00
Cast iron carwheels	12.75 to 13.25
No. 1 machinery cast	19.00 to 19.50
No. 1 railroad cast	15.25 to 15.75
Burnt cast	10.25 to 10.75
Stove plate	10.25 to 10.75

Detroit

Further Increase in Ford Production Scheduled for August —Better Steel Demand Looked For

DETROIT, Aug. 13.—The automotive industry, as usual, holds the center of the stage in this district, with the low-priced cars right in front of the footlights. The lead developed last month by the Ford Motor Co. seems to be increasing, as it is understood that the Ford company has scheduled 190,000 units for August, while the Chevrolet Motor Co. will probably not get within 50,000 units of that total.

Complete statistics on July motor car production have not yet been received, but of those companies which have made returns, about half exceeded their estimated output for the month. The manufacturers whose final figures show an increase over early estimates for July are the Hupp Motor Car Corporation, Olds Motor Work, Graham-Paige Motors Corporation, H. H. Franklin Mfg. Co. and the Chrysler Corporation.

The Packard Motor Car Co. will introduce new models at increased prices some time during the fall. These will be eight-cylinder cars.

The Auburn Automobile Co's. new

ESTIMATED AUTOMOBILE PRODUCTION FOR AUGUST
(Actual Figures for June and July Shown)

	June	July	August (Estimated)
Auburn	3,144	2,026	2,000
Buick	14,665	26,279	30,000
Chevrolet	151,297	137,831	135,000
Chrysler	42,351	27,171	32,000
Ford	177,419	175,000	190,000
Franklin	1,405	1,325	1,200
Graham-Paige	5,987	4,849	4,500
Hudson-Essex	31,737	23,707	20,000
Hupmobile	2,030	2,494	2,500
Nash	9,070	6,672	7,000
Oldsmobile and Viking	7,361	11,220	12,000

Cord model, with a price range slightly over $3,000, is now under production, with a schedule for August of 1100 units. The rate will be gradually increased to a maximum of 1500 units a month.

The table on page 441 shows the production standing for the month just passed, in comparison with that for June and the estimated production for August:

Steel commitments from the automotive plants are not coming in as fast as might be desired, but a general improvement is looked for to take care of the expected production increases for September and October. Mill prices are generally firm.

Structural steel demand in this district has been light, but apparently a change is due in the next 10 days, when a number of small and medium-sized jobs will be announced for bids. One of these is a telephone building at Benton Harbor, Mich., which will probably require 360 tons. There are also projected telephone buildings at Saginaw and Detroit which have not yet progressed far enough to permit estimates of the steel tonnage.

The market on waste material in this district continues firm but no changes in price have been registered during the past week.

Dealers' buying prices per gross ton, f.o.b. cars, Detroit:

Hvy. melting and shov. steel	$14.25 to $14.75
Borings and short turnings	9.00 to 9.50
Long turnings	8.50 to 9.00
No. 1 machinery cast	12.50 to 13.00
Automobile cast	13.00 to 13.50
Hydraul. comp. sheets	14.00 to 14.50
Stove plate	9.00 to 9.50
New No. 1 busheling	12.50 to 13.00
Old No. 1 busheling	11.00 to 11.50
Sheet clippings	8.75 to 9.25
Flashings	13.00 to 13.50

Fabricated Structural Steel

Railroad Work Will Take Almost 75 Per Cent of Total Awards of 43,000 Tons

RAILROAD work played a conspicuous part in structural steel lettings the past week, awards by carriers having accounted for close to 75 per cent of the total of 43,000 tons. Over 19,000 tons will go into the construction of highway and railroad bridges. For the first time in many weeks non-industrial projects were a comparatively minor factor in the market. Outstanding transactions were 14,500 tons for two bridges across the Hackensack River in New Jersey for the Pennsylvania Railroad and 9400 tons for a New York subway section.

Highway and railroad bridges were the largest single source of new inquiries during the week. Slightly more than 16,000 tons out of a total of 42,000 tons of fresh work will be required for that purpose. Among the jobs on which bids are being taken are 7000 tons for a highway bridge at Toledo, 6000 tons for a New York bank building and 5000 tons each for a highway bridge at Quebec and for a bank building at Akron, Ohio. Awards follow:

BOSTON, 250 tons, River Street bridge, to Boston Bridge Works, Inc.

BOSTON, 160 tons, Lamson & Hubbard Co. store, to unnamed fabricator.

BEVERLY, MASS., 200 tons, Bass River bridge, to Boston Bridge Works, Inc.

GOULD'S MILL, VT., 200 tons, bridge, Springfield Terminal Railway, to Boston Bridge Works, Inc.

CENTRAL VERMONT RAILWAY, 200 tons, bridge at White River Junction, Vt., to American Bridge Co.

BOSTON & MAINE RAILROAD, 190 tons, machine shop at Somerville, Mass., to New England Structural Co.

NEW YORK, 300 tons, building at 1418 Broadway, to Taylor-Fichter Steel Construction Co., Inc.

NEW YORK, 2000 tons, office building at Madison Avenue and Fifty-seventh Street, to Taylor-Fichter Steel Construction Co., Inc.

NEW YORK, 1500 tons, hotel at Sixty-seventh Street and Broadway, to Dreier Iron Works, Inc.

NEW YORK, 500 tons, building for Lawyers' Club at 16 Vesey Street, to Taylor-Fichter Steel Construction Co., Inc.

NEW YORK, 500 tons, 170th Regiment Armory, to Dreier Iron Works, Inc.

NEW YORK, 9400 tons, route 106, section 6, of subway, to McClintic-Marshall Co.

PENNSYLVANIA RAILROAD, 14,500 tons; bridges over Hackensack River in New Jersey; 10,000 tons for passenger bridge, to American Bridge Co.; 4500 tons for freight bridge, to Phoenix Bridge Co.

PENNSYLVANIA RAILROAD, 1100 tons, bridges; 500 tons to American Bridge Co. and 600 tons to McClintic-Marshall Co.

LEBANON, PA., 180 tons, silk mill, to Progressive Iron Works, Reading, Pa.

READING, 325 tons, building for Y. M. C. A., to Progressive Iron Works.

SEABOARD AIR LINE, 200 tons, bridge at Raleigh, N. C., to American Bridge Co.

NEW KENSINGTON, PA., 1300 tons, United States Aluminum Co., to McClintic-Marshall Co.

LANSING, MICH., 1600 tons, power house, to Whitehead & Kales.

DETROIT, 200 tons, bridge for Detroit, Toledo & Shore Line Railroad, to American Bridge Co.

ECORSE, MICH., 375 tons, bridges at Highland Park and Ecorse for Detroit, Toledo and Ironton Railroad, to American Bridge Co.

GREENFIELD, OHIO, 700 tons, bridge for Detroit, Toledo and Ironton Railroad, to American Bridge Co.

CLEVELAND, 445 tons, First Christian Science Church, to Massillon Bridge & Structural Co.

BIG FOUR RAILROAD, 1000 tons, bridge construction, to American Bridge Co.

CHICAGO, 425 tons, Swift & Co., fertilizer plant, to Rochester Bridge Co., Rochester, Ind.

CHICAGO, 100 tons, building for Pie Bakers of America, to Midland Structural Steel Co., local.

CHICAGO, MILWUKEE, ST. PAUL & PACIFIC, 3200 tons; 2000 tons for car repair shops at Milwaukee, to Worden-Allen Co.; 1200 tons for grade separation work, to American Bridge Co.

EAST ST. LOUIS, ILL., 800 tons, mill building for Laclede Steel Co., to St. Louis Structural Steel Co.

ROCKFORD, ILL., 400 tons, Rockford Drop Forge Co., to Wisconsin Bridge Co.

KENOSHA, WIS., 200 tons, Young Men's Christian Association Building, to an unnamed bidder.

NORTHERN PACIFIC, 375 tons, viaduct at Superior, Wis., to American Bridge Co.; previously reported to an unnamed bidder.

SAWTELLE, CAL., 100 tons, Soldiers' Home addition, to Brombacher Iron Works.

OLYMPIA, WASH., 100 tons, bridge over Solduc River, to Isaacson Iron Works.

BOISE, IDAHO, 257 tons, reclamation work for United States Bureau of Reclamation, to unnamed interest.

Structural Projects Pending

Inquiries for fabricated steel work include the following:

BOSTON, 600 tons, South Station.

NEW YORK, 1000 tons, building for Gordon Baking Co. in Queens.

NEW YORK, 6000 tons, Farmers Loan & Trust Co. building; general contract to George A. Fuller Co.

STATE OF NEW JERSEY, 2000 tons, bridge over Hackensack River; J. F. Chapman & Son, Hillside, N. J., low bidder on general contract.

PHILADELPHIA, 500 tons of sheet steel piling, Dorset Boulevard.

PHILADELPHIA, 1500 tons, reported as 800 last week, Henry Street Bridge.

JAMAICA, N. Y., 700 tons, garage for Nash Motors Co.

MONTREAL, 3500 tons for Montreal Star Co.

QUEBEC, 5000 tons, bridge over St. Jacques River for Department of Public Highways.

ROCHESTER, N. Y., 3500 tons, city bridge.

NILES, OHIO, 500 tons, Niles Trust Co. Building.

AKRON, OHIO, 5000 tons, bank and office building for Central Savings & Trust Co.

TOLEDO, 7000 tons, previously reported with tonnage unstated, Maumee River bridge; bids taken.

CLEVELAND, 600 tons, two grade elimination bridges for Cleveland Suburban Railway Co.

CLEVELAND, 2000 tons, jail courts building.

CLEVELAND, 200 tons, Lakewood sales and service station for Packard Motor Car Co.

CLEVELAND, 250 tons, hangar for Curtiss Aircraft Corporation.

FINDLAY, OHIO, 150 tons, building for Ohio Oil Co.

POWERTON, ILL., 3000 tons, power house; Sargent & Lundy, engineers.

CHICAGO, tonnage not stated, food products building; Burnham Brothers, Inc., architects.

CHICAGO, tonnage not stated, 31-story garage; J. B. French & Co., general contractor.

STURGEON BAY, WIS., tonnage not stated, 140-ft. lift span.

EAST ST. LOUIS, ILL., 425 tons, Curtiss Airport building.

DALLAS, TEX., 1200 tons, building for Bell Telephone Co.

PHOENIX, ARIZ., 400 tons, building for the Calumet & Arizona Mining Co.

SEATTLE, 700 tons sheet piling, sea wall on Alki Street; bids opened.

Non-Ferrous Metal Markets

Copper Demand Increasing, Tin Quiet and Steady, Zinc and Lead Firm

NEW YORK, Aug. 13.

Copper.—July statistics favorable to sellers, and expanding sales have been factors influencing a stronger copper market. In July, according to the American Bureau of Metal Statistics, there was an increase in stocks of refined copper of 14,689 tons over June and a decrease of 12,000 tons in blister copper. Thus the increase in copper above ground for the month was a little over 2500 tons. In view of the fact that only 40,200 tons was shipped abroad, as compared with 50,000 to 55,000 tons normally, this increase is considered bullish. Shipments to domestic consumers at 138,900 tons in July were about 4800 tons less than in June, while the foreign shipments last month were about 8200 tons less than in the previous month. A significant fact is that production at the mines at 2559 tons per day was nearly 200 tons per day less in July than in June and was about 600 tons per day less than the peak of 3163 tons in April, when curtailment in production was started; the July daily rate is the smallest since August last year. Sales of copper are reported as eminently satisfactory under present conditions. The total thus far to foreign consumers has been about 21,000 tons this month. Domestic sales are rapidly expanding, having been about 17,000 tons last week as compared with about 11,000 tons the week before and 4000 tons per week during the recent dull markets in the past two months. Prices continue very firm and unchanged. Electrolytic copper is quoted at 18c. delivered in the Connecticut Valley, with the official quotation of Copper Exporters, Inc., at 18.30c., c.i.f. usual European ports. There has been no change in these quotations since the middle of April. Lake copper is also firm and unchanged at 18 to 18.12½c., delivered.

Tin.—Sales of spot Straits tin for the week ended Saturday, Aug. 10, were about 1200 tons. The action of the Federal Reserve Board in increasing its rate from 5 to 6 per cent on Aug. 8 had its effect on the tin market in London, together with some sentimental influence on other metals. On the following day the London market declined and, because of this, sales in New York amounted to 600 tons. This was practically all bought by consumers, with deliveries as far ahead as March. It is believed that

THE WEEK'S PRICES. CENTS PER POUND FOR EARLY DELIVERY

	Aug. 13	Aug. 12	Aug. 10	Aug. 9	Aug. 8	Aug. 7

Sheet aluminum	14.00c.	16.00c.
Cast aluminum	12.25c.	14.25c.

consumers here are well covered for this year and that they took advantage of the lower prices to cover future requirements. London quotations have been unusually steady up to Aug. 9, due largely to the support given to the market by the so-called "group." Prices at Singapore today were £217, equivalent to about 47c., New York. Thus, values in the Far East are still high relative to the London and New York markets. In London today spot standard was quoted at £208 10s., future standard at £212 10s. and spot Straits at £212. A fair business was reported in New York today with spot Straits quoted at 46.37½c.

Lead.—Demand is a little quieter than it was last week, but sales, which are largely confined to spot and nearby delivery of carload and small lots, continue in fair volume. There is some September business going, but the bookings are not yet large. Prices are very firm at 6.55c. St. Louis. The quotation of the leading interest is unchanged at 6.75c. New York.

Zinc.—The market is devoid of news features. Prices continue firm for Prime Western with most producers asking 6.80c. East St. Louis, or 7.15c., New York. Most orders, which are small, are for early shipment. The manifestation of increasing interest last week in future delivery has not continued to be evident thus far this week. Production of ore in the Joplin district was estimated at 13,500 tons, which was offset by nearly an equivalent amount of shipments. The ore surplus is now estimated at about 45,000 tons. The price is unchanged at $44 per ton, Joplin.

Antimony.—In a quiet market Chinese metal is quoted at 8.75c. for spot and 8.62½c. for future, duty paid, New York.

Nickel.—Wholesale lots of ingot nickel are quoted at 35c. per lb., shot nickel at 36c. and cathode electrolytic nickel at 35c.

Aluminum.—Virgin metal, 98 to 99 per cent pure, is obtainable at 23.90c. per lb., delivered, according to published quotations.

Non-Ferrous Metals at Chicago

CHICAGO, Aug. 13.—This market is less active both in sales and inquiry. Prices for tin are easier while quotations on lead are advanced. The old metal market is quiet.

Prices per lb., in carload lots: Lake copper, 18.50c.; tin, 47.62½c.; lead, 6.70c.; zinc, 6.87½c.; in less-than-carload lots, antimony, 9.62½c. On old metals we quote copper wire, crucible shapes and copper clips, 14c.; copper bottoms, 11.50c.; red brass, 11.50c.; yellow brass, 8c.; lead pipe, 4.50c.; zinc, 3.25c.; pewter, No. 1, 24.50c.; tin foil, 26c.; block tin, 36c.; aluminum, 12.87½c.; all being dealers' prices for less-than-carload lots.

Reinforcing Steel

Awards Total Only 4800 Tons and Inquiries 2600 Tons

QUIETNESS still exists in reinforcing steel, awards in the past week having totaled only 4800 tons. Eight hundred tons was for an office building in Chicago and 600 tons for an office structure in San Francisco. New inquiries will require 2600 tons. Awards follow:

BOSTON, 250 tons, Boston & Albany roundhouse, to Truscon Steel Co.

SOMERVILLE, MASS., 150 tons, Boston & Maine roundhouse, to Joseph T. Ryerson & Son, Inc.

NEW YORK, 270 tons, route 106, section 6, of subway, to McClintic-Marshall Co.

NEW YORK, 300 tons, building at 40 Wall Street, to Carroll-McCreary Co., Inc.

NEWARK, N. J., 600 tons, building for Packard Motor Car Co., to Igoe Brothers.

CHICAGO, 800 tons, Trustee System building, to Calumet Steel Co.

CHICAGO, 400 tons, building for Warner Brothers, Inc., to an unnamed bidder.

CHICAGO, 100 tons, West Town Bank building, to Calumet Steel Co.

CHICAGO, 450 tons, Parker public school, to an unnamed bidder.

CHICAGO, 100 tons, Woolworth store, to Concrete Engineering Co.

BERWYN, ILL., 160 tons, bank building, to Calumet Steel Co.

SAN FRANCISCO, 400 tons, warehouse for American Can Co., to Soule Steel Co.

SAN FRANCISCO, 175 tons, abattoir, to W. S. Wetenhall Co.

SAN FRANCISCO, 600 tons, Shell Oil building, to Soule Steel Co.

Reinforcing Bars Pending

Inquiries for reinforcing steel bars include the following:

HARTFORD, CONN., 700 tons, warehouse.

NEW YORK, 500 tons, boardwalk at Rockaway Beach.

TOLEDO, 130 tons, Maumee River bridge.

CHICAGO, tonnage not stated, apartment building on North Sheridan Road; Levy & Klein, architects.

CHICAGO, 100 tons, garage on Plymouth Court; J. B. Franch, general contractor.

CHICAGO, 150 tons, public school.

HINSDALE, ILL., 200 tons, sewage disposal plant.

STOCKTON, CAL., 150 tons, theater; bids Aug. 12.

SAN FRANCISCO, 630 tons, printing plant on First Street; bids being taken.

Lincoln Company Enlarges Plant

To provide increased manufacturing facilities, the Lincoln Electric Co., Cleveland, manufacturer of Linc-Weld motors and Stable-Arc welders, has placed contracts for the erection of a plant addition which will add approximately ½ acre more floor space. The new structure will be aproximately 110 x 200 ft. and will have a 65-ft. span electric traveling crane. Steel structure is to be fabricated by the arc welding process in the plant of the Austin Co., Cleveland, which designed and will erect the building.

Railroad Equipment

Central of Georgia Will Buy 500 Box Cars

FRESH inquiries for almost 1300 cars, including 500 box cars for the Central of Georgia, 400 refrigerator cars for the Pacific Fruit Express and 200 gondola underframes for the Santa Fe, appeared during the past week. Aside from the purchase of 300 flat cars by the Northern Pacific, buying has been negligible. The Texas & Pacific has placed an order for 15 oil-burning locomotives. Details of the week's business follow:

Santa Fe is in market for 200 gondola underframes.

New York, New Haven & Hartford is inquiring for 12 steel underframes for wooden baggage cars and for from 2 to 20 oil-electric rail motor cars. This railroad has ordered one club car from Osgood Bradley Car Co.

Central of New Jersey is asking for revised bids on 250 70-ton steel mill gondola cars.

Pacific Fruit Express is expected to buy 400 50-ton refrigerator cars.

Patapsco & Back River has ordered two locomotives from Baldwin Locomotive Works.

Texas Corporation is inquiring for four tank cars.

Moss Tie Co. has contracted for one special box car with Mount Vernon Car Mfg. Co.

Philadelphia & Reading Coal & Iron Co. has purchased 10 automatic drop dump cars from American Car & Foundry Co. and three 30-ton electric locomotives from Westinghouse Electric & Mfg. Co.

Braden Copper Co. has ordered 23 30-ton flat cars from American Car & Foundry Co.

Phillips Petroleum Co. has ordered 10 tank cars from General American Tank Car Corporation and five tank cars from American Car & Foundry Co.

Cities Service Tank Line has bought four tank cars from American Car & Foundry Co.

Texas & Pacific has bought 15 oil-burning locomotives from Lima Locomotive Works.

Chicago & North Western will buy 150 tram cars.

Central of Georgia is in market for 500 box cars and may make inquiry for 50 flat cars.

Northern Pacific has ordered 300 flat cars from Siems-Stemble Co.

Unfilled Brass Ingot Orders

CHICAGO, Aug. 12.—On August 1, unfilled orders for brass and bronze ingots and billets on the books of the members of the Non-Ferrous Ingot Metal Institute amounted to a total of 13,243 net tons, according to an announcement of the institute issued today. This compares with 13,339 tons on June 1, with 17,215 tons on May 1, and with 22,755 tons on April 1.

Hickman, Williams & Co. have been made agents in the Chicago district for Pioneer iron, which is produced by Republic Iron & Steel Co.

PERSONAL

ROBERT W. WOLCOTT, president Lukens Steel Co., sailed Aug. 3 on the DeGrasse for a two months' trip to European countries. H. B. SPACKMAN, formerly vice-president and a member of the board of directors, also is in Europe for the summer.

—

HERMAN ARBER, who has been manager of the coil department of the Dudlo Mfg. Co., Fort Wayne, Ind., subsidiary of the General Cable Corporation, has been appointed General plant superintendent, succeeding WENDELL C. GLASS, who recently resigned. GEORGE KIERSPE, manager of the Dudlo coil department at Rome, N. Y., will assume Mr. Arber's former duties at Fort Wayne.

—

EDWIN KARLSON has been made vice-president in charge of manufacturing of the Peerless Motor Car Corporation, Cleveland. He was formerly with the Marmon Motor Car Co., Indianapolis. S. T. Creighton, also formerly with the Marmon company, has been appointed purchasing agent.

—

GEORGE P. LENZ has been appointed purchasing agent of the Corrigan, McKinney Steel Co., Cleveland, to succeed JOHN FIELDING, who has tendered his resignation, effective Sept. 1, to become associated with the Butler Consolidated Coal Co., Cleveland. Mr. Lenz has been with the company about 25 years, and for some time has been assistant purchasing agent.

—

CHARLES E. GRIFFITH has resigned as treasurer and director of the Illinois Iron & Bolt Co., Carpentersville, Ill., after having served the organization for 56 years. He was made secretary of the company in 1888 after having filled the position of bookkeeper for 25 years. At various times he acted as purchasing agent, and for many years has been a director of the company.

—

WALTER H. UNDERWOOD, formerly sales manager for the St. Louis Coke & Iron Co., is now in the pig iron sales department of the Chicago office of Hickman, Williams & Co.

—

CHARLES M. EASTERLY, formerly with the Inland Steel Co., Chicago, has been elected first vice-president in charge of sales of the Canton Rolling Mills Corporation, Canton, Ohio.

—

S. S. PORTER, vice-president, Calumet Steel Co., Chicago, returned Aug. 8 from a six weeks' motor trip through England and Scotland.

—

C. K. EVERITT, managing director and works manager, Edgar Allen & Co., Ltd., Sheffield, England, will attend the convention of the American Society for Steel Treating in September at Cleveland, in company with American agents for Allen steels.

PAUL A. MEEHAN, formerly with the American Dressler Tunnel Kilns, Inc., Cleveland, has been placed in charge of the newly-organized tunnel kiln department of the Simplex Engineering Co., Washington, Pa.

—

WILLIAM MCBRIDE, up to a year ago president of the Fort Pitt Spring & Mfg. Co., Pittsburgh, has been elected president of the Mead-Penn Iron Works Co., Meadville, Pa., succeeding OTTO KOHLER.

—

W. D. LITTLE, of the Hoskins Mfg. Co., Detroit, has been reelected chairman of the electric furnace section of the National Electrical Manufacturers Association, New York, and R. F. BENZINGER, associated with the Electric Furnace Co., Salem, Ohio, has been reelected secretary.

—

ALAN G. CARY has been appointed representative in the St. Paul and Minneapolis territory, with offices at 204 Endicott Building, St. Paul, for the Union Chain & Mfg. Co., Sandusky, Ohio.

—

WILLIS B. KYLE, who resigned July 1 as vice-president and general manager of the McClintic-Marshall Co., of California, has purchased a one-third interest in the Modern Iron Works, Los Angeles. He is being succeeded as manager of the McClintic-Marshall Co. in the Los Angeles district by E. F. GOHL.

—

PHILIP DRESSLER, president, American Dressler Tunnel Kilns, Inc., Cleveland, will personally take charge of all engineering and design work in connection with tunnel kiln installations. L. A. VINCENT, vice-president, will take care of the thermal engineering department of the company.

—

P. F. BAILLET has been made manager of foreign sales, with offices at 461 Eighth Avenue, New York, for Ampco Twist Drill Co., Jackson, Mich.

—

E. F. DUBRUL, general manager, National Machine Tool Builders' Association, Cincinnati, has been appointed on the council of the American Institute of Weights and Measures in place of the late Worcester R. Warner.

—

FREDERICK H. PAYNE, president of the Greenfield Tap & Die Corporation, Greenfield, Mass., has been made president of the newly created Massachusetts Industrial Commission.

—

GEORGE MCLAUGHLIN, for a number of years a member of the Cincinnati office of the American Sheet & Tin Plate Co., has been promoted to assistant manager of sales at Cincinnati.

—

WILLIAM FORSSTROM, for the last nine years chief engineer of the Wisconsin Steel Works, International Harvester Co., has retired on account of ill health. He will make his permanent home in Tucson, Ariz., where he has business interests. Previous to his connection with the Wisconsin Steel Works, he was for four years chief engineer for the Youngstown Sheet & Tube Co., with headquarters at Youngstown. For 13 years Mr. Forsstrom was chief engineer for the LaBelle Iron Works, and previous to that he served the Jones & Laughlin Steel Corporation.

—

GEORGE W. DAVIS, Chicago branch manager of Gears & Forgings, Inc., has been transferred to the Milwaukee office, where he will have charge of sales.

—

O. H. AMMANN, engineer of the Fort Lee suspension bridge across the Hudson River, and GUSTAV LINDENTHAL, engineer of the Hell Gate Bridge, New York, have been added to the staff of the Rosenwald Museum of Industry and Science, Chicago.

—

E. R. S. REEDER, formerly district manager of sales for the Ludlum Steel Co., has been appointed manager of special contracts of the Widia department by Thomas Prosser & Son, New York, agents in the United States for Friedrich Krupp, A. G., Germany.

—

GEORGE R. HARRISON has been appointed Cleveland representative, with offices in the Rockefeller Building, for the Reading Chain & Block Corporation.

To Consolidate Aircraft and Propeller Companies

The Standard Steel Propeller Co., Pittsburgh, and the United Aircraft & Transport Corporation, New York, will be consolidated, pending the approval of holders of 75 per cent of the stock of the Standard Company. The United Company, which was formed several months ago by a merger of several large airplane and air transport companies, already controls the Hamilton Propeller Co.

The Standard company has been manufacturing steel propellers for some time and is at present working on plant additions at Homestead, Pa., which will quadruple present output. The company will remain at Pittsburgh and present officers will probably be retained.

The Ohio Gear Co., Cleveland, has appointed A. R. Young, Indianapolis, as its representative in western Ohio and in Indiana; the Specialty Sales & Engineering Co., in western Pennsylvania; and the E. G. Long Co., New York, in the New York district.

OBITUARY

HENRY S. PICKANDS, member of the firm of Pickands, Mather & Co., Cleveland, and prominent in the iron ore, pig iron and shipping industry, died of heart failure Aug. 10, in his office. He was 53 years of age. Mr. Pickands was born in 1875 in Marquette, Mich., and when he was six years of age his parents moved to Cleveland. He was

HENRY S. PICKANDS

graduated from University School, Cleveland, in 1894, and from Sheffield Scientific School of Yale University in 1897. On leaving college he went to work in the office of Pickands, Mather & Co., which had been founded in 1881 by his father, Col. James Pickands, and Samuel Mather. He became a partner in the firm in 1900. He devoted special attention to the operation of blast furnaces and docks and to the purchasing department of the firm. Aside from his membership in Pickands, Mather & Co., he had various business connections, being a director of the American Shipbuilding Co., vice-president of the Great Lakes Towing Co., director of the Union Trust Co., vice-president of the Interlake Steamship Co., all of Cleveland, and a member of the executive committee of the Empire Steel Corporation, Mansfield, director of the Zenith Furnace Co., Duluth, and president of the Toledo Furnace Co., Toledo. He took a deep interest in civic affairs and was noted for his philanthropies. He was chairman of the board of trustees of University School, Cleveland, and its leading benefactor. Always an ardent prohibitionist, he had been president of the Dry Maintenance League of Cleveland for the past nine years and at times took an active part in political campaigns as a speaker in behalf of prohibition. He was a member of the Cleveland Chamber of Commerce, Union Club, and University Club of Cleveland, Yale Club of New York, and various other clubs. Mr. Pickands was the second member of the firm to be taken away suddenly this year, Harry Coulby, another of the partners, having died early in the year.

—

THOMAS E. GRIFFITH, for twelve years general manager of the W. S. Tyler Co., Cleveland, died Aug. 10, following an operation. He was 50 years of age and became connected with the company as an office boy about 35 years ago.

—

MERTLAND M. HEDGES, formerly president of the Hedges-Walsh-Weidner Co., Chattanooga, Tenn., manufacturer of boilers, died at his home at Signal Mountain, Tenn., on Aug. 7, aged 69 years. Many years ago he and James F. Casey purchased the Webb Boiler Works at Chattanooga, changing its name to the Casey-Hedges Co. In 1927 it was consolidated with the Walsh & Weidner Boiler Co., as the Hedges-Walsh-Weidner Co. Mr. Hedges served as president of the new company until a few months ago, when he retired.

—

J. C. WARD, managing director of Edgar Allen & Co., Ltd., Sheffield, England, and also a director of the Edgar Allen Steel Co., Inc., New York, died Aug. 8, aged 66 years. He was at one time president of the American company and also was formerly president of the American Manganese Steel Co., Chicago.

—

LUTHER B. MCMILLAN, consulting engineer of Johns-Manville, Inc., New York, died Aug. 10, as the result of injuries received when the airplane of which he was owner and pilot crashed near the Newark, N. J., Metropolitan Airport on the evening of Aug. 9. He was an ardent aeroplanist and had made many extended trips throughout the country. He was born at Bem, Mo., Sept. 21, 1891, and was graduated from the Texas Agricultural and Mechanical College in 1911. After being awarded a fellowship at the College of Engineering of the University of Wisconsin, he was an instructor for two years at that institution. Since 1916 he has been identified with the Johns-Manville company. He was a conspicuous member of the American Society of Mechanical Engineers, being a member of the council of the society at the time of his death.

—

WALTER BRADLEE SNOW, retired engineer, publicity man, and advertising agent, died at Falmouth, Mass., Aug. 9, aged 68 years. He was graduated from the Massachusetts Institute of Technology in 1882. In 1907 he organized Walter B. Snow and Associates as publicity engineers. He was president of the Reversible Collar Co., a trustee of the Watertown Savings Bank, and past secretary of the Massachusetts Commission for the Blind, a director of the Garland School for Homemaking, a member of the corporation of the Perkins Institution for the Blind, and a clerk of the Watertown Planning Board. He was the author of "Mechanical Draft" and "Steam Boiler Practice."

—

ROLAND GERRY, for many years identified with the Jones & Laughlin Steel Corporation, Pittsburgh, died at his residence in that city on Aug. 9. He was born at Waterford, Me., in 1860, and prior to his retirement on Jan. 1, 1925, had spent his entire business career of 44 years with the Jones & Laughlin company. For many years he was manager of sales in the cold-rolled department, having general supervision over cold-finished steel bars and railroad track accessories. He relinquished those duties on Feb. 1, 1922, but remained with the company for the next three years as special sales agent and a director.

—

HARRY E. KIES, manager, malleable and steel division, American Radiator Co., died Aug. 10 in the Buffalo General Hospital, following an operation, aged 60 years. He had been with the American Radiator Co. for many years.

Cadmium Output in 1928 Increased

The production of metallic cadmium in the United States in 1928 amounted to 1,875,896 lb., valued at $1,144,297, as reported by producers to the United States Bureau of Mines. This is an increase of 75 per cent in quantity over the production of 1,074,654 lb. in 1927. There were 233,101 lb. of cadmium, valued at $128,901, imported into the United States during 1928, compared with 22,400 lb., valued at $13,172 in 1927. No imports of this metal were recorded for 1926.

Value of Materials Used for Fireproofing Described

Relative values of different materials used for the fireproofing of steel structures are described in a booklet written by Jack Singleton, district engineer of the American Institute of Steel Construction, Inc., New York, and published by the institute. In his discussion, Mr. Singleton states that "when fabricating plants contract for, manufacture and erect a steel building for a client, their responsibility does not end there. The steel frame is not suitable for use without a myriad of attendant details, which must be settled before the building is ready for occupancy. Chief of these is the fireproofing of the steel skeleton, vitally necessary to protect the very investment itself."

Machinery Markets and News of the Works

Tool Buying Has Slackened

Sales, However, Are Running Well Ahead of Those in Same Period of Last Year

THERE has been a slackening in machine tool buying the past week, attributed in large measure to the vacation season. Sales, however, are running well ahead of those in August, 1928, and continued good demand from a variety of sources insures total bookings considerably above normal for this time of the year.

Some builders, including a Cleveland turret lathe maker, report that business this month has paralleled that in July, but most companies state that August has brought a slight recession.

The matter of deliveries is an important factor affecting sales at the moment. In numerous cases buyers are finding that they cannot get tools for at least several months or longer, and therefore are refraining from placing orders.

The General Electric Co. has contracted for additional equipment for its electric refrigerator manufacturing department, and the Westinghouse Electric & Mfg. Co., which is entering the electric refrigerator field, has purchased tools for its new production division. The International Harvester Co. has bought a few tools for its Rock Island, Ill., plant.

The Santa Fe has closed for several items, while the Chicago, Milwaukee, St. Paul & Pacific is inquiring for two switch planers.

New York

NEW YORK, Aug. 13.—Machine tool buying so far this month compares favorably with that of July. Orders are mostly for single tools, except for the continued buying by large users, especially the General Electric Co., which has pending two tools for its Lynn plant, and six engine lathes for Schenectady. The Westinghouse Electric & Mfg. Co., which has bought more than 25 tools since the first of the year for its refrigerator manufacturing plant at Springfield, Mass., has issued an additional inquiry that includes two production lathes. Deliveries on most tools are extended, in some cases into December and January.

Contract has been let by Chevrolet Motor Co., Detroit, to John W. Cowper Co., Inc., Buffalo, for new assembling plant at Tarrytown, N. Y., with main one-story unit, 400 x 1200 ft., and smaller buildings, to cost more than $2,000,000 with equipment.

Cylinder Grinding Co., New York, has leased building at 334 West Seventieth Street for new machine shop; part of works will be given over exclusively to production of piston rings.

Mohawk Carpet Mills, Inc., Amsterdam, N. Y., has plans for new steam power house to cost about $200,000 with equipment.

Board of Education, Rensselaer, N. Y., is said to be planning installation of manual training equipment in new junior high and grade school to cost about $200,000, for which revised plans are being drawn by C. H. Gardinier, 75 State Street, Albany, N. Y., architect.

John J. Raskob, identified with General Motors Corporation, and associates have acquired a majority interest in Aero Supply Mfg. Co., College Point, L. I., and will be active in management. Company specializes in manufacture of airplane hardware and is said to be planning extension. It recently acquired Standard Automatic Products Corporation, Corry, Pa., manufacturer of turnbuckles and kindred equipment for aircraft, and National Steel Products Co., Dayton, Ohio, manufacturer of steel specialties for airplanes, and will continue both companies as subsidiaries.

Albany Steel & Iron Supply Co., Albany, N. Y., is considering a one-story addition to storage and distributing plant to cost about $35,000 including equipment. F. A. Hunsdorfer is president.

C. M. Morhous, 13 Stetson Avenue, Plattsburg, N. Y., and associates have organized Mobodo Aircraft Co., with capital of $50,000, and plan early operation of local plant to manufacture airplanes and parts. L. A. Bouyea, Plattsburg, is also interested in new organization.

Todd Shipyards Corporation, 25 Broadway, New York, is establishing a new division at its South Brooklyn works for repair of marine turbine engines, including machinery and facilities for manufacture of turbine blades and other parts. C. C. Seigh, formerly connected with Westinghouse Electric & Mfg. Co., East Pittsburgh, will be in charge of department.

Westchester County Board of Supervisors, White Plains, N. Y., has authorized purchase of property at Croton Point Park for establishment of County airport. Present acquisition will soon be increased to about six acres by further purchases, and plans will be drawn for hangars, repair shops, and other units, to cost more than $100,000 with equipment. County engineering department will be in charge.

C. B. Meyers, 31 Union Square, New York, architect, has plans for multi-story automobile service, repair and garage building, to cost more than $150,000 with equipment.

Curtiss Airports Corporation, 27-29 West Fifty-seventh Street, New York, is said to have plans for airplane base and airport near Milwaukee, consisting of hangars, repair shops, and other units, to cost about $100,000 with equipment.

Western Electric Co., 195 Broadway, New York, manufacturer of telephone equipment, radio apparatus, cable, etc., has leased three buildings at plant of Riegel Sack Co., Jersey City, N. J., totaling 150,000 sq. ft. floor space, for new branch plant to be operated in conjunction with works at Kearny, N. J. Acquired property will be used primarily for production of telephone apparatus.

Wood Newspaper Machinery Corporation, 688 South Second Street, Plainfield, N. J., manufacturer of printing machinery, etc., will soon begin erection of one-story addition, 90 x 160 ft., for which general contract recently was awarded to Wigton-Abbott Corporation, 705 Park Avenue, New York, to cost over $65,000 with equipment.

Board of Education, Essex County Vocational Schools, Hall of Records, Newark, will receive bids on general contract until Aug. 27 for three-story boys' vocational school at Bloomfield, N. J., to cost $500,000 with equipment. Guilbert & Betelle, Chamber of Commerce Building, Newark, are architects. Robert O. Beebe is director.

Long Branch Country Club & Airport, Long Branch, care of R. Kearney Reid, Citizens' National Bank, Broadway, trustee, has plans for an airport at Eatontown, to include hangar, repair shop, and other units, to cost more than $75,000 with equipment. Arthur E. Gravatt, address noted, is architect for organization.

Globe Machine & Tool Co., Newark, has leased floor in building at 261 Rose Street, to manufacture tools, dies and kindred specialties.

Stilson Mfg. Co., West Orange, N. J., has leased building at 82 Main Street, for manufacture of metal goods and novelties.

South Atlantic

BALTIMORE, Aug. 12. — W. A. Fingles, Inc., 29 South Howard Street, Baltimore, manufacturer of sheet metal products, has rejected bids recently received for a two-story plant, to cost about $65,000 with equipment, and is said to be planning to ask new bids on general contract. E. G. Blanke, 330 North Charles Street, is architect. William A. Fingles is president.

Leathersteel Products Co., Garrett Building, Baltimore, has been organized to take over and expand company of same name, with headquarters at 73 Long Wharf, Boston, specializing in manufacture of combination steel-leather mats and similar products. Plans are under way for establishment of new plant at Baltimore, with removal of present Boston works to that location. Charles H. Dankmeyer is president of new company, and John H. Mooney, vice-president.

Sylvania Industrial Corporation, 122 East Forty-second Street, New York, recently organized with capital of $3,500,000, has taken over 200-acre tract near Rappahannock River, Fredericksburg, Va., and plans construction of mill to manufacture transparent and other processed paper products. Initial mill will cost over $750,000 with machinery. Project will include a machine shop and boiler house.

Firestone Tire & Rubber Co., Akron, Ohio, has purchased property on Oak Street, Baltimore, as site for three-story factory branch, service and sales building, 85 x 235 ft., to cost about $200,000 with equipment.

Goodyear Tire & Rubber Co., Akron, Ohio, is reported planning new mill near Rockmart, Ga., to cost more than $800,000 with equipment.

Arctic Air Co., Inc., Munsey Building, Baltimore, recently organized by Carter F. Hall, is considering establishment of plant near Wheeling, W. Va., to manufacture electrically-operated water-cooling equipment for railroads, industrial and other service, initial unit to cost about $30,000 with equipment.

Wicomico County Board of Education, Salisbury, Md., is considering installation of manual training equipment in new high school to cost about $300,000, for which bids will be asked soon on general contract. Smith & May, Calvert Building, Baltimore, are architects.

Nashville, Chattanooga & St. Louis Railway Co., Nashville, Tenn., in cooperation with United States Cold Storage & Warehouse Co., 2101 West Pershing Road, Chicago, is reported planning twelve-story cold storage warehouse and refrigerating plant at Atlanta, Ga., to include both dry and cold storage divisions, and railroad car facilities, to cost $2,000,000 with equipment.

Pitcairn Aviation, Inc., Land Title Building, Philadelphia, operated by North American Aviation, Inc., is said to be planning construction of hangar, 150 x 250 ft., with repair and reconditioning shop, at Candler field, Atlanta, Ga., to cost about $60,000 with equipment.

Board of Trustees, Loyola College, Charles Street, Baltimore, has plans for three-story engineering building, to cost about $150,000 with equipment, and expects to ask bids on general contract in fall. L. R. White, Hearst Tower Building, is architect.

Standard Paper Mfg. Co., Richmond, Va., has begun work on three-story addition to mill, 50 x 150 ft., to cost about $70,000 with machinery.

Mueller Co., Decatur, Ill., manufacturer of brass plumbing fixtures, has awarded contract to Smith & Williams, Atlanta, for a branch plant at Atlanta, to cost $80,000 with equipment.

Philadelphia

PHILADELPHIA, Aug. 12.—Contract has been let by John G. Lorenz Corporation, Thirty-third and Reed Streets, Philadelphia, manufacturer of steel and iron products, to Farrell-Roth Construction Co., 24 South Forty-sixth Street, for one-story addition, totaling 24,000 sq. ft. floor space, to cost about $80,000 with equipment. E. J. Fitzmaurice, Pennsylvania Building, is consulting engineer.

Eaton Bumper & Spring Service Co., 223 North Twenty-second Street, Philadelphia, a subsidiary of Eaton Spring & Axle Co., Cleveland, has leased new one-story building, 72 x 170 ft., to be erected at 1521 North Third Street, for a new service, repair and sales unit, to cost about $75,000 with equipment.

Crane Co., 1301 Locust Street, Philadelphia, with headquarters at 836 South Michigan Avenue, Chicago, is said to have plans for new local factory branch and distributing plant, to cost about $85,000 with equipment.

West Philadelphia Motor Co., 4615 Walnut Street, Philadelphia, has awarded general contract to Wark Co., 1600 Walnut Street, for two-story service, repair and sales building, 65 x 214 ft., to cost about $100,000 with equipment.

F. & E. Aubel, 2503 Germantown Avenue, Philadelphia, operating a general iron and steel works, are considering a new one-story unit, to cost about $60,000 with equipment.

Judson C. Burns, Inc., Eleventh and Chestnut Streets, Philadelphia, distributer of electric refrigerators, electric washing machines, etc., has leased new building totaling 20,000 sq. ft. floor space, for new storage and distributing plant, to include service and repair departments.

Koalamatic Combustion Co., Philadelphia, has been organized by Harry Fomalont, 106 South Fifty-ninth Street, and associates, to take over and expand company of same name, with local headquarters in Weightman Building, manufacturer of coal-saving devices, thermostat combustion units and kindred specialties. Horace J. Mullin, 2232 North Nineteenth Street, is interested in new organization.

Atlantic City Electric Co., Atlantic City, N. J., has plans for a new power switching and substation at Pleasantville, to cost more than $500,000 with equipment. It will be used in conjunction with new generating station at Deepwater Point on Delaware River, now in course of construction, to cost $10,000,000. Project will include steel tower transmission line from power plant to Pleasantville and neighboring points, to cost about $1,000,000.

Harrisburg Gas Co., Harrisburg, Pa., has plans for a one and two-story equipment, storage and distributing plant, with service and repair department, to cost about $175,000 with equipment. United Engineers & Constructors, Inc., Broad and Arch Streets, Philadelphia, is architect and engineer.

Traveling ovens, power equipment, conveying and other machinery will be installed by General Baking Co., 420 Lexington Avenue, New York, in new plant at Allentown, Pa., to cost $400,000. Company will build a similar plant at Detroit, to cost over $850,000 with equipment.

Philadelphia & Reading Coal & Iron Co., Reading Terminal, Philadelphia, will install coal-mining and operating equipment in connection with opening up of large new properties at Bear Valley Mines, near Shamokin, Pa., entire development to cost more than $300,000.

Detroit

DETROIT, Aug. 12.—Contract has been let by Auto Specialties Mfg. Co., Monroe, Mich., manufacturer of automobile jacks, malleable castings, etc., to Owen-Ames-Kimball Co., Grand Rapids, Mich., for group of one-story plant units to increase floor space about 85,000 sq. ft. Equipment will include two electric furnaces, conveying and other machinery, total project to cost $750,000. F. E. Davidson, 53 West Jackson Boulevard, Chicago, is architect.

City Council, Grand Haven, Mich., has plans for an addition to municipal electric light and power plant, to cost more than $200,000 with equipment. Giffles, Hamilton & Weber, Grand Rapids National Bank Building, Grand Rapids, are architects.

General Parts Corporation, recently organized, will take over and succeed to company of same name with main plant at Flint, Mich., manufacturer of automobile parts, as well as parts for electric locomotives, etc. New company has arranged for stock issue of $850,000, part of fund to be used for expansion.

Panyard Piston Ring Co., Muskegon, Mich., has been organized by P. P. Schnorbach and C. G. Bigge, both of Manistee, Mich., to take over plant and other assets of Panyard Machine & Mfg. Co., Muskegon, recently acquired at receiver's sale. New company will operate with capital of $50,000. Extensions and improvements will be made.

Checker Cab Mfg. Corporation, Gibson Street, Kalamazoo, Mich., manufacturer of taxicabs, will soon take bids on general contract for one and two-story addition, to cost over $400,000 with equipment. Albert Kahn, Inc., Marquette Building, Detroit, is architect and engineer.

Michigan Bell Telephone Co., 1365 Cass Avenue, Detroit, will soon take bids on general contract for a one-story equipment storage and distributing plant at Grand Rapids, to include mechanical and electrical repair and service departments, as well as automobile service division, to cost $185,000 with equipment. Smith, Hinchman & Grylls, Marquette Building, Detroit, are architects.

National Petroleum Corporation, Grand Rapids, Mich., has recently acquired producing properties of Puritan Oil Corporation, Muskegon, Mich., as well as oil lands in other counties. New owner contemplates extensions and improvements in Muskegon plant, including storage and distributing facilities.

Chevrolet Motor Co., Detroit, will soon take bids on general contract for one and two-story addition to local assembling plant, to cost more than $200,000 with equipment.

Detroit Butcher Supply Co., 1455 Gratiot Avenue, Detroit, manufacturer of knives, fixtures, etc., has awarded

general contract to W. S. Pocock & Co., 1726 Seward Street, for two-story plant, to cost about $55,000 with equipment. Pollmar & Ropes, Hoffman Building, are architects.

Chicago

CHICAGO, Aug. 12.—Local machine tool dealers look for a more active fall market as the result of industrial expansion now under way. Current sales are well above those of August, 1928, but in most instances show a decline from last month. The International Harvester Co. has placed a few orders for its Rock Island plant. Another farm implement manufacturer, who had expected to issue a list this summer, is said to be making use of considerable standard equipment which was replaced earlier in the year by special machine tools.

The Santa Fe has closed several items of long standing and the Northern Pacific will buy a 24-in. shaper. The Burlington is in need of a floor stand grinder and the American Steel Foundries will purchase a large turret lathe. Several railroads have asked for preliminary figures for use in preparing 1930 budgets. Deliveries remain stationary.

Chicago Steel Tank Co., 6400 West Sixty-sixth Street, Chicago, is building an addition, 120 x 500 ft. Foltz & Co. are architects and engineers.

Louis E. Emerman, machinery jobber, has purchased McCord Mfg. Co. plant at 120th Street and Illinois Central Railroad, and will concentrate distributing operations there.

Ero Mfg. Co., 2234 Ogden Avenue, Chicago, manufacturer of automobile equipment and accessories, has leased one-story and basement factory, 75 x 100 ft., at 2229 Ogden Avenue, for expansion.

Brooks, Bramhall & Dague, First National Bank Building, Decatur, Ill., architects, will soon take bids on general contract for two-story automobile service, repair and garage building, to cost $100,000 with equipment.

Greenlee Brothers, Inc., Columbia and Twelfth Streets, Rockford, Ill., manufacturer of wood-working machinery, tools, etc., has awarded general contract to Security Building Co. for one-story addition, 100 x 120 ft., to cost over $75,000 with equipment.

Golden Cycle Mill Co., Colorado Springs, Colo., A. E. Carlton, president, is planning construction of new flotation mill at mining properties, to cost about $65,000 with machinery.

Lyle Signs, Inc., 171 Twenty-seventh Avenue, S. E., Minneapolis, Minn., manufacturer of signs, displays, etc., has awarded general contract to Holm-Johnson Co., Essex Building, for one-story plant, 40 x 150 ft., with extension, 45 x 60 ft., to cost about $40,000 with equipment. C. P. Pesek, 1641 Hennepin Avenue, is architect.

Iowa Public Service Co., Sioux City, Iowa, has plans for new steam-operated electric power house at Storm Lake, Iowa, to cost about $45,000 with equipment.

State Board of Administration, Bismarck, N. D., is planning early call for bids for coal-handling, conveying and storage equipment for installation at Valley City, N. D., to cost about $17,000. Ernest R. Boyd, Jamestown, N. D., is architect.

The Crane Market

A FAIR volume of inquiry for overhead cranes is pending, but buyers are slow to place business. Buyers of crawl-tread cranes are active, but standard locomotive cranes are quiet. The Foundation Co., 120 Liberty Street, New York, has closed on four crawl-tread cranes for export and the Worthington Pump & Machinery Co., Harrison, N. J., has bought a used locomotive crane.

Among recent purchases are:

De Laval Separator Co., Poughkeepsie, N. Y., 5-ton, double-hook, magnet crane from Whiting Corporation.

Foundation Co., 120 Liberty Street, New York, four 15-ton crawl-tread cranes for export from Industrial-Brownhoist Corporation.

Worthington Pump & Machinery Co., Harrison, N. J., used 20-ton Orton locomotive crane, reported purchased from Philip T. King, New York.

Standard Oil Co., Whiting, Ind., crawl-tread locomotive crane from Orton Crane & Shovel Co.

Alex N. Smith, Harriman, N. Y., crawl-tread shovel and crane from Orton Crane & Shovel Co.

Rockford Iron Works, Rockford, Ill., 5-ton, 20-ft. span overhead electric crane from unnamed builder.

Crane Co., 836 South Michigan Avenue, Chicago, has plans for a one-story factory branch and distributing plant at Waukegan, Ill., to cost $55,000 with equipment. C. W. Webster, 5 North Genesee Street, Waukegan, is architect.

Board of Education, Quincy, Ill., is considering installation of manual training equipment in new three-story high school to cost $450,000, for which bids will be asked on general contract early in fall. Behrensmeyer & Haffner, W. C. U. Building, are architects.

General Mica, Inc., First National Bank Building, Pueblo, Colo., Joseph Stanko, head, has plans for first unit of new mica grinding and refining plant at Blende, about three miles from city, to cost about $30,000 with equipment.

New England

BOSTON, Aug. 12.—The past week was one of the quietest experienced in many months by machine tool dealers, and manufacturers also report a falling off in business. There has, however, been some activity in presses and hammers of the lighter type. New England dealers look for good business late in 1929 and early next year if actual and tentative inquiries can be taken as an indication. Deliveries, however, will be an important factor for several months. Particular interest is being taken in the development of aircraft manufacture in New England.

Although large tools are selling slowly, demand for small tools holds up remarkably well.

Bridgeport Brass Co., East Main Street, Bridgeport, Conn., contemplates erection of a storage shed, 42 x 77 ft. Light conveying and lifting equipment may be purchased.

Sikorsky Mfg. Co., Stratford, Conn., has plans for a one-story wind laboratory, 50 x 100 ft., for which fan and blower equipment is required.

Hollingsworth & Vose, 333 Washington Street, Boston, paper manufacturers, are erecting a machine shop addition at East Walpole, Mass. Metal-working tools are under consideration.

Pitney-Bowes Postage Meter Co., Stamford, Conn., manufacturer of postage affixing machines and parts, etc., has plans for a two-story addition, 60 x 300 ft., including improvements in present buildings, to cost more than $85,000 with equipment. Fletcher-Thompson, Inc., Bridgeport, Conn., is architect and engineer.

Strathmore Paper Co., Mittineague, Mass., has plans for a hydroelectric generating plant for mill service at West Springfield, Mass., to cost more than $75,000 with equipment. L. R. Howe is company architect in charge.

Wetmore-Morse Granite Co., Barre, Vt., has plans for a one-story machine and forge shop, 50 x 150 ft., to cost about $45,000 with equipment. L. F. Caroni & Co., 1056 Chapel Street, New Haven, Conn., are architects.

Boston & Albany Railroad Co., South Station, Boston, has awarded contract to J. F. Fitzgerald Construction Co., 38 Chauncy Street, for new engine house with repair facilities at Beacon Park yards, Allston, to cost more than $50,000 with equipment.

Eastern Aircraft Corporation, Pawtucket, R. I., recently organized by Ray C. Van Arsdale and associates, has acquired local plant of Pressed Metal Co., for manufacture of all-metal aircraft. Company will be affiliated with Bavarian Aircraft Corporation of Germany, and will produce in this country Messerschmidt type of aircraft now being manufactured there, initial models to cover a three-passenger cabin plane, seven-passenger plane, and small training plane.

Buffalo

BUFFALO, Aug. 12.—Spriesch Tool & Mfg. Co., 133 South Elmwood Avenue, Buffalo, manufacturer of tools, dies, etc., has plans for a one-story machine shop, to cost about $30,000 with equipment. Company was recently organized to take over business of Joseph Spriesch. George A. Setter, 67 Burch Avenue, West, is architect.

Eastman Kodak Co., Rochester, N. Y., has authorized an expansion and improvement program, to cost about $15,000,000 over three-year period, including buildings and equipment at local Kodak Park factories, and extensions in subsidiary plant of Tennessee-Eastman Corporation, Kingsport, Tenn., on which work recently was started. Last-noted project is reported to cost about $5,000,000.

Central High School District No. 1, Amherst, N. Y., is planning installation of manual training equipment in new high school to cost about $400,000. Paul H. Harbach and James W. Kideney, 271 Delaware Avenue, Buffalo, are architects.

Fleet Aircraft, Inc., 2050 Elmwood Avenue, Buffalo, manufacturer of commercial airplanes and parts, is considering establishment of a new assembling plant in Southern California for Pacific Coast trade, to cost more than $75,000 with equipment. Company is affiliated with Consolidated Aircraft Co., same address. Lawrence D. Bell is president.

Department of Public Works, Municipal Building, Buffalo, has plans for marine airport foot of Georgia Street, including hangars, repair shops and other units, to cost about $150,000 with equipment. Col. Howard Beck, 374 Delaware Avenue, city architect, is in charge.

Cleveland

CLEVELAND, Aug. 12.—Machine tool sales and inquiry tapered off the past week. However, the volume of business is still good for this season of the year. Orders were confined to single machines. Demand is well scattered with little business coming from the automotive industry. Turret lathe sales so far this month have equaled the good volume of business taken in the corresponding period of July. Prospective buyers are slow in placing orders, which is attributed in a large measure to the vacation season.

National Bronze & Aluminum Foundry Co., East Eighty-eighth Street and Laisy Avenue, Cleveland, will enlarge its plant by erection of a one-story building, 71 x 109 x 200 ft., monitor-type.

Dill Mfg. Co., 684 East Eighty-second Street, Cleveland, manufacturer of tire valves and valve parts, has acquired a building site on Mandalay Road on which it plans erection of a new factory to more than double present capacity.

Whiteway Stamping Co., 1201 East Fifty-fifth Street, contemplates erection of a new plant with 40,000 sq. ft. of floor space on part of site formerly occupied by King Bridge Co.

Plans are under way by Cleveland Heights Air Terminal, Marshall Building, Cleveland, R. P. Cunningham, vice-president, for airport on Ridgebury Boulevard, consisting of hangars, repair shops, oil storage and other buildings, to cost more than $1,000,000 including equipment.

Toledo Foundry & Machine Co., Toledo, Ohio, has plans for complete electrification of plant and will soon begin installation of equipment. W. J. Wuerfel is secretary and treasurer.

Hercules Motor Corporation, Canton, Ohio, manufacturer of gasoline engines for motor trucks, buses, etc., and other power units, has acquired 3-acre tract adjoining plant, and will erect one-story addition to total about 68,000 sq. ft. floor space, designed to increase present capacity about 50 per cent. It is estimated to cost over $350,000 with equipment.

A. L. Licker, Guarantee Title Building, Cleveland, and associates have awarded general contract to Simon Construction Co., 785 East Eighty-eighth Street, for one-story automobile service, repair and garage building, 80 x 430 ft., to cost $150,000 with equipment.

Benton & Anderson Co., Cleveland, manufacturer of welding equipment, etc., has purchased Taylor-Winfield Corporation, Warren, Ohio, manufacturer of electric butt and other welding apparatus, oil cans, etc., and will consolidate. Company will be operated as subsidiary. Expansion in output is planned. Purchasing company has factory branches at Chicago, Detroit and St. Louis.

Cleveland Electric Illuminating Co., Illuminating Building, Cleveland, has plans for new four-story steam-operated electric generating station at Ashtabula, Ohio, 250 x 325 ft., to cost more than $5,000,000 with equipment. Contract for superstructure has been let to Hunkin-Conkey Construction Co., Newman-Stern Building, Cleveland.

Board of Education, Mentor Rural School District, Mentor, Ohio, is considering installation of manual training equipment in new two-story high school addition to cost about $200,000. Miller & Son, 27 West Madison Street, Youngstown, are architects.

Pittsburgh

PITTSBURGH, Aug. 12.—The machinery trade in this district continues exceedingly active. Inquiries are still piling up and the volume of work in prospect indicates extension of heavy buying into the fall. Westinghouse Electric & Mfg. Co. is closing regularly against its third quarter list and is also issuing additional inquiries from time to time. United States Aluminum Co. has delayed the purchase of tools for its new machine shop at New Kensington until about Sept. 1. Another company in this district has inquired for 20 or more tools and the Bethlehem Steel Co. is expected soon to close against six machines for its Cambria plant at Johnstown.

Railroad buying leaves something to be desired, but the volume of industrial work has more than made up for this inactivity. However, the Baltimore & Ohio is now inquiring for several tools, including an 18-in. lathe and a 3-ft. radial drill.

Steel companies in this and nearby districts with large expansion programs under way are rather slow in making known their tool requirements, but the delay is welcomed by some dealers who will be in better position to quote on this business later in the year.

Pittsburgh Steel Co., Union Trust Building, Pittsburgh, has plans for new by-products plant at Gibsonton, near Monessen, Pa., to cost over $2,000,000 with equipment.

Coshocton Iron Co., East Monongahela, Pa., is erecting one-story addition to local mill, to cost over $130,000 with equipment. Company specializes in production of mining equipment, castings, etc., and is an interest of Combustion Engineering Corporation, 200 Madison Avenue, New York.

General Electric Co., Schenectady, will carry out an extension program at its New Kensington, Pa., works to cost about $100,000. Two new units are being established for pickling and other service, replacing other structures. Company has leased former plant of Commercial Box Co., and will remodel for making welding electrodes. F. H. Mains is local manager.

H. M. Cresswell, 215 Glen Avenue, Ellwood City, Pa., and associates have organized Standard Cotter Pin Co., with capital of $75,000, and plan early operation of local factory to manufacture cotter pins and other small iron and steel specialties. John J. Tyler, 416 Ninth Street, is interested in new company.

Pennzoil Co., Oil City, Pa., an interest of South Penn Oil Co., 545 William Penn Way, Pittsburgh, is planning expansion at its oil refinery, to include new filter press division, boiler house and other units, to cost more than $80,000 with equipment.

James L. Stuart, Oliver Building, Pittsburgh, engineer, has plans for a two-story automobile service, repair and garage building, 100 x 350 ft., to cost about $150,000 with equipment.

United Aircraft & Transport Co., New York, has purchased Standard Steel Propeller Co., 221 West Seventh Avenue, Pittsburgh, manufacturer of aircraft propellers and kindred products, and will operate as a division. Work is under way on addition to Standard company to cost more than $100,000 with equipment.

Gulf States

BIRMINGHAM, Aug., 12. — Alamo Airplane Co., Milam Building, San Antonio, Tex., has plans for aircraft manufacturing plant with initial unit, 106 x 300 ft., for parts production and assembling, to cost about $40,000 with equipment. A. W. Forrester is one of heads of company; Boyd Hammond is company engineer.

Orient Petroleum Co., Wichita Falls, Tex., has plans for extensions and improvements in local oil refinery to increase capacity from 2500 to 10,000 bbl. crude oil per day. Department will be installed for production of gasoline; expansion will be carried out in storage and distributing division. Entire project will cost over $500,000 including machinery. Company is a subsidiary of Atlantic-Pacific & Gulf Oil Co.

Champion Fibre Co., Canton, N. C., has purchased 225-acre tract at Fox, on Warrior River, about six miles from Tuscaloosa, Ala., as site for new mill to manufacture kraft paper stocks, to cost over $3,500,000 with machinery. Company is affiliated with Champion Coated Paper Co., Hamilton., Ohio.

Prest-O-Lite Co., 30 East Forty-second Street, New York, manufacturer of acetylene equipment, welding apparatus, etc., has awarded general contract to Frost Construction Co., Tampa, Fla., for local branch plant at Tampa, one-story, to cost $90,000 with equipment.

Roth Brothers Auto Supply & Machine Co., North Flores Street, San Antonio, Tex., has plans for three-story addition to service, repair and garage building, to cost over $100,000 with equipment. Ralph H. Cameron, Majestic Theater Building, is architect; Beretta-Stiles Co., National Bank of Commerce Building, is mechanical engineer.

Southern Air Transport Co., Fort Worth National Bank Building, Fort Worth, Tex., has approved plans for extensions at Menefee airport, New Orleans, including new repair, reconditioning and assembling building, entire program to cost about $60,000. Thomas Hardin is vice-president and general manager.

Eagle Aircraft Corporation, Kansas City, Mo., is arranging for establishment of factory branch, parts and distributing plant at Dallas, Tex. A hangar has been leased at Love Field and other buildings will be provided. E. E. Porterfield is president. Company also operates Lincoln-Page Co., Lincoln, Neb., and Wallace Aero Co., Chicago, as subsidiaries.

Swift & Co., Union Stock Yards, Chicago, is contemplating new plant at Paris, Tex., to cost about $135,000 with equipment.

City Council, Birmingham, is considering construction of a municipal airport on 300-acre tract near Tarrant City, to include hangars, repair shop, oil storage and other buildings, to cost more than $90,000 with equipment. A. J. Hawkins is engineer.

Packard Motor Car Co., Detroit, will soon begin superstructure for two-story service, repair and sales building at New Orleans, 120 x 150 ft., for which general contract recently was let to J. V. & R. T. Burke, Inc., New Orleans Bank Building, to cost about $120,000 with equipment. Albert Kahn, Inc., Marquette Building, Detroit, is architect and engineer.

Cincinnati

CINCINNATI, Aug. 12.—Although the volume of new business of district machine tool manufacturers has declined slightly, demand continues brisk for August and is on a higher level than for the corresponding period last year. Fresh bookings have increased the large amount of unfilled orders and assure capacity production well into the fall. Manufacturers continue to report extended deliveries and in some instances business has been refused because of inability to make early shipments.

Chicago, Milwaukee, St. Paul & Pacific is inquiring for two switch planers for its Tomah, Wis., shops. Canadian Ingersoll-Rand Co. is in the market for one 84-in. planer and the Great Lakes Steel Corporation is asking for a 96-in. open-side planer.

Contract has been let by Hobart Mfg. Co., Troy, Ohio, manufacturer of meat choppers and kindred products, to Henry Heiser, Dayton, for one-story addition to cost about $20,000.

Board of Education, Van Buren Township, Dayton, Ohio, is said to be planning installation of manual training equipment in new high school to cost about $275,000. Walker & Norwich, American Building, are architects.

Officials of Realty Enterprises, Inc., Marion E. Taylor Building, Louisville, are considering erection of three-story automobile service, repair and garage building, 80 x 230 ft., to cost about $100,000 with equipment.

Ohio Steel Foundry Co., Springfield, Ohio, has awarded general contract to A. G. Samuelson, Inc., Springfield, for a one-story addition, 100 x 200 ft., to cost about $45,000 with equipment.

Officials of Aluminum Co. of America, Inc., Oliver Building, Pittsburgh, have organized a new power subsidiary under name of Nantahala Power & Light Co., to carry out a hydroelectric power project in Tennessee, supplementing developments of Knoxville Power Co., Knoxville, another affiliated interest. New company will have a capital of $10,000,000. Plans are under way for a hydroelectric power plant near Fontana on Tennessee River, to be followed by similiar developments at Bushnell, Needmore and Aquone. Entire project will cost over $75,000,000 with transmission system, including hydroelectric power plant of the Knoxville Power Co., now under way at Calderwood.

Lincoln Service & Motor Sales Co., Dayton, Ohio, has plans for one-story service, repair and sales building, 100 x 225 ft., to cost about $110,000 with equipment. Fred J. Hughes, Dayton, is architect.

Indiana

INDIANAPOLIS, Aug. 12.—Board of Works, City Hall, Indianapolis, Theodore H. Dammeyer, president, is said to be planning an automobile service, repair and garage building for municipal cars, to cost about $100,000 with equipment.

Milroy Milling Co., Milroy, near Rushville, is planning to rebuild part of grain milling plant and elevator destroyed by fire Aug. 2.

General Insulating & Mfg. Co., Alexandria, is planning three-story addition, to cost more than $65,000 with equipment.

Standard Oil Co. of Indiana, Inc., Indianapolis, is arranging increase in capital from $375,000,000 to $450,000,000, part of fund to be used for purchase of Pan-American Petroleum & Transport Co., 120 Broadway, New York, and for expansion in refineries, pipe lines, storage and distributing plants and other properties.

Indianapolis Power & Light Co., Monument Place, Indianapolis, is arranging for construction of new steam-operated electric generating plant on White River, where site has been acquired, to cost more than $7,000,000, including steel tower transmission lines, power switching stations and other facilities.

Forse Equipment Co., Fairview and Fourteenth Streets, Anderson, manufacturer of machinery for dry-cleaning, parts, etc., is said to be planning establishment of new plant, to cost more than $40,000 with equipment.

Bloomington Limestone Co., Bloomington, has acquired properties of Indiana Oolitic Stone Co., in that vicinity, and plans expansion for development of limestone and other quarries, with additional loading, conveying and kindred equipment.

Wabash Foundry Co., Wabash, is erecting an addition which will increase present floor space 7200 sq. ft.

St. Louis

ST. LOUIS, Aug. 12.—City Council, Kirksville, Mo., has plans for a municipal electric light and power house, to cost over $70,000 with equipment. Black & Veatch, Mutual Building, Kansas City, Mo., are consulting engineers.

City Aviation Committee, Lawton, Okla., Harry Stackhouse, chairman, has plans for a hangar, 80 x 125 ft., at municipal airport, with repair and reconditioning facilities, to cost about $100,000 with equipment.

United Aircraft & Transport Corporation, New York, has purchased Stearman Aircraft Co., Wichita, Kan., manufacturer of commercial airplanes. Stearman company will be operated as a unit, with Lloyd Stearman in charge. Expansion in output is planned.

Schwartzmann Service Co., Inc., St. Louis, will erect a one-story and basement automobile service, repair and garage building, 135 x 182 ft., to cost more than $100,000 with equipment. E. E. Christopher, Louderman Building, is architect.

Farmers' Gin Co., Sayre, Okla., is considering erection of three cotton oil mills at Sayre and neighboring localities, to cost about $100,000 including equipment.

Jesco Lubricants, Inc., Kansas City, Mo., care of H. A. Miller, 4430 Park Street, architect, manufacturer of refined oil, has plans for new two-story plant at North Kansas City, to cost about $45,000 with equipment.

Watt Plumbing Co., 608 South Cincinnati Street, Tulsa, Okla., will soon begin construction of one-story storage and distributing plant, 140 x 300 ft., to cost about $50,000 with equipment. Mechanical shop and pipe fitting department are planned. N. B. Fleming, Commercial Building, is architect.

Chevrolet Motor Co., Detroit, is said to have acquired property at Little Rock, Ark., as site for new factory branch and parts station, one-story, 100 x 200 ft., to cost over $100,000 with equipment.

Curtiss-Wright Corporation, Buffalo, formed recently by merger of Curtiss Aeroplane & Motor Co., Buffalo, and Wright Aeronautical Corporation, Paterson, N. J., is concluding purchase of Travel Air Co., Wichita, Kan., manufacturer of airplanes and parts. It is proposed to continue plant at Wichita and expand capacity.

Stuart Aero Products, Inc., Thirteenth and Rutger Streets, St. Louis, has been organized and is operating plant manufacturing airplane parts. A. E. Stuart is president.

Milwaukee

MILWAUKEE, Aug. 12.—The slight decline noticed by some machine tool dealers is attributed to seasonal lull and the let-up in automobile output. Production, however, is being well maintained by other branches of the metal-working industry. Inquiries continue strong. Employment figures for Aug. 1 show that 43,761 persons were employed in Milwaukee industries during July as compared with 43,814 for the previous month.

Kohler Co., Kohler, Wis., has appropriated $1,000,000 for erection of three-story and basement addition, 80 x 600 ft., to be equipped with two Dressler tunnel kilns, each 400 ft. long, supplementing present four Dressler kilns.

Board of Water Commissioners, Sheboygan, Wis., will take bids until Aug. 27 for municipal water filtration plant to cost about $750,000, bids to be separate for equipment and structures. William Koehn is superintendent. Burdick & Howson, Chicago, and Jerry Donahue Engineering Co., Sheboygan, are consulting engineers.

Outboard Motors Corporation, Milwaukee, is about to start erection of $150,000 brick and steel addition to Evinrude factory, consisting of one-story shop, 80 x 255 ft.; testing room, 64 x 64 ft., and other buildings. When completed Lockwood Motor Co. division, Jackson, Mich., and Elto Outboard Motor Co. division, will remove to new structures. Stephen F. Briggs, Briggs & Stratton Co., Milwaukee, is chairman of board of directors, and J. Brown, of the same company, is engineer.

Curtiss Flying Service, Inc., New York, will start erection soon at Granville, Milwaukee County, of two hangars, 100 x 120 ft. each, with machine and service shop. Stone & Webster, Boston, have contract for buildings.

University of Wisconsin, Madison, has to let contract to C. B. Fritz & Co., 138 North Frances Street, Madison, for new mechanical engineering building, three stories, 230 x 230 ft. Total appropriation

is $577,000. Arthur Peabody is State architect.

Northwestern Motor Co., Starr Avenue, Eau Claire, Wis., has begun construction of a one-story addition, 42 x 125 ft., to gray iron foundry.

Unit Corporation of America, Fifty-third Avenue and Burnham Street, Milwaukee, is erecting a one-story factory to house Universal Power Shovel Co., Detroit, a subsidiary, which will move to Milwaukee about Aug. 15. Latter company manufactures excavators, gears, clutches and other mechanical devices.

Pacific Coast

SAN FRANCISCO, Aug. 8.—Contract has been let by Boiler, Tank & Pipe Co., 4061 Piedmont Avenue, Oakland, Cal., to Herrick Iron Works, Eighteenth and Campbell Streets, for one-story plant on 3-acre tract, initial unit to cost about $65,000 with equipment. A crane runway, 60-ft. span and 350 ft. long will be constructed.

Crescent City Grammar School District, Crescent City, Cal., has approved plans for a one-story manual training shop at local school, to cost about $25,000 with equipment. Norman R. Coulter, 46 Kearny Street, San Francisco, is architect.

S. & W. Lawn Sprinkler Co., 2308 West Washington Street, Los Angeles, has plans for one-story mechanical shop, to cost about $25,000 with equipment. Edward L. DiVall Co., 2406 West Washington Street, is architect.

Willard Storage Battery Co., East 131st Street and St. Clair Avenue, Cleveland, has engaged Claud Beelman, Union Bank Building, Los Angeles, architect, to prepare plans for new branch plant on site recently acquired in Union Pacific industrial district, to cost about $600,000 with equipment.

Anderson Barngrover Mfg. Co., West Julian Street, San Jose, Cal., manufacturer of fruit-handling and packing machinery, has plans for one-story assembling plant, 85 x 225 ft., to cost about $45,000 with equipment. Charles W. McKenzie, Bank of San Jose Building, is architect.

International Harvester Co., 606 South Michigan Avenue, Chicago, is planning new factory branch and distributing plant at Tacoma, Wash., to cost about $35,000 with equipment. A parts and service department will be installed.

Snohomish Iron Works, Snohomish, Wash., is said to be planning to rebuild part of plant recently destroyed by fire.

Board of City Trustees, Sacramento, Cal., is considering construction of municipal airport on 230-acre tract in East Sacramento district, including hangars, repair shops, oil storage and other buildings, to cost over $500,000 with equipment. Jens C. Petersen, California State Life Building, is architect.

Central Arizona Light & Power Co., Phoenix, will soon begin construction of steam-operated electric generating plant near city, to cost more than $2,000,000, including steel tower transmission system. Company is operated by Electric Bond & Share Co., 2 Rector Street, New York.

Firestone Tire & Rubber Co., 7 East Polk Street, Phoenix, Ariz., with headquarters at Akron, Ohio, has asked bids on general contract for new factory branch and distributing plant, 140 x 181 ft., to cost about $80,000 with equipment.

P. & C. Hand Forged Tool Co., Milwaukee, suburb of Portland, Ore., is contemplating erection of an addition or an entire new plant, to take care of increased business.

Los Angeles Steel Casting Co., Los Angeles, has been formed to take over business of Los Angeles Foundry Co., manufacturer of steel castings. Personnel of latter company will remain unchanged.

Canada

TORONTO, Aug. 12.—Some improvement is noted in demand for machine tools. Total sales for the week, however, were slightly below those of the previous week, due to the holiday on Monday. New business is appearing in good volume but generally in single tools for replacement. Inquiries are good and indicate a strong demand within the next few months. Small tools are active.

Canadian Lightning Fastener Co., St. Catharines, Ont., will build an addition to double present capacity. Contract for construction has been awarded to Newman Brothers. C. J. Gibson, Toronto, is architect. Equipment will be purchased.

British Metal Corporation of Canada, Sterling, N. B., will build an addition and erect a power house.

Bids will be called in about a week for main building, boiler house, etc., at Longueuil, Que., for Fairchild Aircraft, Ltd., 1253 McGill College Avenue, Montreal. W. H. Wardell, 1463 Union Avenue, is engineer.

Hiram Walker & Sons Metal Products, Ltd., Kildare Road, Walkerville, Ont., have started work on a one-story addition, 40 x 60 ft., to cost $25,000.

Tenders will be called soon for an addition to plant of Kingston Shipbuilding Co., Ltd., Kingston, Ont.

International Pulp & Paper Co., Ltd., Montreal, will start work soon on erection of a pulp and paper mill at Chatham, N. B. Later, company also proposes to build a mill at St. Leonard, N. B.

Hayes Wheels & Forgings, Ltd., has started work on an addition to Merritton, Ont., plant to cost $100,000 and will spend $325,000 on addition to plant and machinery at Chatham, Ont.

Plant of Canada Crushed Stone Co., Vinemount, Ont., was destroyed by fire with a loss of between $80,000 and $90,000, covered by insurance. Owners plan to rebuild immediately.

Simmons, Ltd., Montreal, will start work at once on an addition to local plant to cost $145,000.

Western Canada

Westminster Paper Co., New Westminster, B. C., whose mill was destroyed by fire, announces that it will rebuild on Fraser River, at a cost of $1,000,000.

Foreign

PLANS have been approved by Manila Electric Co., Manila, P. I., for a hydroelectric generating plant at Botocan Falls, near Mayjay, Province of Laguna, for initial capacity of 15,000 hp. Transmission line will be built to Manila and other points, project to cost more than $1,500,000 with equipment. It is proposed to purchase a considerable part of machinery in United States.

Ford Motor Co., Detroit, in connection with program for establishment of European plants, has authorized new assembling works near Warsaw, Poland, to cost more than $750,000 with equipment. Company is completing remodeling of plant at Marina, near Cork, Ireland, heretofore used as automobile assembling works and to be run in future exclusively for production of Fordson tractors.

Continuing its foreign expansion program, Spencer Kellogg & Sons, Inc., Niagara Square, Buffalo, manufacturer of linseed and other refined oils, has purchased plant and business of Copra Milling Corporation, Manila, P. I., producer of cocoanut oils. Extensions and improvements are planned.

Monterrey Iron & Steel Co., Monterrey, State of Nuevo Leon, Mexico, is building new mill for manufacture of steel wheels for street and railroad cars, as well as smaller wheel units for mining and industrial service. It is reported to cost more than $100,000 and is scheduled for service early in fall.

Uddeholm Co., Stockholm, Sweden, is planning construction of a new paper mill at Skoghall for production of kraft stocks. It is also proposed to build an addition to electro-chemical works in same district, entire project to cost about 5,000,000 kroner with machinery.

Officials of American & Foreign Power Co., operated by Electric Bond & Share Co., 2 Rector Street, New York, have organized Shanghai Power Co., to take over and operate electric power plant and properties of International Settlement, Shanghai, China, recently acquired. Plans are being considered for expansion.

New Trade Publications

Gas Burners.—American Gas Furnace Co., Elizabeth, N. J. In bulletin No. 6 is cataloged a number of gas burners produced by the company, including blow pipes, machlet tips, glass fires and fish tail burners.

Stationary Boiler Superheaters.—Superheater Co., New York. In bulletin T-19, entitled "Elesco Multiple-Loop Single-Pass Superheater," is shown the application of the same basic principle—multiple-loop, single-pass arrangement—to all Elesco superheaters for stationary boilers.

Duriron Centrifugal Pumps.—Bulletins 151 and 152, Duriron Co., Dayton, Ohio, describe pumps with 2 and 4 in. suctions for handling corrosive or abrasive fluids. Special features are a duriron shrouding which protects the shaft clear through the stuffing box, and a stuffing box which will not leak.

Tanks.—Commercial Shearing & Stamping Co., Youngstown, Ohio. A pamphlet of 12 pages describes the company's line of "cold-formed" tank heads and tank accessories.

Ladles.—Whiting Corporation, Harvey, Ill. Catalog No. 210, containing 24 well illustrated pages, gives full details and specifications of the company's new ball bearing helical worm-geared ladles, as well as information about the company's standard worm-geared ladle and pin spur-geared ladle. This catalog supersedes catalog No. 202.

THE IRON AGE

New York, August 22, 1929

ESTABLISHED 1855

VOL. 124, No. 8

All-Metal Dirigible Has Gas-Tight Sheath Made of Aluminum Alloy Sheet

As a result of seven years of study and extensive experimentation on scale models, an all-metal dirigible has been constructed for the United States Navy by the Detroit Aircraft Corporation. Special equipment for riveting the thin sheets into a huge gas bag had to be perfected; several novel constructional methods were also devised. Its trial flights are scheduled to begin the week this article is printed.

This Navy dirigible, called the ZMC-2, resembles the Zeppelin type of airship in that it is a rigid ship, built to carry the strains and stresses of flight by means of a rigid hull. However, the means of carrying these shears and stresses have been worked out along entirely different engineering lines.

One fundamental principle enunciated by Count Zeppelin underlies all forms of aerial navigation. In explaining his early experiments with rigid airships, Zeppelin said: "The forces of nature cannot be eliminated, but they may be balanced one against the other." Continuing, he pointed out that ocean steamers are so built that they weigh less than the amount of water displaced by their hulls, and consequently they float above the water. Applying this principle to the lighter-than-air ship, Zeppelin devised a rigid hull so designed that when filled with a light gas it had sufficient buoyancy to lift a cabin suitable for motors, crew and a reasonable pay load, together with surplus fuel for emergencies.

As has been pointed out many times, the German airships were made possible by the discovery of aluminum alloys, which by suitable heat treatment could be made as strong as mild steel (volume for volume) and much stronger than a mild steel piece of equal weight. The skeletons of all Zeppelins have been made of these alloys of the duralumin type (with the exception of the British ship R-101, described in THE IRON AGE, June 27, which used a considerable quantity of stainless steel). Very complicated structural framing has been devised to meet the varying stresses imposed. Main frames are huge wheels, tied together to the center with wire cables. Frames are connected by a series of longitudinal girders, and the panels in the outer surface securely tied by cross bracing.

Recent trend in aircraft construction has been toward the simplification of this skeleton. In the all-metal dirigible ZMC-2 this idea has been developed to its logical conclusion. As may be seen from an interior view, the main frames are merely hoops built up of cellular metal girders, and the ship is practically free from internal tie wires. Furthermore, the cross bracings in the outer surface are dispensed with, because the sheet metal sheathing is riveted securely to girders and longitudinals, and is sufficient-

THE All-Metal Dirigible Grew like a Plant. A riveting machine travelled on a circular track, adding row after row of sheets to the sheathing, one half of the entire structure being lifted one course at a time.

ly rigid to carry the normal shearing stresses in the hull.

Studies of this design developed the facts that not only can an airship be built possessing all of the obvious advantages of all-metal construction but, contrary to common belief, "metalclad" construction in the larger sizes does not weigh very much more than a ship of the same size made with a fabric cover. This is due not only to the fact that the shell or hull plating of the metal airship itself carries the tensile and shear stresses, and reduces the internal framing necessary, but also acts as a gas tight bag. To illustrate the latter point more fully, consider the actual physical structure of the two different types:

The surface of the fabric covered ship consists of five layers (exclusive of framing), from outside to inside, thus:

1. Outer fabric cover with (2) doped coating.
3. Shear wiring.
4. Cord netting.
5. Gas cell fabric lined with gold-beater skin.

These five layers in the fabric covered rigid airship collectively perform the functions of:

1. Fairing the surface.
2. Protection against atmosphere.
3. Transmission of tensile stresses.
4. Accommodation of pressures.
5. Retention of buoyant gas.

The single metal surface in the metalclad ship performs all these functions and performs each of them with a saving in construction cost.

Riveting Machine for Thin Sheet

It will be apparent that some economical method of joining thin alloy sheet metal into a gas-tight unit is a prerequisite to the construction of any ship having these advantages. A riveting machine described in THE IRON AGE, Nov. 18, 1926, was devised for this purpose, which has successfully driven about 3,500,000 rivets, 0.035 in. diameter, in the ZMC-2, with only one-third of 1 per cent defective rivets. In its operation three strands of wire are fed into the machine like thread in a sewing machine. It inserts and completes 135 rivets a minute, or about 5000 rivets in one hour. The overlap is ½ in.; in this are driven three rows of rivets, 12 to the inch. The cost per lineal foot of seam is about the same as the cost of sewing, cementing and taping 1 ft. of fabric seam. Thus was answered the question of how to put the thin sheets of plating together.

The metal from which the sheathing is made is known as Alclad, 0.0095 in. thick, weighing approximately 0.165 lb. per sq. ft. (including overlap for seams). Alclad is aluminum clad duralumin—that is, a sheet of strong aluminum alloy of the duralumin type, covered on both sides by a thin coating of pure aluminum for corrosion resistance. Nearly all of the other parts of ZMC-2 are also made of this material, which has been used extensively in all-metal airplanes for some time past. There is therefore little of the experimental in its present use; its chief characteristics are uniformity, strength and high resistance to corrosion.

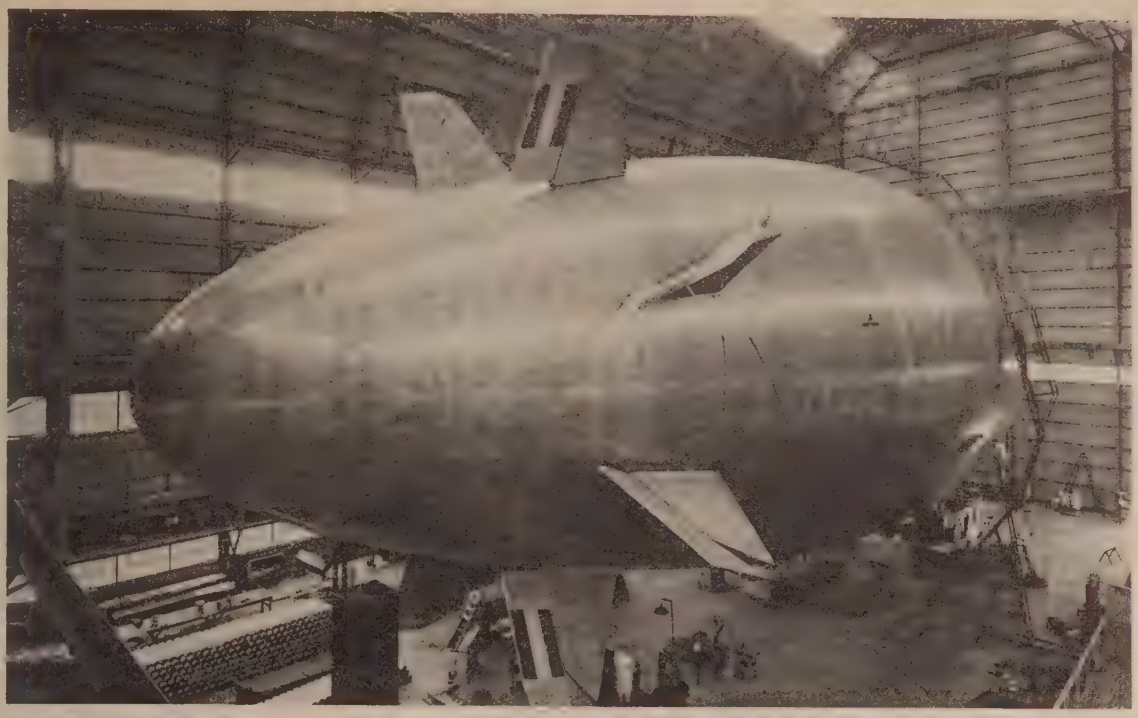
CONTROL Car for Crew of Three, Nearly Complete, Before Attachment to Hull. Dirigible will be driven by two Wright whirlwind motors, 220 hp. each, supported on outriggers one to right and one to left of control car

Development of Design

Some words descriptive of the preliminary work are appropriate.

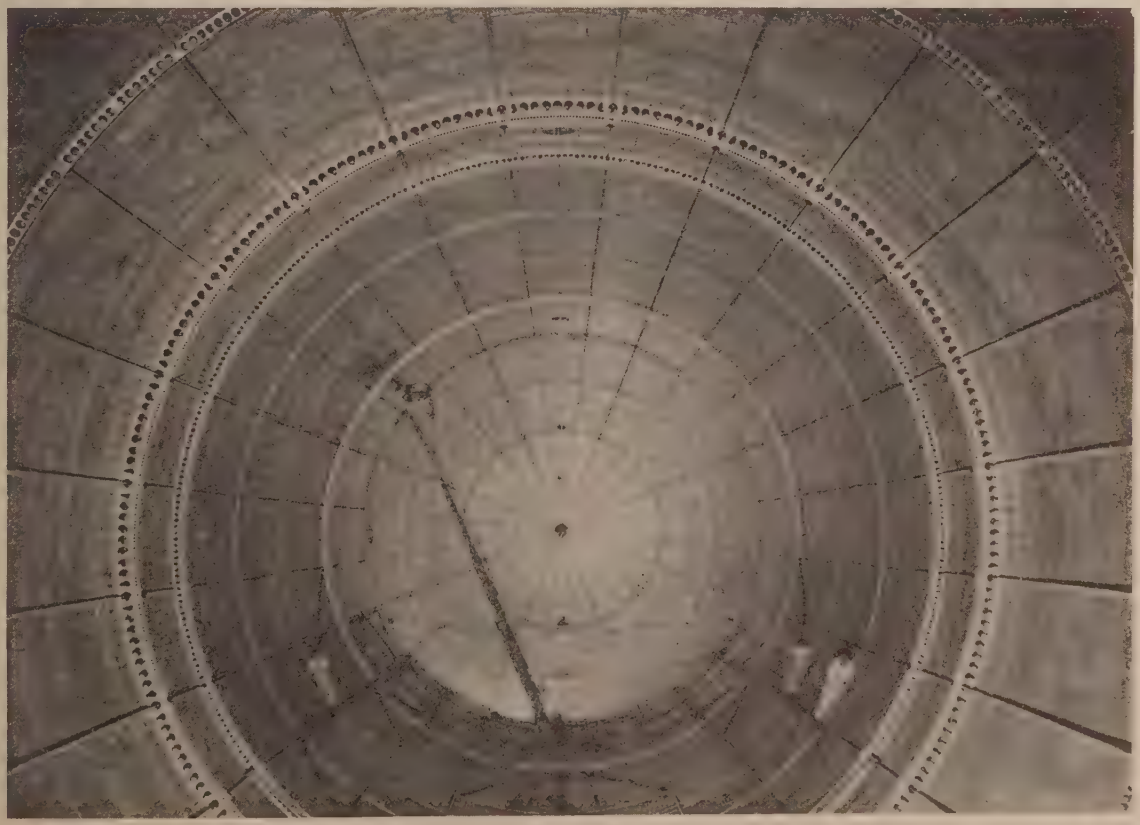
During the great war the engineering and productive skill of many of America's great industries were concentrated on the production of aircraft and aircraft engines, but the readjustment period immediately following the armistice threatened to wipe out the then infant aircraft industry. When the financial and industrial readjustment did not take place as rapidly as anticipated, a group of Detroit men, most of whom were prominently identified with the automotive industry, decided that some definite step should be taken, not only to save the engineering developments of the war period, but to begin a program of scientific research with the view of adapting the principles of military flight to commercial transportation.

In 1922 the Aircraft Development Corporation was formally organized to conduct this investigation. One of the



HULL of ZMC-2 Practically Complete, Looking Toward Prow. Six of the eight control fins are shown; the two at the sides have movements interlocked and act as elevators. The pairs on top and on bottom are rudders

THE Metal Sheath Is Structurally Part of the Dirigible, Taking Shear Stresses Normally Assumed by Intricate Cross Bracing. Note that the interior is comparatively free from tie wires, and the framing of main members and longitudinals is very simple



objectives was the application of the principle of all-metal construction to both heavier-than-air and lighter-than-air craft. At that time there was no metal alloy which could be worked into thin sheets combining the necessary strength with lightness, thickness and corrosion resistance to build an all-metal airship. Several years of experimentation followed.

Among the more prominent concerns assisting in the experimental and research work are: General Motors Corporation, Ford Motor Co., Aluminum Co. of America, Massachusetts Institute of Technology, University of Michigan, University of Detroit and the Detroit Edison Co. Detroit Aircraft Corporation was later organized to construct the ZMC-2 and to engage in other activities connected with aviation.

In the course of the development, metal ships of different sizes were designed in considerable detail and

General Specifications of ZMC-2

Length of hull	149 ft. 5 in.
Maximum diameter	52 ft. 8 in.
Fineness ratio	2.83
Displacement of hull	202,200 cu. ft.
Total ballonet displacement	50,600 cu. ft.
Ratio of ballonet volume to hull volume	25 per cent
Thickness of skin	0.0095 in.
Length of car	24 ft.
Width of car	6 ft. 6 in.
Number of air valves	3
Number of gas valves	2
Number of fins	8
Total fin area	440 sq. ft.
Total elevator area	190 sq. ft.
Total rudder area	95 sq. ft.
Total automatic rudder area	95 sq. ft.
Engines (Wright Whirlwind J-5)	2
Power at 1800 r.p.m.	440 hp.
Propeller diameter (all metal)	9 ft. 2 in.

Forecasted Performance

Gross lift (100 per cent inflation with 92 per cent helium)	12,242 lb.
Weight empty	8,900 lb.
Useful load	3,342 lb.
Crew (three)	600 lb.
Fuel (200 gal.)	1,200 lb.
Oil (25 gal.)	200 lb.
Ballast (50 gal.)	420 lb.
Radio	180 lb.
Passengers and cargo	742 lb.
Range with 250 gal. at cruising speed	680 miles
Maximum possible range (still air)	1,000 miles
Maximum speed at 440 hp.	62 miles per hr.
Cruising speed at 220 hp.	50 miles per hr.
Static ceiling	10,000 ft.

a thorough stress analysis, involving even the integration of all forces as applied to each square foot of the hull surface, was worked out carefully. A large metal model of the ZMC-2 was built to the scale of 1 to 30, and tested at different angles of pitch to verify the theory of the design, of the main bending and shearing actions, and of the factors of safety. Such systematic effort was necessary to develop, mathematically and experimentally prove, the theory of the metalclad airship. This combined research work represents the equivalent of 65 man-years.

Low Fineness Ratio for ZMC-2

The early Zeppelin and similar ships were very long when compared with their width. Some were ten or twelve times as long as they were thick. In the language of aeronautics, the ratio of "fineness," which is the ratio of length to the diameter of a ship, was as high as 10 or 12.

Since that time a general tendency has been to lower this ratio. The Zeppelins of 1918 and 1919 were about 8.6 times their diameters, and the Los Angeles, which is a post-war ship, has a ratio of 7.3.

Careful study of stresses and pressures on the surface of large airships combined with laboratory experiments proves that air resistance of ships with a ratio as low as 5 is even less than many of the long, slender ships.

This fact is due to the discovery that air currents flowing around a body completely immersed in the air have certain influences on long, narrow ships of great size which are not found in ships of shorter and thicker design. Thus the new British ships, R-100 and R-101, being built for trans-Atlantic travel with accommodations for 100 passengers, are about 130 ft. in diameter and 725 ft. long, and have a ratio of fineness of 5.5, the lowest of any dirigible attempted up to the ZMC-2, whose ratio is 2.83.

The designers of the ZMC-2 learned by experiments that rudders and elevators designed to utilize air that is flowing along the surface of a ship are more efficient than those which, placed at the stern, act on air that has already passed the body of the ship. They learned that by placing the elevators and the rudders on the side of the hull some distance from the stern of the ship, greater efficiency and better control could be had with the same surface areas.

It was also discovered that much of the air passing along the surface of a ship does not have any effect on the ordinary type of rudder and elevator. Because of this fact, the ZMC-2 has not the usual vertical rudder and horizontal rudders. Instead, it has a series of eight fins projecting from the hull about 30 ft. forward of the stern. These fins are so synchronized that two on each side act as elevators and two on the top and two on the bottom act as rudders.

In performance, the ZMC-2 will be similar to the non-rigid blimp made of fabric, but as an engineering achievement it is at least equal in importance to that of any rigid airship ever built.

Its size of 200,000 cu. ft. was determined to be sufficient to fulfill experimental requirements of the Navy Department.

After sufficient progress had been made in the underlying engineering work, Congress appropriated $300,000 for the purpose of building this experimental airship. Admiral William A. Moffett, Chief of the Bureau of Aeronautics, said:

"This all-metal dirigible of 200,000 cu. ft. capacity is separate and apart from the Navy's program to construct two airships of 6,500,000 cu. ft. each. It is metal covered, which is, from the standpoint of the Navy, entirely experimental. It incorporates many new and highly technical problems of all-metal construction, which have been developed by well known civilian engineers.

"The construction of this craft was authorized by Congress for the purpose of determining the advantages of all-metal lighter-than-air craft. This particular ship was designed and built in the most convenient size to provide a practical test of all-metal construction and to enable aeronautical engineers to develop the relative advantages thereof."

Summarizing the situation, it may be said that the all-metal dirigible combines three distinct characteristics, none of which have ever been incorporated in a lighter-than-air ship. They are as follows:

1. It will be built entirely of metal, instead of a sheathing fabric which hitherto has been used in dirigibles.

2. It will embody advanced principles in shape, that is, its diameter—50 ft.—will be only about one-third of its length—150 ft.—whereas the familiar Zeppelin type of airships have been from 7 to 12 times as long as they have been thick.

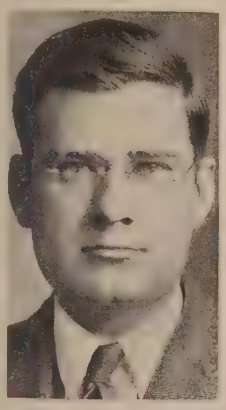
3. Its method of control will differ radically from previous dirigibles. Its elevators and rudders, which regulate its maneuvers up, down and sideways, instead of being at the rear end, will be in the form of eight fins projecting from the hull about 30 ft. forward of the stern.

British aircraft makers have been attracted by the possibilities of the nitriding process. Various parts are being made of it, including gudgeon pins, cylinders, gear wheels, cam shafts, pinions and tappets.

Engineering of Non-Ferrous Metals

Conditions Found in Modern Machines Require Close Specifications and Tests for Properties Now Known Only in an Empirical Way

BY JOHN R. TOWNSEND*



JOHN R. TOWNSEND

THE engineering aspects of non-ferrous metals are of importance when comparing the utility of these materials. The means of accomplishing greater economy in manufacturing operations are often known, but we are nevertheless hampered in the materials available for use.

Precedent has dictated the selection of non-ferrous metals for many years, but recent developments in the mechanical arts have drawn attention to the defects in some old materials and the advantages of some more recently developed. Demands for higher efficiency in the use of these metals requires materials unknown 25 years ago, materials combining great strength with light weight, hardness with toughness, wear resistance with ease of working, and metals having greater corrosion resistance, high endurance limit, heat resistance, improved electrical conductivity and a host of other special properties.

Obscure Causes of Common Failures

The essential requirements of all materials of construction are: strength, hardness, toughness, and elastic properties. These properties may be controlled by specifications employing common and well known tests. Experience has shown, however, that with non-ferrous metals it is especially necessary to control other properties, such as internal strain, fatigue endurance, "directional" properties, (or variations in strength and elasticity dependent upon the direction of rolling and drawing of sheet or rod stock), creep, season cracking, tension properties at elevated temperatures, corrosion and heat resistance. The lack of the proper attention to these properties of non-ferrous metals may result in the selection of a material, which has the desired strength, appearance and workability, yet may be decidedly dangerous to use and result in sudden and even disastrous failure of the parts involved.

Examples of such sudden failure are on every hand. For instance, a shop mechanic may report that a part has failed because it has "crystallized." He is most probably referring to a failure due to "season cracking," fatigue or creep or to a fracture produced at a temperature where the metal loses its ductility. All of these failures will resemble each other in that the fracture will be coarsely crystalline in appearance, due to the path of rupture favoring the trans-crystalline cleavages. It should be noted that each of these failures is due to different service conditions. Some of them are only common to certain non-ferrous metals, or vary in degree with these metals. This further complicates the problem.

Failures Occurring After Stresses Have Been Successfully Resisted

Season cracking, or the spontaneous failure of seemingly sound parts made of some brasses, bronzes or nickel silver, is due to a combination of high internal or applied stress and corrosion. Some non-ferrous metals are entirely free from this trouble; examples are nickel, copper, monel metal and Everdur. Other alloys are only susceptible for a limited range of composition. For example, brass containing 15 per cent zinc or less is free from this trouble. To correct the tendency, finished parts of brass may be annealed at a low temperature (which will relieve the internal strain), or sheet, rod and tube may be "sprung" or bent to equalize the manufacturing strains. Parts made to sustain load continuously and subject to atmospheric corrosion will fail if the conditions are severe enough.

Creep, or the continued movement or flow of a metal under load, is common for lead, tin and zinc at atmospheric temperatures and under moderate loading. Many other metals creep and eventually rupture when loaded at slightly elevated temperatures.

Whereas fatigue failure of steel parts under repeated stressing has been understood for many years and the endurance limit (or stress below which fracture does not occur under repeated loading) for steel is approximately 40 per cent of its ultimate strength, the endurance limit for some of the non-ferrous alloys has been found to be as low as 12 per cent of its ultimate strength!

Some non-ferrous metals have brittle ranges at elevated temperatures. For example, annealed high brass sheet has practically no ductility at 600 deg. Fahr., and will break easily at that temperature, revealing an intercrystalline fracture.

These various types of failure can be prevented either by selecting metals that are not subject to these troubles or by so proportioning each design as to eliminate them, at least within the life of the part.

At present our understanding of such common properties, as wear, punching, drawing, forming, welding, soldering, brazing and riveting, is mainly empirical, for we have as yet acquired relatively little systematic knowledge of these properties of non-ferrous metals.

Economic Factors Govern Use of Special Alloys

In addition to the above-mentioned properties concerned with *use* of these metals, there are a number of economic factors that must be taken into consideration when a metal or alloy is to be used in quantity and in a commercial manufacturing operation. These are cost, source of supply, uniformity of quality and the degree

*Bell Telephone Laboratories, New York.

to which the metal may be controlled by specifications.

The cost of the metal must be consistent with the use to which it is being put. When possible the source of supply should be wide spread, domestic, competitive and reasonably free from interruption. This ideal can not always be met, because nature has not provided us with unlimited and widespread domestic sources of supply of metals. Metals are bought in a world market, and this may sometimes cause the abandonment of native mines in favor of sources abroad which are richer and cheaper to work. For example, tin and antimony, which are extensively used in non-ferrous alloys are imported from abroad—tin from the East Indies and antimony from China.

Competitive sources of supply are necessary to obtain favorable prices. Here again, competition may be impossible. Then the force of other considerations must be great enough to overcome the objection to relying upon limited sources. Generally speaking, the newer alloys of exceptional and widespread utility are the result of long continued research activities by their inventors and are necessarily of higher price and limited source. The general policy of their producers, however, appears to be to market these alloys at but a slight increase over the cost of the ingredients, the increased demand for the base metals being considered an adequate return.

Rigid Specifications Necessary for Mass Production

The matter of specification requirements is also becoming one of increasing importance. It is absolutely essential that supplies of non-ferrous metals be uniform in quality, shape and thickness; if otherwise, design and manufacturing difficulties will arise. Modern high-speed production methods depend upon a careful set up of machinery and this in turn upon the continuous flow of uniform material, if the dimensions for formed, punched, drawn, welded and forged parts are to be sufficiently interchangeable, and high-speed production unhampered. Adequate supply consequently requires an intimate knowledge of the properties of metals, a thorough revision of our old methods of test and the creation of new ones to control more accurately these useful properties. Materials specifications, if they are to be wholly effective, to meet the requirements of uniformity, must contain in addition to specific requirements, methods for inspection and sampling. This is leading to a more general use of statistical methods of quality control as a means of guaranteeing the economical use of materials in high-speed production.

Surface Seams in Rails Cause of Crescent-Shaped Base Fractures

AS a sequel to a fatal derailment in 1928, James E. Howard, engineer-physicist of the Interstate Commerce Commission investigated the occurrence of seams in the base of rails. The accident in question was the result of a fracture from that cause. His remarks are summarized below.

Base fractures are commonly progressive, not immediately forming in new rails, but with an interval of time elapsing between their incipient formation and final rupture. They originate at a longitudinal seam in the lower surface of the base, thence gradually extending upward. A crescent-shaped piece of the base is eventually detached. The final stage of complete rupture is reached by the upward extension of the fracture from the base of the rail, traversing upward through the web and the head.

It has been the experience in the examination of crescent-shaped base fractures that such fractures invariably started at a longitudinal seam. In some cases the seam was several hundredths of an inch in depth and displayed blue-black walls. Such a seam or lap was made without doubt during the fabrication of the rail. Other explanations have been offered for the presence of some of these manifestations. Short, intermittent lines have been attributed to the breaking through of small blowholes which had formed near the surface when the ingot was cast.

The presence of surface seams covering a portion of the periphery of the head and a portion of the base led to the introduction of a deseaming process which at least removed the seaminess at the particular pass at which it was done. Diagonal rolling has been given consideration in the fabrication of rails.

Structural shapes display similar seaminess, often much exaggerated, and in which there is a relation between the location of the seams and the roll designs in which the shapes were formed. Seams are found at definite places in rolled angles, channels and beams, especially in the latter in pronounced degree.

Influences which lead to the formation of surface seaminess appear to cause different results on different occasions. Some rails are nearly free from seaminess, whereas others are very much affected, too seamy to justify putting them into the track.

Tests of bases of rails, by crosswise bending the flanges, display a high degree of strength, apparently in excess of service requirements. Such results, however, furnish additional examples of the remote relations between primitive static tests and the endurance to repeated strains of service. Variations in the state of seaminess of the bases of different rails, from those nearly immune and those extremely charged with numerous and deep seams, would appear to indicate that some control of conditions at the mill was possible during fabrication which would restrain their formation.

Short sections of rails from each of several rail mills were pickled in hot acid and their bases photographed. The results were not all the same in degree, but from no source were the rails presented of complete exemptions from base seaminess. General experience leads to the belief that fluctuations would be found if the tests were repeated, but substantially the same results would be reached.

A sharp reentering angle, as well known, is a menace to all grades of carbon steels which are exposed to repeated stresses, and especially alternating stresses. It is probably safe to say also menacing to steels exposed to shocks and vibratory stress.

Iron ore has been stripped and mined by steam shovels for years on an enormous scale. As a whole, operation is on a greater scale than that at open-pit copper mines, but no single iron mine handles nearly as much material as the Utah Copper Co. at Bingham, Utah, and few of the iron mines handle as much as the other open-pit copper mines. However, the removal of up to 21,000,000 cu. yd. of capping and 35,000,000 tons of iron ore in a season of eight months with 300 to 400 power shovels in operation and standard transportation systems is a great feat.

Electrifies Superior Strip Mills

Hot Rolling Mills Are Centralized and Equipped with Electric Drive with Minimum Loss of Production and an Increase in Capacity

BY H. H. WRIGHT*

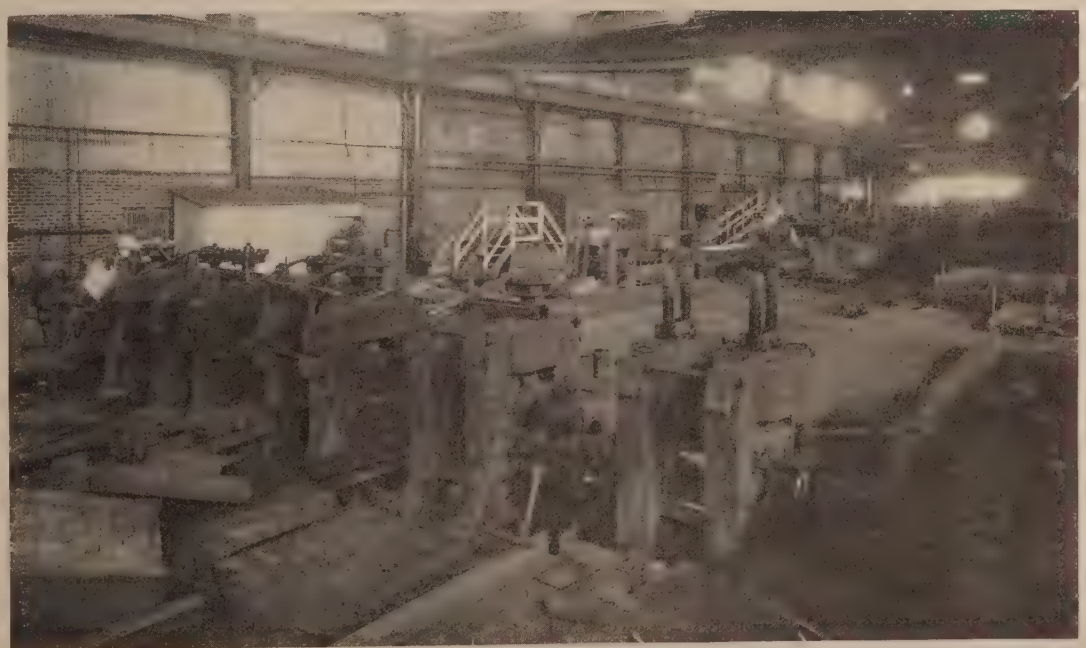
CENTRALIZATION of hot mill production in a group of mills which could be equipped with modern electric drive and otherwise adapted to the company's needs has been accomplished by the Superior Steel Corporation, Pittsburgh, at its Carnegie, Pa., works, with a minimum of expense and loss of production. With a growing demand for the strip steel products in which the company specializes, an increase in hot mill capacity had become imperative. With the exception of the 10-in. mill, all the hot mills were steam driven and the steam equipment had become uneconomical to operate. In making the changes the older steam mills were kept intact for use in emergencies and to help out in times of peak demand.

The 10-in. mill is an electrically driven unit, consisting of a 20-in. rougher, a vertical edger, a 10-in., three-stand intermediate train and a two-stand, 10-in. finishing train. The capacity of this mill was limited by the drive on the finishing train, which was an induction motor with no provision for speed adjustment. Near the 10-in. mill was a steam driven 14-in. mill, which was in good condition but uneconomical to operate because steam for the engines was supplied from an isolated boiler house on which the labor cost and standby losses were high.

It was decided that, by modifying the 14-in. mill slightly and replacing the engines with motor drive, practically all the requirements for heavy strip could be handled in this mill and that, by replacing the 10-in. mill finishing train drive with an adjustable-speed motor, the capacity for rolling medium widths could be increased satisfactorily. With the installation of a new electrically driven 8-in. mill, the hot mill capacity for narrow, medium and light-gage material could be rounded out and make it possible to shut down a steam-driven mill. This program was carried out and has resulted in an increase in hot mill capacity and reduced operating costs.

The modified 14-in. mill, shown in an accompanying illustration, consists of a 20-in., three-high breakdown stand in tandem with a 14-in., two-high flat pass and two vertical edgers; a three-stand 14-in. intermediate train, and a 14-in., two-stand finishing train. The original drive consisted of two engines, one of which drove the intermediate and finishing stands as a single five-stand train. The roughing mill engine was direct connected to the first

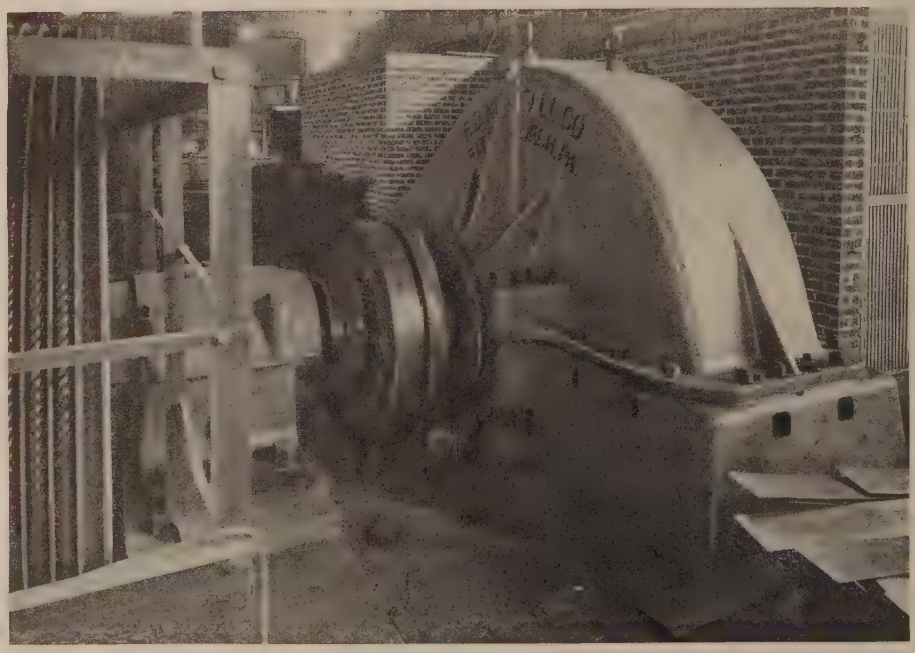
*General engineer, Westinghouse Electric & Mfg. Co., East Pittsburgh, Pa.



THE 14-in. Mill as Seen from Finishing Side. The motors driving the edgers and intermediate stands are located in the motor room on the left. The drives for the roughing and finishing stands are in houses on the right

14-in. flat stand and drove the breakdown stand and vertical edgers through a rope transmission. To give greater flexibility the rope transmission on the edging stands was eliminated and individual adjustable-speed drive provided for each stand.

The breakdown stand and first flat stand could be driven satisfactorily by a 1500-hp. constant-speed motor, so the 1500-hp., 352-r.p.m. motor was taken from the finishing train of the 10-in. mill and connected to the first flat pass through a helical reduction gear unit which has a ratio of 352/120 r.p.m. The old engine shaft, flywheel and rope sheave and rope transmission to the breakdown stand were retained. The engine base and main bearing were entirely removed and a new pedestal installed to replace the main engine bearing. The gear unit and motor were mounted partly on the old engine foundation and partly on a new foundation, and to correct for possible misalinement of shafts due to unequal settling of foundation, flexible couplings were used on both the high and low-speed sides of the gear unit.



THE 1500-hp. Gear Unit on the 14-in. Mill. The bearing next to the rope sheave is located in the position formerly accepted by the engine main bearing

The vertical edging stands are each driven by a 300-hp., 600-volt, 600/1200 r.p.m., direct-current motor through a helical gear unit. All gear units, both for the edging rolls and the 1500-hp. main roll drives, have roller bearings.

The 14-in. intermediate train required a constant speed drive, and a 2000-hp. 180-r.p.m. direct-connected synchronous motor was installed. To allow adjustment for variation in roll diameter and draft, the two 14-in. finishing stands were equipped with a separate set of pinions and coupled to a 2000-hp., 600-volt, 200/360 r.p.m. direct-current motor. To replace the 1500-hp. motor, which was moved from the 10-in. mill finishing train to the 14-in. unit, a 1500-hp., 600-volt, 325/450 r.p.m. direct-current motor was installed.

The 8-in. unit has five stands and is equipped with two sets of pinions to allow the use of two motors. The roughing stand, intermediate stand and two edging stands are driven by an 800-hp., 450-r.p.m. synchronous motor and the finishing stand by a 500-hp., 600-volt, 400/600 r.p.m. direct-current motor.

Electric power for the entire plant is distributed about the plant at 2200 volts. The existing substation and motor room at the 10-in. mill was enlarged to house all the new switching equipment, the 2000-hp. synchronous motor, the 300-hp. edger motors and gear units for the 14-in. mill and the 2500-kw., 600-volt, three-unit, synchronous motor-generator which supplies 600-volt direct current to all the adjustable-speed motors. Direct current is distributed from the station at 600 volts through overhead cables, and the alternating-current motors, not located in the main substation, are supplied through 2200-volt, three-phase feeders.

The arrangement for generating at a central point all the 600-volt direct current required for a number of mills is ideal where the drives are not widely scattered. With this arrangement advantage can be taken of the fact that all motors are not fully loaded at one time, thus reducing the capacity of the generators. In this installation the combined capacity of all the 600-volt direct current motors is 4600 hp. and they receive power from a motor-generator of 2500 kw. capacity.

For the sake of simplicity in the control it was desirable to have the 800-hp. and 2000-hp. synchronous motors started by connecting them directly to the 2200-volt line without the use of auto-transformers or reactors. In the case of the 2000-hp. motor this method of starting would impose a sudden load on the system greater than the total plant load had previously been, which would affect the voltage of the entire system. This surge is practically eliminated by a very simple procedure. Before starting the 2000-hp. motor, the 2500-kw. synchronous motor-generator is started with no line disturbance by means of an auto-transformer. The set is brought up to speed, synchronized and full excitation applied. The 2000-hp. motor is then started at full voltage and, because of the effect of the motor-generator, which acts as a condenser, the resultant demand on the 2200-volt system is reduced to a low value.

The contract for the electrical equipment, gear units, couplings, pedestal bearing to replace the main engine bearing on the 14-in. mill, for the machine work involved in removing the engine crank disk and grinding a new journal on the engine shaft and for the labor and material was given to the Westinghouse Electric & Mfg. Co.

Germany's Electric Steel Furnaces

There Are Now 56 Arc and 13 Induction Units—Arc Furnaces More Popular — Operating Features of Both Types

A SURVEY recently completed by St. Kriz, in *Stahl und Eisen*, March 28, 1929, pages 417 to 425, under the auspices of the Verein deutscher Eisenhüttenleute, reveals the fact that there are 56 arc-type electric steel furnaces in operation ranging in capacity from 0.3 to 15.4 tons. There are also 13 induction furnaces of from 2.5 to 10 tons capacity.

The apparent popularity of the arc furnace over the induction type is probably due to its greater flexibility in the matter of material charged, long life, and better power characteristics.

Bottom contact, which in the early days of the industry was hailed as a forward step, is becoming obsolete. Only three of the 56 arc furnaces are so equipped.

The various essential features of the comparison, briefly enumerated, are as follows:

Size: As in the United States the most widely used are those from 2 to 8 tons capacity.

Transformer Rating: This varies uniformly with the size of the charge, being about 750 kva. for the 2-ton furnace and 4000 kva. for the 16-ton.

Furnace Voltage: For the small furnaces the voltage impressed during melting and refining runs about 80 to 100. In the larger units (12 to 15 tons) about 190 volts are used in melting and 120 in refining. In contrast to these figures which are for basic practice, furnaces running with acid slags may employ slightly higher voltage, due to the lower electrical conductivity of the slag. Variation in voltage is accomplished by taps on the primary or by changing from delta to star connections or both.

Reactances: Most installations contain reactance coils on the high-voltage side of the transformers, in order to steady the arcs and prevent surges in the circuit.

Hearth Dimensions: The cubical contents of the furnace below the working level are approximately 0.2 cu. meter per ton (about 7 cu. ft.), with a slag surface of about 0.5 sq. meter per ton (about 5.5 sq. ft.). Maximum depth of the bath is about 2 ft.

Hearth Material: In the basic furnaces, either magnesite or dolomite is used. In a few cases silica brick are used above the slag line, and in about a third of the furnaces a quarter or half-course of firebrick is used between shell and lining. The average life of the dolomite walls is 74 heats and of the hearth 416. For magnesite these figures are about 50 per cent greater.

Roof Material: Silica brick roofs of 10 to 12 in. thickness are almost universally used. Life of the roof varies from 23 to 138 heats. Expressed as pounds per ton of charge the consumption of silica varies from 3 to 50.

Cooling: Opinion is divided as to the economy of water cooling, except of the electrode clamps. Certain plants use water-cooled doors, door frames or roof frames. Others find the increased heat loss and repairs exceed the savings in materials.

Electrode Consumption: In 33 furnaces carbon electrodes are used, the average consumption being 32 lb. per ton of cold charge and 17 lb. per ton of steel with liquid charges. The Söderberg (self-burning) electrode is used in 5 furnaces, and is consumed at the average rate of 44 lb. per ton of solid charge. These are employed mainly for the larger sizes (15 to 17 in.), where the consumption of solid electrode is slightly higher than 44 lb. per ton.

Graphite electrodes are used by 23 furnaces, showing the following average results:

	Lb.
Per ton of cold charge.....	16.3
Per ton of hot charge.....	6.6
Per 1000 kwhr.....	17.4

Power Consumption: The rate of use of electrical energy during melting depends on the speed of melting and the size of the charge. Thus the average 7-ton furnace with a cold charge will melt in about 6 hr. using 700 kw., in 3 hr. with 1500 kw. and in 2 hr. with about 2200 kw. In the refining period the power input is dependent on the size of the charge, 500 kw. for the 4-ton, 750 kw. for the 7-ton and 1000 kw. for the 11-ton furnace.

Steel Plate Floor in Office Building

THE first important application of steel plate or "battledeck" flooring has been made by the Eastern Bridge & Structural Co. in the lobby of the Worcester Pressed Steel Co. Building, Worcester, Mass. The steel plates are 3/16-in. thick, 24-in. wide and largely in 12-ft. lengths. These are welded to 3-in. standard I-beams. The welds are continuous bead type, the plates being tack-welded in place before the running of the bead. Complete cost data are being compiled by the American Institute of Steel Construction, New York.

Machining Airplane Cylinders

Steps in Transforming a Forging Into a Finished Barrel and Preparing the Cylinder Head to Go Into Assembly

BY FAY LEONE FAUROTE*

EACH of the three Wright engines, the five-, seven- and nine-cylinder, uses the same unit assembly of cylinder, cylinder head and valve mechanism. Because of the unusual form and combination of steel and aluminum used, the method by which the components forming this unit assembly are fabricated and combined is sure to prove of interest to metal workers.

The cylinder head, which is cast from aluminum alloy in the Wright foundry, is cleaned, sand blasted, heat treated to 950 deg. Fahr. for 5 hr., cooled in still air, aged for one hour at 450 deg. Fahr., again heated to 950 to 975 deg. for 1 hr., cooled and aged again for 1 hr. at 450 deg.

For its first machining, the casting is chucked on the outside diameter at the open end against the face of the flange in a Gisholt turret lathe, and the rocker boxes, exhaust and intake ports are targeted. The flange is rough and finish turned, and the boss faced, bored and drilled. The component is then transferred to a Bullard Mult-Au-Matic, where the following operations take place:

Rough and finish face open end to 3.525 ± 0.005 in. dimension.

Break sharp edges on outside dimension.

Rough bore 5⅛-in. diameter x 1 13/64 in. deep.

Rough form dome 3⅛ in. deep from face.

Finish turn dome 2 11/16-in. radius x 3.150 in. deep and bore 5 1/32 in. diameter.

Finish bore thread diameter to 5.250 ± 0.002 in. x 1.250 ± 0.002 in. deep from face.

Form 3/16 in. x 5 23/64 in. diameter, undercut square with thread diameter, holding 1.250 ± 0.002-in. depth.

Chamfer 45 deg. to 5⅜ in. diameter.

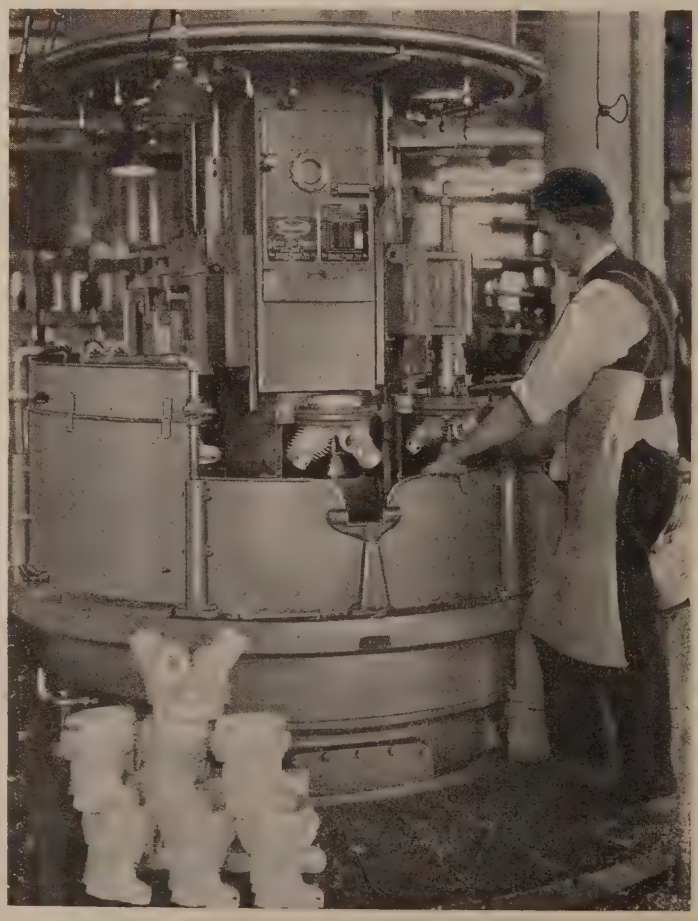
Form 1/32 x 45 deg. chamfer at outside diameter of flange.

Cut 5 11/32 in.-12P modified buttress thread.

There are six stations on the Bullard Mult-Au-Matic, one for chucking and five for machining. As a head is installed and moved to first operation, all stations are stepped up one and the finished head is removed. Thus five machining operations take place simultaneously. There are, at present, three Mult-Au-Matics at the Wright plant; one is used exclusively for machining cylinder heads and one exclusively for cylinder barrels. The other can be used for machining either the cylinder head or the barrel.

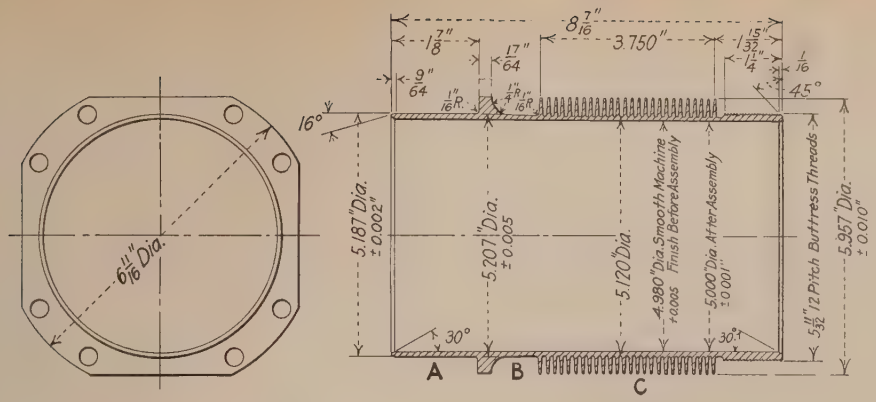
If necessary, following the above operations, the buttress thread is retapped on the drill press, after which the part is given a careful inspection, and a water test at from 500 to 600 lb. pressure. If leaks or sweating occur at the water test, sodium silicate is pumped into the cylinder at a temperature of 150 to 212 deg. Fahr. and at 500 to 600 lb. pressure. The cylinder is then washed in warm water for about a minute and baked for an hour at 500 to 600 deg. Fahr.

A 24-in. drill press is used for rough and finish boring the intake port and chamfering, after which a Leland-Gifford two-spindle special drill drills and reams the valve guide holes, spotfacing and cham-



BORING, Tapping and Finishing Dome on Cylinder Head of J-6 Series "Whirlwind" Engine on Six-Station Machine

*Mechanical engineer, New York. In THE IRON AGE of July 18, page 148, Mr. Faurote described the airplane engines of the Wright Aeronautical Corporation. In the issue of Aug. 8, page 337, he told how the connecting rods were machined and in the issue of Aug. 15, he covered the machining of the crankshaft. Remaining articles are devoted to the crankcase and to the assembly problem.

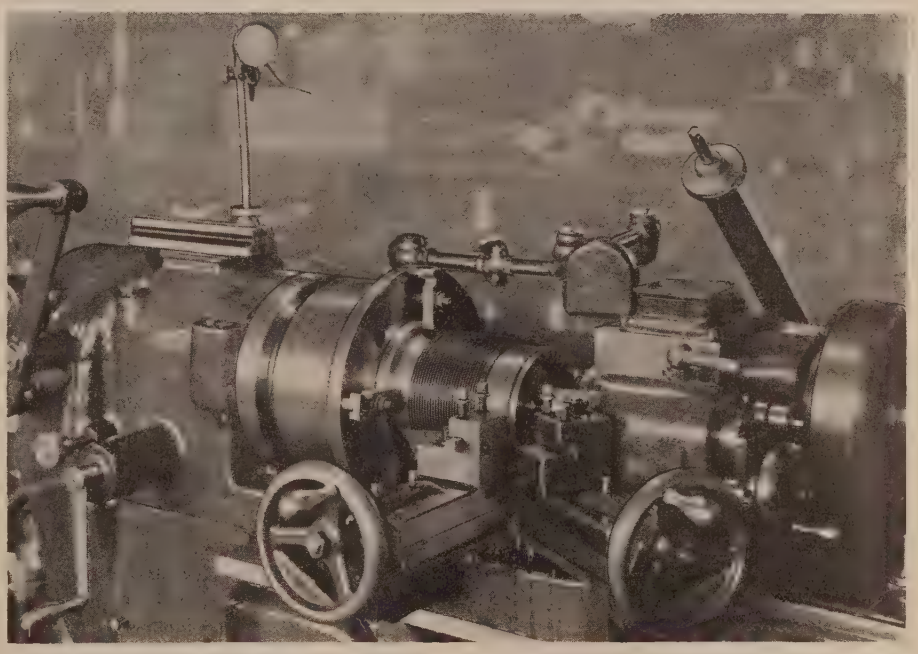


ACCURACY in Maintaining Precise Dimensions Features the Machining of Cylinder Barrels for Airplane Use, as with All Other Engine Parts. At left is the standardized "Whirlwind" Cylinder

MILLING thread on Cylinder Barrel, Facing and Chamfering Cylinder Seat in Same Operation, Thus Having Positive Square Seat with Thread (Right)

* * *

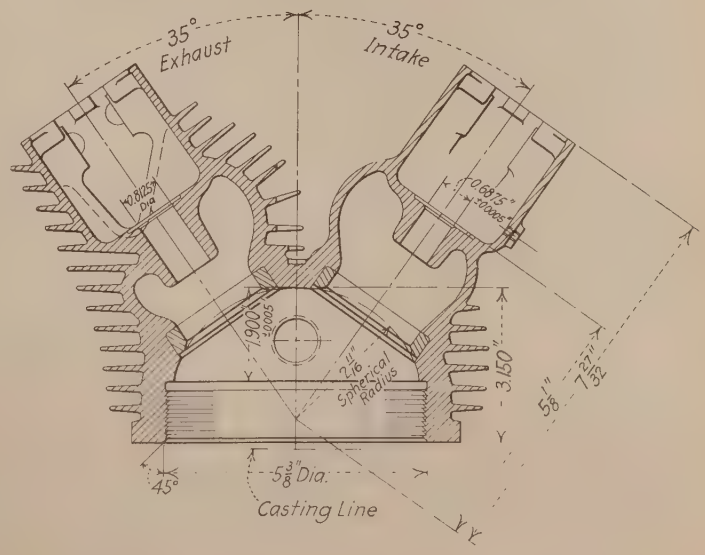
SECTION (Lower Right) Through Exhaust and Intake Ports on Cylinder Head, Indicating Extent of Cooling Ribs on Head and Exhaust



fering. The valve seats are then rough and finish bored and the bosses faced. The rocker box faces are milled on the Milwaukee special duplex miller, and the exhaust flanges are rough and finish milled on the No. 2 plain miller.

A Cincinnati horizontal miller, 18-in., then mills the rocker box bosses, and a Leland-Gifford two-spindle special drill drills and counterbores the intake and exhaust rocker boxes. A special Leland-Gifford two-spindle drill also drills and finish reams the bosses, and a single-spindle drill counterbores the rocker box boss. The rocker box faces are drilled and reamed, and the holes countersunk, and a 20-in. Barnes drill press drills a hole through the spark-plug boss, counterbores and countersinks and taps.

The No. 2 Leland-Gifford 20-in. three-spindle drill puts the "F" holes in the exhaust flange, countersinking and tapping them also. After counterboring the holes in the exhaust flange, the part is clamped in the drill jig and a hole is drilled through the boss on the



side of the intake rocker box. It is spotfaced and tapped. A bench operation removes the sharp edges in the cylinder bore and the spark-plug holes. The intake and exhaust port walls are filed and scraped, and cuts blended where necessary. After washing in hot water the cylinder head is given a complete inspection.

Machining the Cylinder Barrel

STEEL forgings for the Wright Whirlwind cylinder barrel are purchased already heat treated according to specifications. When received at the Wright plant they are inspected for dimensions, examined for defects and for external appearance relative to machining, such as scale, and tested for hardness.

The first machining operation is on the Fay automatic roughing lathe, which rough turns and forms the outside diameter. The process is as follows: First a hole is chucked in; then diameters 5 5/16 in. and 5 7/16 in. are formed (at *A* and *B* on diagram), making a flange 7/16 in. thick, forming an angle at back of flange and holding left end to a 15/16-in. dimension. Next a 5½-in. diameter is turned (at C in diagram), making 3 15/16 in. dimension over radiating fins. Then a 6 1/16-in. diameter is turned over the fins; also a 6 13/16-in. diameter over the flange. Finally the thread end is faced to 1 7/16-in. dimension.

Next the forging is taken to a Bullard Mult-Au-Matic. Here the flange outside diameter is finish turned to 6 11/16-in. diameter. A 4 15/16-in. rough bore is put through. Then the end is rough and finish faced to 1 25/32 in. from face of (unfinished) flange. The 5.187-in. diameter is rough turned to 5¼ in. Next the flange is rough faced to 1 27/32 in. from end, holding 1/16 in. radius in corner.

Then the back of flange is rough tapered and angled, making flange 11/32 in. thick. The 5.207-in. diameter is turned to 5¼ in.; ¼-in. and 1/16-in. radii are held, making width of cut 15/16 in. The 5.187-in. diameter is then finish turned to 5.205 ± 0.003 in. and the flange finish faced to 1⅞ + 0.000 — 0.010 in. from end.

Following this, the back of flange is finish tapered and angled, making flange 9/32 + 0.000 — 0.010 in. thick, and with 5.207 ± 0.005-in. diameter and 5.120 ± 0.005-in. diameter, holding ¼-in. and 1/16-in. radii and making width of cut 1 in. The bore through cylinder barrel is then finished through to 4.980 ± 0.002-in. diameter. A 30-deg. chamfer is formed to gage on inside of bore at both ends, and a 16-deg. chamfer is formed outside at left end, making 9/64 to 3/16 in.

The thread is milled and the end of cylinder is faced and chamfered all in one operation on a specially designed Hanson-Whitney thread miller. This provides for a positive square seat with relation to the thread. The threads, as usual, are cut on the barrel while it revolves; during each complete revolution of the barrel the tool traverses the width of one thread and the thread is thus made continuous.

Sharp edges at top of fins are broken slightly on a speed lathe before the cylinder barrel is given a thorough washing in gasoline. It is then inspected and delivered to finished stores or to the cylinder machining assembly.

Assembling Cylinder Barrel and Head

AT this point the cylinder barrel, which in the meantime has been machined as above (virtually in the same manner as described in the former articles on the manufacture of the Wright engine, THE IRON AGE, March 1, 1928, p. 591), is ready for assembly with the cylinder head. The cylinder is heated to 650 to 700 deg. Fahr. and held at this temperature for half an hour, after which it is removed from the furnace and set on pads of the fixture, open end up. The intake pipe connection is driven into seat, as are the exhaust valve seats and intake valve seats. The cylinder barrel is then screwed into place, the plugs and clamps removed and the assembled cylinder set on a bench to cool in an inverted position, that is, with the open end up.

After filing and scraping the intake and exhaust port walls and inspecting the assembly for cracks, the spark-plug inserts are screwed into place and the assembled cylinder given a hydraulic test at 500 to 600-lb. pressure per sq. in. Cylinders for Government use are always tested in the presence of the Government inspector.

The next operation is drilling eight 13/32-in. diameter holes through the flange on a special multiple-head Leland-Gifford drill. After riveting the intake connections to the cylinder head, a hole is drilled through the intake pipe connection, a hole drilled in the flange boss, reamed, formed and tapped. A Cincinnati duplex miller then straddle-mills the cylinder barrel flange to 2 31/32 in. from center, four sides. After removing all burrs, the job is washed in Oakite about 30 sec., then rinsed in cold water, then in hot, finally sprayed with Hilo metal primer, baked at 450 deg. Fahr. for 1½ hr., sprayed with Hilo black cylinder enamel, baked at 450 deg. Fahr. for 1½ hr. and cooled in air. All priming and enamel are of course kept off all finished surfaces on cylinder head, and also the lower flange face and cylinder barrel.

On a two-spindle sensitive drill, holes for the dowel pins are put in and the dowel pins placed. All the holes are retapped to remove the enamel, the valve guide holes rereamed, the intake and exhaust valve guides pressed into place and hand reamed, as are the rocker box holes also. A Cincinnati plain grinder with a live head squares up flange and grinds diameter to 5.187 ± 0.002 in. A back spotfacing machine spotfaces eight 13/32-in. holes in flange 11/16 in. diameter, after which the assembly is taken to a Heald automatic grinder, which rough and finish grinds the cylinder bore to 5.000 ± 0.001-in. diameter. The cylinder is finished by stoning on a Hutto lapping machine 5.000 ± 0.001 in. diameter. After washing thoroughly with gasoline and undergoing a complete inspection, the cylinder assembly is then delivered to the finished stockroom ready for the engine assembly line.

Soft Surface on Quenched High-Carbon Steel

In order to determine whether the speed of cooling was sufficient to retain austenite at the surface of quenched high carbon steel, or whether the expansion and contraction stresses would modify the theoretical condition materially, Professor Honda and his associates quenched a number of small blocks (20 x 20 x 40 mm.) of Swedish steel. Their results are given in *Science Reports*, Tohoku Imperial University, for May, 1929.

The specimens quenched were sawn lengthwise by a copper band with carborundum powder scattered over it, and one-half of them were again cut into halves. During these processes, the specimens were always cooled in water in order to avoid their tempering. Exterior and interior surfaces were then explored with microscope, with scleroscope and with X-ray diffraction apparatus.

Results, summarized in the table, show that the amount of retained austenite in the outer layer is greater than in the center, the excess increasing with carbon content and quenching temperature.

Carbon content per cent	*Quenching temperature deg. C.*	*Retained austenite X-ray Analysis external surface per cent*	*Retained austenite X-ray Analysis sectioned area per cent*	*Shore Hardness external surface*	*Shore Hardness sectioned area*

Government-Built Steel Motor Boats

Fleet of Ten Built by United States Engineer Corps—Methods of Shop Fabrication Outlined

BY JOHN VAN HORNE*

THREE arc-welded steel motorboats for use as carriers and tow boats on the Mississippi River and its tributaries are being built by the Corps of Engineers, United States Army. This is the second fleet to be so constructed by the Army engineers; the first seven, launched over a year ago, have been in continuous service ever since.

These launches are constructed entirely of steel, all permanent connections being made by the electric arc-welding process. Each craft is 28 ft. long over all, 7 ft. wide and 2 ft. 4½ in. deep. The freeboard varies with the load, the draft being very little when the boat is not loaded. The boats have flat bottoms, slightly stepped close to the stern, and have a rather sharp rise at bow, making a broad, flat prow, similar to the seaplane type.

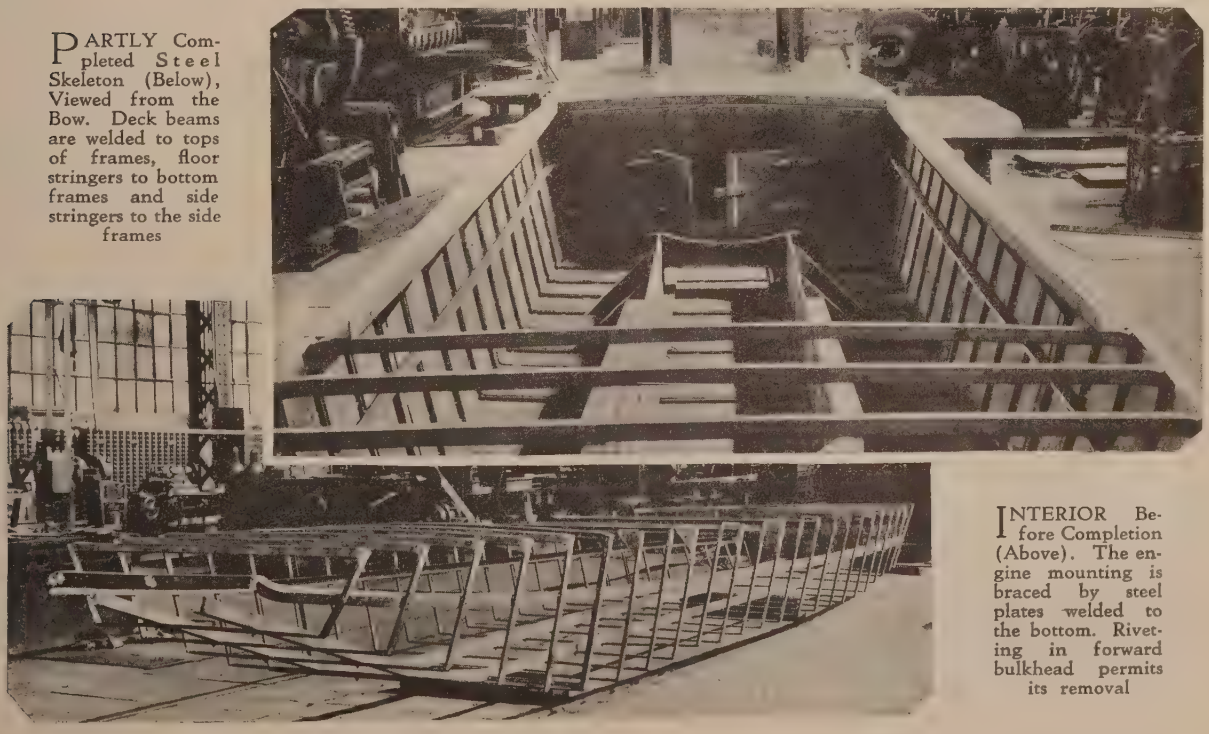
Some idea of the construction of these boats may be gained from the illustrations. One shows the partially completed steel skeleton of a hull. Each rib is made from one steel channel, 1½ x 9/16 x ¼ in., except that the frame at rear end of forward bulkhead is a 1½ x 1½ x ⅜-in. angle. The two floor stringers are 3 x 3 x ⅜-in. angles, punched and bolted in position to each frame, prior to arc welding.

Angle stringers are welded, on each side, to the channel frames. These stringers are punched, and bolted to the frames, to maintain perfect alinement until arc welded. Deck beams over the forward and after bulkheads are 1½ x 1½ x ⅜-in. angles, welded directly to top ends of frames. Clamps formed from flat plate are welded to alternate frames to carry the strip of deck on each side of the open cockpit.

An interior view from the uncovered after bulkhead, looking forward, shows the engine base or mounting. This is constructed entirely from ¼-in. steel plate, permanently welded to the floor or bottom of the craft and to the two floor stringers. The engine base is braced on two sides by triangular pieces of steel plate with bottom edges crimped and welded to the bottom plates.

The coaming around the cockpit consists of one piece

*Field engineer, Lincoln Electric Co., Cleveland.



PARTLY Completed Steel Skeleton (Below), Viewed from the Bow. Deck beams are welded to tops of frames, floor stringers to bottom frames and side stringers to the side frames

INTERIOR Before Completion (Above). The engine mounting is braced by steel plates welded to the bottom. Riveting in forward bulkhead permits its removal

of 2 x 2 x ¼-in. angle on each side and end. As can be seen in the interior view, the rear end of forward bulkhead is fabricated by riveting, so that it may be removed, when desired.

Bottom and side plates are joined to the frames by short fillet welds about 1½ in. long and approximately 7 in. apart. The bottom is of ¼-in. plate, the sides of 3/16-in. plate and the deck of No. 10 gage sheet steel. The bumpers at the bow are for pushing barges. They are constructed of 8 in. x 1¾ in. channels, braced by triangular pieces of 3/16-in. plate, and 2 x 2 x 3/16-in. angles attached to the deck and prow.

Each boat is to be powered by a 125-hp. six-cylinder gasoline engine.

Recommended Practice For Using Lanoline Rust-Preventive

AN extended investigation into the relative suitability of several substances for preserving bright steel parts against corrosion has been described by C. Jakeman of the National Physical Laboratory, Teddington, England. (Engineering Research Special Report No. 12.)

It was found that, in general, greasy preservatives are more satisfactory than hardening pastes or varnishes, and that, of all the substances tested, lanoline, whether brushed on or deposited from a solution, forms the best coating, and has very great adhesion to steel even at high temperatures.

Benzine is the best solvent for naphtha, but is to be avoided upon sanitary grounds. The only other satisfactory solvents found are solvent naphtha (a mixture of toluene and xylene) or a petroleum product known in England as "white-spirit." To promote drying, i.e. to reduce the time that the lanoline has a "tacky" feel, paraffin wax up to 10 per cent or ceresin up to 3 per cent can be used. In order that one may be sure a brushed surface has been entirely covered, 0.5 per cent of oil-soluble aniline scarlet BB or oil-soluble aniline blue may be used without detriment to the preservative coating.

Lanoline may be used either as a grease or a solution. As a grease it should be well rubbed in with a rag, and will adhere more readily and in a thinner coat if it is mixed with about 10 to 15 per cent of white-spirit. As a solution it may be applied by a brush or used for dipping, the solvent being either white-spirit or solvent naphtha free from benzine. Mixtures of 50 per cent by weight with either solvent are satisfactory for use at temperatures between 40 deg. and 80 deg. Fahr., and the lanoline dissolves readily at 140 deg. Fahr.

It is usually sufficient to clean the metal with a dry cloth before either dipping it or applying the solution, but with very fine work, such as gages or safety razor blades, it may be desirable to clean the metal thoroughly with petrol before applying a white-spirit solution, or with naphtha for a naphtha solution. Bolts machined with soluble oil as a cutting fluid may fail to take a lasting coat, but machined with lard oil take it readily.

A gallon of mixture, corresponding to about 1.9 gal. of preservative, will protect about 1200 sq. ft. of surface. As between the two solutions, both of which are equally effective, that made with white-spirit dries less rapidly than the naphtha solution, but is less inflammable. The effect, however, of the inflammable vapor given off from either solution after a few hours drying is negligible.

Rails of the same heat, some having been tested without ever having been in track, and some tested after having carried 20,000,000 tons of traffic, have been studied at the Bureau of Standards. It is found that the endurance limit of the steel has not been changed either up or down by the wheel loads. Consequently it is concluded that the so-called transverse fissure, a defect of the fatigue type, must start from nucleii existing in the rails before they are laid in track. (Technologic Paper No. 363.)

Mammoth Electrical Rotor Built of Welded Steel

THE extent to which welding is being used by electrical manufacturers in the construction of large equipment is illustrated by the 16-ft. spider made by the Westinghouse Electric & Mfg. Co., East Pittsburgh, for the Aluminum Co. of America, to be installed in the plant of the Knoxville Power Co., Knoxville, Tenn. It is to be the rotor for a 45,000-kva. alternating-current generator, attached to a vertical water wheel running at 150 r.p.m. The rotor is constructed entirely of heavy steel slabs and rolled steel shapes, and the joints are made by electric arc-welding. It weighs 60,000 lb., is 16 ft. diameter and 4 ft. 4 in. wide at the rim.

Transue & Williams Office Building and, at Right, Employees' Entrance

Forging and Stamping Equipment

Modern Practice, Exemplified in Transue & Williams Plant, Shows the Large Part Taken by Mechanical Handling

IMPROVED and increased facilities for the manufacture of steel forgings and the adoption of the most modern practices in forging operations and in the handling of work in process, effecting speed and economies in operation, have been provided in the forge shop of the Transue & Williams Steel Forging Corporation, Alliance, Ohio, which has recently completed an extensive revamping and expansion program. Efficiency in the stamping plant has also been increased by various improvements.

The combined use of hammers, headers and bull-dozers for continuous operations in metal forming is provided for in the arrangement of some of the forging units. Monorails serve some of the units to expedite the movement of work, permitting the forgings to be handled through all operations without reheating. For heat treating forgings new continuous electric furnaces have been installed and other electric furnaces are provided for heat treating special steels and for case hardening by the nitrogen process. The plant is equipped as a commercial shop for making forgings for all industrial uses in sizes from 1/10 lb. to 450 lb. Its capacity is 4000 tons of forgings per month.

A continuous forging unit for making crankshafts is one of the outstanding features of the plant. Finished shafts are produced from the billet in this unit in four operations with one heating of metal. This is accomplished by the arrangement of the forging equipment to permit the speeding up of operations. Another interesting feature of the plant is the trimming press department, which is equipped with conveyors for handling forgings and scrap.

Improvement of transportation methods was one of the first matters considered in modernizing the plant. Work in process is kept off the floor by being handled in standard skids, mostly 30 by 60 in. by 24 in. deep, holding approximately 4000 lb. These are handled by a battery of lift platform electric trucks, one of which is provided with a boom and hoist for lifting dies. Truck transportation necessitated good floors. Consequently new floors were laid in the shops and the areas around the shops, considerable of which is used for storage of work in process, and the roadways connecting the buildings were paved with brick or concrete to facilitate the operation of trucks. The floors are of a 6-in. concrete base and paving brick, with a 1-in. cushion of slag between the brick and concrete. The paving laid the past few months aggregated 135,000 sq. ft.

Furnaces in the Three Main Forge Shops

THERE are three forge shops and the flow of material in these is generally in the direction of the shipping department, which adjoins the cold trimming department.

No. 1 forge shop contains mostly heavy equipment. This includes 8000, 10,000 and 16,000-lb. steam hammers. The largest hammer is used for railroad forgings and for heavy automobile and bus forgings, such as housing sections, crankshafts, front axles and other heavy parts. Heating furnaces are provided in sufficient size and number to afford ample heating service so that the proper heating and soaking temperature can be assured.

A large oil-fired forging furnace equipped with automatic temperature control was recently installed for precision heating of large axle forgings. The furnace is of the batch or "in and out" type, 14 ft. wide x 5 ft. deep. It is provided with five doors, each 2 ft. 1 in. wide by 17½ in. high. It is fired with four low-pressure burners, two being located in each wall. It is also equipped for firing with gas.

In this shop is a 5-in. and a 3-in. National forging machine. The larger machine is used for upsetting flanges on crankshafts, for forming helical worms and for other forging work, including piercing the hole through cluster and other gears. Equipment also includes a 28-in. and a 24-in. bulldozer that are used for such work as stretching axles, twisting crankshafts and forming pads.

The equipment in No. 2 shop is largely board drop hammers. As most of the work in this shop is cold trimmed, not much press equipment is required.

Two of the furnaces serving the hammers have air

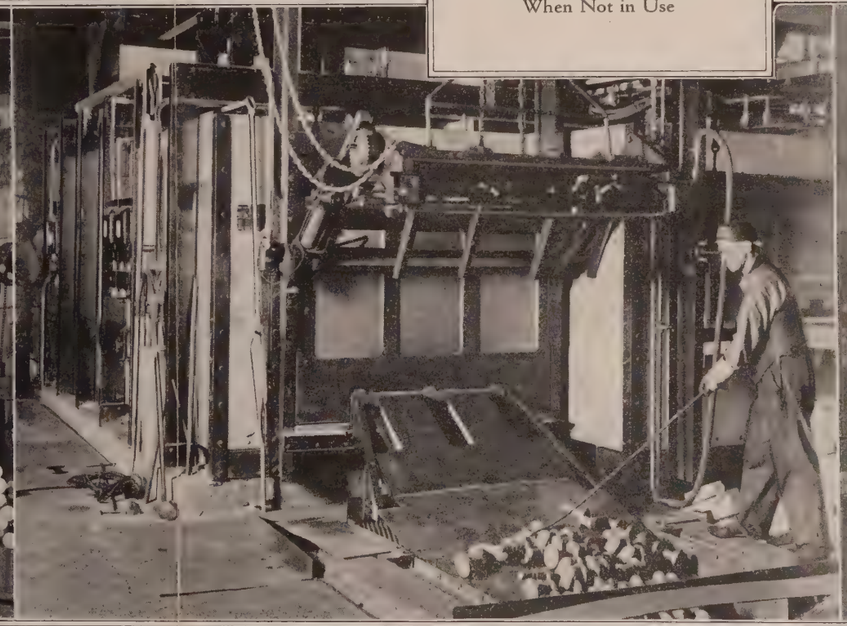
THE Tray Dumping Mechanism at the Discharge End of Drawing Furnace Is Raised Up When Not in Use



DIE Blocks are Heated for Hardening in Two Electric Furnaces and Quenched in Oil Tanks in Front of the Furnaces

recuperators. The air before going to the furnaces is heated to 750 deg. Fahr. by waste gases taken from the front of the furnace, thereby improving atomization in the furnaces. This has resulted in a more uniform and constant temperature and a reduction in fuel oil consumption.

Light and medium heavy forgings are made in the No. 3 hammer shop, which is equipped with steam hammers ranging from 1000 to 6000-lb. capacity. The furnaces for the most part are placed in a line with the hammers in this as well as in the other two shops.

The continuous unit for forging crankshafts is located in this shop. This unit includes a continuous pusher type heating furnace, a 5000-lb. hammer for blocking, a 4000-lb. hammer for restriking, a hot trimming press and a 5-in. header for upsetting the flange. The flange is upset to exact size so that no flash is left to be trimmed off. All operations are done with one heating of the metal.

The continuous heating furnace, which is oil-fired, is 4 ft. wide and 27 ft. long inside, the heating section being 21 ft. long and the soaking section 6 ft. long. The burners are located at the sides in staggered position in the heating section and set on end in the soaking section. The bars are unloaded from skids, charged into the furnace in a single row by a mechanical pusher and discharged through a side door by the hammer operator. Inspection doors are provided at intervals down the one side of the furnace. It has automatic temperature control and temperature recording instruments.

The hammers, trimming press and upsetting machine are located in line and the work is swung from one machine to the next. After upsetting the shafts go to a continuous electric furnace for normalizing and then are pickled, straightened, inspected and shipped.

An arrangement that is unusual is provided at the No. 3 forge shop. The hammers are too close together to permit electric trucks to haul material back and forth between them. Also, because of a difference in grade, the floor is about 10 ft. above the outside ground level. The handling problem that was thus caused was solved by erecting a balcony at floor level along the outer side of the building wide enough for two trucks, and providing for passageways into it on each side of the hammers through which the material is hauled. Shop No. 1 is served by an overhead traveling crane and Nos. 2 and 3 by monorails for handling dies.

Unique Combination for Hardening and Drawing

MISCELLANEOUS forgings are heat treated in two large pusher type continuous electric furnaces in a single housing separated by an insulated wall. These furnaces were built for a large output as well as flexibility of operation in order to serve the needs of the contract forging shop, which cover the various heat treatments of steel forgings, such as normalizing, hardening, drawing and annealing. The unit was also designed to handle miscellaneous sizes and shapes of forgings, ranging from pieces weighing only a few ounces to crankshafts, front axles, etc., weighing over 100 lb. each.

One furnace is used for hardening and the other for drawing and both for normalizing. The arrangement of the two furnaces and a conveyor type quenching tank comprising the unit is counterflow—that is, the hardening furnace and quench tank are arranged in a line with the material moving through this part of the equipment in a direction opposite to that taken by the material moving through the drawing furnace, so that the charging end of the hardening furnace is adjacent to the discharging end of the drawing furnace and vice versa. The electrical capacity of the drawing furnace is sufficient for its use in normalizing or annealing, with a production in proportion to the furnace length.

The hardening furnace chamber has a capacity for heating 2100 lb. of steel per hour. The heating chamber is divided into three zones, each separately and automatically controlled. The drawing furnace has a capacity of 2450 lb. of steel per hour. This chamber is 3½ ft. longer than the hardening furnace, the additional length allowing for the extra time required for drawing when running continuously as a unit with the other chamber—that is, the parts after hardening and quenching are taken continuously and at the same production rate through the drawing chamber, thus synchronizing the two operations from a production standpoint.

The furnace is heated by resistors of the cast T-grid type. These are mounted in the roof and in the floor so that the work is heated from above and below.

Both furnaces have the same method of conveying material. At the charging end of each chamber is located a motor-driven pusher intermittently operated by an electric timer, the cycle of which is variable at 15 sec. intervals through a time range varying from 1 to 6 min. Three heat resisting alloy rails extend longitudinally through the furnace, these being supported upon transverse piers extending above the furnace bottom. Material is carried through the furnace on heat resisting alloy shoes resting upon and guided by the longitudinal rails. At the discharge end of each chamber the rails terminate in slope castings. Beyond the discharge door of the hardening furnace this casting is so arranged with slots that the material is carried directly into the quenching tank and the alloy shoes are dropped through the slots, thus avoiding repeated cooling, which is destructive to heat resisting alloys.

The doors at both ends are mechanically operated by motor-driven lifting mechanisms mounted above the furnaces. These are actuated by timers and synchronized with the pusher providing the following sequence of operation:

The doors on both ends of the chamber automatically rise.

The pusher head advances, conveying the unheated material into the furnace and discharging a set of shoes loaded with forgings from the chamber at the same time.

The pusher head recedes.

Both charging and discharging doors lower.

Larger forgings are carried through the furnace directly on the shoes from which they slide to the quenching tank conveyor. Small forgings are carried on trays on the shoes. The trays at the discharge end are received by an automatic air-operated dumper which turns the tray over, discharging the contents into a conveyor that carries the forgings into the quench tank. The tray is retained in the brackets of the dumping mechanism. A valve operation then rotates the brackets to the original position and the tray is removed for reloading. When large forgings are being handled, the tray dumper, then not in use, is swung upward clear of the furnace discharge slope. Parts that are to be normalized are also discharged upon the quenching tank conveyor, the quenching water being partly drained off so that the conveyor belt is above the water line.

The quenching tank, of steel plate construction, is 16 ft. long, 7 ft. wide and 4 ft. deep. Its conveyor, which is motor-driven, is of the beaded flight type. Effective use of the quenching medium is secured by a recirculating water system. A double propeller in the front end of the quenching tank causes the water to pass to the back of the tank and it returns to the propeller compartment back of baffles that are located at the sides of the tank. The conveyor with its supports is an integral unit and by the unfastening of a few bolts it can be moved forward in the tank several feet to facilitate the removal of scale.

The furnaces are operated at a temperature of 1550 to 1600 deg. Fahr. for hardening and also for normalizing, and at 800 to 1150 deg. for drawing. The time of heating is from 45 min. to 2¼ hr., depending on the work.

Die blocks are heated for hardening in two 60-kw. fur-

naces. These are 27 in. wide, 15 ft. high and 5 ft. deep. They can also be used for heating miscellaneous steel forgings to be annealed. They have a capacity for heating 450 lb. of steel per hour to a temperature of 1550 deg. Fahr. Variable power input permits either large or small dies to be brought to hardening temperature on the same time temperature cycle.

The hearth consists of two parallel lines of roller rails extending the full length of the furnace and with extensions in front. The dies are placed on trays on which they are shoved through the furnace on rollers that ride on the

Control Equipment for the Electric Furnaces is Located in a Sheet Steel and Glass Enclosed Room

rails. The rollers and rails are heat treated alloy steel. The heating elements, which are of standard T-Grid cast nickel chrome alloy, are placed in the roof and below the roller rails. Cast elements also extend into the throat or vestibule at the furnace front to provide compensation for heat lost through the doors.

Handling Stainless and Other Alloys

FOR heating high-chromium stainless steels and other special alloy steels for forging, there is a specially designed, oil-fired, semi-muffled type of furnace. This is designed so that the flame will not come in contact with the steel, which is heated by radiant heat from the arch and wall. The furnace is provided with Wilson-Maeulen automatic temperature control.

The manufacture of forgings of the special Nitralloy steel has been started in an experimental way. After parts made of this steel are forged they are rough machined and then are hardened, quenched and drawn. The finished machining follows, after which they are nitrided.

An electric furnace has been installed for commercial nitriding and experimental work. The work is placed in a nitriding box fabricated of heat-resisting steel. There are heating units on the six sides of the furnace chamber. The furnace has two thermocouples, one for the chamber and the other for the nitriding box. The former is connected to an indicating controlling pyrometer and the latter to a single point pyrometer for measuring the temperature in the nitriding box. Pipes integral with the box extend through tubes in the rear wall of the furnace and are connected to other pipes leading from the tank which supplies the ammonia for nitriding. This furnace was built by the Hevi-Duty Electric Co., Milwaukee.

The control equipment for the furnaces is in a separate room that is entirely inclosed in a two-story sheet steel and glass partition housing. The control for each chamber of the large continuous heat treating unit includes three panels, each having its own control pyrometer, thermostatic relays, circuit control switch and a radial tap switch for regulating the power input. Each of these panels corresponds to one of the three control zones in each chamber. In the rear of the panel are located the magnetic contactors, which are of the oil break type. These contactors are for making and breaking the power supply to each of the separate furnace control zones for automatic temperature control.

Above the control room in a second story is located the transformer equipment, stepping down the service current, which is 2400 volts, 3-phase, 60-cycle, to the proper voltage required for each section of the furnaces. The power comes to this compartment from an overhead line to a bus arranged in back of the transformers, with primary oil switch protection. The transformers, which are of the air-cooled type, are cooled by means of air supplied to the transformer compartment by means of an individual blower which brings the air directly from the outside of the building.

The continuous heat treating furnaces, the die block hardening furnaces, the large forging furnace, the billet heating furnace and the control equipment for the electric furnaces were supplied by the Electric Furnace Co., Salem, Ohio.

[A second installment of this article will cover the handling and trimming of forgings, three methods of cleaning forgings, handling dies, storing and preparing the steel stock, and the stamping department.]

Wire Corrosion Lessened By Copper, Says German Investigator

An investigation of corrosion tests of barbed wire and wire netting, both black and galvanized and with or without the addition of copper, has been made in Germany. The results were published in *Stahl und Eisen*, by K. Daeves and briefly they were as follows:

	Period of Exposure, Months	Kind of Steel	Copper, Per Cent	Loss in Weight, Per Cent
Black wire	21½	No copper added	0.03	23.0
		Copper added	0.23	16.0
Galvanized wire	21½	No copper added	0.03	12.0
		Copper added	0.23	7.0
Galvanized wire netting	18	No copper added	0.03	28.1
		Copper added	0.15	19.3

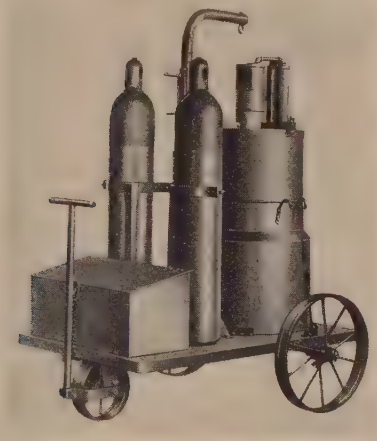
The copper content not only retards rusting but helps to preserve the zinc coating on the galvanized wire for a considerably longer time than on the wires without copper, says the author. Further corrosion tests with material containing various percentages of copper and with different coatings are in progress.

Flotation of Manganese Ores

Experiments by the United States Bureau of Mines and the Missouri School of Mines at Rolla, Mo., show that many of the oxidized ores of manganese contain that metal in the form of the mineral known as psilomelane. This mineral will float in ordinary oil emulsions. Experimental runs on one ore recovered 80 per cent of the manganese and rejected 94 per cent of the insoluble; this result was attained with reagents and practices no different from these in commercial operation on other ores.

Truck for Oxy-Acetylene Equipment

NEW types of trucks to accommodate Carbic low-pressure acetylene generators have been introduced by the Oxweld Acetylene Co., New York. One of these, shown in the view, also carries two cylinders of oxygen chained to a steel rack. The generator is secured to the steel deck by means of angle iron braces and two long bolts inserted in the handles of the generator and tightened by means of turnbuckles.



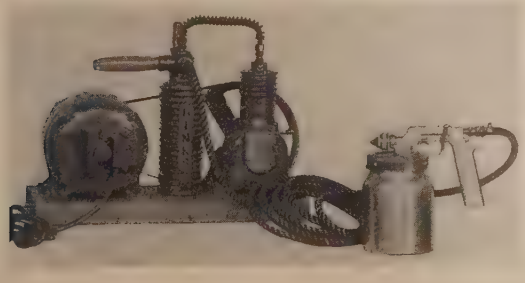
The Crane Is Used in Charging and Emptying the Acetylene Generator

A sturdy crane is provided to be used in charging and emptying the generator. With this crane it is an easy matter to lift the gas-bell out of the generator; the water and residue can then be drained off through the outlet at the bottom. The crane jib is made in three sections which can be telescoped when not in use to decrease the height. The truck has two 24-in. steel wheels with 3-in. tires, and a castor wheel which is 12 in. in diameter by 2 in. All wheels are provided with grease cups for lubrication.

General Utility Spray Painting Outfit

FOR touching up, refinishing, repainting, relacquering, spraying disinfectants and other general utility work, the Binks Mfg. Co., 3114 Carroll Avenue, Chicago, is offering a new Hurley all-purpose spray painting and finishing outfit.

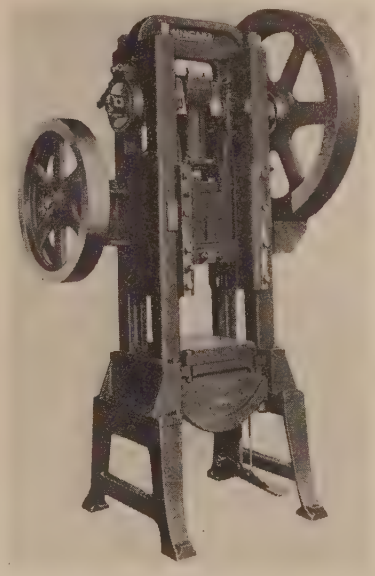
The outfit comprises a 1-qt. all-metal container, the company's new pressure cup spray gun that supplies an atomized flat spray 4 in. in width, and an air compressor, which is belt driven from a ¼-hp. General Electric motor and has a capacity of 2.16 cu. ft. of air per min. A cast-iron, ribbed air container is mounted between the motor and the compressor on a pressed metal base having rubber feet. The cylinder and base are cast in block of seasoned gray iron and are accurately machined.



The Spray Gun Supplies a 4-In. Wide Flat Spray. The 1-qt. container is made of metal

Small Press Has Frame of Tie-Rod Construction

TO meet the demand for a small press of unusual strength and rigidity, the Niagara Machine & Tool Works, Buffalo, has brought out a single-crank power press the frame of which is of four-piece steel tie-rod construction. Two sizes, designated as the No. 54 and the No. 56, are made, and can be furnished plain or single back-geared in belt or motor-driven types. The rated capacity is 32 and 56 tons, respectively. In addition to large and small blanking jobs, the machines are suitable for many of the lighter drawing operations.

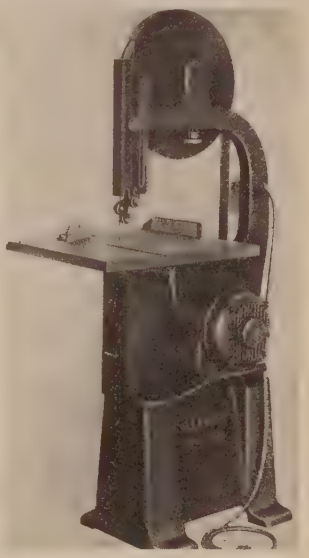


The Tie Rods, Shrunk in Place in the Frame, Add to Rigidity

The tie rods are shrunk in place in the frame. Strip stock can be fed from left to right through the openings in the uprights. The bed is at a convenient working height.

Band Saw with Direct-Connected Motor Drive

AN 18-in. portable band saw with motor-on-shaft drive and a 20 x 24-in. table that carries a miter cross-cut gage and parallel ripping fence, which increases the usefulness of the machine, has been added to the line of the Oliver Machinery Co., Grand Rapids, Mich. The distance from saw to column is 18 in. and the height from table to upper guide is 8 in. Saw blades from ⅛ to ½ in. wide, 9 ft. 8 in. long are used. By using gages the machine will rip material 11 in. wide and cross-cut and miter up to 8 in. The table tilts 45 deg. to the right.



The Lower Band Saw Wheel Is Mounted on the Motor Shaft. Rear view shows motor and floor base mounting

The cast-iron band saw wheels are 18 in. in diameter, have a 1¼-in. rubber-covered face, and are mounted in ball bearings. The upper wheel has 4-in. vertical adjustment for tensioning the saw and a micrometer tilting device for tracking the saw on the wheel. Guides are furnished both above and below the table. The saw runs against the outer edge of a hardened wheel which revolves on a ball bearing. Hardened steel adjustable side guides or lips prevent sidewise turning of the saw.

The column of the machine and the 18-in. floor base that is optional equipment are one-piece castings. Safeguards are provided at all necessary point. The ½-hp., 900-r.p.m. ball-bearing motor employed is entirely inclosed and takes current from either lighting or power circuits. For direct current and single-phase alternating current motors a tumbler switch is furnished, while for three-phase a.c. motors a "safety first" switch is mounted on the machine. Floor space occupied by the machine, which is designated as the No. 192, is 22 x 34 in.; the weight, with motor and floor base, is 625 lb.

Industrial Recession Is About Due

Greater Weight of Unfavorable Factors Must Make Itself Felt—Supplies Exceed Demand at Current Prices

BY DR. LEWIS H. HANEY
DIRECTOR, NEW YORK UNIVERSITY BUREAU OF BUSINESS RESEARCH

Favorable Factors

1. *Recovery in building activity in July.*
2. *High railroad freight traffic and earnings.*
3. *Increased exports.*
4. *Employment decreased less than usual in July.*
5. *High Federal Reserve ratio; gold imports.*

Unfavorable Factors

1. *Total industrial production above normal maximum limits.*
2. *Member banks over-loaned and money tight.*
3. *Decline in unfilled steel orders.*
4. *Decline in department store sales.*
5. *Automobile production decreased more than seasonally, with sales spotty and stocks of used cars accumulating.*
6. *Machine tool orders declined.*
7. *Commodity price movement lower again.*
8. *Widespread drouth damages grain and fruit crops.*

ONE must be impressed with the fact that there are very few *new* favorable factors to report this month and that the number of developments indicating the approach of declining business activity has increased. The public will probably not realize the turn for another two or three months, but some general business recession seems about to get under way.

That the steel industry is likely to share in the anticipated recession is indicated by the fact that the ingot output has now for three months been in excess of estimated current requirements, as illustrated by the composite demand line. Incidentally, the reports of better deliveries and the ability of iron and steel producers to build up stocks, again, confirm this indication.

Recession in Steel Output Forecast

NOT in the last decade, at least, has steel production been above the demand line, while the latter has itself been declining, without a recession occurring in steel production; and the present abnormal rate of steel production but makes such a recession the more probable. Furthermore, the average daily ingot output actually did decline in July, and at a rate somewhat more than usual for the season.

The June drop in indicated requirements for steel was due chiefly to lessening building activity, railroad traffic, mining and automobile production, all of which decreased more than usual for the season. These items more than offset the gains in general manufacturing, and in exports. A sharp recovery in construction contracts in July (chiefly public works and utilities), as well as some gain in freight traffic, promised larger requirements in that month, but not enough to balance current production. This conclusion is confirmed by the decrease in the unfilled orders of the Steel Corporation in July. And the rather unfavorable June showing made by orders for sheets and steel castings, together with the large decrease in orders for railroad equipment in July, is to be noted.

As to the future, the spurt in construction contracts is probably temporary. Declines in machine tool orders, automobile production and the steel ingot output are among the reasons for expecting some decrease in general manufacturing. In view of the copper and oil situations, there seems to be no reason to expect any gain in mining activity.

Other Factors

Crop damage here and in Canada, the largest importer of our products, cannot be fully compensated for by the price advances that have occurred. Moreover, taking all these things into consideration, it is reasonable to anticipate less than the usual seasonal gain in railroad transportation, and we note that the American Railway Association estimates car-loadings for the second half at a little lower rate than for recent years. Thus, a slackening of the steel demand in the last quarter is suggested.

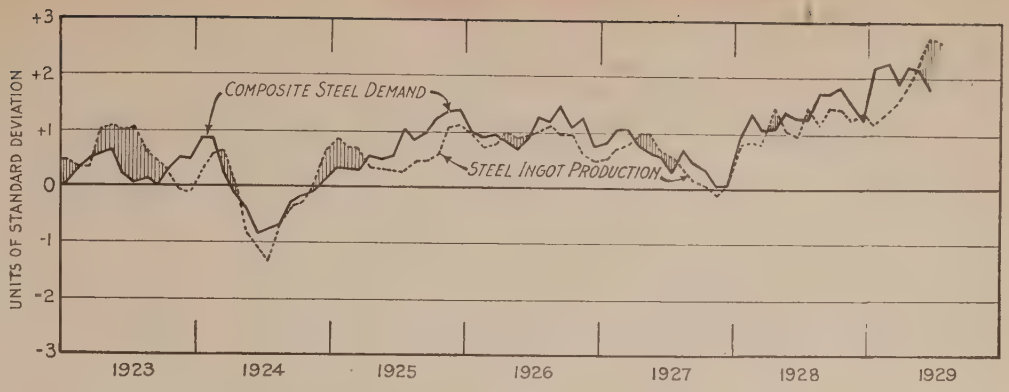
Barometer Predicts Moderate Let-Up

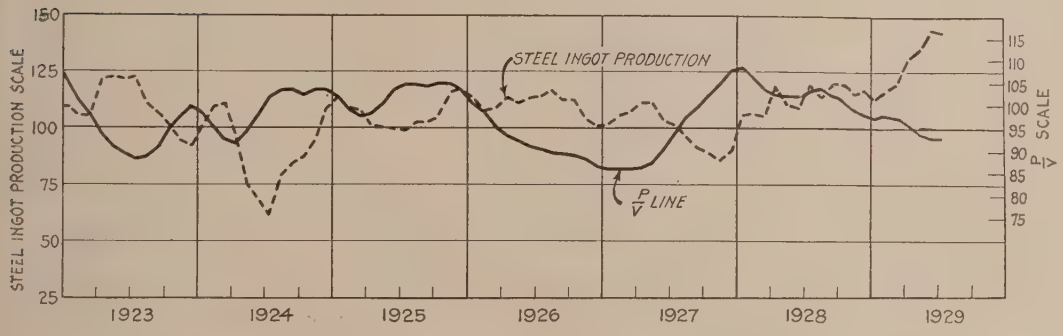
FURTHER support for the foregoing conclusion is given by the P-V line—a general business barometer based on the ratio of commodity prices to the physical volume of trade. This line has now fallen below normal, for the first time since the middle of 1927. It indicates that, *at the current price level*, the supply of commodities is in excess of the quantity demanded. It forecasts a moderate recession in business.

Being so closely linked with the general business situation, the steel industry is subject to the forecasts of this barometer. Thus we find that now, as in 1923 and 1926, the decline of the P-V line below normal has shortly preceded the peak of steel production. The July decline in ingot production is probably significant.

Allowing for the normal growth of the country's requirements, and for the usual seasonal variations, the average daily production of steel ingots decreased in July, so as to give us an "adjusted" index of 143, against 145 in June. A year ago the index stood at 119. It is significant both that the steel output is 43 per cent above esti-

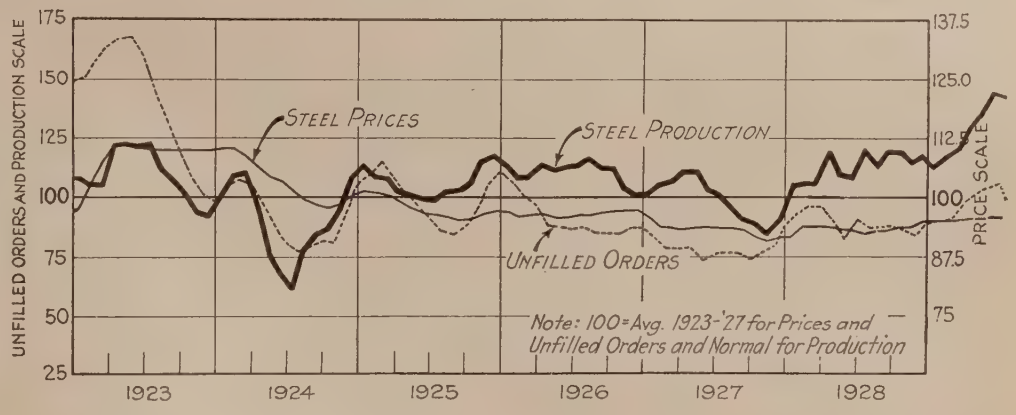
COMPOSITE Steel Demand Has Fallen Well Below the Level of Ingot Production (Adjusted). It is believed that demand will show a further moderate decline

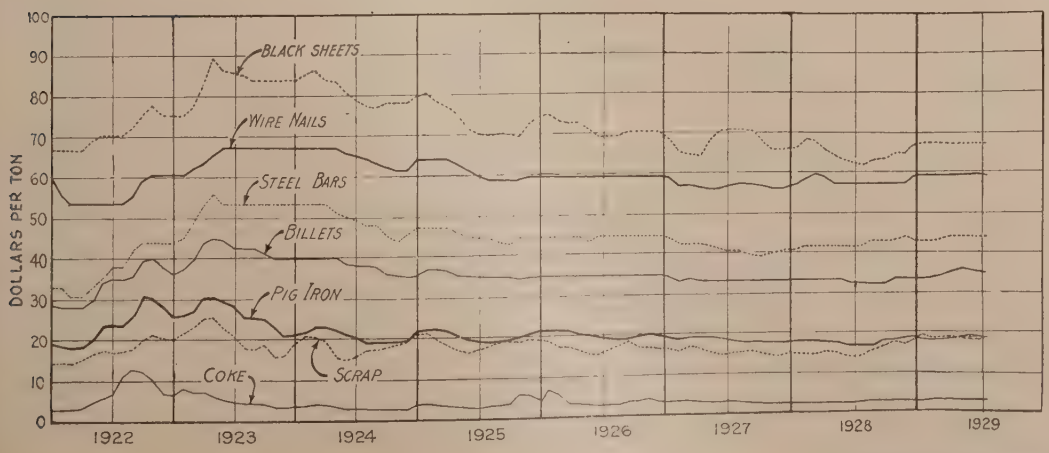




MOVEMENT of P-V Line Continues Below Normal. Steel production cannot much longer maintain its tremendous pace

STEEL Production in July, 43 Per Cent Above Normal Requirements, Was Almost Up to the 45 Per Cent Excess in June. Prices have declined slightly. Unfilled orders decreased heavily





BARS Are Likely to React to Lessened Automobile Demand and Sheet Prices Appear to Be Pegged. Pig iron cannot go much lower without a break in scrap prices and a reduced coke cost. Nails have responded to the decline in building construction

mated normal, and that the decrease was more than usual for the season.

Unfilled Orders Turn Downward

UNDER the circumstances, it is not surprising to find that the unfilled orders of the largest producer at the end of July were reduced to the lowest level since last December. The decline was the largest since May, 1928. It was decidedly more than seasonal and makes our adjusted index only 99 per cent of the average for the years 1923-1925, as compared with 106 in June and 87 a year ago.

Note that this is the first mid-year reversal of an upward trend in unfilled orders, following a prolonged rise, since 1923.

Naturally this situation has been attended by some price weakness. THE IRON AGE composite index of finished steel prices declined last week from a level which it has held since March. On June 20 (THE IRON AGE, page 1711), we pointed out that conditions then suggested that finished steel prices would hold steady until August—also that the steel industry was at or very near a peak, with some recession probable before fall. It now seems likely that finished steel prices will show continued irregularity and that they will gradually sag, on the average, until about the turn of the year, but that no large decline will occur before early 1930.

Incidentally, it also seems probable that steel production will not decline very sharply, if at all, in August or September, or until pig iron production has nearly caught up with it.

The very gradual rounding off of pig iron prices (now $18.42, against a July average of $18.44 and a June average of $18.65) indicates no early curtailment of pig iron production, a conclusion reinforced by the facts that such production is still low compared with the steel output, and that pig iron is relatively cheap.

Not Much Misalinement in Prices

THE structure of iron and steel prices is little out of normal adjustment. It resembles the structure found in similar periods, as in the latter part of 1926. Among the deviations from normal may be mentioned the higher level of steel scrap prices and the fact that wire nails and galvanized sheets are a little low.

Statisticians, however, will note at least two unusual movements. Nails have declined in price without a preceding decline in black sheets, and billets have shown some reduction without the usual drop in pig iron prices. The drop in nails is as anticipated, being due to the large reduction in residential building.

Sheet prices, as quoted, are clearly pegged. The underlying condition of demand and supply must be considerably weaker, and, though we must remember that this item has been relatively low for some time, sheets seem likely to sell lower, as nails have had to do. Concessions in the sheet market continue to be reported.

Bars appear to be a little too high with relation to most other items, and are likely to follow billets before long, particularly as the slump in automobile production is obviously hurting the demand.

Pig iron prices cannot go much lower, on account of the existing price levels for coke and steel scrap; but pig iron production is abnormally large, the demand is dull, and stocks are reported to be accumulating. Probably a decline in the pig iron market awaits only a break in scrap prices and a recession in steel production.

As to steel scrap, the price plainly is abnormally high, and the market situation is being weakened by the growing production of pig iron. As steel production declines, the scrap market is likely to break.

It is interesting to note that the unusually high prices of heavy melting scrap have come at a time when steel production is unusually large in comparison with the pig iron output. They are likely to last only as long as that condition continues.

Earnings of Steel Companies Show Large Gain

Report of Ludlum Steel Co., including Atlas Steel Co., for the quarter ended June 30, shows a net income of $311,958, after all charges, equivalent to $1.40 a share on 170,000 no-par value shares of common stock. This compares with $389,437, or $1.87 in the previous quarter. In the second quarter of 1928, net income, excluding that of the Atlas Steel Co., was $125,537, equivalent to 93c. a share on 135,000 shares of no-par value common stock.

The Ohio Seamless Tube Co. reports net earnings in the first six months of this year of $428,065, after all charges before dividends, equivalent to $4.78 a share on common stock outstanding, as against $267,238, or $2.74 a share in the same period of 1928.

The profit of the Empire Steel Corporation for the six months ended June 30 was $803,006, after interest, depreciation, etc., but before federal taxes. Net sales amounted to $15,492,278.

Toledo Steel Foundry Holds Open House

Open house was extended by the Industrial Steel Casting Co., Toledo, Ohio, to its friends, on Tuesday, Aug. 20. In sending out engraved invitations for the occasion, the company included an attractive folder, inscribed to each individual invited, which included over a dozen reproductions of photographs of the foundry, its equipment and products.

Commodity Prices Increased in July

Wholesale prices of commodities, as reported by the United States Bureau of Labor Statistics, advanced from 96.4 in June to 98 in July, both figures being based on 100 as the average of 1926. The figure was 98.3 in July, 1928, or slightly higher than at present. Six of the 10 groups showed increases, three showed decreases, mainly fractional. The largest increases were registered by farm products and foods.

Metals and metal products dropped from 105.1 in June to 105 in July, both being compared with 98.6 a year ago. The drop from June was brought about wholly by a decline from 98.2 to 97.9 of the iron and steel component. The non-ferrous metals gained fractionally from 104.8 to 105.1, while the other elements of the metal list showed no change.

Exports of Power Farming Equipment Increased

WASHINGTON, Aug. 19.—Increases in exports of tractors and harvesting machinery from the United States indicates that the movement toward power farming is progressing throughout the world, according to the Agricultural Implements Division of the Department of Commerce. During the six months ended June, 1929, shipments of power farming machinery have increased, while corresponding decreases have taken place in threshers, grain harvesters and binders. The most noteworthy improvement was in shipments of wheel tractors which showed a net gain in all types and sizes of $6,164,709. The most interesting feature of harvesting machinery exports was the remarkable gain in combines, which increased more than 2000 in number and more than $3,000,000 in value.

Distribution Census May Cover Construction

WASHINGTON, Aug. 16.—The executive committee for the Census of Distribution held a meeting here on Friday of last week and discussed questions relating to its forthcoming work. The possible inclusion of construction contractors with a view to ascertaining the distribution of materials used was one matter discussed. The committee, approved last week by Secretary of Commerce R. P. Lamont, is headed by F. M. Feiker, managing director of the Associated Business Papers, Inc., New York. Other members are Dr. Melvin T. Copeland, professor of marketing, Graduate School of Business Administration, Harvard University; W. E. Freeland, Freeland & Warren, Inc., Boston; Herbert P. Sheets, managing director, National Retail Hardware Association, Indianapolis, and Henry S. Dennison, president, Dennison Mfg. Co., Framingham, Mass.

Better Business in European Markets

Export Trade Improving—Cartel Memberships and Prices Under Review—Less Unemployment in Austria—Tin Plate Mill for Poland

(*By Cable*)

LONDON, ENGLAND, Aug. 19.

PIG iron is still quiet under the influence of the holidays, but inquiries for Cleveland foundry grades are increasing. The outlook for fall is firm, despite a steadily increasing output, especially as costs are increasing and consumers' stocks are small.

Export business has been curtailed by lack of supplies. East Coast hematite, mixed numbers, is selling at £3 15s. 6d. ($18.30) a ton, although furnaces claim that even £4 ($19.40) a ton would be unprofitable at present costs. Finished steel is quiet, with British prices firm. Some works, including Bolckow, Vaughan & Co. and the Cargo Fleet Iron Co., are still well engaged and omitted the usual holiday stop. Export business is quiet, but the Dominions are showing some interest in purchasing.

British exports in July were 35,500 tons of pig iron, of which the United States received 1600 tons. The total of iron and steel exports was 375,800 tons.

Tin plate business is improving with some good sales made for third quarter and a firm attitude on the part of makers, who have closed some good business for export to South America and Australia. Domestic demand is slightly more active. Galvanized and black sheets are quiet.

British makers have booked some good orders for railroad coaches and freight cars, including 285 for the Central Argentine Railway and 316 for the Rhodesia Railways.

Continental steel markets are stabilizing and prices are slightly firmer in some cases, but the anticipated general recovery has not yet begun. British finishing mills have taken a moderate tonnage of semi-finished material. Belgian and Luxemburg works are reported to be gradually refilling their order books, but delivery delays are still short.

French, German, Belgian and Luxemburg steel producers recently met to discuss means of arresting the decline and reestablishing prices at their former level.

German Cartel Prices Shaded —Luxemburg May Join

LONDON, ENGLAND, Aug. 5.—Control of domestic prices by the German syndicates is seriously threatened by the action of one of the large Westphalian steel merchants, who has acquired a small steel mill and begun the production of steel bars, rods and beams. While output of the mill does not exceed 50,000 tons a year, the fact that it is offering these products at 1.50 to 2.50 m. (36c. to 60c.) a metric ton less than the established syndicate prices is expected to disturb the market and a reduction of prices by the syndicates in certain districts is believed likely.

Recent developments have brought about a change in the relations of Luxemburg with Germany and Belgium. Formerly Luxemberg mills worked more closely with Belgium than with Germany, but recently they have been engaged in severe competition with Belgian mills and are beginning to cultivate closer relations with Germany. An increasing tonnage of Luxemburg steel is being sold through German sales organizations, not only in Germany but for export, and it is believed in some quarters that the Luxemburg mills will become members of the German cartels before long.

Austrian Business Good— Unemployment Declines

VIENNA, AUSTRIA, Aug. 3.—Unemployment has declined to about 100,000, the lowest point since 1924. The iron and steel industry is active largely on orders from the Government, especially for the state railroads. Wire rods, wire and sheet mills are quiet. Machinery builders are seeking increased export business.

Pig iron production in the first quarter of this year was 113,574 metric tons, steel ingot output 153,759 tons and rolling mill production 114,571 tons. The principal producer, the Austrian Alpin Montan A. G., reports a considerable increase in its output of iron ore and the company's steel mills are operating at 90 per cent to full capacity, with rolling mills at 103 per cent of rated capacity. Much of the business on the books of the Alpin Montan A. G. is for the railroads, placed under an investment plan, which provides for the renewal of permanent way material and rolling

*Open-hearth steel, 10s. ($2.42) per ton extra.

stock through financing by Vienna banks. A program of orders for 1930 is being negotiated at present, which includes 60,000 tons of rails and other permanent way material, compared with 54,000 tons in 1929.

The company is engaged for the next three months on domestic orders and is in an independent position on export orders, which, at present prices, offer little or no profit.

German Mills to Cut Extra on Open-Hearth Steel

HAMBURG, GERMANY, Aug. 1.—It is expected that the extra for open-hearth steel for export will soon be reduced from 7s. 6d. ($1.82) per ton, to 5s. ($1.21) per ton. Until 1927 the extra was 5s. ($1.21) per ton, but it was then advanced. The reduction of the extra would be in line with efforts of German mills to increase export sales of open-hearth steel. Prior to 1927, little structural steel of open-hearth quality was sold for export, but now sales of shapes, plates and sheets average 35,000 tons a month. Most of these exports are to the United Kingdom and the British dominions, where there is a decided preference for open-hearth steel.

Tube Cartel Prices Shaded

HAMBURG, GERMANY, Aug. 3.—Although reports of disagreement among members of the International Tube Cartel are denied, evidence accumulates of lower prices on tubes than are recognized by the cartel. In the past week a contract on gas tubes for India was taken by a merchant at about 3 per cent less than the cartel quotation. Small tube contracts at concessions from the fixed prices are frequently reported. British merchants are importing tubes freely, the marketing agreement with the United Kingdom, which provides an allotment, not yet being in effect.

Poland to Make Tin Plate

HAMBURG, GERMANY, Aug. 3.—Polish mills are preparing to enter into the production of tin plate and by the end of 1930 production is expected to be sufficient to satisfy domestic requirements fully and permit some export. In the past, almost the entire Polish requirements of tin plate have been supplied by Welsh makers.

German Cast Scrap Weak

HAMBURG, GERMANY, Aug. 8.—Prices of machinery cast scrap have declined from 69 m. to 68m. ($16.42 to $16.18) per ton within the past week, while other grades are strong, with heavy melting steel firm at 66m. ($15.71) per ton, delivered to consumers' works.

Michigan Steel Corporation, Ecorse, Mich., has removed its Detroit offices to 2400 New Union Trust Building.

British Steel Exports Improving

Imports of Raw and Semi-Finished Material Offset by Exports of High Value—Short Rail Hauls a Factor

THAT the cheap labor, or cheap production advantage, of Continental countries over British steel producers has much diminished in the last year or two is suggested by E. T. Good in the *Engineer*, London. British shipbuilders, he points out, are not importing big tonnages of foreign plates today because of cheapness, as the cheapness has disappeared. In other lines it has lessened.

British exports for the first five months of this year, compared with the same period of 1928, showed an increase of 172,100 tons. Imports showed a decrease of 226,300 tons. The article continues: "But the tonnage figures do not tell the whole story. Whereas our imports average less than £9 value per ton, our exports are worth an average of more than £15 per ton. Actually, our exports in the first five months of this year have been worth £29,300,600 ($142,107,910), while our imports have been valued at only £9,882,100 ($47,928,185).

"Our biggest export line in tonnage is the galvanized steel sheet, worth about £15 ($72.75) a ton, and our second largest export tonnage is in tin plate, worth nearly £20 ($97) a ton. Though Germany, France and Belgium often beat us in export tonnage, we are always on top in value, except when we have a big mining stoppage. Twenty and more years ago we exported over 1,000,000 tons of pig iron annually—a low-priced raw material for foundries and steel works. Now we export less than half that tonnage of pig iron; but our exports of galvanized steel sheets and some other high-priced products have doubled, trebled and even quadrupled since the early years of the present century. On an iron and steel tonnage basis we are doing a much smaller share of the world's trade, but in value we continue to do at least fairly well.

"In no foreign country have they ore and coal and works all close together as we have.

"Again, no foreign country has either coal mines or iron and steel works near ports. We have. As regards imported ore we have some of our blast furnaces so situated that the ships can land the material right alongside the stacks, and we have coal pits and coke ovens practically at the back doors of our works. We have such a combination of geographical advantages—such short and cheap hauls by rail plus such shipping facilities—that a ton of British steel can be delivered in Canada for a much less, inclusive transport cost, than a ton of American steel can be delivered in that Dominion bordering on the United States.

"In Germany the average haul for raw materials to works and finished products to ports is about 150 miles. In France it is about 200 miles. In our country it is under 30 miles. Even in tiny Belgium the works are so situated that imported ore has to travel about 80 miles from the seaboard to the furnaces, and the finished steel for export has to travel the same distance to the docks, with the result that we hold a transport cost advantage over the Belgians. Over the Germans, the French and the Americans our advantage is very great."

Polish Membership in Steel Cartel Still Delayed

WARSAW, POLAND, Aug. 2.—The Polish Steel Syndicate has been renewed until Dec. 31, 1931. In its annual report the syndicate says that the inclusion of Polish mills in the International Tube Cartel has not had the expected result in preparing for Polish entry into the International Steel Cartel, for the obstacles to membership still exist. One obstacle has been removed by the German-Polish agreement on trade in iron and steel scrap, but this agreement is not effective until the pending German-Polish general commercial treaty has been negotiated.

The agreement for protection of markets adhered to by Poland, Czechoslovakia, Austria and Hungary has been extended to the end of this year and this also is a factor favorable to Poland's entry into the International Steel Cartel. Polish mills, however, are insistent upon their right of a monopoly in supplying their own domestic market, claiming that development of capacity in the past year justifies this demand. It is further pointed out that despite relatively low duties on steel, foreign competitors have sold but little tonnage to Polish consumers, except in wire rods and light gage sheets, not produced in Poland.

Wire Rod Cartel Reduces Far Eastern Prices

HAMBURG, GERMANY, Aug. 3.—Wire rod quotations to Far Eastern markets have been further reduced by the Continental Wire Rod Cartel. For Yokohama, Japan, and Hongkong, China, the new price is £7 13s. 6d. ($37.22) per ton, c.i.f., and for Shanghai, Tsingtau, China, and Osaka and Kobe, Japan, £7 15s. 6d. ($37.70) per ton, c.i.f.

Lower prices are said to have been necessary to meet American and Canadian competition, as Far Eastern agents of the cartel have frequently cabled that American and Canadian sales of wire rods are increasing. It is believed that with this reduction of about 5s. ($1.21) a ton, more wire rod business will be received by Continental mills from both Japan and China.

Makes Many Metal Tariff Reductions

Senate Committee Would Make Manganese Ore Free, Reduce the Ferroalloy, But Raise Minimum Duty on Steel

WASHINGTON, Aug. 20.—Revisions made by the 11 Republicans of the Senate Committee on Finance in the metal schedule of the House tariff bill include these changes:

Putting manganese ore on the free list and reducing the duty on ferromanganese from 1⅞c. a lb. of contained manganese to 0.65c.

Increasing the duty on pig iron from its present rate of $1.125 a ton to $1.50, and transferring sponge iron from a grouping with muck bar, bar iron and the like (taking, say, 0.3c. a lb.), to the pig iron paragraph, with a duty of $2 a ton.

Making the minimum duty on iron and steel bars and shapes and cast steel 0.3c. a lb. by eliminating a 0.2c. rate that the House bill provided to apply to steel valued at not over 1c. a lb.; thus, under the Senate committee change, the 0.3c. rate would apply for steel valued at not over 1½c. a lb., and not merely for steel in a range of prices between 1 and 1½c.

Raising the minimum chromium content in iron or steel, before the added 8 per cent ad valorem duty applies, to 0.3 per cent instead of 0.2 per cent.

The important changes are shown in the accompanying table. The subcommittee in charge of the metal schedule was headed by Senator Reed of Pennsylvania.

The proposed duty on 80 per cent ferromanganese would be $11.65 per ton, as against the prevailing duty of $33.60, a cut of $21.95 a ton.

The present duty of 1c. a lb. on the contained manganese, based on a 50 per cent ore, nets a duty of $11.20 per ton. It was left unchanged in the House Hawley bill. The vote to place it on the free list by the Senate committee was close, 6 to 5. Previously the Senate committee had voted 7 to 4 to give manganese ore a sliding scale of rates, beginning with 10 per cent ore, but rescinded its action shortly before it completed its work on the dutiable and free list.

While the duty on steel scrap was left unchanged at 75c. per ton, the Senate committee added the items "hammer scale, roll scale, and mill scale" in this class. On alloy scrap the Senate committee reduced to 3c. a lb. from 4c. a lb. the duty on the chromium content in excess of 0.3 per cent instead of 0.2 per cent.

An important change was made in the basket clause. The House bill provided a duty of 50 per cent on nonprecious metals coming under this clause, while the Senate cut the rate to 45 per cent. It is estimated that iron and steel products dutiable under this paragraph (399) are valued at about $9,000,000 annually.

The duty on steam turbines was reduced to 15 per cent from 30 per cent and on punches, shears and bar cutters it was reduced to 35 per cent from 40 per cent. These and other important changes are shown in the accompanying table.

Molders' patterns were named separately and the duty was fixed at 50 per cent as against various rates provided in the House bill. Upholstery nails, thumb tacks and chair glides were made dutiable at 40 per cent as against the House rate of 3c. a lb. Butts and hinges were specifically named by the Senate committee and the House duty of 50 per cent continued. In the House bill they would come under the basket clause. Slight changes were made in the phraseology in paragraph 352, covering twist drills and other metal-cutting tools, duties remaining at 50 and 60 per cent, the latter relating to alloy tools. The electrical paragraph (353) was changed to exclude clockwork mechanism included in electrical mechanisms. Laboratory instruments were also excluded, while electric meters were included.

Antimony metal, paragraph 376, was given a sliding scale by the Senate committee as against the House duty of 2c. a lb. Roughly the Senate scale provides a duty of 3½c. a lb. if the price is over 7c. and not over 8c., and it scales down to a duty of ½c. a lb. if the price is over 13c. a lb. A provision added describes "price" as meaning the wholesale price (averaged for a period of one week) of ordinary brands "in the New York market as shown by the last quotation (given in a recognized weekly trade journal to be designated from time to time by the Secretary of the Treasury) prior to the date of arrival of the imported antimony in the United States."

The duty on fluorspar was left unchanged at $8.40 per gross ton, while the duty of 23/40 of 1c. a lb. was continued on dead burned magnesite. The duty on crude magnesite was changed to 15/32 of 1c. from 5/16 of 1c. a lb. The duty on amorphous graphite was reduced to 5 per cent from 10 per cent.

Principal Senate Finance Changes in Metal Schedule of House Tariff Bill

Senate Committee Paragraph		Senate Committee	House Bill
301	Pig iron, per gross ton	$1.50	$1.125
301	Granular or sponge iron, per gross ton	2.00	0.3 (lb.)
302	Tungsten ore, lb. contained tungsten	45c.	50c.
1713	Manganese ore, lb. contained manganese	Free	1c.
302	Manganese alloys (includes ferromanganese), per lb. contained manganese	0.65c.	1⅞c.
302	Aluminum silicon alloys, per lb.	3½c.	5c.
302	Silicon aluminum alloys containing iron, per cent	25	5c. (lb.)
302	Ferro-chrome, chromium content, per lb.	2½c.	3½c.
302	Cerium metal, per lb.	$1	$2
302	Ferro-cerium, per lb.	$1	$2
	Per cent	25	25
312	Structural shapes, per lb.	0.3c.	0.2c.
312	Sheet piling, per lb.	0.3c.	0.2c.
316	Tungsten and molybdenum products, per cent	60	25 (up)
353	Electrical products, per cent	30	40
354	Pocket knives, valued not over 40c. per dozen, each	4c.	1c.
	Per cent	50	50
	Valued at more than 40c. per dozen, not more than 50c., each	7c.	5c.
	Per cent	50	50
369	All automobiles, motorcycles, light trucks, light busses, chassis and body, per cent	10	25
372	Steam turbines, per cent	15	30
372	Punches, shears and bar cutters, per cent	35	40
376	Antimony metal	Sliding scale per lb.	2c.
390	Nickel oxide, per lb.	Free	1c.
399	Basket clause (non-precious metals), per cent	45	50

Central Alloy's Sales of Toncan Iron Increase

During the first seven months of 1929 Central Alloy Steel Corporation sold more of its rust-resisting Toncan iron than in all of 1927 and came within 7 per cent of equaling the total volume for 1928, according to an announcement by the company. Sales to date are 62 per cent higher than for the same period last year. Total shipments of all the company's finished products in the first half of 1929 were 520,946 tons, against 476,946 tons in the first half of 1928.

Enduro-Nirosta steel, made by the Central Alloy Steel Corporation, has been specified for the kitchen equipment of the eastern Pennsylvania prison to be erected near Philadelphia. This company will also supply rust-resisting Toncan iron for all sheet and light plate metal work at the prison.

Titusville Iron Works Co., Titusville, Pa., has moved its New York sales office to 285 Madison Avenue. This company, which has manufactured steel heating and power boilers, tanks and engines for the past 65 years, has become a division of the Struthers Wells-Titusville Corporation, Titusville. The corporation consists of the Struthers Wells Co., Warren, Pa.; Titusville Forge Co. and the Titusville Iron Works Co. The sales offices of the three divisions at New York are in charge of M. A. Cordner, who has been associated with the Titusville Iron Works Co. for 25 years.

To Interpret the Chicago World's Fair

Committee of Engineers Will Plan That Exposition May Tell Story of 100 Years Advancement

IN order that engineering science may be adequately interpreted to the public and that its relation to the progress during the past century may be graphically depicted, leading engineering authorities in this country have been asked to serve on the National Research Council Science Advisory Committee to the Chicago World's Fair Centennial Celebration to be held in 1933. The engineers will strive to formulate a philosophy for the exposition of engineering knowledge which will reveal the advancement made in the United States since the beginning of the so-called industrial revolution and up to the present time.

The engineering members of the advisory committee include Dean Anson Marston, Department of Engineering, Iowa State College of Agriculture and Mechanic Arts, who will prepare data on civil engineering progress; William L. Batt, S-K-F Industries, New York; for mechanical engineering; C. F. Kettering, General Motors Research Corporation, Dayton, for automotive data; W. H. Eisenman, secretary American Society for Steel Treating, who will report on steel treating; Prof. A. H. White, Department of Chemical Engineering, University of Michigan, on chemical engineering; Prof. Arthur N. Talbot, Engineering Experiment Station, University of Illinois, on materials testing; Arthur D. Little, Cambridge, Mass., on chemistry; Prof. Colin G. Fink, Department of Chemical Engineering, Columbia University, on electro-chemistry; and Prof. C. K. Leith, University of Wisconsin, geology.

According to present plans the Chicago World's Fair will be different from any exposition heretofore held. The present plans are that the material progress made during the past one hundred years be displayed in such a way that visitors, in whatever field they may be interested, will be enabled to form not only a picture of the existing state of the art, but to form an idea of the development of that art from it genesis, so far as possible, in the fields of pure science knowledge.

The members of the executive committee of the advisory board are: Dr. Frank B. Jewett, chairman; Dr. George K. Burgess, Washington; Gano Dunn, New York; Dr. Vernon Kellogg, Washington; Prof. M. I. Pupin, New York; Dr. Max Mason, New York; and Dr. William Allen Pusey, Chicago. Maurice Holland, New York, has been appointed executive secretary and the committee has established offices at 40 West Fortieth Street, New York.

Colhed, a New Alloy Die Steel

A SPECIALLY made carbon-vanadium tool steel for cold-heading dies has recently been put on the market by the Vanadium Alloys Steel Co., Latrobe, Pa. It is manufactured in such a manner that the center of the bar is claimed to be as solid as the outside. Dies used for cold-heading work usually have the impression sunk in that part of the steel which corresponds to the center of the bar and many users of cold-heading dies have experienced considerable difficulty in sinking and chipping because of porosity of the steel, says a statement of the company.

This new steel, sold under the trade name of "Colhed," has a higher vanadium content than other carbon-vanadium steels now on the market. The thickness of the hardened case can be accurately controlled, it is claimed, by merely varying the temperature. The new steel has been under test in operating conditions for approximately two years and is now being introduced to the trade.

Dies made of "Colhed," cold formed a 15/16-in. square head on a ⅞-in. diameter bolt, have averaged, it is stated, 30 per cent better than a number of other steels. They cold formed the head on a No. 10 countersunk flathead screw, averaging 125,000 pieces per die, with runs as high as 300,000 pieces.

In cold forming alloy steel roller bearings, the new steel dies turned out 49,000 bearings per day. Some of the dies will be exhibited at the National Metal Exposition in Cleveland the week of Sept. 9.

Blast Furnace for Japan

The Asano Bussan Co. has retained the Freyn Engineering Co., Chicago, in connection with the design of a complete blast furnace plant to be located in Japan.

Japanese May Make Own Steel Piling

WASHINGTON, Aug. 17.—It is reported that the Yawata Steel Works in Japan is seriously considering the manufacture of sheet steel piling, according to a report received by the Department of Commerce from Tokio. With the great building activity which has taken place since 1923, a big market for sheet piling has developed in Japan, particularly with the introduction of improved methods of building construction. The Yawata Steel Works is understood to be seeking a share of this business and, inasmuch as all of the sheet steel piling which is imported is patented, the Yawata works is said to be endeavoring to design a purely Japanese type.

The report also says that, according to the sales department of the Yawata works, a larger proportion of wire rods should be supplied by Japanese mills, and the company proposes to increase its wire rod production next year. Imports of wire rods have been exceptionally heavy during the past two months, and the price has been declining. The present Continental quotations are about 105 yen ($49.03) while the Yawata works is quoting 100 yen ($46.70) for August delivery.

Jones & Laughlin Expands Employees' Program

The Jones & Laughlin Steel Corporation has expanded its employees' benefit program to provide a total of $60,000,000 in group life insurance. T. M. Girdler, president, has announced the placing of a contract for an increase of $35,000,000 protection for the 25,000 employees of the corporation and its subsidiaries, the increase to become effective Aug. 31. Under the new arrangement individual life insurance benefits for the majority of the employees are larger than heretofore. The increases range from $1,000 to $4,000, with benefits determined according to occupation.

Testing Society Data Misused by Advertisers

There have been instances of the misuse, by advertisers, of data published by the American Society for Testing Materials. As a result of this the executive committee of the society has adopted the following statement of policy:

> Data or statements, quoted from society reports for advertising purposes, must be properly acknowledged and must be clearly identified as such and set apart from any interpretations or comments on them that are made by the advertiser. It is preferable that such data or statements shall be quoted in full. When considered necessary to abstract portions of data or statements, such abstracting must be satisfactory to the responsible committee of the society and be sufficiently complete that it will not state or imply conclusions other than those stated in the official society reports.

If there are any who contemplate using the society's data for advertising, the staff of the organization is willing to review such advertising copy upon request.

A preliminary program of the third Empire Mining and Metallurgical Congress, to be held in South Africa, from March 24 to May 9, has been issued. The congress headquarters are at 100 Fox Street, Johannesburg, South Africa. The various mining and metallurgical societies of Great Britain, Canada, Australia, South Africa and India cooperate in these congresses, which are held every three years.

This Issue in Brief

Metalclad construction in the larger sizes of airships, contrary to common belief, does not weigh much more than a fabric-covered ship of the same size. Single metal surface of Alclad Navy dirigible performs all of functions of five layers, exclusive of framing, with a saving in construction cost.—Page 454.

* * *

Although endurance limit for steel (or stress below which fracture does not occur under repeated loading) is about 40 per cent of its ultimate strength, for some non-ferrous alloys it is as low as 12 per cent.—Page 457.

* * *

Crescent-shaped base fractures of rails originate at a longitudinal seam in the lower surface of the base, thence gradually extending upward, investigation reveals. Such a seam or lap, it is held, is made during fabrication of the rail.—Page 458.

* * *

Finished steel prices probably will gradually sag until about the turn of the year, states economist. Decline in pig iron market awaits only a break in scrap prices and a further recession in steel production.—Page 476.

* * *

Steel company increases hot-strip steel capacity and reduces operating costs by centralizing production in a group of mills equipped with electric drive. Older steam-operated mills have been kept intact for use in emergencies and in times of peak demand.—Page 459.

* * *

By using monorails to expedite the movement of work, forgings are handled through all operations without reheating, thereby reducing production costs.—Page 467.

Cost, source of supply, uniformity of quality and degree to which the composition can be controlled by specifications are factors to be considered in choosing a non-ferrous metal or alloy for use in a commercial manufacturing operation.—Page 457.

* * *

Industrial recession but of only moderate proportions, and in which the steel industry will participate, is predicted by Dr. Haney. Declines in machine tool orders, automobile production and steel ingot output are believed to presage some decrease in general manufacturing. The public may not discern the downward trend for another two or three months.—Page 474.

* * *

Continuous forging unit produces finished crankshafts with one heating of metal from the billet in four operations. Unit consists of continuous heating furnace, 5000-lb. hammer for blocking, 4000-lb. hammer for restriking, hot trimming press and 5-in. header for upsetting the flange.—Page 471.

* * *

Method of controlling ZMC-2, the Navy's new dirigible, differs radically from previous practice. Its elevators and rudders, instead of being at the rear end, are in the form of eight fins projecting from the hull about 30 ft. forward of the stern.—Page 456.

* * *

Diameter of new all-metal dirigible is only one-third of its length, whereas the length of the familiar Zeppelin-type of airships has been from 7 to 12 times its cross diameter. Short and thick ships have less air resistance.—Page 456.

Cylinder barrel for Wright whirlwind engine is rough turned and outside diameter formed on automatic roughing lathe. Flange outside diameter is finish turned and back of flange is rough tapered and angled and then finish tapered and angled on Bullard Mult-Au-Matic. Thread is milled and end of cylinder faced and chamfered on specially-designed thread miller.—Page 464.

* * *

Main frames of all-metal dirigible ZMC-2 are merely hoops built up of cellular metal girders. Ship is practically free from internal tie wires. The cross bracings in the outer surface are dispensed with, because the sheet metal sheathing is riveted securely to girders and longitudinals and is sufficiently rigid to carry the shearing stresses in the hull.—Page 453.

* * *

Season cracking, or the spontaneous failure of seemingly sound parts made of some brasses, bronzes or nickel silver, is due to a combination of high internal or applied stress and corrosion. To correct the tendency, finished brass parts may be annealed at a low temperature or sheet, rod and tube may be "sprung" or bent to equalize the manufacturing strains.—Page 457.

* * *

Five machining operations on cylinder head of Wright whirlwind engine are performed simultaneously on Bullard Mult-Au-Matic. There are six stations, one for chucking and five for machining. As a head is installed and moved to first operation, all stations are stepped up and the finished head is removed.—Page 462.

ESTABLISHED 1855

Steel Makes Its New Uses

WE are hearing constantly, in connection with the increase in steel production, that "steel is going into new uses." The common belief seems to be that it is only a matter of somebody finding the new uses, by way of new classes of wares being wanted by the public, or of steel being substituted for something else. Such a conception is inadequate, for often the larger demand is not a matter of steel as formerly made having a new outlet open up, but of steel itself being so improved as to become more widely usable. The improvements relate both to the character of the steel and to the form in which the mill is able to supply it.

There is the case of rails. Prior to 1906 more than half the rails being laid by regular railroads were under 85 lb. per yard. Last year one-fourth the standard rails produced were 120-lb. and over, and one-half were 100-lb. and over but under 120-lb. A reasonably close estimate may be made that if the same mileage of track that was laid last year in rails 100-lb. and over had been laid with 85-lb. rails instead, the quantity would have been just half a million gross tons less. Now, there was a time when the railroads were reluctant to adopt much heavier rails in fear that the texture would not be so good. The rail makers have dealt with that situation by producing these heavy rails of a quality that meets any reasonable expectation.

Hoops have been made almost from time immemorial. The steel industry devised means for rolling them wider and thinner, the material being called "strips," with a production last year of 2,161,988 gross tons, apart from production of 560,426 tons of hoops and bands. Yet in 1909 (when if there were any "strips" they were reported as bands and hoops), the combined production was 645,512 tons. It was the development in rolling that opened up the market.

Since 1909 production of sheets 13 gage and lighter has been multiplied three and a half times. That was largely a case of better sheets making their enlarged market—better in physical qualities and better in surface finish.

In 1909 only 158,978 tons of alloy steel ingots were made, less than 1 per cent of the total of ingots. Last year 3,045,225 tons of alloy steel ingots were made, or more than 6 per cent of the total. The tonnage was multiplied by 19 and the proportion increased nearly nine-fold.

There is another and important side to this matter. In various connections the steel industry, in a way, has worked against itself. By increasing tensile strength and trustworthiness it has enabled consumers to use less weight of steel to accomplish a desired result. The H or wide-flange beam section is an illustration as to the form of steel. In the long run, of course, the industry benefits by this particular kind of improvement, but the consumer benefits still more.

The proper conception, then, is that while people have been finding new uses for steel, the steel industry has been providing steel of better quality and wider variety of form, which enable it to fit into new uses.

Economic Topsy-Turviness

AS we read the accounts of current events and the expressions of current opinions on economic issues we confess to bewilderment or such a state of mind as Alice had in Wonderland.

Mathew Woll, a well-known vice-president of the American Federation of Labor, warns us that this country is jeopardizing its prosperity by exporting its surplus capital, by which apparently he means the use of our credit for creation of capital abroad. He foresees that such a creation of capital is going to result in production that will come into competition with the production from capital at home, and will, therefore, cause further unemployment here.

Labor leaders are greatly concerned about domestic unemployment. However, the Department of Commerce, the Harvard Economic Service, Colonel Ayres and other authorities tell us that we are still enjoying unprecedented prosperity, which, of course, does not harmonize with representations as to unemployment.

We suspect that the fears and tears of the labor leaders are associated with the unemployment of relatively few persons whom altered conditions have prevented from having everything their own way. The situation of the musicians, who made themselves prohibitive in the ordinary theater and now find themselves ousted by the phono-cinema, is a striking illustration of this.

Congress is trying to make a new tariff that will decrease competitive importations and in certain lines prevent them. Some Congressmen favor rates of duty that would be completely protective. We recognize our own need for an export trade and aim at the creation of a costly merchant marine which we wish to be kept occupied. But apparently many of us dream of selling without buying and at the same time expect Europe to pay its indebtedness to

us. Yet no one tells us how such results are going to be achieved.

Economic obtuseness is not, however, confined to the United States. In the Hague reparations conference Philip Snowden, chancellor of the British exchequer, is averse to the payment of reparations by Germany in goods, for he conceives that such receipts will deprive British capital and labor of the opportunity to produce. It is hard to see, however, how Germany is going to be able to pay otherwise than in goods, and whether that be done directly or indirectly does not seem to matter very much.

M. Loucheur of the French Ministry has the same aversion to payment in goods, but he also expresses fear of the American menace. Thus, while our own statesmen are dreading the European peril, the European statesmen fear an American peril.

At the same time M. Loucheur held up the United States as a model of how to obtain prosperity. In imitation, in his mind, it would be necessary only for Europe to raise its wage scale and so provide its population with increased buying power. A similar idea prevails in some quarters in this country, especially in the halls of the labor unions.

An American company became interested in a great industrial enterprise in Europe and introduced real American methods, which meant increased efficiency in production, in the course of which process it raised wages in order to secure the best workers and give them sufficient calories of food, at the same time reducing the number of workers. In this illuminating instance the local labor unions promptly objected to wages being raised and workers being displaced, and the national Government inquired what was going to be done with the thousands of inferior workers who were made idle.

Mr. Snowden and M. Loucheur, Mr. Woll and some of the proponents of general tariff advances at Washington are, of course, playing for their own hands. It is human nature for every one to want to get for himself all that he can. It is also human nature to want to have a cake and eat and keep the cake. In international economics, however, the playing of the games in this way certainly makes for bewilderment.

Color Sells Metal Partitions

COLOR is doing much to popularize the use of steel partitions in building construction. The consumption of single pickled full cold rolled sheets and of cold rolled strip steel in this field has increased notably in the last year or two. An outstanding advantage of metal partitions is that usually they are built in sections and are movable, permitting an easy rearrangement of floor space, which is often required both in commercial and industrial office buildings. Against the flexibility of steel partitions are the greater expense and much slower work in removing and replacing tile and plaster partitions, to say nothing of the litter created in tearing the latter out.

The adoption of the easily applied lacquers of nearly every hue has given a range of color choice in building partitions and removed the objections many have had to the use of steel for this purpose. The green coating once generally applied to such steel did not appeal to the artistic taste and created sales resistance to the metal partition industry. For partitions in factory buildings the cold looking but practical green coated metal is still being used, but for office partitions the vogue has turned to coatings of eye satisfying colors. Under present methods of manufacture the green enamel is applied to the metal by dipping and then is baked on. This provides protection against corrosion. Then the color coating is applied by spraying. One company is now making steel partitions in 72 colors or shades and in addition is supplying partitions in various grains. On some contracts the entire color scheme is worked out for groups of artistic offices, so that furniture, hangings and floor coverings may harmonize with what is selected for the partitions.

Ice Cream Pants for Steel Workers

EVEN the most casual visitor at the Huntington, W. Va., plant of the International Nickel Co. (where nickel and monel metal are smelted and rolled) is impressed with one marked characteristic. It is immediately evident in the parked and hedged grounds, and the lawns extending between the buildings, up to the very doors. Windows are washed and buildings brightly painted on roofs and sides. But it doesn't stop just there. Such cleanliness and orderliness rule on the inside of the buildings as well. In the roasting department, where the sulphur is driven off the copper and nickel matte, there is hardly a whiff of the sulphur smoke that all but suffocates the unsuspecting visitor in a copper smelter. And in steam hammer shop and rolling mills the heating furnaces, even though some of them are seven years old, look as if installed last month—clean, painted, doors fitting tight, no sign of sooty smoke; everything shipshape.

It takes more than a supply of clean natural gas fuel to explain this situation; it takes even more than the apparent desire to maintain the plant and equipment at 100 per cent efficiency. It is certainly related to a conviction on the part of the management and men that the plant must be scrupulously clean in order to produce a high-grade cold-rolled sheet or cold-drawn articles, all with surfaces free from slightest blemish.

"It's all very well to do such a thing in a plant whose product is worth 50 cents a pound," it might be objected, "but it would increase the expense burden unduly if the output sold for only 4 cents." As a matter of fact, such an objector could find much the same situation existing at the Nickel company's near neighbor, the Ashland plant of the American Rolling Mill Co. This, it will be recalled, is where the continuous rolling of sheets was developed. It also contains a modern open-hearth department, blooming mill, and extensive finishing departments. The parked grounds are not so extensive, but the steel making departments and heavy blooming mills are notably tidy and orderly. The reason is aptly stated in a sign posted on the safety bulletin board in the blooming mill: "You can't make good soup in a garbage can, nor can you make high-finish sheets in a dirty mill."

Such a sign might be more appropriate in the cold rolling department (almost everything made at Ashland requires one or more cold passes after the final

annealing and pickling). Prominent display in the blooming mill merely indicates that the entire staff, from scrap unloader to shipping room roustabout, must work together to keep dirt out of and away from the steel. It would be only natural for the men in the finishing mills, in the cold rolling and inspecting departments, to have this ideal more prominently in mind. They have no hope that carelessness on their part will be covered up by further operations on the same sheet. In fact, at Ashland the crew of one of the wet cold mills, under the leadership of their foreman and the approval of the management, started the style of coming to work in white shirts and duck pants. Why not? It is hot in the summertime in Kentucky, and why shouldn't they wear seasonable clothes? They work in as clean a place as a soda fountain and much cleaner than most kitchens, where white clothes are the expected uniform.

The only difficulty with such a scheme seems to be that the men might pay more attention to keeping their clothes clean than they would to keeping the mill going—especially after their wives had faced the laundry problem. Smocks or aprons doubtless would help. Experience might even show that it would pay for the employer to meet the laundry bills, as do the bakers and restaurant owners now. At any rate, the conditions in these two plants show that it is possible and even profitable to conduct heavy metallurgical operations in cleanly surroundings, when every one concerned realizes constantly that "You can't make good soup in a garbage can."

More Pig Iron in Steel

A CAREFUL estimate of basic open-hearth steel production in the first half of this year, compared with the basic pig iron production just reported, indicates that a trifle over 2 per cent more of such steel was represented by pig iron, instead of scrap, than in the year 1928, while there was a trifle less than 2 per cent more, comparing the average of 1927 and 1928.

This does not seem like much of a change, but it means about half a million tons of scrap in the half year, and that is quite an item when it comes to getting the scrap together. When about 24,250,000 tons of basic open-hearth steel ingots and castings were made in the half year, and 12,984,864 tons of basic pig iron, the total scrap used was, roughly speaking, the difference; but the major part of that scrap was works scrap which takes care of itself, rising and falling as total production of steel—including Bessemer—fluctuates.

Obviously this increased use of pig iron in steel making was not voluntary. Scrap in the three principal markets ranged $2 to $3 a ton higher in the first half of this year than in the year 1928, so that there is no difficulty in distinguishing which was cause and which was effect. The frequent comment made earlier in the year, that on account of higher scrap prices steel makers would use more pig iron, is borne out.

The statistics of pig iron production in the first half of this year, given in last week's IRON AGE, illustrate some other interesting points. There is no longer a relationship between Bessemer pig iron production and the production of Bessemer steel and acid open-hearth steel. In 1906 and 1907, the two peak years in Bessemer steel production, the production of Bessemer and acid open-hearth steel was 95 per cent of the production of Bessemer pig iron. In 1912 and 1913 the percentage dropped to 91½. An excess of pig iron is requisite on account of losses in steel making, partly compensated by the use of scrap, and for the manufacture of ingot molds. In the first half of this year production of Bessemer pig iron (excluding low phosphorus) was 4,769,864 tons, while production of Bessemer steel ingots was 3,606,000 tons, or only 76 per cent as much.

Production of foundry iron in the half year, 2,111,170 tons, represented a rate of 4,250,000 tons per annum. As early as 1903 foundry pig iron output ran that high, and there were four 5,000,000-ton years before the war. The production of gray iron castings has evidently decreased in the last 20 years, for it is reasonably certain that foundries are not using more scrap than formerly. Yet cast iron pipe, enameled sanitary ware and radiators have undoubtedly increased. The ordinary casting of 20 years and more ago, instead of growing, has been partly replaced by rolled steel and forged steel.

However, a good statistical showing is made for the malleable iron casting. Before the war there was never a million-ton year in production of malleable pig iron, though there were approaches in 1907 and 1913. Yet in just one-half of this year production was 1,274,300 tons, showing incidentally a 35 per cent increase over the first half of last year.

CORRESPONDENCE

Welded Joints in Structures Are Self-Tested

To the Editor: Those of us who have seen certain failures in arc welding put back its progress are very anxious to do everything we can to prevent the recurrence of such mistakes. There are many engineering data being formulated for the theoretical side of arc welding, but none of these figures avails if the weld is not made correctly. These short comments are along the lines of practical welding and how to inspect it, with special reference to the comforting thought that welds are self-testing.

I think the clearest view of an arc weld in a structure is that it is a casting, merging and joining rolled structural members. The casting (weld) has not been forged or rolled; it has the properties of a casting. If welded to a casting, it would be 100 per cent physically, mechanically and structurally. But welded to a forged or rolled section, it must be used under such conditions and in such a manner that the weld is not asked to stand the strains and stresses of the rolled or forged section.

We have been fortunate in solving this difficulty by making the welded section stronger than the members being joined. This is very easy to do by increasing the section 10 to 15 per cent at the joint, and as the weld is stiffer and the elastic limit is higher than for a rolled or forged section of metal of approximately the same chemical composition, all strains are transmitted to the parent metal.

Contraction occurring in an arc weld during cooling forms the long-sought-for test for welded joints; it also improves the weld by stretching it. For instance, if you

haven't made the weld correctly or of sufficient section, the contracting strains will crack the weld. Contraction of a hot joint either stretches the joint or moves the parent metal, and very seldom in structural welding are the parent members movable.

It doesn't harm either the weld section or the parent metal to be stretched; in fact, the more it is worked beyond the elastic limit, within reasonable limits, the better it is. If the ultimate strength is exceeded by the contracting stresses and the weld breaks either in itself or away from the parent metal, it gives you the inspection test that you are looking for and it shows you that it has to be re-welded. Never in all my experience have I seen a weld crack days, months, or years after it was made; it cracks when it cools, then and there, or never.

All this applies to structural steel that contains 0.25 per cent carbon and lower. It is a good rule to avoid welding higher carbon steel (that is, 0.35 carbon and over) while it is under stress. Our experience shows that high-carbon steel should not be welded if the joint carries loads that vary in intensity, unless the proper heat treatment can be subsequently done.

C. J. HOLSLAG,
Chief Engineer and Vice-President,
Electric Arc Cutting & Welding Co.
Newark, N. J.

New Method of Sales Promotion Work

Sales Executives of Members of Structural Steel Fabricators' Association to Work for New Uses

AN advisory committee on salesmanship covering the New York district has been established by the American Institute of Steel Construction, Inc. This committee is drafted from the sales executives of the fabricators of structural steel in that district. It will meet with the staff of the institute monthly to advise on the work of the national body as it regards the development of broader markets for structural steel.

The New York Advisory Committee, at its organization meeting in July, consisted of R. W. Knight, McClintic-Marshall Co., chairman; W. Spence, Hedden Iron Construction Co.; A. M. Conneen, 3rd, Hedden Iron Construction Co.; A. J. Post and L. A. Post, of Post & McCord; J. B. Cooke, Paterson Bridge Co.; J. N. Lord, Paterson Bridge Co.; John L. Hay, Jr., Hay Foundry & Iron Works; G. D. McNaughton, Levering & Garrigues, and Charles A. Gross, Shoemaker Bridge Co. This committee will deal directly with the executives of the American Institute of Steel Construction, Inc.

Among the subjects discussed at the organization meeting was the development of a market for steel framed residences, the utilization of steel in the erection of hangars, bridges and irrigation dams. Technical problems dealing with the development of a steel plate floor system, known as the "battledeck" floor, were discussed at length and numerous welded sections of such a floor were subjected to close examination and inspection.

A more scientific method of fireproofing structural steel and the broader adoption of steel in the erection of school buildings came up for analysis. The committee, in consultation with the executive staff of the institute, decided that there was a big field for cooperative effort, especially in the development of a more aggressive selling effort and sales training. The discussion resulted in some constructive recommendations. In extending the uses and the market for structural steel, the opportunities for joint action were considered such as providing a necessity for monthly consultation.

The first meeting was attended by the members of the executive staff of the American Institute of Steel Construction, Inc. They were Charles F. Abbott, executive director; F. N. Frankland, director of technical service; T. H. Hendrix, assistant to the executive director; V. G. Iden, director of public relations; J. N. Keenan, district engineer at New York; B. F. Hastings, district engineer at Philadelphia, and Donald McConaughy, representing the advertising agent, N. W. Ayer & Sons Co.

This is the first time, it is believed, that the sales representatives of constituent member firms have been drafted into the service of a national trade organization. The American Institute of Steel Construction, Inc., however, is distinctly a selling organization planned for the purpose of developing new uses and a broader market for steel in bridges, buildings and other structures. It is felt that, by drawing upon the selling staffs of its constituent members to supplement the work of the district engineers directly engaged by the institute, a much more aggressive campaign can be initiated in the spread of a better appreciation of structural steel among engineers, architects, owners and investors.

July Building Awards Were Second Largest on Record

Building contracts awarded during July in the 37 States east of the Rocky Mountains were the second largest monthly total on record amounting to $652,436,100, reports the F. W. Dodge Corporation. This was a gain of 12 per cent over the total for the same month of 1928 and of 20 per cent over that for June, 1929.

New York and northern New Jersey established a new July record with a volume of $219,884,400, representing an increase of 104 per cent over the preceding month and of 60 per cent over July, 1928. The Middle Atlantic States and Texas also reached a new high level for July, while the New England States had the second highest July on record.

Thirty-one per cent of the awards was for residential buildings, 30 per cent for public works and utilities, 14 per cent for commercial structures, 10 per cent for industrial buildings and 7 per cent for educational buildings.

Automobile Spring Plant Building at Detroit

Construction of a new plant for the manufacture of automobile springs has been started by the Detroit Steel Products Co., Detroit. The new unit will have a floor area of 125,000 sq. ft. and will cost $1,000,000. Rapid growth of the company's steel sash business is responsible for the expansion program. With the removal of the automobile spring division to the new plant, the present plant will be given over entirely to the production of steel sash.

Lake Erie Bolt & Nut Co. Buys American Bolt Co.

Lake Erie Bolt & Nut Co., Cleveland, has acquired the American Bolt Co., Birmingham, said to be the largest manufacturer of bolts and nuts in the South. The consolidation brings together two of the oldest bolt and nut companies in the country, the Lake Erie company having been established 75 years ago and the American company 82 years ago.

The American Bolt Co. was owned by Nathan L. Miller and F. H. Mohns of Birmingham. Mr. Miller, who has been president, will retire and the plant will be operated as a wholly owned subsidiary of the Lake Erie company with the present active management headed by Mr. Mohns. The name of the American Bolt Co. will be retained.

The fall meeting of the American Refractories Institute and the Refractories Division of the American Ceramic Society will be held on Sept. 24 at the Deshler-Wallick Hotel, Columbus, Ohio. Dorothy A. Texter, Oliver Building, Pittsburgh, is secretary of the American Refractories Institute.

Iron and Steel Markets

Steel Output High, Orders Decline

Heavy Production and Shipments Cutting Deeper Into Mill Backlogs—Automobile Steels Affected Most— Further Weakness in Southern Iron

A TAPERING demand for steel is yet to be reflected definitely in mill operations, which are still at a near-capacity rate in most districts.

Meanwhile shipments are cutting heavily into backlogs in some lines, and prospects for a continuance of present high output in September depend somewhat on the extent of the expected recovery in automobile buying.

Automobile steels, including body sheets, strip steel and bars, have been more affected by declining specifications than other products. Some automobile companies are rather slow in getting in production on new models, and meanwhile are taking steel in relatively small quantities and in less aggregate volume than they used last month. Indications point to heavier motor car output next month.

Other metal-working industries are on high production schedules and apparently are consuming steel in undiminished tonnage. Notable among the most active lines are building construction and the manufacture of oil tanks, fabricated pipe, farm tractors and steam shovels.

Plates are in the strongest position among finished steel products. Chicago plate mills are booked for four to ten weeks and Pittsburgh mills from six to eight weeks. At Chicago, 6500 tons of plates has been ordered for oil tanks to be built in the Southwest and 15,000 tons for similar work is pending.

In sheets, specifications are holding up fairly well, despite the decline in consumption by the automobile industry. The leading sheet producer is operating its mills at just under 100 per cent this week and has a backlog sufficient for 60 days. Tin plate demand is receding, however, partly because the bulk of the season's requirements has been covered, but also on account of lessened needs in California, where crop damage has reduced the food pack. Some strip steel mills have reached the point of being in actual need of orders.

Pipe mills are operating at about 65 per cent, which is considered a good rate in view of the large capacity and the volume of business which has gone in recent months to a fabricator of pipe electrically welded from plates. About 250,000 tons of pipe will be required for a gas line from Amarillo, Tex., to Omaha and Chicago which the Texas Co. is sponsoring. A 10,000-ton pipe line at Everett, Wash., is up for bids.

Rail mills, now at about a 75 per cent operation, will soon reach the end of their orders, with the beginning of the fall buying movement at least four to six weeks off. Mill schedules may be reduced somewhat further by Sept. 1.

Builders of railroad cars will complete their present orders within a month or so, and new car buying in prospect is not in large volume. Several roads mentioned as possible buyers have yet to issue formal inquiries. The week's orders totaled 750 cars.

Building construction continues active, the week's awards of structural steel, at 51,000 tons, having been the largest since the last week of June. Included were 8100 tons for New York subway work, 7000 tons for a bank building in Newark, N. J., and 7000 tons for a bridge at Toledo, Ohio. The pending list was augmented by 32,000 tons.

Despite the growing unevenness of demands for various forms of finished steel, ingot output in principal producing districts holds at about 95 per cent, the falling off in some lines being offset by continued large demands in others. There is promise of high ingot production during the remainder of the quarter, even assuming a further reduction in requirements of finished steel, as badly depleted stocks of raw steel will be built up.

Outstanding in the pig iron situation is the continued weakness of Southern iron, which has declined another 50c. a ton at Chicago to $12.50, Birmingham, thereby underselling Chicago iron on a delivered basis by $2 a ton. Elsewhere in the North, Alabama iron is competing strongly for business at prices ranging from $13 to $14, yet Northern iron prices have not been affected. Shipments of Birmingham district furnaces have increased in the past two weeks, largely because of sales to outside territories.

Some buying of iron for fourth quarter has been done, but generally melters are waiting. Most furnaces are sold up for this quarter, and one Buffalo interest has withdrawn from the market for deliveries earlier than October. At Cleveland, shipments have gained through releases by foundries in the automotive field.

Foundry equipment manufacturers report July the largest month for orders since last August. Bookings for the seven months of the year were 23 per cent ahead of the corresponding period of 1928 and shipments averaged 63 per cent above those of the January-July period last year.

Heavy melting steel scrap is up 25c. a ton at Chicago on sales of 15,000 tons or more and down 25c. a ton at Pittsburgh. Strength in scrap is apparent at St. Louis, Cleveland, Detroit and Birmingham.

THE IRON AGE composite prices remain at last week's levels, that for pig iron at $18.42 a ton and that for finished steel at 2.398c. a lb. Pig iron is $1.38 higher than a year ago and finished steel is $1 a net ton higher.

Pittsburgh

Steel Making at 95 Per Cent Rate—Backlogs and Reserve Stock Needs Promise Continued High Operation

PITTSBURGH, Aug. 20.—Recession in steel market activity is of the most gradual character and is hardly discernible in ingot production, which in this district is at least 95 per cent of capacity. The principal steel making unit of the Steel Corporation and the district's largest independent company are practically at full capacity and of the other open-hearth furnaces numbering 58, only 11 are inactive.

This high rate of steel production, however, finds its principal foundation in commitments made some time ago, as new demands in a number of lines have been slowly but steadily tapering off for the past several weeks. It will be recalled that during the second quarter producers not only were committed against full current production, but in many lines were sold ahead for from one to more than two months. This was the result of fear on the part of consumers they would not get all the steel they wanted as promptly as they wanted it.

Deliveries against these forward protections now are serving, particularly in the case of the automotive industry, to obviate the necessity of large fresh buying. Companies making only a few products or serving a limited number of consuming industries are feeling the recession more heavily than those with wider distribution and a larger line of products. The latter still have really sizable order books, notably in the heavy tonnage products.

Few makers of bars can make quicker delivery than two weeks in any of the sizes and the demands upon local makers of plates, resulting from the shortage in the Chicago district, also make reasonably early shipment on new business difficult. Backlogs in strips are diminishing under the influence of heavy shipments and moderate new buying.

Reports as to sheet business vary somewhat, but at least the leading producer has experienced some increase in tonnage releases. Tin plate business is quiet, but that is a somewhat seasonal condition, with the canning season moving toward its peak and most of the requirements already spoken for. Business in wire products is good for the time of year.

Taken as a whole, business leaves little cause for complaint. While the trend is lower, it is not sharply so, and taking steel simply as steel without regard to its finished form, producers have enough specified tonnage not to be much concerned about maintaining a relatively full rate of steel making capacity during the remainder of this quarter. There are no reserve stocks and in the interest of economical plant operation, building up such stocks will be a possibility even if demands over the remainder of the year fail to turn upward from the present volume.

Prices generally are well maintained. In spots, they would not be called firm, but at least there is no downright weakness. Primary materials offer little of interest, except that scrap prices appear slightly softer

as a result of efforts by dealers to secure orders and a lack of interest by consumers in fresh supplies.

Pig Iron.—This market is steady as to prices, but business is very slow. Melters seem to have exceeded their requirements in their purchases for second quarter and now are able to go along without supplementing deliveries on those purchases to any considerable extent. Shipments on old orders are good and with a fairly heavy melt by the iron foundries it is believed most of the iron is going into consumption instead of to the melters' piles. Carnegie Steel Co. has taken off one of its Edgar Thomson blast furnaces for repairs, but Republic Iron & Steel Co. has put on its one idle Hazelton furnace in Youngstown, leaving the number of active stacks for this and nearby districts the same as a week ago.

Prices per gross ton, f.o.b. Valley furnace:

Basic	$18.50
Bessemer	19.00
Gray forge	18.00
No. 2 foundry	18.50
No. 3 foundry	18.00
Malleable	19.00
Low phos., copper free	27.00

Freight rate to Pittsburgh or Cleveland district, $1.76.

Prices per gross ton, f.o.b. Pittsburgh district furnace:

Basic	$19.00
No. 2 foundry	19.00
No. 3 foundry	18.50
Malleable	19.50

Freight rates to points in Pittsburgh district range from 63c. to $1.13.

Semi-Finished Steel.—Requirements of non-integrated steel manufacturers of billets, slabs and sheet bars are not so heavy as they were at the opening of the present quarter, since demands for strips and tin plate are notably lighter. The result is a somewhat easier supply situation, despite the fact that ingot production also has tapered slightly and much of the steel released for one use has gone into other channels. But there is no easing in prices. Buyers are largely under contract for the entire quarter and there is enough stability in finished steel prices to obviate pressure for lower prices on semi-finished. Prices appear firm at $35, Pittsburgh or Youngstown, for base size billets, slabs and sheet bars. Wire rods are firmly held at $42, base, Pittsburgh or Cleveland, and releases on contracts are steady.

Bars, Plates and Shapes.—The market is well maintained at 1.95c., base Pittsburgh, on these products on the general run of business. Plate prices are especially firm, because mills in this and nearby districts have commitments that preclude delivery promises of earlier than six weeks. It is reported that some mills that can make more prompt shipment are able to get 1.95c., f.o.b. mill, on shipments into the Pittsburgh district, or well in excess of 2c., delivered. Bar mill obligations range from two to three weeks in some sizes to as much as four weeks in others. The market is becoming limited in standard structural shapes, as so much of the current construction work is being supplied with special shapes. There are no large backlogs in standard structural shapes, but enough business is coming in daily to keep the mills steadily engaged.

Rails and Track Supplies.—This is usually a dull period in the demand for track accessories and the present is no exception. Most of the regular 1929 standard-section rail contracts have been completed, and it will be a month or so before 1930 requirements come before producers.

Wire Products.—Makers say that they still are able to get 2.50c. base, a lb. Pittsburgh, on plain or manufacturers' wire in this district, despite reports of lower prices in other consuming territories. Nails are commonly at $2.55, base, per keg, in carload lots. It seems that the order rather than its source governs the price, although there has been no formal abandonment of the plan announced late last year which set up prices for four or five distinct classes of buyers. Business as a whole is described as being somewhat above the average for this time of the year.

Tubular Goods.—Demand is sufficient to sustain an operation of welding and seamless pipe capacity in this and nearby districts of approximately 65 per cent. This is a better showing than it appears to be, as productive capacity, notably in seamless pipe, has grown materially in the past two years and the estimate is against the increased capacity. Although much large lap-weld pipe business has been lost by local producers to the Milwaukee company, producing electrically welded pipe, a fairly large amount of such business is coming to this district and most of the seamless pipe capacity is in this and nearby districts. Demand for butt-weld pipe is much less seasonal than formerly and there is not the variation in demand there was a few years ago. The automobile makers are taking less mechanical tubing than earlier in the year, but other tubing demands still bulk large. The pipe line which will convey natural gas from the Amarillo, Tex., field to Chicago, sponsored by the Texas Co., will probably be placed before the end of the year. This line, which will run first to Omaha and then to Chicago, will require 550 miles each of 22-in. and 24-in. pipe, amounting to approximately 250,000 tons. It is expected that the plans of companies owning by-product coke ovens to widen their markets for gas will result in a good demand later for line pipe.

Sheets.—Business has shown some increase in the past week and the leading interest, has found occasion to increase its rolling mill schedules to within a point or two of 100 per cent of capacity. This company has a backlog sufficient to insure substantially full operations for 60 days. Experience of most independent producers is of a similar tenor, but in the Youngstown district there are instances of makers having pretty well completed orders and being obliged to curtail production because of light strictly new buying. It is explained that so much tonnage is reaching buyers on old commitments that there is not much reason for additional purchases. Ford Motor Co. requirements are expanding, and there is a fairly well sustained demand from other builders. Introduction of new models is spread out over a more extended period than was true in recent years and changes in models do not mean such steep dips in the demand for steel. Sheet prices are not absolutely solid, but at the same time glaring weakness is lacking.

Tin Plate.—Mill operations reflect

The Iron Age Composite Prices

Finished Steel

Aug. 20, 1929, 2.398c. a Lb.

One week ago	2.398c.
One month ago	2.412c.
One year ago	2.348c.
10-year pre-war average	1.689c.

Based on steel bars, beams tank plates, wire, rails, black pipe and black sheets. These products make 87 per cent of the United States output of finished steel.

	High		Low	
1929	2.412c.,	April 2;	2.391c.,	Jan. 8
1928	2.391c.,	Dec. 11;	2.314c.,	Jan. 3
1927	2.453c.,	Jan. 4;	2.293c.,	Oct. 25
1926	2.453c.,	Jan. 5;	2.403c.,	May 18
1925	2.560c.,	Jan. 6;	2.396c.,	Aug. 18

Pig Iron

Aug. 20, 1929, $18.42 a Gross Ton

One week ago	$18.42
One month ago	18.42
One year ago	17.04
10-year pre-war average	15.72

Based on average of basic iron at Valley furnace and foundry irons at Chicago, Philadelphia, Buffalo, Valley and Birmingham.

	High		Low	
1929	$18.71,	May 14;	$18.29,	March 19
1928	18.59,	Nov. 27;	17.04,	July 24
1927	19.71,	Jan. 4;	17.54,	Nov. 1
1926	21.54,	Jan. 5;	19.46,	July 13

F.o.b. Lackawanna	2.05c.
F.o.b. Bethlehem	2.05c.
Del'd Cleveland	2.14c.
Del'd Philadelphia	2.01c. to 2.06c.
Del'd New York	2.14½c.
C.i.f. Pacific ports	2.35c.

Hot-Rolled Hoops, Bands and Strips

	Base per Lb.
6 in. and narrower, P'gh	2.00c.
Wider than 6 in., P'gh	1.90c.
6 in. and narrower, Chicago	2.20c.
Wider than 6 in., Chicago	2.10c.
Cooperage stock, P'gh	2.20c.
Cooperage stock, Chicago	2.30c.

Cold-Finished Steel

	Base per Lb.
Bars, f.o.b. Pittsburgh mill	2.30c.
Bars, f.o.b. Chicago	2.30c.
Bars, Cleveland	2.35c.
Shafting, ground, f.o.b. mill	*2.65c. to 3.60c.
Strips, P'gh	2.75c. to 2.85c.
Strips, Cleveland	2.75c. to 2.85c.
Strips, del'd Chicago	3.05c. to 3.15c.
Strips, Worcester	2.90c. to 3.00c.
Fender stock, No. 20 gage, Pittsburgh or Cleveland	4.25c.

*According to size.

Wire Products

(Carload lots, f.o.b. Pittsburgh and Cleveland, to jobbers and retailers.)

	Base per Keg
Wire nails	$2.55 to $2.65
Galvanized nails	4.55 to 4.65
Galvanized staples	3.25 to 3.35
Polished staples	3c. to 3.10c.
Cement coated nails	$2.55 to $2.65

	Base per 100 Lb.
Bright plain wire, No. 6 to No. 9 gage	$2.40 to $2.50
Annealed fence wire	2.55 to 2.65
Spring wire	3.50 to 3.60
Galv'd wire, No. 9	3.00 to 3.10
Barbed wire, galv'd	3.20 to 3.30
Barbed wire, painted	2.95 to 3.05
Woven wire fence (per net ton to retailers)	65.00

Chicago district mill and delivered Chicago prices are $1 per ton above the foregoing. Birmingham mill prices $3 a ton higher; Worcester, Mass. (wire), mill $3 a ton higher on production of that plant; Duluth, Minn., mill $2 a ton higher; Anderson, Ind., $1 higher.

Cut Nails

	Per 100 Lb.
Carloads, Wheeling, Reading or Northumberland, Pa.	$2.70
Less carloads, Wheeling or Reading	2.80

Light Plates

No. 10, blue annealed, f.o.b. P'gh	2.10c. to 2.20c.
No. 10, blue annealed, f.o.b. Chicago dist.	2.30c.
No. 10, blue annealed, del'd Phila.	2.42c. to 2.52c.
No. 10, blue annealed, B'ham	2.35c.

Sheets

Blue Annealed

	Base per Lb.
No. 13, f.o.b. P'gh	2.25c. to 2.35c.
No. 13, f.o.b. Chicago dist.	2.45c.
No. 13, del'd Philadelphia	2.67c.
No. 13, blue annealed, B'ham	2.50c.

Box Annealed, One Pass Cold Rolled

No. 24, f.o.b. Pittsburgh	2.85c.
No. 24, f.o.b. Chicago dist. mill	2.95c. to 3.00c.
No. 24, del'd Philadelphia	3.17c. to 3.27c.
No. 24, f.o.b. Birmingham	3.10c.

Metal Furniture Sheets

No. 24, f.o.b. P'gh	4.10c. to 4.20c.

Galvanized

No. 24, f.o.b. Pittsburgh	3.50c. to 3.60c.
No. 24, f.o.b. Chicago dist. mill	3.60c. to 3.70c.
No. 24, del'd Cleveland	3.59c. to 3.69c.
No. 24, del'd Philadelphia	3.92c. to 4.02c.
No. 24, f.o.b. Birmingham	3.75c.

Tin Mill Black Plate

No. 28, f.o.b. Pittsburgh	2.90c. to 3.00c.
No. 28, f.o.b. Chicago dist. mill	3.00c. to 3.10c.

Automobile Body Sheets

No. 20, f.o.b. Pittsburgh	4.10c.

Long Ternes

No. 24, 8-lb. coating, f.o.b. mill	4.00c.

Vitreous Enameling Stock

No. 24, f.o.b. Pittsburgh	3.90c.

Tin Plate

	Per Base Box
Standard cokes, f.o.b. P'gh district mills	$5.35
Standard cokes, f.o.b. Gary	5.45

Terne Plate

(*F.o.b. Morgantown or Pittsburgh*)
(Per Package, 20 x 28 in.)

8-lb. coating I.C.	$11.20
15-lb. coating I.C.	14.00
20-lb. coating I.C.	15.30
25-lb. coating I.C.	$16.70
30-lb. coating I.C.	17.75
40-lb. coating I.C.	19.85

Alloy Steel Bars

(F.o.b. makers' mill)

Alloy Quality Bar Base, 2.65c. to 2.75c. per Lb.

S.A.E. Series Numbers		Alloy Differential
2000	(1½% Nickel)	0.25
2100	(1½% Nickel)	0.55
2300	(3½% Nickel)	1.50
2500	(5% Nickel)	2.25
3100	Nickel Chromium	0.55
3200	Nickel Chromium	1.35
3300	Nickel Chromium	3.80
3400	Nickel Chromium	3.20
4100	Chromium Molybdenum (0.15 to 0.25 Molybdenum)	0.50
4100	Chromium Molybdenum (0.25 to 0.40 Molybdenum)	0.70
4600	Nickel Molybdenum (0.20 to 0.30 Molybdenum, 1.25 to 1.75 Nickel)	1.05
5100	Chromium Steel (0.60 to 0.90 Chromium)	0.35
5100	Chromium Steel (0.80 to 1.10 Chromium)	0.45
5100	Chromium Spring Steel	0.20
6100	Chromium Vanadium Bars	1.20
6100	Chromium Vanadium Spring Steel	0.95
9250	Silicon Manganese Spring Steel (flats)	0.25
	Rounds and squares	0.50
	Chromium Nickel Vanadium	1.50
	Carbon Vanadium	0.95

Above prices are for hot rolled steel bars, forging quality. The ordinary differential for cold-drawn bars is ¾c. per lb. higher. For billets 4 x 4 to 10 x 10 in., the price for a gross ton is the net price for bars of the same analysis.

Billets under 4 x 4 in. carry the steel bar base. Slabs with a sectional area of 16 in. or over carry the billet price. Slabs with sectional area of less than 16 in. or less than 2½ in. thick, regardless of sectional area, take the bar price.

Rails

	Per Gross Ton
Standard, f.o.b. mill	$43.00
Light (from billets), f.o.b. mill	36.00
Light (from rail steel), f.o.b. mill	34.00
Light (from billets), f.o.b. Ch'go mill	36.00

Track Equipment

	Base per 100 Lb.
Spikes, ⅝ in. and larger	$2.80
Spikes, ½ in. and smaller	2.80
Spikes, boat and barge	3.00
Tie plate, steel	2.15
Angle bars	$2.75
Track bolts, to steam railroads	$3.80 to 4.00
Track bolts, to jobbers, all sizes, per 100 count	70 per cent off list

Welded Pipe

Base Discounts, f.o.b. Pittsburgh District and Lorain, Ohio, Mills

Butt Weld

Steel Inches	Black	Galv.	*Iron* Inches	Black	Galv.
⅛	45	19½	¼ and ⅜	+11	+36
¼ to ⅜	51	25½	½	23	5
½	56	42½	¾	28	11
¾	60	48½	1 and 1¼	31	15
1 to 3	62	50½	1½ and 2	35	18

Lap Weld

2	55	43½	2	23	9
2½ to 6	59	47½	2½ to 3½	28	13
7 and 8	56	43½	4 to 6	30	17
9 and 10	54	42½	7 and 8	29	16
11 and 12	53	40½	9 to 12	26	11

Butt Weld, extra strong, plain ends

⅛	41	24½	¼ and ⅜	+13	+48
¼ to ⅜	47	30½	½	23	7
½	53	42½	¾	28	12
¾	58	47½	1 to 2	34	18
1 to 1½	60	49½			
2 to 3	61	50½			

Lap Weld, extra strong, plain ends

2	53	42½	½	29	13
2½ to 4	57	46½	2½ to 4	34	20
4½ to 6	56	45½	4½ to 6	33	19
7 to 8	52	39½	7 and 8	31	17
9 and 10	45	32½	9 to 12	21	8
11 and 12	44	31½			

On carloads the above discounts on steel pipe are increased on block by one point, with supplementary discount of 5%, and on galvanized by 1½ points, with supplementary discount of 5%. On iron pipe, both black and galvanized, the above discounts are increased to jobbers by one point with supplementary discounts of 5 and 2½%.

Note.—Chicago district mills have a base two points less than the above discounts. Chicago delivered base is 2½ points less. Freight is figured from Pittsburgh, Lorain, Ohio, and Chicago district mills, the billing being from the point producing the lowest price to destination.

Boiler Tubes

Base Discounts, f.o.b. Pittsburgh

Steel		*Charcoal Iron*	
2 in. and 2¼ in.	40	1½ in.	1
2½ in.—2¾ in.	48	1¾ in.	8
3 in.	54	2 in.—2¼ in.	13
3¼ in.—3¾ in.	56	2½ in.—2¾ in.	16
4 in.	59	3 in.	17
4½ in. to 6 in.	48	3¼ in. to 3½ in.	18
		4 in.	20
		4½ in.	21

On lots of a carload or more, the above base discounts are subject to a preferential of two fives on steel and of 10 per cent on charcoal iron tubes. Smaller quantities are subject to the following modifications from the base discounts:

Lap Welded Steel—Under 10,000 lb., 6 points under base and one five; 10,000 lb. to carload, 4 points under base and two fives. Charcoal Iron—Under 10,000 lb., 2 points under base; 10,000 lb. to carload, base and one five.

Standard Commercial Seamless Boiler Tubes

Cold Drawn

1 in.	63	3 in.	48
1¼ to 1½ in.	55	3¼ to 3½ in.	50
1¾ in.	39	4 in.	53
2 to 2¼ in.	34	4½, 5 and 6 in.	42
2½ to 2¾ in.	42		

Hot Rolled

2 and 2¼ in.	40	3¼ to 3½ in.	56
2½ and 2¾ in.	48	4 in.	59
3 in.	54	4½, 5 and 6 in.	48

Beyond the above base discounts a preferential discount of 5 per cent is allowed on carload lots. On less than carloads to 10,000 lb., base discounts are reduced 4 points with 5 per cent preferential; on less than 10,000 lb., base discounts are reduced 6 points, with no preferential. No extra for lengths up to and including 24 ft. Sizes smaller than 1 in. and lighter than standard gage take mechanical tube list and discounts. Intermediate sizes and gages not listed take price of next larger outside diameter and heavier gage.

Seamless Mechanical Tubing

	Per Cent Off List
Carbon, 0.10% to 0.30%, base (carloads)	55
Carbon, 0.30% to 0.40%, base	50

Plus differentials for lengths over 18 ft. and for commercial exact lengths. Warehouse discounts on small lots are less than the above.

to some extent the fact that Pacific Coast requirements were under early estimates on account of crop damage. Much tonnage produced for California was diverted elsewhere and reduced the requirements of the other consuming points by a corresponding amount. October specifications, which should have been in by Aug. 15, are not yet flowing in freely, but on the other hand there are occasional rush orders from points which are exceeding their estimated needs. Export business in tin plate is reported to be almost nil. Mill operations range from 75 to 85 per cent, with 80 per cent the general average.

Cold-Finished Steel Bars and Shafting.—If there has been a definite change in demand, it has been in the direction of an increase. As new models of motor cars begin to sell, parts makers get larger orders and in turn release more tonnage on orders. The market appears well established at 2.30c., base Pittsburgh, on the general run of business.

Strip Steel.—Mill activity in both hot and cold-rolled strips is somewhat out of tune with current demand; there is high engagement of productive capacity, but it appears to be chiefly on orders placed some time ago on which producers now are catching up. It is not hard to understand why there should be slackening in new buying, when it is considered that shipments are large enough to take care easily of the lighter requirements of the automotive industry, which is the largest single outlet for strip steel. The decline in demand from that source is rather sharp compared with the conditions of last year, when there was almost no decline in automobile production during the summer. But, taking the average of the past five years, the dip is rather less than usual. Prices appear well established at 1.90c to 2c., base Pittsburgh, for hot-rolled and at 2.75c. to 2.85c. base, for cold-rolled strips.

Coke and Coal.—If there is a definite trend in furnace coke prices it is downward, since extra demands that were coming from the steel companies, when high production of iron was urgent, have ceased and supplies are somewhat in excess of the regular demand. It has not been necessary lately for buyers to go above $2.75 a net ton at ovens for standard Connellsville beehive furnace coke, and for loaded cars on which consignment has been lacking even less has been done. Foundry coke is quotable all the way from $3.15 to $4.75, but on reputable brands of standard 72-hr. fuel, the market is not under $3.75, and on special brands the top quotation is readily obtained. Aside from the seasonal increase in the demand for coal for household use, the coal market is as dull as ever and prices show no tendency to get any firmer.

Old Material.—The market is dull and its tone indefinite. While good heavy melting steel is scarce, as is evidenced by recent purchases by two steel makers at $20 for strictly No. 1 railroad steel, another melter was able to buy a fair-sized tonnage of regular No. 1 grade at $18.50. The market on the steel works grades is probably as high as it will be for the present, because steel makers appear to be covered against their present order books and, while one of them is seeking supplies, the more common condition is that limitations are in force as to the amount of scrap that will be taken in. Some dealers, needing orders, are actively soliciting business in the heavy melting grade at $19. Recognizing recent sales, No. 1 heavy melting steel is quotable from $18.50 to $19.50. Price changes otherwise are unimportant. It is difficult to secure recent prices for machine shop turnings because the demand is now chiefly from dealers who sold.

Prices per gross ton delivered consumers' yards in Pittsburgh and points taking the Pittsburgh district freight rate:

Basic Open-Hearth Grades:	
No. 1 heavy melting steel	$18.50 to $19.50
No. 2 heavy melting steel	16.50 to 17.00
Scrap rails	18.00 to 18.50
Compressed sheet steel	18.50 to 18.75
Bundled sheets, sides and ends	17.00 to 17.50
Cast iron carwheels	16.50 to 17.00
Sheet bar crops, ordinary	20.00 to 20.50
Heavy breakable cast	13.00 to 13.50
No. 2 railroad wrought	19.00 to 19.50
Hvy. steel axle turnings	16.50 to 17.00
Machine shop turnings	11.75 to 12.25
Acid Open-Hearth Grades:	
Railr. knuckles and couplers	22.00 to 22.50
Railr. coil and leaf springs	22.00 to 22.50
Rolled steel wheels	22.00 to 22.50
Low phos. billet and bloom ends	23.00 to 23.50
Low phos., mill plates	23.00 to 23.50
Low phos., light grades	20.50 to 21.50
Low phos., sheet bar crops	20.50 to 21.50
Heavy steel axle turnings	16.50 to 17.00
Electric Furnace Grades:	
Low phos., punchings	20.00 to 21.00
Hvy. steel axle turnings	16.50 to 17.00
Blast Furnace Grades:	
Short shoveling steel turnings	13.50 to 14.00
Short mixed borings and turnings	12.50 to 13.00
Cast iron borings	12.50 to 13.00
Rolling Mill Grades:	
Steel car axles	21.50 to 22.00
Cupola Grades:	
No. 1 cast	15.00 to 16.00
Rails 3 ft. and under	20.00 to 21.00

Warehouse Prices, f.o.b. Pittsburgh

	Base per Lb.
Plates	3.00c.
Structural shapes	3.00c.
Soft steel bars and small shapes	2.90c.

Cement coated nails, per keg	3.05

Konel, New Heat-Resisting Metal, Put on Market

Development of a new metal known as "Konel," which is said to be much stronger than other metals at high temperatures and which can be used extensively in the moving parts of internal combustion engines and other extremely hot places, has been announced by the Westinghouse Electric & Mfg. Co., East Pittsburgh.

Originally developed at the company's research laboratories as a substitute for platinum in the manufacture of filaments for radio tubes, the new metal was discovered to be harder to forge than steel and to be very tough at high temperatures when most metals lose their strength.

As a substitute for platinum it is stated that Konel metal is already saving approximately $250,000 monthly in the manufacture of radio tubes.

Luria Office in Detroit

Luria Brothers & Co., Inc., Reading, Pa., has opened a district office in suite 2037 and 2038 Book Building, Detroit, in charge of C. H. R. MacKenzie, formerly associated with Joseph Schonthal Co., Columbus, Ohio. W. R. Richey will be Mr. MacKenzie's assistant. The Luria firm also has district offices at Pittsburgh, Philadelphia, Lebanon, New York and Boston, and has five scrap yards, located at Pittsburgh, Reading, Lebanon, Coatesville and Donaghmore, Pa. The company has been engaged in the scrap iron and steel business since 1889.

China Steel

Various types of substitute materials have appeared from time to time that gave the general surface appearance of clay wall tiling. They have included enameled paper, wall board and composition tile. Those that have survived have found a substantial market resulting from the present demand for attractive, elaborately fitted lavatories and bathrooms, according to *Industrial Bulletin* of Arthur D. Little, Inc.

Now comes a new material, "china-steel," with a porcelain enamel coating on die-formed metal tiles, specially designed for nailing into place. The surface coat of the new tile is very similar to that of the more expensive clay, and the joints may be pointed up in much the same way. It is lighter, thinner, and is warranted not to crack. Perhaps the greatest potential advantage is the freedom from dependence on skilled tile setters.

Milled studs	70

Chicago

Little Change in Steel Operations Likely for Several Weeks —Alabama Iron Makers Aggressive

CHICAGO, Aug. 20.—Pressure on local steel mills is relaxing, but in view of their heavy commitments producers are unlikely to show much change in their open-hearth operations for several weeks to come. A leading interest still finds specifications equal to shipments, but other mills are slowly reducing their backlogs. An important independent whose finishing mill operations have declined continues to produce steel ingots at capacity in order to restore depleted reserves of semi-finished material.

With deliveries slowly improving, specifying is at shorter range and production prospects for September have become more uncertain. While ingot output in the district is still at close to capacity, a decline to a rate of 85 or 80 per cent within the next 30 days is regarded as a possibility.

Railroad car builders, who form an important consuming group in this district, will complete their present production programs within a month or two. While almost every important Western carrier has been mentioned as a probable buyer of equipment this fall, few inquiries are actually out for figures. On the other hand, the vacation season, now at its height, has undoubtedly had an adverse effect on steel orders, with the likelihood that for this reason alone a recovery in demand will manifest itself next month.

An improvement in specifications from the automotive industry is also looked for. While releases from that source now are at a low ebb, increased operations among automotive foundries and better orders from a Western body builder point to heavier motor car production soon. Local mills, as well as producers elsewhere, may be adversely affected as a result of the reported intention of the Ford Motor Co. to supply all of its requirements in carbon and alloy bars from its own mills, beginning with September.

Structural steel lettings are heavier this week, and a larger amount of fabricating work is in prospect. A further decline in Alabama foundry iron to $12.50, Birmingham, has accentuated the competitive situation in the local pig iron market. Although Northern melters are no longer accustomed to using high phosphorus iron, the delivered price on the Southern product in Chicago is fully $2 a ton below that on local pig iron, and the margin is even greater at other points in this territory.

Pig Iron.—Southern foundry iron is now available in relatively small tonnages at $12.50, base Birmingham, a decline of 50c. a ton from the commonly quoted market of a week ago. The delivered price in Chicago is $18.50 a ton, or fully $2 a ton under the delivered quotation on Northern brands. Chicago district producers are still holding to $20, base, furnace, having made no move to meet the price competition from Alabama makers. It is generally recognized that foundry practice in this territory has got away from the use of iron containing high phosphorus and low manganese and that melters are reluctant to change their methods. Moreover local blast furnace interests are still in a strong position, having almost no stocks and being fortified with good backlogs. There is no question, however, that low prices on Alabama iron have caused many buyers to postpone forward purchasing, pending further price developments. Total sales of Southern iron in this territory in the past two months probably did not exceed 25,000 tons, but more and more trial orders are being placed. In the St. Louis district, sales of the Southern product are estimated at 50,000 tons. Foundry melt in Chicago and tributary areas is well sustained. There has been almost no seasonal letup in activity except among foundries serving the automobile industry. Output of motor car castings, moreover, seems to have passed its low point, since a number of important automotive foundries in western Michigan have increased their melt. Melters serving the tractor and machine tool industries are operating at a capacity rate. Inquiries have been put out for 6000 tons by stove and furnace interests in southern Michigan, indicating that they are getting ready for a seasonal increase in their manufacturing programs. The Oliver Farm Equipment Co., South Bend, Ind., has placed 3000 tons of foundry and malleable for delivery through the remainder of the year. The National Sewing Machine Co., Belvidere, Ill., is in the market for 1500 tons. Foundry grades from Lake Erie furnaces continue to be offered at concessions below the quotations of Chicago district producers. A cargo of boat iron was unloaded at Milwaukee last week.

Prices per gross ton at Chicago:

N'th'n No. 2 fdy., sil. 1.75 to 2.25	$20.00
N'th'n No. 1 fdy., sil. 2.25 to 2.75	20.50
Malleable, not over 2.25 sil.	20.00
High phosphorus	20.00
Lake Super. charcoal, sil. 1.50	27.04
So'th'n No. 2 fdy. (all rail)	$18.51 to 19.01
Low phos., sil. 1 to 2, copper free	29.50
Silvery, sil. 8 per cent	29.79
Bess. ferrosilicon, 14-15 per cent	46.29

Prices are delivered consumers' yards except on Northern foundry, high phosphorus and malleable, which are f.o.b. local furnace, not including an average switching charge of 61c. per gross ton.

Plates.—Although specifications are not so large as recently, they still exceed shipments by a small margin. With 1000 tons to 1500 tons moving daily from local mills to the Milwaukee pipe fabricator, plates are in the strongest position among the finished rolled products. Demand for plates for oil storage tanks is also well sustained, 6500 tons of tankage having been placed in the Southwest during the week, with 15,000 tons of pending work still before the trade. Steel specifications from railroad car builders are expected to run out within the next month. While practically every important Western railroad has been mentioned as a probable buyer of equipment this fall, a relatively small amount of inquiry is actually in the market. Even if liberal orders were placed now, specifications for the steel could not reach the mills for at least 30 days. Plate deliveries range from four to six weeks on some specifications to eight, nine and 10 weeks on others. Mill prices are firm.

Ferroalloys. — New business is light, but shipments continue to go forward in record volume.

Prices delivered Chicago: 80 per cent ferromanganese, $112.56; 50 per cent ferrosilicon, $83.50 to $88.50; spiegeleisen, 19 to 21 per cent, $39.76 to $41.76.

Structural Material.—Mill deliveries of plain material show improvement, now ranging from four to six weeks. While one important local producer reports that the week's specifications were equal to shipments, the trend is undoubtedly toward a further reduction of backlogs. Competition among fabricators is still keen, with bids on current work low, but the amount of prospective work likely to mature this fall has assumed encouraging proportions. Among definite inquiries that have come out during the week is one for 4850 tons from the Great Northern Railway, representing 1930 bridge requirements. The Milwaukee Electric Railway & Light Co. is about to place 2000 tons for an office building at Milwaukee. The Pittsburgh Plate Glass Co. has awarded 2700 tons for a plant at Oklahoma City, Okla., to the Muskogee Iron Works. Plain material prices are unchanged.

Mill prices on plain material, per lb.: 2.05c. base, Chicago.

Bars.—Announcement that the Ford Motor Co. will supply all of its bar requirements from its own mills in September is of wide interest, since steel producers in this and other districts will be adversely affected. Bar demand from other automobile manufacturers continues to diminish as preparations go forward for the bringing out of new models. Improvement in specifications is expected some time in the first half of September, if not before. Meanwhile, deliveries from local mills have shortened, now ranging from four to six weeks. Steel requirements of tractor manufacturers are expected to show little reduction, in view of large orders recently received from the Soviet Government. Road machinery makers are reported less active than earlier in the year. Mill prices on mild steel bars are firm at 2.05c. a lb., Chicago. Backlogs of mills rolling alloy steel bars continue to decline in keeping with the reced-

ing operations of the automobile industry. There continues to be a well diversified demand for iron bars, part of it attributable to the recent tense situation in soft steel bars. Releases in rail steel bars are gradually tapering. Mill operations are well sustained, partly because of the building up of stocks of fence posts for the fall trade.

Sheets.—Recent cool weather has resulted in better mill operations, which now range from 75 to 80 per cent of capacity. Producers are booked three to four weeks ahead. Receipt of specifications from a Milwaukee builder of automobile bodies indicates that the leading Wisconsin motor car builder is getting under way on the production of new models. Weakness in prices has been confined mainly to galvanized sheets, with competition most severe in the Southwest.

Base prices per lb., deliv'd from mill in Chicago: No. 24 black sheets, 3c. to 3.05c.; No. 24 galv., 3.65c. to 3.75c.; No. 10 blue ann'l'd, 2.35c. Deliv'd prices at other Western points are equal to the freight from Gary, plus the mill prices, which are 5c. per 100 lb. lower than Chicago delivered prices.

Strip Steel.—Demand for hot-rolled strip continues to taper, but there has been no further reduction in specifications for cold-rolled material, output of which remains at 65 per cent of capacity. For mill prices see page 489.

Cast Iron Pipe.—Industrial buying is fair, but there are few municipal lettings and business from railroads and utilities is light. Operations of pipe foundries range from 60 to 70 per cent. Demand will improve in the fall if work now in engineers' offices reaches the market. Madrid, Neb., has awarded 120 tons of 2, 4 and 6-in. to the Central Foundry Co. Lamar, Colo., took bids Monday on 2300 tons of 14-in. and 350 tons of 4 to 10-in. centrifugal pipe. Royal Oak, Mich., also received tenders Monday on 450 tons of 6 and 8-in. Class B. The South Park Commissioners, Chicago, will take general contract figures Aug. 21 on 500 tons of 2 to 32-in. Class B. Prices are unchanged.

Prices per net ton, del'd Chicago: Water pipe, 6-in. and over, $45.20 to $46.20; 4-in., $49.20 to $50.20; Class A and gas pipe, $3 extra.

Rails and Track Supplies.—Local rail mills are still running at a 75 per cent rate, but will reduce operations toward the end of the month. The fall rail buying movement is expected to set in within the next four to six weeks. Bookings in track fastenings are of a routine character.

Prices f.o.b. mill, per gross ton: Standard section open-hearth and Bess. rails, $43; light rails, rolled from billets, $36. *Per lb.:* Standard railroad spikes, 2.80c.; track bolts with square nuts, 3.80c.; steel tie plates, 2.15c.; angle bars, 2.75c.

Reinforcing Bars.—An increase in the amount of live pending work has encouraged distributers, although lettings are still only of fair proportions. Bookings in concrete bars so far this year has been 15 to 20 per cent smaller than during the same period in 1928. The decline is ascribed largely to a falling off in local apartment house and public school construction. Competition for current business is keen, with prices flexible.

Bolts, Nuts and Rivets.—Specifications for bolts and nuts have improved somewhat, but there has been a sharp drop in releases of small rivets because of the decline in automobile production. The customary summer slump in bolt and nut consumption by the farm equipment manufacturers has not materialized, specifications from tractor plants being particularly good.

Wire Products.—Specifications thus far in August have shown some improvement over those of the corresponding period last month, releases from jobbers being notably good for the season. It is too early for buyers to take interest in contracts and prices have not yet become sufficiently stabilized to encourage much new business of any kind. The trade is no longer so much concerned about mail-order-house sales of nails, barbed wire and fencing at blanket delivered prices with the freight allowed, believing that this development has been given more attention than it deserves. It is pointed out that sales through that channel do not constitute more than 5 per cent of the total consumption of the three products. For mill prices see page 489.

Coke.—Shipments of by-product foundry coke reflect a sustained melt throughout the territory served by local ovens. Prices continue at $8 a net ton, ovens.

Old Material.—Heavy melting steel has advanced on purchases of 15,000 tons by one independent steel producer and odd lots by another at $15.75 a gross ton, delivered. The price paid justifies the recent advancing tendency of the market when activity was confined to trading among dealers, although it falls short of the figures paid on considerable railroad material. Consumers contend that they are well stocked with scrap and that their requirements in September are likely to diminish. Sellers, while recognizing the possibility of reduced steel output next month, believe that consumption will still be large in comparison with the supply of scrap. Reduced output of scrap by automobile makers and other industries has prevented the accumulation of a large floating supply. Outside of steel works grades, the old material list has been quiet, with consumer purchases confined to scattered lots. Every test of the market, however, has brought out a higher price. The Rock Island took bids on a list of 3000 tons yesterday.

Prices deliv'd Chicago district consumers:

Per Gross Ton

Basic Open-Hearth Grades:	
Heavy melting steel	$15.25 to $15.75
Shoveling steel	15.25 to 15.75
Frogs, switches and guards, cut apart, and misc. rails	16.75 to 17.25
Hydraul. compressed sheets	13.50 to 14.00
Drop forge flashings	10.50 to 11.00
No. 1 busheling	13.25 to 13.75
Forg'd cast and r'l'd steel carwheels	18.75 to 19.25
Railroad tires, charg. box size	18.75 to 19.25
Railroad leaf springs cut apart	18.75 to 19.25
Acid Open-Hearth Grades:	
Steel couplers and knuckles	17.00 to 17.50
Coil springs	19.00 to 19.50
Electric Furnace Grades:	
Axle turnings	14.50 to 15.00
Low phos. punchings	17.00 to 17.50
Low phos. plates, 12 in. and under	16.75 to 17.25
Blast Furnace Grades:	
Axle turnings	12.50 to 13.00
Cast iron borings	10.25 to 10.75
Short shoveling turnings	10.25 to 10.75
Machine shop turnings	7.00 to 7.50
Rolling Mill Grades:	
Iron rails	16.00 to 16.50
Rerolling rails	17.75 to 18.25
Cupola Grades:	
Steel rails less than 3 ft.	17.50 to 18.50
Steel rails less than 2 ft.	19.00 to 19.50
Angle bars, steel	17.00 to 17.50
Cast iron carwheels	14.00 to 14.50
Malleable Grades:	
Railroad	17.00 to 17.50
Agricultural	15.50 to 16.00
Miscellaneous:	
*Relaying rails, 56 to 60 lb.	23.00 to 25.00
*Relaying rails, 65 lb. and heav.	26.00 to 31.00

Per Net Ton

Rolling Mill Grades:	
Iron angle and splice bars	15.00 to 15.50
Iron arch bars and transoms	21.50 to 22.00
Iron car axles	26.50 to 27.00
Steel car axles	17.50 to 18.00
No. 1 railroad wrought	14.00 to 14.50
No. 2 railroad wrought	13.50 to 14.00
No. 1 busheling	9.00 to 9.50
No. 2 busheling	7.00 to 7.50
Locomotive tires, smooth	14.50 to 15.00
Pipes and flues	10.00 to 10.50
Cupola Grades:	
No. 1 machinery cast	14.50 to 15.00
No. 1 railroad cast	14.00 to 14.50
No. 1 agricultural cast	13.25 to 13.75
Stove plates	12.25 to 12.75
Grate bars	11.75 to 12.25
Brake shoes	11.50 to 12.00

*Relaying rails, including angle bars to match, are quoted f.o.b. dealers' yards.

The Michigan Steel Corporation, Detroit, has moved its Detroit offices to 2400 New Union Trust Building, at Congress and Griswold Streets, that city.

New York

Pig Iron Sales Total About 10,000 Tons—Steel Orders Fall Off—8100 Tons Awarded for Subway

NEW YORK, Aug. 20.—Sales of pig iron in this district during the past week, at about 10,000 tons, were slightly smaller than in the previous week. Shipments on contracts are in good volume, and there is a fair total of new inquiry for foundry iron, but most buyers appear to be interested only in small lots for early delivery. Exceptions are an inquiry for 1000 to 2000 tons of foundry iron for delivery in the third and fourth quarter and another for 1000 tons for third quarter delivery, with shipments extending into the last quarter. Southern furnaces continue to be active factors, but sales are reported to have been small, although the new rail and water freight rates, via Savannah, with free lighterage in New York Harbor on 200 tons or more, make it possible to reach certain New York tidewater plants at a low rate. The free lighterage extends up the Hudson River to Edgewater, N. J., down the harbor to Sixty-ninth Street, Brooklyn, up the East River to Melrose Station and includes the Gowanus Canal and Newtown Creek in Brooklyn. Buffalo furnaces are endeavoring to maintain $18 a ton, base, on foundry iron, but $17.50 a ton has not entirely disappeared, although it is less common than a week or more ago. Eastern Pennsylvania sellers have quoted $19 to $19.50 a ton, furnace, on sales into this district. Although Alabama furnaces quote $14 a ton, Birmingham, for foundry grade and $13 a ton for basic iron, sales of foundry have been made at about $13 a ton when a sizable tonnage was involved.

Prices per gross ton, delivered New York district:

Buffalo No. 2 fdy., sil. 1.75 to 2.25	$22.41 to $22.91
*Buf. No. 2, del'd east. N. J.	20.78 to 21.28
East, Pa. No. 2 fdy., sil. 1.75 to 2.25	20.39 to 21.52
East. Pa. No. 2X fdy., sil. 2.25 to 2.75	20.89 to 22.02

Freight rates: $4.91 from Buffalo, $1.39 to $2.52 from eastern Pennsylvania.

*Prices delivered to New Jersey cities having rate of $3.28 a ton from Buffalo.

Ferroalloys.—Demand for spiegeleisen is only moderate. Probably about 1000 tons has been placed in the last few weeks for spot and early delivery at unchanged quotations. No new business in ferromanganese is reported. Specifications on contracts continue heavy.

Finished Steel.—Business in the past week has tapered somewhat as a result of seasonal conditions. However, mills look for the slowing down in buying to be of short duration and already there are indications in some lines of better bookings. Production continues at capacity, with deliveries of bars, shapes and plates ranging from four to six weeks. Prices are firm, with structural shapes quoted at 2.19½c., New York, and plates at 2.22½c. Structural steel is less active than a week ago, but prospects are favorable for a large volume of lettings in the immediate future. The outstanding award of the past week was 8100 tons for route 107, section 6, of the New York subway. Another important letting was 7000 tons for a Newark, N. J., bank building. Inquiry has been made for 5800 tons for Kings County Hospital in Brooklyn. Sheet steel specifications and orders have been of fairly good volume, but have declined from those of the previous few weeks. Galvanized sheets are selling at 3.50c., Pittsburgh, and black at 2.85c. Blue annealed stock is firm at 2.35c. for No. 13 gage. Weakness persists in wire goods. Common wire nails are being sold at $2.55 per keg, Pittsburgh, or lower. Plain wire is priced at 2.40c. a lb., Pittsburgh. The Nippon Oil Co. has postponed for 30 days action on its export inquiry for 19,000 base boxes of tin plate.

Mill prices per lb., deliv'd New York: Soft steel bars, 2.29c.; plates, 2.22½c.; structural shapes, 2.19½c.; bar iron, 2.14c.

Reinforcing Bars. — The Kalman Steel Co. will furnish 800 tons of bars for the new Chevrolet assembly plant at Tarrytown, N. Y. Otherwise, awards have been for jobs taking only small tonnages. Fresh inquiries have been light, but mills are well engaged on a substantial volume of orders ranging from 25 to 100 tons each. Prices are steady and unchanged.

Billet steel reinforcing bars in 40, 50 and 60-ft. lengths, 2.05c. per lb., Pittsburgh, and 2.30c. per lb., Pittsburgh warehouse, for cut lengths. Out of New York warehouse, 2.90c. per lb. for lots of 5 tons or more, 3.05c. for lots of 2 to 5 tons and 3.30c. for less than 2 tons, all delivered at job.

Cast Iron Pipe. — Prices are unchanged, ranging from $31 to $33 a ton, f.o.b. Northern foundry. Most of the current buying is confined to orders for a carload to slightly less than 100 tons for privately owned companies. Some small export orders have been closed for shipment to the Philippine Islands and to Central American markets. The Plainfield Union Water Co., Plainfield, N. J., has closed on 288 tons of 12-in. water pipe with a Northern maker. Bloomfield, N. J., has opened bids on 150 tons of 6-in. Class C pipe.

Prices per net ton deliv'd New York: Water pipe, 6-in. and larger, $33.60 to $34.60; 4-in. and 5-in., $36.60 to $37.60; 3-in., $43.60 to $44.60. Class A and gas pipe, $3 extra.

Warehouse Business.—Consumer activity continues in the purchase of small lots of material from stock, but at the present rate August business is expected to be smaller than that of last month. There is a fair demand for galvanized sheets, but black sheets are quiet and prices on both grades are subject to some concessions. Buying of structural material is limited to small lots, and a renewal of activity is not expected until next month.

Coke.—The market is inactive except for shipments on contracts. Standard furnace coke is unchanged at $2.75 to $2.85 a net ton, Connellsville.

Special brands of beehive foundry coke are quoted at $4.85 a net ton, ovens, or $8.56 a net ton, delivered to northern New Jersey, Jersey City and Newark, and $9.44 to New York and Brooklyn. By-product coke is quoted at $9 to $9.40 a net ton, Newark or Jersey City, and $10.06, New York or Brooklyn.

Old Material.—Consumer buying of scrap is small. Prices of all grades are unchanged. Heavy melting steel continues active among brokers who are filling contracts, but all grades of cast scrap are quiet and prices are lacking in strength. Brokers are paying $14.50 a ton for heavy breakable cast to deliver on $15 contracts, but users are only offering $14 to $14.50 for new contracts.

Dealers' buying prices per gross ton, f.o.b. New York:

No. 1 heavy melting steel	$12.75 to $13.35
Heavy melting steel (yard)	8.00 to 9.75
No. 1 hvy. breakable cast	10.75 to 11.75
Stove plate (steel works)	8.00 to 8.25
Locomotive grate bars	8.25 to 8.75
Machine shop turnings	7.75 to 8.00
Short shoveling turnings	7.75 to 8.00
Cast borings (blast furn. or steel works)	7.00 to 7.75
Mixed borings and turnings	6.75 to 7.75
Steel car axles	19.50 to 20.00
Iron car axles	24.00 to 25.00
Iron and steel pipe (1 in. dia., not under 2 ft. long)	10.75
Forge fire	9.75 to 10.25
No. 1 railroad wrought	12.00 to 12.50
No. 1 yard wrought, long	11.00 to 11.50
Rails for rolling	13.25 to 13.75
Cast iron carwheels	12.50 to 13.00
Stove plate (foundry)	8.00 to 8.50
Malleable cast (railroad)	14.00 to 14.50
Cast borings (chemical)	10.00 to 10.50

Prices per gross ton, deliv'd local foundries:

No. 1 machry. cast	$17.00
No. 1 hvy. cast (columns, bldg. materials, etc.), cupola size	15.00
No. 2 cast (radiators, cast boilers, etc.)	14.50

Detroit Scrap Strong

DETROIT, Aug. 20.—While there have been no price changes the past week on old material in this district, there is an apparent shortage in offerings of some grades at prevailing prices. The strength of the market is shown by the fact that there seems to be enough material to be had by paying a premium.

Dealers' buying prices per gross ton, f.o.b. cars, Detroit:

Hvy. melting and shov. steel	$14.25 to $14.75
Borings and short turnings	9.00 to 9.50
Long turnings	8.50 to 9.00
No. 1 machinery cast	12.50 to 13.00
Automobile cast	13.00 to 13.50
Hydraul. comp. sheets	14.00 to 14.50
Stove plate	9.00 to 9.50
New No. 1 busheling	12.50 to 13.00
Old No. 1 busheling	11.00 to 11.50
Sheet clippings	8.75 to 9.25
Flashings	13.00 to 13.50

Warehouse Prices, f.o.b. Cleveland

	Base per Lb.
Plates and struc. shapes	3.00c.
Soft steel bars	3.00c.

No. 9 gal. wire, per 100 lb.	3.35
Com. wire nails, base per keg	2.90

*Net base, including boxing and cutting to length.

Cleveland

Specifications Off Somewhat, But Full Capacity Production Continues—Better Sales of Pig Iron

CLEVELAND, Aug. 20.—Specifications for finished steel fell off somewhat the past week. However, mills in this district continue to operate at close to 100 per cent of capacity. While deliveries on most products as yet show little gain, the mill backlogs will be reduced considerably by Sept. 1, unless there is marked gain in specifications. No cancellations or suspensions from the motor car industry are reported, but the amount of steel that is being taken by that industry has been reduced sharply. Local forge and stamping plants engaged in automobile work are taking less steel than recently because of a curtailment in operations.

Automobile manufacturers are going rather slow in getting under production schedules on new models until their stocks of old cars are disposed of. Stocks of used cars have also been very large but these are believed to have been cut down considerably. While automobile manufacturers are buying forgings and other parts, they are following a conservative policy by placing orders for comparatively small quantities. The feeling in the automotive industry appears to be rather optimistic, with expectation, however, that it will hardly get back this year to the pace it set during the first half.

Metal working plants outside of the automotive field as a rule are keeping up close to recent operations. Manufacturers of steam shovels are still crowded with orders and are operating their plants at capacity.

Backlogs of auto body sheets have been about wiped out and mills need orders for hot and cold-rolled strip steel. Some of the strip sheet mills also need business. A Cleveland mill is now making regular water shipments of steel bars to Toledo in addition to Detroit.

Pig Iron.—Sales gained somewhat the past week, during which Cleveland interests took orders for 20,000 tons of foundry and malleable grades, as compared with 15,000 tons in the previous week. A large proportion of the business entered is for the fourth quarter now that the present quarter is more than half over. The reduction in price of Southern foundry iron has led some producers of Southern grades to seek business in Cleveland and in other parts of northern Ohio, but with present foundry practice the demand for iron with high phosphorus content is quite limited in this territory. Consequently it is not expected that Southern iron will become much of a factor here. While prices on Southern iron are not clearly defined, this iron is at present quoted at $13 to $13.50 in this territory. Prices on Northern foundry iron are unchanged at $18.50, Cleveland, for outside shipment, $19 for local delivery and $20, Lake furnace, for Michigan delivery. Shipments, which fell off during the first half of the month, increased the past week through releases from some of the foundries in the automotive field. Stove and furnace manufacturers continue good operations and are taking iron freely. Low phosphorus iron is moving slowly.

Prices per gross ton at Cleveland:

N'th'n fdy., sil. 1.75 to 2.25	$19.50
S'th'n fdy., 1.75 to 2.25	$19.00 to 19.50
Malleable	19.50
Ohio silvery, 8 per cent	28.00
Basic Valley furnace	18.50
Stand. low phos., Valley	26.50 to 27.00

Prices except on basic and low phosphorus are delivered Cleveland. Freight rates: 50c. from local furnaces; $3 from Jackson, Ohio; $6 from Birmingham.

Iron Ore.—The movement is maintaining the pace set earlier in the season and it is expected that water shipments will be in excess of 10,500,000 tons this month. Most consumers will continue present shipping schedules at least through September. Shippers see no reason to revise their recent predictions that the season's movement will exceed 65,000,000 tons and break all previous records.

Semi-finished Steel.—The demand for sheet bars, billets and slabs is not quite as heavy as recently and pressure for deliveries has disappeared. Shipments are being made against $35 contracts. Consumers generally are covered for the quarter and there is no new inquiry. A leading local producer continues to operate at 100 per cent of capacity and is gaining slightly on deliveries, although this plant is fully committed for nearly two weeks.

Steel Bars, Plates and Shapes.—The volume of business was not so heavy the past week as during the previous week. However, the tonnage entered so far this month does not show a marked falling off from the corresponding period of July. The decline in specifications is most noticeable in steel bars, owing to the slowing down of the automotive industry. Plates are still moving fairly well in small lots, but deliveries by some of the mills are now being promised in two weeks. In the building field there is good inquiry for small lots of fabricated material. The McClintic-Marshall Co. was low bidder for the Maumee River Bridge, Toledo, requiring 7000 tons. Five hundred tons of sheet steel piling will be required for the Ohio Savings Bank & Trust Co. Building, Toledo. Prices are steady at 1.90c. to 1.95c., Cleveland, for steel bars and 1.95c., Pittsburgh, for plates and shapes.

Sheets.—While business is fair, shipments exceed incoming orders, so that backlogs are being slowly re-

duced. Falling off in the demand from the recent peak is more noticeable in auto body sheets than in other grades, and some of the mills have caught up on deliveries on that grade. Automobile companies are restricting their purchases to rather small lots, apparently not wishing to make heavy commitments for extended deliveries until they know what their operating schedules will be during the next few weeks. Most mills are still comfortably filled on black sheets for three or four weeks. While the demand for wide blue annealed sheets is holding up well, some of the mills are in need of blue annealed tonnage. Considerable demand has developed recently from barrel manufacturers for No. 28 gage material for drums for insecticides. Prices appear better stabilized than recently. Black sheets are firm at 2.85c., Pittsburgh, and sheet mills are holding quite firmly to 2.35c. for blue annealed. While 3.50c. on galvanized has not disappeared, most mills are holding to 3.60c. and are taking business at that price.

Wire Products.—Demand for wire is slow. Plain wire is commonly quoted at 2.40c., Cleveland, for outside shipment and to local jobbers, although some of the mills are adhering to 2.50c. for manufacturers wire for local delivery. There appears to be no definite price basis for nails for shipment to competitive points. For local delivery some business is being taken in mixed car lots at $2.65 per keg.

Warehouse Business.—The seasonal lull is in evidence and business is lighter than last month. However, sheets are moving in good volume. No price concessions are reported.

Strip Steel.—Specifications for hot-rolled strip continue rather light and some of the mills need tonnage, particularly in wide material. Prices appear firm, although there is little new business. The demand for cold-rolled strip is also slow. While some of the mills have enough business to keep them operating well for three or four weeks, others need tonnage. The 2.85c. Cleveland and Pittsburgh price is generally quoted, although there has not been enough business recently to test this price, most consumers being under contracts at 2.75c.

Coke.—While shipments of foundry coke are fair, there is not much new business. Premium brands of Connellsville foundry coke are steady at a maximum of $4.85 a net ton. Ohio by-product foundry coke remains at $8.25, Painesville. By-product ovens are taking a fair amount of business in coke for domestic use, which is bringing $4.50, Ohio ovens, for egg size and $4 for nut.

Old Material.—While scrap is coming out somewhat more freely than recently, the market remains firm. There is some activity among dealers who are covering against short orders, but no new buying by mills is reported. A Cleveland mill is taking steel making scrap more liberally than recently but is not releasing orders for blast furnace material. Dealers are paying $15.25 to $15.50 for ordinary No. 1 heavy melting steel for one Cleveland mill and $16.50 for selected scrap for another local consumer. Compressed sheet steel is higher locally. In the valley district No. 1 heavy melting steel is bringing $18.50 and compressed sheet steel $18 from dealers.

Prices per gross ton delivered consumers' yards:

Basic Open-Hearth Grades:	
No. 1 heavy melting steel	$15.25 to $15.75
No. 2 heavy melting steel	14.50 to 15.00
Compressed sheet steel	15.50 to 16.00
Light bundled sheet stampings	12.00 to 12.50
Drop forge flashings	13.00 to 13.25
Machine shop turnings	9.75 to 10.25
Short shoveling turnings	11.50 to 11.75
No. 1 railroad wrought	13.50 to 14.00
No. 2 railroad wrought	16.00 to 16.50
No. 1 busheling	13.25 to 13.75
Pipes and flues	9.00 to 9.50

Philadelphia

Plate and Shape Mills Well Engaged—Pig Iron Price Firmer, But Untested by Large Sale

PHILADELPHIA, Aug. 20.—Plate mills are well engaged with current specifications and in most cases have tonnage in sight sufficient to make the August total of business larger than in July. Shape mills are also operating full and have received heavier orders this month than last, with the smaller fabricating shops increasingly active. The steel bar market, however, is quiet and deliveries are fairly prompt. Sheets are also inactive and black and galvanized sheet prices are still lacking in strength.

Bids opened by the Pennsylvania Railroad on plates, shapes, bars and sheets brought out quotations of 1.90c. to 1.95c., f.o.b. mill, on bars, 1.85c. to 1.95c., mill, on plates and 1.90c. to 1.95c., mill, on shapes. Sheet bids were 2.20c. for No. 10 blue annealed, 2.35c., mill, for No. 13 blue annealed, 2.85c. to 2.95c., mill, for black sheets and 3.50c. to 3.60c., mill, for galvanized. The Pennsylvania Railroad is reported to have closed on a tonnage of wrought iron pipe for use in electrification work.

Pig Iron.—Sellers of Southern pig iron are still competing for tonnage in eastern Pennsylvania, offering foundry iron at $13 to $14 a ton, f.o.b. furnace, on a rail and water freight rate for small lots, of $5.25 a ton, loaded on cars Philadelphia. Eastern Pennsylvania furnaces have developed a firmer attitude in the past week and show no inclination at present to offer any concession from $21 a ton, base, on foundry iron, but no sizable tonnage has been closed to offer a test of this price. Birmingham furnace interests are reported by sellers of managanese ore to be negotiating for more than their usual ore requirements, evidently for the purpose of increasing the manganese content of their pig iron to make it more satisfactory to Northern users. Inquiry is fair but mostly for small lots of foundry iron. An exception is 500 tons of No. 2 plain and No. 1X for the American Engineering Co., Philadelphia. Buyers are beginning to show some interest in their fourth-quarter requirements, but have not yet issued inquiries for the last quarter. Basic iron is quiet, with the two leading buyers in this district covered for the remainder of this quarter.

Prices per gross ton at Philadelphia:

East. Pa. No. 2, 1.75 to 2.25 sil.	$21.26 to $21.76
East. Pa. No. 2X, 2.25 to 2.75 sil.	21.76 to 22.26
East. Pa. No. 1X	22.26 to 22.76
Basic (del'd east. Pa.)	19.75 to 20.25
Gray forge	20.00 to 20.50
Malleable	21.25 to 21.75
Stand. low phos. (fo.b. N. Y. State furnace)	22.00 to 23.00
Cop. br'g low phos. (f.o.b. furnace)	23.50 to 24.00
Va. No. 2 plain, 1.75 to 2.25 sil.	24.04
Va. No. 2X, 2.25 to 2.75 sil.	24.54

Prices, except as specified otherwise, are deliv'd Philadelphia. Freight rates: 76c. to $1.64 from eastern Pennsylvania furnaces; $4.54 from Virginia furnaces.

Bars.—Demand is small, but mills still have a fair backlog of orders on

their books and are maintaining 1.95c., Pittsburgh, or 2.27c., Philadelphia. At the opening of bids by the Pennsylvania Railroad on 6500 tons of bars, 1.90c., f.o.b. mills, was quoted by makers at Pottsville, Pa., and Steubenville, Ohio, and 1.95c., f.o.b. mill, by the other bidders.

Reinforcing Bars.—Billet steel bar prices show no improvement, and, with makers quoting down to 1.95c., Pittsburgh, or 2.27c., delivered Philadelphia, usually with no extra for cutting to length and occasionally shading this price, rail steel bar mills are booking but little business. The quotation on rail steel bars is 1.95c., Franklin, Pa., or Tonawanda, N. Y., or 2.27c., delivered Philadelphia, with no extra for cutting to length. The Magee Carpet Co., Bloomsburg, Pa., has awarded 100 tons of rail steel bars for a new building to the Danville Structural Steel Co. The Soldiers and Sailors Memorial Bridge, Harrisburg, Pa., requiring 3000 tons of bars, has been awarded to the Taylor-Davis Co.

Shapes.—Most eastern Pennsylvania shape mills are operating full and in some instances expect that August business will be larger than that for July. Orders from small fabricators are beginning to increase and on certain sizes mills are quoting slight delays in delivery. Prices are unchanged at 1.95c. to 2.05c., f.o.b. nearest mill to consumer, or 2.01c. to 2.11c., delivered Philadelphia. Bids on 2550 tons of shapes, opened by the Pennsylvania Railroad were 1.95c., f.o.b. mill, with two exceptions, which were 1.90c., f.o.b. Pottsville and f.o.b. Steubenville, Ohio, or Pittsburgh.

Plates.—Delays in deliveries are slightly longer than on other steel products, with mills well engaged and expecting August business to exceed July. Prices are firm at 2.05c., Coatesville, or 2.15c., delivered Philadelphia. At the Pennsylvania Railroad opening of bids on 20,000 tons of plates quotations were 1.95c., f.o.b. mill, except for bids of 1.85c., f.o.b. Cleveland, and 1.90c., f.o.b. Steubenville, or Pittsburgh.

Sheets.—Blue annealed sheet quotations are firm at 2.35c. per lb., Pittsburgh, for No. 13 gage and 2.20c., Pittsburgh for No. 10 gage, light plates, blue annealed. Black sheets are 2.85c., Pittsburgh, or 3.17c., delivered Philadelphia, and galvanized are 3.50c. to 3.60c., Pittsburgh, or 3.82c. to 3.92c., delivered Philadelphia. An automobile body builder in this district has closed a contract with a Middle-Western manufacturer of trucks to supply disk wheels on its output for the rest of this year. Bids on sheets for the Pennsylvania Railroad were 2.35c., f.o.b. mill for No. 13 gage and 2.20c., mill on No. 10 gage, quoted on 400 tons of blue annealed sheets, 2.85c. to 2.95c., f.o.b. mill, quoted on 300 tons of black sheets and 3.50c. to 3.60c., mill, quoted on 100 tons of galvanized sheets.

Imports.—In the week ended Aug. 17, a total of 6320 tons of iron ore arrived at this port from Algeria, 3909 tons of chrome ore from Cuba, 50 tons of pig iron from Sweden and 225 tons of spiegeleisen from the United Kingdom. Steel arrivals consisted of 106 tons of structural shapes from Belgium and 71 tons from Germany, 23 tons of steel bars from Germany and 15 tons of steel bands from France.

Old Material.—All grades are inactive, especially cast scrap. Eastern Pennsylvania consumers of heavy breakable cast are not offering more than $14 a ton on new purchases, although dealers are paying $14.50 a ton to fill contracts. Shipments of No. 1 heavy melting steel are in good volume to a consumer at Bethlehem, Pa., but mills at Coatesville, Pa., and Claymont, Del., have found it necessary to curtail shipments on contracts, which have been too heavy recently. A Claymont, Del., mill, which usually disposes of its low phosphorous plate scrap is using it, being unable to obtain enough for it from other consumers.

Prices per gross ton delivered consumers' yards, Philadelphia district:

No. 1 heavy melting steel	$16.50 to	$17.00
Scrap T rails	16.00 to	16.50
No. 2 heavy melting steel	12.50 to	14.50
No. 1 railroad wrought	16.00 to	16.50
Bundled sheets (for steel works)		11.50
Hydraulic compressed, new	14.50 to	15.50
Hydraulic compressed, old	12.00 to	12.50
Machine shop turnings (for steel works)		12.00
Heavy axle turnings (or equiv.)	14.00 to	14.50
Cast borings (for steel works and roll. mill)	11.00 to	11.75
Heavy breakable cast (for steel works)		15.00
Railroad grate bars	12.00 to	12.50
Stove plate (for steel works)	12.00 to	12.50
No. 1 low phos., hvy., 0.04% and under	22.00 to	23.00
Couplers and knuckles	19.50 to	20.50
Rolled steel wheels	19.50 to	20.50
No. 1 blast f'nace scrap	10.50 to	11.00
Wrot. iron and soft steel pipes and tubes (new specific.)		15.00
Shafting	19.00 to	19.50
Steel axles	23.00 to	23.50
No. 1 forge fire		14.00
Cast iron carwheels	16.50 to	16.75
No. 1 cast	16.50 to	17.00
Cast borings (for chem. plant)		14.50
Steel rails for rolling	16.50 to	17.00

Electrochemists' Program for Fall Convention

Arrangements are rapidly being completed for the annual fall convention of the American Electrochemical Society to be held at the William Penn Hotel, Pittsburgh, Sept. 19 to 21. A symposium on "Contributions of Electrochemistry to Aeronautics" is attracting considerable attention and papers are already in hand for the session. Dr. J. D. Edwards of the Aluminum Co. of America, New Kensington, Pa., will preside. Among those who will take an active part are Edward P. Warner, editor of *Aviation;* Dr. George W. Lewis, director of aeronautical research, national advisory committee for aeronautics, and Starr Truscott, assistant to Dr. Lewis.

There will also be sessions on the electroplating and refining of various metals, including chromium, as well as sessions on organic electrochemistry. An attractive open discussion has been arranged for by the officers of the electrothermic division of the society and a number of electric furnace experts will participate. Some of the papers, already accepted, are the following:

"Recent Developments in the Analysis of Carbon in Iron and Iron Alloys," by N. A. Ziegler, of the Westinghouse Electric & Mfg. Co., Pittsburgh.

"The Use of Tantalum as Cathode for the Electrodeposition of Copper," by L. W. Strock and Hiram S. Lukens, of the University of Pennsylvania, Philadelphia.

"Cathode Potentials and Electrode Efficiencies of Copper in Copper Cyanide—Sodium Cyanide Solutions," by G. M. Smith and J. M. Breckenridge, of Vanderbilt University, Nashville, Tenn.

"The Determination of Sulphate in Chromic Acid and in Chromium Plating Baths," by H. H. Willard and Richard Schneidewind, of the University of Michigan, Ann Arbor, Mich.

"On the Road to Pure Iron and Some of its Indicated Properties," by T. D. Yensen, of the Westinghouse Electric & Mfg. Co., Pittsburgh.

Social features will include a smoker, a dinner and a dance.

The spring meeting of 1930 will be held in St. Louis. Carl Hambuchen and Gaston DuBois are the local committee. The headquarters will be held at the Coronada Hotel but the date has not yet been definitely decided, although it will probably be the last week in May. The symposium scheduled will deal with "Hydrometallurgy of Copper, Silver, Zinc, Lead and Cadmium," with T. H. Donahue of the Anaconda Lead Products Co. as chairman.

A motor boat engineering conference, sponsored by the Society of Automotive Engineers and the National Association of Engine and Boat Manufacturers, will be held at the Whittier, 461 Burns Drive, Detroit, Aug. 31.

MOVEMENT OF LAKE SUPERIOR ORE, IN GROSS TONS

Port	July, 1929	July, 1928	Season to Aug. 1 1929	Season to Aug. 1 1928

Pacific Coast

Pipe Line at Everett, Wash., Will Take 10,000 Tons of Steel —Cast Iron Pipe More Active

SAN FRANCISCO, *Aug.* 17 (*By Air Mail*).—Demand for iron and steel products on the Pacific Coast has fallen off, as is usual at this season of the year, yet a fair volume of business has been booked. The cast iron pipe market was the most active of the week, about 3000 tons having been placed, and several fair-sized tonnages came into the market for figures. The Western Pipe & Steel Co. took 1928 tons of plates for a penstock and surge tank at Tacoma, and bids have been called for on 10,000 tons of plates for a riveted steel pipe line at Everett, Wash.

Pig Iron.—Foundry operations continue to show little signs of improvement, and as a result sales and inquiries are limited to small tonnages. Prices are unchanged.

Bars.—The largest inquiry for reinforcing bars calls for 2300 tons for a wharf at the foot of Ninth Avenue, Oakland, bids on which have been opened. Prices appear to be firmer now than at any time in more than a year, and 2.30c., base, is being quoted on carload lots, with 2.60c. applying on lesser lots. In the Los Angeles district, prices are $2 a ton higher. Movement of merchant steel bars is confined to unimportant lots. On this class of material, 2.35c., c.i.f., is firm.

Prices per gross ton at San Francisco:

*Utah basic	$25.00 to $26.00
*Utah fdy., sil. 2.75 to 3.25	25.00 to 26.00
**Indian fdy., sil. 2.75 to 3.25	25.00 to 26.00

*Delivered San Francisco.
**Duty paid, f.o.b. cars San Francisco.

Plates.—Bookings, other than the 1928-ton lot for Tacoma, mentioned above, were in lots of less than 100 tons. Everett, Wash., will open bids Aug. 28 on 10,000 tons for a riveted pipe line. Alternate bids will be taken on wood and reinforced concrete pipe. No award has yet been made of 3000 tons for a pipe line at Bremerton, Wash. Prices appear firm at 2.35c., c.i.f. Coast ports.

Shapes.—Structural steel bookings were fairly large this week. The Judson-Pacific Co. took 400 tons for a factory for the Hazel-Atlas Glass Co., Oakland, 100 tons for an apartment in San Francisco, 100 tons for a memorial building in Vallejo, Cal., and 200 tons for a hangar for the Boeing Air Transport at Cheyenne, Wyo., placed through the Austin Co. of Washington. The Western Iron Works booked 300 tons for a store on Market Street, San Francisco. Shapes are firm at 2.35c., c.i.f. New inquiries include 350 tons for a Masonic Home at Decoto, Cal.

Cast Iron Pipe.—Demand for cast iron pipe has improved during the past week or 10 days. A fair-sized amount is up for figures. The Southern Pacific Co., San Francisco, has placed 1974 tons of 4 to 8-in. Class 150 pipe with various unnamed interests. The Pacific States Cast Iron Pipe Co. took 248 tons of 4 to 8-in. Class 150 pipe for a golf course at Palo Alto, Cal., for Stanford University. The United States Pipe & Foundry Co. booked 371 tons of 4 to 8-in. Class 150 pipe for the Naval ammunition depot, Hawthorne, Nev., and 106 tons of 8 and 18-in. Class 150 pipe for Alhambra, Cal. F. A. Rhodes secured 145 tons of 4 and 6-in. Class B pipe for San Diego. New inquiries include 1385 tons of 6 to 12-in. Class B or 150 pipe for the East Bay Municipal Utility District, Oakland, bids on which will be opened Aug. 19. The Spring Valley Water Co., San Francisco, has taken bids on 182 tons of 8-in. Class 150 pipe. Alturas, Cal., has opened bids on 199 tons of 4 to 8-in. Class B pipe. The R. E. Hazard Contracting Co. was low bidder on 144 tons of 4 and 6-in. Class B pipe for Plata Avenue and on 201 tons of 4 and 6-in. Class C pipe for El Prado Avenue, San Diego.

Railroad Material.—San Francisco will open bids Aug. 23 on 550 tons of 98 to 120-lb. girder rails, 21,000 tie plates, 13,000 brace tie plates, 130 kegs of track spikes, 30 kegs of track bolts and 82 special layouts.

Warehouse Prices, f.o.b. San Francisco

	Base per Lb.
Plates and struc. shapes	3.15c.
Soft steel bars	3.15c.
Small angles, ⅞-in. and over	3.15c.
Small angles, under ⅞-in.	3.55c.
Small channels and tees, ¾-in. to 2¾-in.	3.75c.
Spring steel, ¼-in. and thicker	5.00c.
Black sheets (No. 24)	4.90c.
Blue ann'l'd sheets (No. 10)	3.80c.
Galv. sheets (No. 24)	5.30c.
Struct. rivets, ½-in. and larger	5.65c.
Com. wire nails, base per keg	$3.40
Cement c't'd nails, 100 lb. keg	3.40

Birmingham

Southern Pig Iron Going to Outlying Territories—Steel Demand Continues Well Above Seasonal Average

BIRMINGHAM, Aug. 20. — District sales of pig iron are growing less owing to the fact that third quarter requirements generally have been covered. One company's third quarter sales to district consumers have slightly exceeded the probable make, and as a whole the margin between bookings and probable make is close. The extent that stocks are reduced will depend largely on the volume of sales to outside territories. Continued pressure by furnace interests for business in competitive territories has resulted in several round tonnage orders from the Middle West and Eastern territories. An increase in shipments in the past two weeks has been brought about by loadings for outside territories, as shipments to district consumers have shown very little increase, if any. Furnaces are maintaining a base price of $14.50 for No. 2 foundry for the district. Reported concessions of as much as $1.50 a ton in competitive territories on basic iron are not confirmed here but are not denied. The No. 1 furnace of the Republic Iron & Steel Co. was blown out for repairs on Aug. 14. The Alabama City furnace of the Gulf States Steel Co. was changed from basic to foundry iron on Aug. 12. Sixteen furnaces are active. Of this number, nine are on foundry, six on basic and one on recarburizing iron.

Prices per gross ton, f.o.b. Birmingham dist., furnaces:

No. 2 fdy., 1.75 to 2.25 sil.	$14.50
No. 1 fdy., 2.25 to 2.75 sil.	15.00
Basic	14.50

Finished Steel.—Backlogs of structural shapes and plates are practically as large now as three weeks ago, being sufficient for over three weeks' operations at the present rate. Backlogs of bars have dropped gradually during the past few weeks, but not to the extent that they have in comparable periods in the past, and new business is considered good. Sheet demand improved last week after a slight decline in the previous week. Wire products business is still well above normal for this season. Steel rail orders are being rapidly worked off, though no date has been set for closing the mill. Prices on galvanized sheets have been reduced to 3.75c. from 3.85c. All other prices are the same. With the orders booked last week and the others that are pending, structural steel fabricators will make a good showing for August in spite of the light business during the first half of the month. New orders of the Virginia Bridge & Iron Co. include 375 tons for railroad sheds at Birmingham; about 400 tons for a railroad station at Atlanta and 180 tons for the Lamson & Sessions Bolt Co. plant at Birmingham. The Ingalls Iron Works Co. has an order for 440 tons for the S. H. Kress store at Greenville, S. C. Reinforcing bar business is better than had been expected and operating schedules are still better than those of one year ago. The Tennessee company is working seven out of nine open-hearths at Ensley, a gain of one since a week ago. All eight are active at Fairfield and the Gulf States Steel Co. continues to work five of its six at Alabama City.

Cast Iron Pipe.—Dullness in the Southern territory is more pronounced and pressure pipe makers are relying largely on distant terri-

tories for new business. Plants in the district are bidding on several fair-sized projects in the Middle West to be awarded within the next week. The American Cast Iron Pipe Co. has booked 2500 tons of 6 and 8-in. pipe for Detroit. A new order of the National Cast Iron Pipe Co. calls for 200 tons for Fulton, Miss. A small project at Nashville, Tenn., has been let to the Alabama Pipe Co. The project at Gadsden, Ala., requiring about 3000 feet of 12 to 18-in. pipe may be awarded this week. The Hollywood, Fla., project has been postponed indefinitely. Plants continue to ship close to their output with operations unchanged. Prices remain at $37 to $38 a net ton, Birmingham, for 6-in. and larger diameters.

Coke.—Specifications on foundry coke under contract are undiminished. Of a total of 1380 by-product ovens, 1322 are active.

Old Material.—Gradual improvement in demand for steel grades during the past several weeks has given the market more strength than it had shown since early spring. Scrap steel rail prices have advanced from $12.50 to $14 and an increase of 50c. a ton has been made in quotations for heavy melting steel, rails for rolling and tramcar wheels. Cast iron carwheels have advanced $1 a ton. Demand for cast iron grades of scrap remains sluggish.

Prices per gross ton, deliv'd Birmingham dist. consumers' yards:

Heavy melting steel	$13.00 to	$13.50
Scrap steel rails		14.00
Short shoveling turnings		9.00
Cast iron borings		9.00
Stove plate	$11.50 to	12.00
Steel axles		21.00
Iron axles		23.00
No. 1 railroad wrought	10.00 to	10.50
Rails for rolling		15.50
No. 1 cast		13.50
Tramcar wheels		13.50
Cast iron carwheels	13.00 to	13.50
Cast iron borings, chem.	13.50 to	14.00

Boston

Pig Iron Buying Slackens—Most Grades of Scrap Easier —Structural Steel Prospects Promising

BOSTON, Aug. 20.—Pig iron buying dropped to small proportions the past week, but indications are it will shortly be more active, as several foundries are privately asking prices on round tonnages. Mystic Iron Works sales were 3000 tons, and, with one exception, at $20.21 to $21.31 a ton, on cars furnace, for No. 2X and No. 1X. The exception was a car of No. 2X at $19.89 a ton, furnace, on a high freight rate. Additional sales of No. 2X Southern iron at or very close to $22.25 to $22.75 a ton, delivered, are reported, these prices figuring back to $14 and $14.50 a ton, base furnace, allowing for a 50c. a ton loading charge. While Buffalo furnaces are endeavoring to hold their price to $18 a ton, base furnace, differentials on No. 1X iron have been waived the past week.

Foundry iron prices per gross ton deliv'd to most New England points:

†Buffalo, sil. 1.75 to 2.25	$22.28 to	$22.78
†Buffalo, sil. 2.25 to 2.75	22.78 to	23.28
*Buffalo, sil. 1.75 to 2.25	22.91 to	23.41
*Buffalo, sil. 2.25 to 2.75	22.91 to	23.91
East. Penn., sil. 1.75 to 2.25	22.65 to	23.15
East. Penn., sil. 2.25 to 2.75	23.15 to	23.65
Va., sil. 1.75 to 2.25		25.21
Va., sil. 2.25 to 2.75		25.71
*Ala., sil. 1.75 to 2.25		23.61
*Ala., sil. 2.25 to 2.75		24.11
†Ala., sil. 1.75 to 2.25	19.75 to	20.25
†Ala., sil. 2.25 to 2.75	20.25 to	20.75

Freight rates: $4.91 all rail from Buffalo, and $4.28 rail and water; $3.65 all rail from eastern Pennsylvania; $5.21 all rail from Virginia; $9.61 all rail from Alabama and $5.75 rail and water from Alabama to New England seaboard.
*All rail rate.
†Rail and water rate.

Cast Iron Pipe.—Newington, Conn., is asking bids on 2950 ft. of 10-in. pipe and 2500 ft. of 6-in., while Gardner, Mass., is in the market for 2000 ft. of 8 and 16-in. Current pipe business is confined to small tonnages placed privately. Foundries continue well sold ahead on small dimensions, but concessions are still obtainable on large pipe. Prices quoted openly on domestic pipe are: 4-in., $46.10 to $47.10 a ton, delivered common Boston freight rate points; 6 to 12-in., $40.10 to $41.10; 16 to 20-in., $39.10. A $3 differential is asked on Class A and gas pipe. Last week French interests unloaded 2931 tons of pipe at Providence, R. I., for the Warwick, R. I., water system. This pipe was sold several months ago.

Reinforcing Steel.—With the exception of 140 tons for a Brookline, Mass., bridge, sales of billet steel bars the past week were again in small tonnages. About 900 tons for two local jobs, pending for some time, may be placed this week, and several bridge jobs in Maine and Rhode Island bring the prospective orders up to about 2000 tons. While 2.66½c. a lb., base, from stock is openly quoted, that price is being shaded on highly competitive business. On rail steel bars, the open price is 2.26½c. a lb., base, delivered common Boston freight rate points.

Fabricated Steel.—Fabricators are figuring quite a number of worthwhile jobs, including 1050 tons for a Boston bridge, 1000 tons for South Station canopies and several other jobs ranging from 200 to 400 tons. Other jobs that will come up for figuring soon are a $2,000,000 State office building at Hartford, Conn., a 400-ton bridge in Connecticut, a State bridge at Fall River, Mass., and another at Weymouth, and a sports arena at Hartford. Although the market is more active than it has been in several months, competition for jobs by fabricators is keen and some low prices are being made on the most attractive business.

Coke.—With numerous foundries closed for a week or two for vacations and with others reporting a noticeable slackening in orders for castings, there has been a letdown in specifications for by-product foundry coke, which remains at $11 a ton, delivered within a $3.10 freight rate zone. The absorption of the New England Coal & Coke Co. by the Koppers interests will have no bearing on fuel prices the remainder of 1929, at least, buyers having been protected by the old management.

Old Material.—The flurry in some Eastern markets occasioned by the high prices paid the Pennsylvania Railroad for scrap has not been reflected in New England. While the market here for steel mill borings is a shade firmer because of good buying and limited supplies, that for most other materials is easier. No. 1 heavy melting steel is now generally $12.25 to $12.50 a ton, on cars shipping point, with an occasional transaction at $12.75, whereas a week ago $12.50 was the minimum. Girder rails do not fetch more than $11 a ton now, against $11.25 a week ago, while mixed borings and turnings prices are off 10c. to 25c. a ton, and chemical borings 25c. Inside prices are being paid more often than outside for other kinds of material shipped to steel mills. Owing to increased offerings, textile machinery cast has dropped to $14 to $14.50 a ton, delivered New England, off 50c. a ton, but No. 1 machinery cast values hold well.

Buying prices per gross ton, f.o.b. Boston rate shipping points:

No. 1 heavy melting steel	$12.25 to	$12.75
Scrap T rails	11.50 to	12.00
Scrap girder rails	10.50 to	11.00
No. 1 railroad wrought	11.00 to	11.50
No. 1 yard wrought	9.00 to	9.50
Machine shop turnings	7.00 to	7.25
Cast iron borings (steel works and rolling mill)	6.50 to	6.75
Bundled skeleton, long	10.00 to	10.50
Forge flashings	10.50 to	10.75
Blast furnace borings and turnings	6.00 to	6.25
Forge scrap	9.00 to	9.25
Shafting	14.00 to	14.75
Steel car axles	18.00 to	18.50
Wrought pipe 1 in. in diameter (over 2 ft. long)	9.75 to	10.00
Rails for rolling	12.50 to	13.00
Cast iron borings, chemical	9.75 to	10.00
Prices per gross ton deliv'd consumers' yards:		
Textile cast	$14.00 to	$14.50
No. 1 machinery cast	15.00 to	15.25
No. 2 machinery cast	13.00 to	13.25
Stove plate	11.00 to	11.50
Railroad malleable	18.00 to	18.50

St. Louis

Pig Iron Users Disposed to Hold Off—Scrap Scarce and Strong

ST. LOUIS, Aug. 20.—Pig iron users are still disturbed by uncertain prices and are disposed to mark time. While the chief consumers are well covered, numerous smaller interests still have iron to buy for the remainder of this quarter and for the last three months of the year. Consumption continues on a large scale, and shipments since Aug. 1 exceed those of the corresponding period last year. Sales reported total about 14,000 tons, the largest single transaction having been 4000 tons of foundry iron taken by a radiator maker from the St. Louis Gas & Coke Corporation. Stove and implement makers figured in the latest buying to the extent of about 3500 tons. About 3500 tons of malleable was included in the week's sales.

Prices per gross ton at St. Louis:

No. 2 fdy., sil. 1.75 to 2.25, f.o.b. Granite City, Ill.	$20.00
Malleable, f.o.b. Granite City	20.50
N'th'n No. 2 fdy., deliv'd St. Louis	22.16
Southern No. 2 fdy., deliv'd	$16.92 to 18.92
Northern malleable, deliv'd	22.16
Northern basic, deliv'd	22.16

Freight rates: 75c. (average) Granite City to St. Louis; $2.16 from Chicago; $4.42 from Birmingham.

Finished Steel.—Business in sheets holds above the seasonal average, with blue annealed still leading in activity. Black sheets are in better demand, and the same is true of galvanized, particularly heavy corrugated material. Winding up of booked car business is reflected in a slowing down in plate specifications. Tin plate is moving in satisfactory volume. Structural fabricators complain of lack of new orders, particularly sizable jobs.

Old Material.—Strength characterizes the market for scrap iron and steel. Virtually all classes of material are strong, the one exception being cast, which has lagged for several weeks. The strongest section of the market comprises heavy melting steel and steel specialties, which have been marked up fractionally during the past several days. Little material is arriving, railroad deliveries having declined in volume, and practically nothing is coming from adjacent country shipping points. Yard stocks are small and assortments incomplete. Mills are resisting dealers' asking prices. Latest railroad offerings include the following lists: Chesapeake & Ohio, 6379 tons; Frisco, 10 cars; International Great Northern, 4300 tons; Chicago, Milwaukee, St. Paul & Pacific, three cars of mixed scrap and 1000 tons of rails; Burlington, 4900 tons, and Rock Island, 110 cars.

Dealers' buying prices per gross ton, f.o.b. St. Louis district:

No. 1 heavy melting or shoveling steel	$14.75 to $15.25
No. 2 heavy melting or shoveling steel	14.50 to 15.00
No. 1 locomotive tires	15.00 to 15.50
Miscel. stand.-sec. rails including frogs, switches and guards, cut apart	17.00 to 17.50
Railroad springs	19.00 to 19.50
Bundled sheets	10.50 to 11.00
No. 2 railroad wrought	15.00 to 15.50
No. 1 busheling	10.00 to 10.50
Cast iron borings and shoveling turnings	9.50 to 10.00
Iron rails	15.00 to 15.50
Rails for rolling	17.25 to 17.75
Machine shop turnings	7.00 to 7.50
Heavy turnings	10.00 to 10.50
Steel car axles	19.00 to 19.50
Iron car axles	26.50 to 27.00
Wrot. iron bars and trans.	21.50 to 22.00
No. 1 railroad wrought	13.75 to 14.25
Steel rails, less than 3 ft.	18.00 to 18.50
Steel angle bars	15.00 to 15.50
Cast iron carwheels	15.00 to 15.50
No. 1 machinery cast	15.25 to 15.75
Railroad malleable	15.00 to 15.50
No. 1 railroad cast	15.00 to 15.50
Stove plate	12.50 to 13.00
Agricult. malleable	15.00 to 15.50
Relay. rails, 60 lb. and under	20.50 to 23.50
Relay. rails, 70 lb. and over	26.50 to 29.00

Warehouse Prices, f.o.b. St. Louis

	Base per Lb.
Plates and struc. shapes	3.25c.
Bars, soft steel or iron	3.15c.

Buffalo

Pig Iron Seller Out of Market for Quarter

BUFFALO, Aug. 20.—Pig iron sales and inquiries are confined to small lots. The withdrawal of one furnace interest from selling for the remainder of this quarter has added strength to the market. Although prices are unchanged, there is talk of a 50c. a ton advance. Consumers in New England and elsewhere in the East, outside the immediate Buffalo district, are still able to buy foundry iron at $18, base, or slightly less in some instances, but prices in the district remain firm at the quotations below.

Prices per gross ton, f.o.b. furnace:

No. 2 fdy., sil. 1.75 to 2.25	$19.50
No. 2X fdy., sil. 2.25 to 2.75	20.00
No. 1 fdy., sil. 2.75 to 3.25	21.00
Malleable, sil. up to 2.25	20.00
Basic	18.50
Lake Superior charcoal	27.28

Finished Steel.—Sales of more than 1000 tons of reinforcing bars are reported, including 800 tons for the Chevrolet assembly plant at Tarrytown, N. Y. Four school jobs account for 200 tons. An addition to the Buffalo works of the General Electric Co. calls for 800 tons, which probably will be awarded soon. Sales of steel pipe are active, and the pending list totals from 4000 to 5000 tons, including 3000 tons for an oil line extension in western New York. Demand for wire mesh for road construction is exceptionally good.

Old Material.—Through an error in transmission, the quotations on No. 1 heavy melting steel appearing in the Aug. 15 issue of THE IRON AGE for the Buffalo district were $18.50 to $19. They should have been $17.50 to $18, and correction is accordingly made to that range. Scrap dealers are seeking material to ship on orders booked during the past two weeks, some of which were taken at $18 for No. 1 heavy melting steel, although a relatively small tonnage, it is stated, went at this price. Some dealers, however, are offering $17.75 for scrap to apply against such orders. Liberal purchasing of stove plate and No. 1 cast within the next week or two is indicated by inquiries which dealers have received for these grades. More liberal buying of machine shop turnings has advanced the price to $9. Good scrap is scarce in this district and dealers see strength in the present market situation.

Prices per gross ton, f.o.b. Buffalo consumers' plants:

Basic Open-Hearth Grades:	
No. 1 heavy melting steel	$17.50 to $18.00
No. 2 heavy melting steel	14.75 to 15.00
Scrap rails	16.50 to 17.00
Hydraul. comp. sheets	14.50 to 14.75
Hand bundled sheets	12.00 to 12.50
Drop forge flashings	14.25 to 14.50
No. 1 busheling	15.50 to 16.50
Hvy. steel axle turnings	14.00 to 14.50
Machine shop turnings	9.00
No. 1 railroad wrought	13.00 to 13.50
Acid Open-Hearth Grades:	
Knuckles and couplers	19.50 to 19.75
Coil and leaf springs	19.00 to 19.50
Rolled steel wheels	19.00 to 19.50
Low phos. billet and bloom ends	20.00 to 20.50
Electric Furnace Grades:	
Short shov. steel turnings	12.00 to 12.50
Blast Furnace Grades:	
Short mixed borings and turnings	11.00 to 11.50
Cast iron borings	10.50 to 11.00
No. 2 busheling	10.00 to 10.50
Rolling Mill Grades:	
Steel car axles	18.75 to 19.25
Iron axles	21.00 to 22.00
Cupola Grades:	
No. 1 machinery cast	16.00 to 17.00
Stove plate	13.00 to 13.50
Locomotive grate bars	12.50 to 13.00
Steel rails, 3 ft. and under	19.50 to 19.75
Cast iron carwheels	14.00 to 14.50
Malleable Grades:	
Industrial	18.00 to 18.50
Railroad	18.00 to 18.50
Agricultural	18.00 to 18.50
Special Grades:	
Chemical borings	12.50 to 13.50

Warehouse Prices, f.o.b. Buffalo

	Base per Lb.
Plates and struc. shapes	3.40c.
Soft steel bars	3.30c.
Reinforcing bars	2.95c.

Com. wire nails, base per keg	$3.60
Black wire, base per 100 lb.	3.75

Cincinnati

Pig Iron Sales Increase—Northern Prices Firm and Southern Are Weak—Scrap Market Strengthens

CINCINNATI, Aug. 20.—Pig iron sales of both Northern and Southern pig iron increased noticeably during the past week, as some district consumers entered the market to cover their needs for the remainder of this quarter and the early part of the fourth. The Indianapolis Castings Co., Indianapolis, took 1200 tons of Northern iron and the Anderson Stove Co., Anderson, Ind., bought 500 tons of the same grade. The reported prices on these and 1000 tons of miscellaneous orders figure back to about $18.50, base Lake furnace, allowing 25c. for silicon differentials. These orders reflect the continued firmness of the Northern market. A Valley furnace sold 2000 tons to an undisclosed buyer. Four sales of Southern iron also were reported. These were in quantities of 1000 tons, 400 tons, 250 tons and 200 tons and were the first sizable tonnages sold since the recent recession in Southern prices. Despite this renewal of interest in Southern iron, the market continues to be weak and, although quotations are being made on a $14.50 Birmingham base, reports of concessions down to $13.50 on tonnage orders have been heard. The only inquiry before the trade is from an Indiana consumer who is asking for 500 tons of malleable and 1000 tons of foundry iron.

Prices per gross ton, deliv'd Cincinnati:

So. Ohio fdy., sil. 1.75 to 2.25	$19.89 to $20.39
Ala. fdy., sil. 1.75 to 2.25	17.69 to 18.19
Ala. fdy., sil. 2.25 to 2.75	18.19 to 18.69
Tenn. fdy., sil. 1.75 to 2.25	17.69 to 18.19
S'th'n Ohio silvery, 8 per cent	26.89

Freight rates, $1.89 from Ironton and Jackson, Ohio; $3.69 from Birmingham.

Coke.—Although the melt is reported to be heavy for August, specifications for by-product foundry coke slackened slightly during the past week, but they are still on a higher level than during the same period last year. Except for the sale of 8000 tons of by-product foundry coke to a Cincinnati consumer, new business is quiet.

Finished Material.—For the second week this month, bookings of sheets kept pace with production, causing the backlogs of nearby producers to remain virtually steady. A Cincinnati manufacturer of metal furniture has made tentative inquiry for 300 tons of sheets. In contrast to the strength of the sheet market, wire nails and wire goods, although fairly active in sales, are suffering because of uncertainty of prices. Wire nail business is being taken at $2.50 and $2.55 a keg, Pittsburgh.

Old Material.—Further strengthening of the district scrap iron and steel market was noticed during the past week, as dealers bid up heavy melting steel, scrap rails for melting and No. 2 railroad wrought 25c. a ton. Continued scarcity in these grades is making it difficult for dealers to keep covered while the quietness of the cast iron grades is causing yard stocks in this type of old materials to increase.

Dealers' buying prices per gross ton, f.o.b. cars, Cincinnati:

Heavy melting steel	$14.25 to $14.75
Scrap rails for melting	14.25 to 14.75
Loose sheet clippings	9.00 to 9.50
Bundled sheets	11.00 to 11.50
Cast iron borings	9.25 to 9.75
Machine shop turnings	8.50 to 8.75
No. 1 busheling	10.50 to 11.00
No. 2 busheling	7.00 to 7.50
Rails for rolling	14.50 to 15.00
No. 1 locomotive tires	14.25 to 14.75
No. 2 railroad wrought	14.25 to 14.75
Short rails	18.50 to 19.00
Cast iron carwheels	12.75 to 13.25
No. 1 machinery cast	19.00 to 19.50
No. 1 railroad cast	15.25 to 15.75
Burnt cast	10.25 to 10.75
Stove plate	10.25 to 10.75
Brake shoes	10.25 to 10.75
Agricultural malleable	14.25 to 14.75
Railroad malleable	15.25 to 15.75

Warehouse Prices, f.o.b. Cincinnati

Seamless steel boiler tubes, 2-in.	17.00
4-in.	34.00

Youngstown

Steel Output Decline Gradual and Small—Price Weakness Has Developed in Wide Strips

YOUNGSTOWN, Aug. 20.—Steel output in this district is declining gradually this month, although the total loss in output is not large. At least one important interest is admittedly maintaining its high operating rate in order to build up badly depleted stocks of finished steel. Valley steel mills are feeling the reduced operations of the automobile industry in some departments, but thus far the unusually high activity of the large steel consuming industries in the territory adjacent to Youngstown has offset lighter automobile steel requirements.

Prospects of a resumption in automobile buying next month are still good, but the heavier steel requirements expected at that time are not yet reflected to any large extent in steel company order books. However, sheet specifications are holding up fairly well and mills have large backlogs. The same may be said of cold-rolled strip, but tonnage releases on hot-rolled strip in both the narrow and wide sizes are disappointing. On the narrow widths, prices are being well maintained at 1.90c. and 2c., Pittsburgh, but severe price competition has developed on wide strips and mills must meet prices as low as 2.10c. and even 2c., Pittsburgh, on large business if they expect to share in it. This product is ordinarily sold on the same base as light blue annealed sheets, or 2.20c., Pittsburgh.

Sheet prices are about the same, with black sheets holding to 2.85c., Pittsburgh, on the general run of business. Galvanized sheets are being sold at 3.50c., but mills in this district refuse to go under 3.60c. except in unusual cases. Automobile body sheets seem to be holding at 4.10c., and the leading Valley maker is committed for several weeks. Metal furniture sheets are also in good demand, and have not experienced the decline in specifications which has occurred in the automobile material.

The pipe business in this district is better than it has been all year. Lap-weld mills are engaged at a comparatively high rate and the new electric welding pipe unit of the Republic Iron & Steel Co. is busy on recent large orders. Tin plate specifications are tapering off, but operations are still at about 85 per cent of capacity.

Steel ingot production of the leading makers averages from 90 to 95 per cent and sheet mills are still running at about 95 per cent. This rate will probably be maintained for at least another month on present business and thereafter will depend on automobile specifications.

The pig iron market is very quiet. No large transactions in basic iron have been reported in several weeks and sales of the foundry grade are confined to small lots. Shipments on contracts are not as heavy as they were last month, but steel foundry operations are good and iron is going to these users at an undiminished rate.

The scrap market has retained its recent strength and sales of heavy melting steel have been made at $19, delivered to Youngstown mills. Compressed sheets are not available at less than $18.50 and are not plentiful at that figure. Sales at higher prices are unconfirmed.

Automobile factories have entered the third week in August with production at a higher level than last month and well in excess of August of last year. Opinion that the August production will approximate 550,000 units is not uncommon in the industry at present, according to *Automotive Industries.*

Canada

Building Construction Is Still Active

TORONTO, ONT., Aug. 20.—Although the demand for merchant pig iron in the Canadian markets is gaining strength, new business is without feature. Sales for the week gained slightly over those of earlier weeks of the summer. Spot demand was responsible for all of the business of the week, with no forward delivery contracts reported. A steady demand prevails for foundry iron, with malleable moving in small tonnages. Prices are firm.

Prices per gross ton:

Delivered Toronto	
No. 1 fdy., sil. 2.25 to 2.75	$24.60
No. 2 fdy., sil. 1.75 to 2.25	24.10
Malleable	24.60
Delivered Montreal	
No. 1 fdy., sil. 2.25 to 2.75	$26.00
No. 2 fdy., sil. 1.75 to 2.25	25.50
Malleable	26.00
Basic	24.50
Imported Iron, Montreal Warehouse	
Summerlee	$33.50
Carron	33.00

Structural Steel.—Building activities are again taking on more life. Bridge construction projects are responsible for a growing demand for steel. Fabricating plants are operating at capacity. Several contracts in prospect range from 2000 to 8000 tons, and most of this business is expected to be closed within a couple of months. No let-up in building is in sight.

Old Material.—Some improvement developed in this market during the week. Business included a few substantial future delivery contracts. Local dealers report a steady demand for machinery cast. Prices are unchanged.

Dealers' buying prices:

	Toronto	Montreal
Per Gross Ton		
Heavy melting steel	$10.00	$8.50
Rails, scrap	11.00	9.00

To Increase Wire Plant at Hamilton, Ont.

In connection with the expansion program of the Steel Co. of Canada, Ltd., Hamilton, Ont., the latest development calls for the erection of a galvanized wire plant at Hamilton. In addition to galvanized wire, barbed wire and other fencing material will be produced.

The company also let a contract for an addition to its Montreal plant.

The new 10 and 12-in. mills at Hamilton came into production at the end of June. The new ore docks at Hamilton to be 3000 ft. long will probably be completed early next year.

Mossberg Company Expands

The Mossberg Pressed Steel Corporation, Attleboro, Mass., has completed a two-story addition to its plant, nearly doubling the floor area. It will now be possible to put all but one or two departments of the plant on daylight production.

The company is engaged in the production of pressed steel beams, beam heads and drop wires for the textile industry and makes specialties used by manufacturers of wire, both bare and insulated. New presses and machine tools have been installed, and in the welding department some of the latest type semi-automatic equipment for gas, arc and spot welding.

Plaster Poured Stone for Foundry Patterns

A stone mixture for making foundry patterns which can be turned, planed, drilled, filed or finished with emery paper is being introduced into this country from Germany, where it was developed by the Monolith Steinmodellplatten Gesellschaft, M. B. H., Dresden. The material, which is designated as Titanite, will be sold in the United States by the S. Obermayer Co., Pittsburgh. It is easily mixed as whitewash and when poured into a mold will harden in six to eight hours. When set, the material is extremely hard and makers claim that 40,000 molds may be made from one pattern plate. Should subsequent alterations be required, Titanite as required may be added, which will set as hard as the original pattern.

The mold for Titanite can be made from any good quality molding sand in the same way as for an iron or plaster of paris pattern. The stone mixture is made up in proportions of five parts of powder to three parts of the solution and thoroughly mixed to a thick paste. It should be poured slowly into one corner of mold and not moved about over the entire surface. The mixture is particularly adapted to use in mass production foundries where thousands of molds must be made from the same pattern and where wear and shrinkage of ordinary wood patterns run into considerable expense.

Melting Non-Ferrous Metals and Alloys in a Cupola

Melting and refining non-ferrous metals in direct contact with a special carbon fuel in a cupola type of furnace is a new departure. This process has been developed by the Barrett Co., 40 Rector Street, New York. According to the company, the process is of particular value for the melting and casting of red brass or bronze, high lead-bearing alloys and casting copper.

Metal charges of 500 to 600 lb. are charged directly on top of an incandescent bed of what is known as "fixed carbon fuel," a product of the company, and are ready to be tapped into the pouring ladles in 11 to 16 min. The charges may consist of all chips (borings and turnings), of all ingots, or of mixed heats of chips, gates, scrap and ingots.

Pouring temperatures are regulated by air control and the depth of the bed of fuel, and a metal-pouring temperature of 2500 deg. Fahr. is claimed to be secured without any difficulty. Features of the new process are pointed out as follows:

High grade of metal secured at the tap hole, thereby reducing the number of rejections in the foundry and machine shop.

Low total cost of melting per ton and per metal charges, due to a high metal-to-fuel ratio.

High-speed melting.

High metal recovery.

Ability to use more foundry scrap, chips, etc., and less composition ingots without affecting the quality of the castings.

Low cost of furnace maintenance and upkeep.

Freedom in the foundry from heat, fumes, gases and noise.

Extreme flexibility of process and furnace.

Simplicity of operation.

Economy of floor space.

Non-Ferrous Metal Markets

Fair Demand for Copper and Tin—Lead and Zinc Quiet —All Prices Firm

NEW YORK, Aug. 20.

Copper.—Despite the announcement, early last week, of July statistics which were favorable to sellers and which it was thought might stimulate buying, the market has remained quiet. Buying by foreign consumers has continued at about the same pace as in the previous three weeks, and there have been fairly good purchases by domestic consumers. Demand from these has not increased, partly because they feel assured that the price will not advance and partly because they learned a lesson when they bid the market up on themselves last March. Orders on the books of consumers are satisfactory and are being augmented each week. Taken as a whole, the market is in a satisfactory condition and prices are stable. There has been no price change since the middle of April. Electrolytic copper is selling at 18c. a lb., delivered in the Connecticut Valley, and the quotation of Copper Exporters, Inc., is officially unchanged at 18.30c., delivered c.i.f. European ports. The Lake copper market is fairly active and firm at 18.12½c. delivered.

Tin.—This market could hardly be more featureless. For the week ended with Saturday, Aug. 17, sales of Straits tin were about 1000 tons. Large consumers, who usually buy far ahead, are uninterested. The only business is for spot and early delivery by such users as are accustomed to buy only for nearby positions. Their orders range from 5 to 20 tons each. The stability of prices, which has been prominent so long, continues. Fluctuations in the week have been only about ½c. a lb. The same steadiness prevails in the London market, where business also is in small volume. Spot Straits tin was quoted today at 46.75c. a lb., New York, as compared with 46.37½c. a week ago. In London today quotations were nearly £2 per ton higher than a week ago, with spot standard quoted at £209 17s. 6d., future standard at £213 15s. and spot Straits at £213 12s. 6d. The Singapore quotation today was £218 10s. Large consumers in this market are well covered ahead because, when prices were down to 45c. to 46c. a lb., they entered the market on a large scale.

Lead.—Demand is confined almost entirely to August delivery and in

Rolled Products

Prices on rolled non-ferrous products are unchanged from those prevailing one week ago.

List Prices, Per Lb., f.o.b. Mill

On Copper and Brass Products, Freight up to 75c. per 100 Lb. Allowed on Shipments of 500 Lb. or Over

Sheets—
- High brass ..... 23.25c.
- Copper, hot rolled ..... 26.75c.
- Zinc ..... 10.25c.
- Lead (full sheets) ... 11.00c. to 11.25c.

Seamless Tubes—
- High brass ..... 28.25c.
- Copper ..... 29.25c.

Rods—
- High brass ..... 21.25c.
- Naval brass ..... 24.00c.

Wire—
- Copper ..... 19.87½c.
- High brass ..... 23.75c.

Copper in Rolls ..... 26.75c.
Brazed Brass Tubing ..... 30.87½c.

Aluminum Products in Ton Lots

The carload freight rate is allowed to destinations east of Mississippi River and also to St. Louis on shipments to points west of that river.

Sheets, 0 to 10 gage, 3 to 30 in. wide ..... 33.00c.
Tubes, base ..... 42.00c.
Machine rods ..... 34.00c.

Chicago Warehouse

(Prices Cover Trucking to Customers' Doors in City Limits)

Sheets—	Base per Lb.
High brass	23.25c.
Copper, hot rolled	27.75c.
Copper, cold rolled, 14 oz. and heavier	30.00c.
Zinc	10.75c.
Lead, wide	11.35c.
Seamless Tubes—	
Brass	28.25c.
Copper	29.25c.
Brass Rods	21.25c.
Brazed Brass Tubes	31.00c.

New York or Cleveland Warehouse

Delivered Prices, Base Per Lb.

Sheets—	
High brass	21.12½c. to 22.12½c.
Copper, hot rolled, base sizes	27.75c. to 28.75c.
Copper, cold rolled, 14 oz. and heavier, base sizes	30.00c. to 31.00c.
Seamless Tubes—	
Brass	26.00c. to 27.00c.
Copper	29.12½c. to 30.12½c.
Brazed Brass Tubes	29.12½c. to 30.12½c.
Brass Rods	18.87½c. to 19.87½c.

New York Warehouse

Delivered Prices, Base Per Lb.

Zinc sheets (No. 9), casks ..... 10.50c. to 11.00c.
Zinc sheets, open ..... 11.50c. to 12.00c.

Metals from New York Warehouse

Delivered Prices, Per Lb.

Tin, Straits pig ..... 48.00c. to 49.00c.
Tin, bar ..... 50.50c. to 51.50c.
Copper, Lake ..... 19.50c.
Copper, electrolytic ..... 19.25c.
Copper, casting ..... 19.00c.
Zinc, slab ..... 7.75c. to 8.25c.
Lead, American pig ..... 7.50c. to 8.00c.
Lead, bar ..... 9.50c. to 10.00c.
Antimony, Asiatic ..... 10.50c. to 11.00c.
Aluminum No. 1 ingots for remelting (guaranteed over 99% pure) ... 25.00c. to 26.00c.
Alum. ingots, No. 12 alloy ..... 24.00c. to 25.00c.
Babbitt metal, commercial grade ..... 25.00c. to 35.00c.
Solder, ½ and ½ ..... 30.25c. to 31.25c.

Metals from Cleveland Warehouse

Delivered Prices, Per Lb.

Tin, Straits pig ..... 51.63c.
Tin, bar ..... 53.63c.
Copper, Lake ..... 19.50c.
Copper, electrolytic ..... 19.25c.
Copper, casting ..... 18.75c.
Zinc, slab ..... 7.75c. to 8.00c.
Lead, American pig ..... 7.25c. to 7.50c.
Lead, bar ..... 9.75c.
Antimony, Asiatic ..... 16.00c.
Babbitt metal, medium grade ..... 18.75c.
Babbitt metal, high grade ..... 56.00c.
Solder, ½ and ½ ..... 31.75c.

Old Metals, Per Lb., New York

Buying prices represent what large dealers are paying for miscellaneous lots from smaller accumulators and selling prices are those charged customers after the metal has been properly prepared for their uses.

	Dealers' Buying Prices	Dealers' Selling Prices
Copper, hvy. crucible	14.75c.	16.25c.
Copper, hvy. and wire	14.50c.	15.75c.
Copper, light and bottoms	12.50c.	13.75c.
Brass, heavy	8.50c.	9.50c.
Brass, light	7.50c.	8.50c.
Hvy. machine composition	12.00c.	13.00c.
No. 1 yel. brass turnings	9.75c.	10.50c.
No. 1 red brass or compos. turnings	11.25c.	12.25c.
Lead, heavy	5.25c.	5.75c.
Lead, tea	4.25c.	5.25c.
Zinc	3.50c.	4.25c.
Sheet aluminum	14.00c.	16.00c.
Cast aluminum	12.25c.	14.25c.

the last day or two sales have been good. There has been little buying by consumers for September, but this will probably develop soon. One large Middle Western producer has sold its August output. Prices continue firm at 6.55c., St. Louis, which has prevailed for some time. The leading interest continues to quote 6.75c., New York, as its contract price.

Zinc.—Demand continues in light volume and is made up principally of small lots for early shipment. Conditions which have prevailed for a week or two continue. Consumers are buying only from hand-to-mouth, but it is believed by some that they are not covered ahead and that purchases on a larger scale must soon appear. Despite this, quotations are firm at 6.80c. a lb., East St. Louis, or 7.15c., New York. On small lots this can possibly be shaded to 6.75c., East St. Louis. The price of ore continues at $44 a ton, Joplin. Production for the week ended Aug. 17 is estimated at 13,700 tons. Sales were again large at about 11,500 tons and shipments were about 12,465 tons. Surplus stocks now stand at about 46,300 tons.

Antimony.—Because an increase in the duty is proposed in the new tariff bill as it comes from the Senate, the market is more active and prices are a little higher. Chinese metal is quoted and sold today at 9c. per lb., New York, duty paid, for spot and nearby delivery with futures at 8.87½c.

Nickel.—In wholesale lots, ingot nickel is quoted at 35c. per lb., shot nickel at 36c. and cathode electrolytic nickel at 35c.

Aluminum.—Virgin metal, 98 to 99 per cent pure, is obtainable at 23.90c. per lb. delivered, according to published quotations.

Non-Ferrous Metals at Chicago

CHICAGO, Aug. 20.—All of the metals are stronger and antimony has advanced to 9.85c. a lb. Tin is the most active metal. The old metals are quiet, with prices unchanged.

Prices per lb., in carload lots: Lake copper, 18.50c.; tin, 47.62½c.; lead, 6.70c.; zinc, 6.87½c.; in less-than-carload lots, antimony, 9.85c. On old metals we quote copper wire, crucible shapes and copper clips, 14c.; copper bottoms, 11.50c.; red brass, 11.50c.; yellow brass, 8c.; lead pipe, 4.50c.; zinc, 3.25c.; pewter, No. 1, 24.50c.; tin foil, 26c.; block tin, 36c.; aluminum, 12.87½c.; all being dealers' prices for less-than-carload lots.

Reinforcing Steel

Awards, Totaling 10,600 Tons, Were Largest Since May

AWARDS, totaling over 10,600 tons, were the largest since the middle of May. Three thousand tons of bars were for a bridge at Harrisburg, Pa., 2100 tons for a boulevard at Pittsburgh and 800 tons for an automobile assembly plant at Tarrytown, N. Y. The only inquiry of the week was 1000 tons for a reservoir and filtration plant at Youngstown. Awards follow:

BROOKLINE, MASS., 150 tons, bridge, to Concrete Steel Co.

TARRYTOWN, N. Y., 800 tons, assembly plant for Chevrolet Motor Co., to Kalman Steel Co.

NEW YORK, 121 tons, pier 3, North River, to Concrete Steel Co.

SAYREVILLE, N. J., 400 tons, building for East New Jersey Power & Light Co., to Concrete Steel Co.

HARRISBURG, PA., 3000 tons, soldiers' and sailors' memorial bridge, to Taylor-Davis Co.

BLOOMSBURG, PA., 100 tons, building for Magee Carpet Co., to Danville Structural Steel Co.

GREENVILLE, PA., 100 tons, sewage disposal plant, to Electric Welding Co.

PITTSBURGH, 2100 tons, Ohio River boulevard, to McClintic-Marshall Co.

CLEVELAND, 150 tons, highway work for Speedway Construction Co., to Pattison-Leitch Co.

CHICAGO, 700 tons, warehouse for Walgreen Drug Co., to Inland Steel Co.

ELKHART, IND., 285 tons, county line bridge, to Concrete Engineering Co.

CHICAGO, 150 tons, Henrici restaurant building, to Olney J. Dean & Co.

RACINE, WIS., 100 tons, apartment building, to Calumet Steel Co.

CHICAGO, 100 tons, Barco Mfg. Co. plant, to Concrete Steel Co.

CHICAGO, 400 tons, Wilbur Wright public school, to unstated bidder.

PEORIA, ILL., 1600 tons, filtration plant, to Laclede Steel Co.

OLYMPIA, WASH., 100 tons, Tacoma Avenue highway, to Northwest Steel Rolling Mills.

TACOMA, WASH., 154 tons, Lake Cushman project, to unnamed interest.

LOS ANGELES, 100 tons, apartment on Formosa Avenue, to unnamed interest.

SAN JOSE, CAL., 100 tons, bridge over Uvas Creek, to W. S. Wetenhall Co.

Reinforcing Bars Pending

YOUNGSTOWN, OHIO, 1000 tons, reservoir and filtration plant.

Foundry Equipment Orders Highest in Eleven Months

Orders for foundry equipment in July, reported by members of the Foundry Equipment Manufacturers Association, were the largest for any month this year and the largest since last August. Shipments were heavier than for June and a marked increase was recorded in the amount of unfilled orders.

Taking the average monthly shipments for 1922, 1923 and 1924 as 100, July's orders were 219.3, against 177.3 in June and 183.9 for the 12 months preceding July.

Shipments in July were 182.1, against 172.7 in June, 124.8 in July, 1928, and 196.8 for the 12 months preceding July.

The unfilled order index rose from 300.8 in June to 368.7. A year ago it stood at 332.1.

Railroad Equipment

North American Car Co. and Reading Buy Cars

RAILROADS ordered more than 750 cars the past week. The North American Car Co. bought 500 tank cars and the Reading purchased 200 gondolas. The market is almost devoid of new inquiries, although considerable business is pending. Details of the week's business follow:

Reading has ordered 200 70-ton gondolas from Bethlehem Steel Corporation.

Elgin, Joliet & Eastern has bought 25 air-dump cars from Magor Car Corporation and 25 from Differential Steel Car Co.

Chicago Great Western has ordered two caboose cars from Mount Vernon Car Mfg. Co.

North American Car Co. has purchased 500 8000-gal. tank cars from Pressed Steel Car Co.

Chicago & Alton has ordered two 60-ft. postal cars, two 70-ft. combination passenger and baggage cars and one 70-ft. baggage and mail car from Pullman Car & Mfg. Corporation.

Consolidated Railroads of Cuba have ordered four combination passenger and baggage gasoline rail motor cars from J. G. Brill Co.

Argentine State Railways is inquiring for two or three Garrett-type locomotives.

Central of Georgia is inquiring for 50 flat cars.

Great Northern has ordered 300 flat cars from Standard Steel Car Co.

Navy Calls for Bids on Steel and Machinery

The Bureau of Supplies and Accounts, Navy Department, will open bids on Sept. 3 for two precision horizontal boring, drilling and milling machines for the Washington Navy Yard to be used in the manufacture of guns for new cruisers. The bureau will receive bids on Sept. 3 for 200 metallic-ladder treads for use at the Brooklyn yard.

On Aug. 27 it will receive bids for 500 tons of medium black steel plates and 400 tons of shapes for delivery at the Philadelphia yard to be used in the modernization of the battleship Pennsylvania. On the same date the bureau will also receive bids for about 150 tons of plates and 140 tons of shapes for the Washington yard to be used in cruiser construction.

Adopts Five-Day Week

MILWAUKEE, WIS., Aug. 19.—The first important industry in Milwaukee to adopt the five-day working week plan is the Moe-Bridges Co., manufacturer of electric lighting specialties that are sold nationally. The company's force includes 325 employees, who will continue to put in 45 hr. weekly, as heretofore, by working 9 hr. a day instead of 8, giving them a Saturday as well as Sunday holiday. The plan is the result of a suggestion emanating from the employees themselves, according to C. A. Bridges, president, who adds that 60 per cent of them are skilled workers and 40 per cent are stockholders. Wages and salaries will be in no way affected by the change.

CARNEGIE LIBRARY OF ATLANTA

PERSONAL

F. C. HOSIMER has been transferred from the home office of the Wagner Electric Corporation, St. Louis, to the Chicago branch sales office.

—

GEORGE E. LEARNARD has been elected chairman of the board of the International Combustion Tar & Chemical Corporation, New York, succeeding F. J. LEWIS, who has resigned because of the pressure of other business activities, but who will continue as a director. WALTER RUNGE has been made president, succeeding W. H. LEWIS, who has also resigned and who will be associated with the corporation in an advisory capacity. GRANT THORN has been elected vice-president in charge of sales.

—

FRED A. CONKLE, formerly associated with the New England Road Machinery Co., Boston, has been appointed railroad representative for the sale of lift-trucks, stackers and skid-platforms by the Lewis-Shepard Co., Boston.

—

WALTER M. MCFARLAND, manager of the marine department, Babcock & Wilcox Co., New York, and C. R. BURT, general manager, Pratt & Whitney Co., Hartford, Conn., have been appointed to represent the American Institute of Weights and Measures at the fiftieth anniversary celebration of the American Society of Mechanical Engineers next year.

—

FRANK D. BREBNER, for many years in charge of the Newcastle, Ind., plant of the Chrysler Corporation, has been transferred to the staff of K. T. KELLER, vice-president in charge of manufacturing, Detroit. The direction of the Newcastle plant will be under E. S. CHAPMAN, who goes there from the manfacturing division of the Detroit office.

—

OLAF ISACHSEN, sales manager of the Strand & Sweet Mfg. Co., Winsted, Conn., has resigned to associate himself with the Wheeler Wire Co., Bridgeport, Conn.

—

JOHN R. JEFFERY, manager of the electrical department of the Allis-Chalmers Mfg. Co., Milwaukee, is retiring after completing 28 years of service with the company and one of its predecessors, the Bullock Electric Mfg. Co., Cincinnati. His assistant, R. S. FLESHIEM, has been appointed to succeed him, and L. W. GROTHAUS, also an assistant manager, has been transferred from the Bullock works, Norwood, Ohio, to Milwaukee to take Mr. Fleshiem's place.

—

E. L. CORD, head of the Auburn Automobile Co., has acquired an interest in the Columbia Axle Co., Cleveland, and in the reorganization to be effected will become chairman of the board. EDWIN H. PARKHURST, formerly vice-president and general manager, will become president. W. R. HOPKINS and BEN F. HOPKINS, Cleveland, who controlled the company and were president and secretary-treasurer respectively, will retire from the board but will retain a substantial interest. R. E. FRIES and F. H. RAGAN will be vice-presidents in charge of sales and factory, respectively.

—

M. A. GROSSMAN, chief research metallurgist of the Central Alloy Steel Corporation, Massillon, Ohio, has sailed for Europe to continue his study of the special European steels which the company is preparing to produce in this country.

—

JOHN H. LAWRENCE, vice-president and manager of Thomas E. Murray, Inc., New York, since its organization, has been elected president. After graduation from Cornell University, he was employed in the engineering department of the New York Edison Co. In 1919 the late THOMAS E. MURRAY, to consolidate the various consulting engineering activities he had engaged in for many years, formed the company which bears his name, and selected Mr. Lawrence as active head in charge. Many of the largest power stations in the country have been designed by the company, including the Hell Gate Station, New York.

—

PAUL D. MERICA has been appointed technical assistant to the president of the International Nickel Co., Inc., New York. Formerly he was assistant manager of that company's development and research department.

—

E. J. SCHWANHAUSSER, for the past two years assistant manager of the Harrison, N. J., works of the Worthington Pump & Machinery Co., has been appointed manager of the Buffalo works of the company.

—

FRED M. CROSS, manager of the Chicago pneumatic tool sales department of the Ingersoll-Rand Co., New York, has been made assistant general manager of pneumatic tool sales and will be located in the New York office. D. W. ZIMMERMAN takes his place in Chicago.

—

AUGUST HERMAN TUECHTER, president, Cincinnati Bickford Tool Co., Cincinnati, was the recipient of the felicitations of some 400 employees of the company on the occasion of his sixtieth birthday, Aug. 15.

—

J. F. LINCOLN, president Lincoln Electric Co., Cleveland, sailed on the Leviathan for London, where he will take charge of a demonstration for European engineers of the Electronic Tornado process of carbon arc welding. The demonstration will take place at the Allen Liversidge plant.

—

E. I. EVANS has been appointed open-hearth superintendent of the Bourne-Fuller Co., Cleveland. He was formerly associated with the Worth Steel Co., Claymont, Del., having been open-hearth superintendent of that company for 11 years.

Koppers Interests to Own Mystic Iron Works

Koppers interests of Pittsburgh, through the recent organization of a holding company called Eastern Gas & Fuel Associates, will gain control of the Massachusetts Gas Companies, a New England public utility organization which owns the New England Coal & Coke Co. and the Mystic Iron Works, the latter the only producer of pig iron in New England.

Eastern Gas & Fuel Associates is offering to exchange its shares for securities of the Massachusetts Gas Companies. Stockholders in the former company will also share in the earnings of the Connecticut Coke Co., New Haven, Conn., and the Philadelphia Coke Co., Koppers interests.

H. B. Rust, who is president of the Koppers Co., Pittsburgh, has been elected chairman of Eastern Gas & Fuel Associates, while W. F. Rust, vice-president of the Koppers Co., is president of the new organization. Other officers are: Vice-presidents, H. Lee and Donald Mac Arthur; treasurer, S. T. Brown; secretary, E. H. Bird; assistant secretaries, John D. Shaner and David M. Gilmore. All of these officers hold similar positions with the Koppers Co.

James L. Richards, president, Massachusetts Gas Companies, and Frederick E. Snow, a member of the executive committee of Massachusetts Gas, are members of the executive committee of Eastern Fuel & Gas Associates, together with W. F. Rust, H. Lee, Donald Mac Arthur and Hugh F. Smith.

The Machine Tool Show

The National Machine Tool Builders' Association for the Machine Tool Show to be held in the Cleveland Public Auditorium, Sept. 30 to Oct. 4, inclusive, is planning to handle an increase in registrants of 50 per cent over the attendance at the first Machine Tool Show, held in the same Cleveland buildings in September, 1927.

The area of this year's show will exceed by 25 per cent that of the 1927 show. Some 5000 hp., it is announced, will be required to carry the maximum load for the machinery that will be in operation.

Nearly 250 separate displays will be presented, occupying areas ranging from 3000 sq. ft. down.

Fabricated Structural Steel

Awards of 51,000 Tons Were Largest Since Last Week of June—Inquiries Total 32,000 Tons

STRUCTURAL steel awards of 51,000 tons were the largest since the last week of June. About one-third of the tonnage will go into bridges. However, lettings were from widely diversified sources, a considerable percentage of the bookings having been designated for industrial work and for railroad projects. Structures for non-industrial purposes again were of minor importance. Outstanding contracts were 8100 tons for a New York subway section and 7000 tons each for a Newark, N. J., bank building and for a bridge across the Maumee River at Toledo.

Fresh inquiries were 32,000 tons, as against 42,000 tons during the previous week. Fifty-eight hundred tons is for a Brooklyn hospital and 4850 tons for bridges for the Great Northern Railroad. Awards follow:

STATE OF NEW YORK, 500 tons, highway bridge, to American Bridge Co.

NEW YORK, 8100 tons, route 107, section 6, of subway, to McClintic-Marshall Co.

NEW YORK, 2000 tons, apartment building at Ninetieth Street and Park Avenue, to Harris Structural Steel Co.

PENNSYLVANIA RAILROAD, 10,000 tons, passenger bridge across Hackensack River, to Bethlehem Steel Corporation; erroneously reported to American Bridge Co.

NEWARK, N. J., 7000 tons, National Newark & Essex Banking Co. building, to Hay Foundry & Iron Works.

ROCHESTER, N. Y., 3500 tons, Smith Street bridge, to Phoenix Bridge Co.

ATLANTA, GA., 400 tons, union passenger depot, to Virginia Bridge & Iron Co.

GREENSBORO, N. C., 440 tons, S. H. Kress Co. store, to Ingalls Iron Works Co.

BIRMINGHAM, ALA., 325 tons, sheds at terminal station, to Virginia Bridge & Iron Co.

BIRMINGHAM, ALA., 180 tons, plant for Lamson & Sessions Bolt Co., to Virginia Bridge & Iron Co.

CLEVELAND, 600 tons, grade elimination bridge for Cleveland Interurban Railway Co., to Bethlehem Steel Co.

LANSING, MICH., 1600 tons, municipal power house, to Whitehead & Kales Co.

TOLEDO, 7000 tons, suspension bridge over Maumee River; McClintic-Marshall Co., low bidder.

ROCK ISLAND, ILL., 1900 tons, wheel house and dock covering for International Harvester Co., to Lakeside Bridge & Steel Co.

FORT WAYNE, IND., 1700 tons, Lincoln National Bank building, to McClintic-Marshall Co.

CHICAGO, 400 tons, addition to building C-6, Corwith plant, Crane Co., to American Bridge Co.

LOCKPORT, ILL., 200 tons, township high school, to Mississippi Valley Structural Steel Co.

ST. LOUIS, 5800 tons, Illinois Terminal Co., bridge approach, to McClintic-Marshall Co.

CHICAGO, 1100 tons, factory addition for Edison Electric Appliance Co., to McClintic-Marshall Co.

ROCKFORD, ILL., 500 tons, plant for Rockford Drop Forge Co., to Wisconsin Bridge & Iron Co.

PERU, ILL., 300 tons, building for Western Clock Co., to Mississippi Valley Structural Steel Co.

OKLAHOMA CITY, OKLA., 2700 tons, Pittsburgh Plate Glass Co. plant, to Muskogee Iron Works.

KANSAS CITY, MO., 450 tons, railroad viaduct, to Kansas City Structural Steel Co.

CHEYENNE, WYO., 200 tons, hangar for Boeing Air Transport, Inc., to Judson-Pacific Co.

ALHAMBRA, CAL., 100 tons, Elks Club, to Pacific Iron & Steel Co.

SAN FRANCISCO, 100 tons, apartment building at Forty-fifth Avenue and Point Lobos, to Judson-Pacific Co.

SAN FRANCISCO, 300 tons, Sommer-Kaufmann store on Market Street, to Western Iron Works.

OAKLAND, CAL., 400 tons, factory for Hazel-Atlas Glass Co., to Judson-Pacific Co.

VALLEJO, CAL., 100 tons, Memorial building, to Judson-Pacific Co.

TACOMA, WASH., 1928 tons of plates, penstock for Lake Cushman project, to Western Pipe & Steel Co.

WEST VANCOUVER, B. C., 600 tons, Capilano bridge, to Western Canadian Structural Steel & Bridge Co.

Structural Projects Pending

Inquiries for fabricated steel work include the following:

MONTREAL, QUE., 3000 tons, university buildings.

MONTREAL, QUE., 1000 tons, Young Men's Christian Association building.

BOSTON, 1000 tons, canopies for South Station.

PITTSFIELD, MASS., 385 tons, Longfellow Inn.

HARTFORD, CONN., 235 tons, First National Stores warehouse.

BROOKLYN, 5800 tons, Kings County hospital.

PHILADELPHIA & READING RAILROAD, 400 tons, bridge across Schuylkill River.

CLEVELAND, 150 tons, service building for White Motor Co.

MILWAUKEE, 2000 tons, office building for the Milwaukee Electric Railway & Light Co.

GREAT NORTHERN RAILWAY, 4850 tons, bridges.

MINNEAPOLIS, 2000 tons, Foshey Building.

DECOTO, CAL., 350 tons, administration building for Masonic Home.

EVERETT, WASH., 10,000 tons plates, pipe line.

German Truck Exports Increasing

HAMBURG, GERMANY, Aug. 10.—A good export trade has been developed by the Bussingwerke A. G., one of the leading German makers of large buses and trucks, specializing in capacities from 5 to 10 tons. The company recently received a large order from the Turkish Government and Russia has purchased more than 400 buses and heavy trucks from the Bussingwerke in the past two years and has just ordered 40 more. Spain and Portugal are also active customers. Despite the downward revision of the German tariff on motor cars this company has been able to meet foreign competition in the domestic market. In 1925 German imports of buses and trucks exceeded exports by 200 per cent, but in 1928 exports were seven times the imports.

July British Iron and Steel Output Heavy

LONDON, ENGLAND, Aug. 16 (*By Cable*).—Production of pig iron in July was 671,900 gross tons and that of steel ingots and castings was 803,800 tons. The July pig iron output was the largest this year. That for steel was the fifth largest, with the peak at 859,900 tons in March.

Comparisons of present output with other years is as follows:

	Pig Iron, Gross Tons	Steel Ingots and Castings, Gross Tons
1913—Av. monthly..	855,000	638,600
1920—Av. monthly..	669,500	755,600
1922—Av. monthly..	403,500	490,100
1923—Av. monthly..	620,000	706,800
1924—Av. monthly..	609,900	685,100
1925—Av. monthly..	519,700	616,400
1926—Av. monthly..	203,500	296,700
1927—Av. monthly..	607,800	758,200
1928—Av. monthly..	550,900	710,400
1929—Av. first quar..	558,000	801,400
1929—April	611,300	808,600
1929—May	654,800	840,400
1929—June	657,800	830,900
1929—July	671,900	803,800

The July output of pig iron compares with a monthly average of 599,600 tons for the first half. The steel production last month compares with 814,000 tons per month for the first half.

Obituary

ALFRED HUTCHINSON COWLES, inventor of the process whereby aluminum in commercial quantities could be produced, died at his home in Sewaren, N. J., Aug. 13, aged 70 years. He was born in Cleveland and was educated at Ohio State and Cornell universities. His interest in electrochemistry led to experiments with the electric furnace, especially in the production of aluminum and aluminum alloys. After many months of research with his brother, Edwin H. Cowles, the Cowles Electric Smelting & Aluminum Co. was formed, which completed an electric smelting plant in Lockport, N. Y., in 1885. At the time of his death he was president of the Electric Smelting & Aluminum Co., Lockport, N. Y.

—

JOHN DAVID HURLEY, president, Independent Pneumatic Tool Co., Chicago, died of a heart attack in his rooms at the Edgewater Beach Hotel, Chicago, aged 74 years.

—

W. CHARLES LIPE, president, W. C. Lipe, Inc., Syracuse, N. Y., mechanical engineering and machine specialties company, is believed to have lost his life in a boat collision on the St. Lawrence at Alexandria Bay, N. Y., on Aug. 16.

Machinery Markets and News of the Works

Tool Sales Have Declined

International Harvester Co. and Western Electric Co. Have Been Large Buyers

A FURTHER seasonal drop in machine tool sales occurred the past week. However, manufacturers and dealers report that business still is sustained far above the level normally reached in midsummer.

The placing of orders for a tractor plant of the International Harvester Co. at Rock Island, Ill., calling for a total expenditure of close to $500,000, has featured the market at Chicago. It is interesting to note that purchases of tools for tractor makers have accounted for from 25 to 60 per cent of dealers' total sales in the Chicago district this year.

Another important source of business has been the Western Electric Co. and a wide range of shops to which it has been compelled to farm out its work on talking motion picture equipment. The Cleveland Union Terminals Co., Cleveland, has completed the buying of a list of 25 tools for locomotive repair shops. The Westinghouse Electric & Mfg. Co., East Pittsburgh, has bought a number of items, but still has to contract for a large part of its third quarter requirements.

The Curtiss-Caproni Corporation, New York, which will equip a new plant at Baltimore for the manufacture of airplanes, has ordered tools against a list issued about two months ago.

Despite the falling off in business, the delivery situation has not been substantially bettered. One large machine tool builder cannot make shipments in less than eight months and another is refusing orders unless customers are willing to wait a year. While these are exceptional cases, it is not unusual to find dealers and manufacturers quoting from three to six months' deliveries on various types of machines.

Machine tool orders fell off somewhat sharply in July as compared with those of June, states the National Machine Tool Builders' Association. The association points out that in other years the seasonal decline has lasted from May to August and that perhaps for the very reason that the recession was postponed for two months this year, the July volume was lower than it might have been. According to the association's index, actual orders in July were 27 per cent higher than in July, 1928, and the three months' average showed a 40 per cent gain.

Says the association: "In the face of the high level of shipments, and the good backlog of unfilled orders, the letting down in orders must be regarded as beneficial to the industry rather than as an alarming sign. If the month of August makes no better showing than July, there would still be no cause for apprehension for the future. Normally, however, July is the poorest of the summer months."

New York

NEW YORK, Aug. 20.—Machine tool business is holding at a remarkably high rate for midsummer. Some local sales offices report a slight decline in bookings, but others are doing a volume of business that compares favorably with the best previous months of the year. One large distributer reports sales in the first half of August equaling those of the first half of July, and the latter month was one of the best of the year for this company. The demand for radial drills is a feature of the current situation. One company last week received orders for 11 radial drills in one day from nine different buyers. The Curtiss-Caproni Corporation, New York, which will equip a new plant in Baltimore for the manufacture of airplanes has placed a large number of orders against a list issued about two months ago.

Contract has been let by Eberhard Faber, Inc., 37 Greenpoint Avenue, Brooklyn, manufacturer of hard rubber goods, etc., to C. C. Woodruff, 213 Tenth Avenue, Long Island City, for five-story addition on Java Street, reported to cost about $65,000 with equipment. F. H. Klie, 250 Park Avenue, New York, is architect.

Rainbow Metal Units Corporation, 125 Harris Avenue, Long Island City, manufacturer of steel shelving, etc., has leased factory at 330 William Street for new plant. It is understood that present plant will be removed to new location and capacity increased for other pressed steel specialties.

General Gas & Electric Corporation, 50 Pine Street, New York, operating electric light and power properties in northern New York, New Jersey, South Carolina and other States, has arranged for increase in capital from 4,000,000 to 4,400,000 shares of stock, no par value, portion of proceeds to be used for expansion. Company has large hydroelectric power project under way on Saluda River in last-noted State, estimated to cost more than $15,000,000.

Department of Mental Hygiene, Capitol Building, Albany, N. Y., will receive bids until Aug. 28 for steel standpipe and elevated tank at Wassaic State School for Mental Defectives, Amenia, N. Y., 1,000,000 gal. and 300,000 gal. capacity respectively. Plans at office of Department of Public Works, Division of Engineering, 353 Broadway, Albany.

Victor C. Farrar, 1 Park Avenue, New York, architect, has filed plans for a one-story machine shop at 518 West Thirty-seventh Street, to cost about $20,000.

Pilot Radio & Tube Corporation, Brooklyn, has concluded arrangements for purchase of Twin Coupler Co., Inc., Poughkeepsie, N. Y., manufacturer of radio frequency coils and kindred products, and will consolidate with organization.

Continental Can Co., 1 Pershing Square, New York, has acquired five acres of land adjoining present plant in Clearing industrial district, Chicago, and has approved plans for new additions, including tin plate mill, sheet coating mill, lacquering plant, can-manufacturing unit, and storage and distributing plant, reported to cost about $1,000,000 with equipment. Work will be carried out in connection with $5,000,000 expansion fund arranged for this year. Company has concluded arrangements for purchase of plant and business of Gille Mfg. Co., Kansas City, Mo., manufacturer tin containers for food products, etc., and will consolidate with organization. Plant will be maintained at present location and operated as individual unit.

Seelig & Finkelstein, 66 Court Street, Brooklyn, architects, have plans for a two-story automobile service, repair and garage building at Raymond and Bolivar Streets, estimated to cost $100,000 with equipment.

Cable Radio Tube Corporation, 80 North Ninth Street, Brooklyn, is carrying out an expansion and improvement program, including installation of additional equipment for larger output. Negotiations

are said to be under way for the acquisition of two new plants to be operated in conjunction with present factory.

United Aircraft & Transport Co., operating Chance Vought Aircraft Corporation, Long Island City, and other similar interests, has acquired Avian Corporation, Los Angeles, manufacturer of all-metal aircraft of special type, and has organized new subsidiary under name of Northrop Aviation Corporation to take over and operate Avian interest. Plans are under consideration for new plant for Northrop organization at Burbank Field, Los Angeles, exclusively for Avian type aircraft, reported to cost more than $75,000 with equipment.

Bakelite Corporation, 247 Park Avenue, New York, manufacturer of insulating products, composition rubber goods, etc., has acquired land at Bound Brook, N. J., and plans new plant, on which work will be started in fall. It will cost more than $300,000 with equipment.

Jersey Central Power & Light Co., 20 South Street, Asbury Park, N. J., has awarded general contract to Deakman-Wells Co., 921 Bergen Avenue, Jersey City, N. J., for steam-operated electric generating plant on waterfront at South Amboy, N. J., for which foundations are under way, main unit, one story, 160 x 160 ft., to be equipped for initial output of 50,000 kw., reported to cost close to $4,500,000 with transmission system. Electric Managament & Engineering Corporation, 57 William Street, New York, is engineer, in charge.

Pennsylvania Railroad Co. is having plans drawn for an eight-story cold storage and refrigerating plant, 230 x 900 ft., on waterfront near Exchange Place, Jersey City, N. J., reported to cost close to $1,000,000 with equipment. George F. Bial, 147 Summit Avenue, Union City, N. J., is architect.

Tung-Sol Lamp Works, Inc., 95 Eighth Avenue, Newark, manufacturer of radio tubes and equipment, is said to be planning immediate call for bids for a four-story addition at High Street and Seventh Avenue, to cost approximately $200,000 with equipment. Portion of new unit will be used for manufacture of miniature electric lamps; company has acquired machinery and equipment of Neptron Corporation, a subsidiary of Hygrade Lamp Co., Salem, Mass., and will remove to new plant unit as soon as available. A new subsidiary has been formed under name of Brown & Caine, Inc., to maintain a plant at Chicago for manufacture of radio and automotive equipment. Fougner & Gautier, 103 Park Avenue, New York, are architects for new Newark factory.

Detroit

DETROIT, Aug. 20.—Grand Trunk Railroad Co., 400 East Jefferson Street, Detroit, has taken bids on new car and locomotive terminal repair shops at Pontiac, Mich., reported to cost over $85,000 with equipment.

Calumet Township Board of Education, Calumet, Mich., is considering installation of manual training equipment in new three-story high and grade school at Calumet and School Streets, estimated to cost $300,000, for which plans have been drawn by J. D. Chubb, 109 North Dearborn Street, Chicago, architect.

Clark Equipment Co., Buchanan, Mich., manufacturer of transmissions, axles, wheels, etc., has awarded general contract to Frank L. Shoemaker Construction Co., East Congress Street, Sturgis, Mich., for one-story plant at Berrien Springs, Mich., 130 x 200 ft., to cost close to $90,000 with equipment.

Scott Engineering Co., Plainwell, Mich., recently organized with capital of $50,000, has taken over local factory of Aluminum Products Co., for production of aircraft engines and parts.

Officials of Continental Motors Corporation, East Jefferson Avenue, Detroit have organized a subsidiary under name of Continental Aircraft Engine Co., with capital of 250,000 shares of stock, no par value, to operate a plant for manufacture of aircraft engines, including parts and assembling departments. R. W. Judson is president of both companies.

John Bean Mfg. Co., 735 Hazel Street, Lansing, Mich., manufacturer of mechanical equipment, has plans for a one and two-story addition to machine shop, reported to cost about $40,000 with equipment. J. N. Churchill, Prudden Building, is architect. H. C. Lisle is manager.

Bay City Shovels, Inc., Bay City, Mich., formerly Bay City Dredge Works, Inc., is completing a new one-story addition, totaling about 18,000 sq. ft. floor space, and will occupy for expansion in assembling division. Cost will be $50,000 with equipment.

Muskegon Motor Specialties Co., Muskegon, Mich., manufacturer of automotive parts and equipment, has awarded general contract to Strom Construction Co., Muskegon, for one-story addition, to cost more than $50,000 with equipment. Company has plans under way for another unit, one story, to be equipped as a heat-treating plant, to cost $30,000 with equipment. Fred L. Flanders is chairman of board.

Board of Education, Village of East Detroit, is said to be planning installation of manual training equipment in three-story junior high school addition, reported to cost more than $250,000, for which bids have been asked on general contract. Warren S. Holmes Co., Capitol Savings & Loan Building, Lansing, Mich., is architect.

Buffalo

BUFFALO, Aug. 20.—Curtiss-Wright Corporation, Buffalo, has been chartered under Delaware laws with capital of 12,000,000 shares of stock, no par value, to take over and consolidate Curtiss Aeroplane & Motor Co., with local plant at Vulcan and Kenmore Avenues, and Wright Aeronautical Corporation, Paterson, N. J., manufacturer of aircraft motors, merger becoming effective Aug. 15. New company plans immediate organization of aviation research corporation, with laboratories, shops, flying field, etc. C. M. Keys, heretofore head of Curtiss company, is president, and Charles L. Lawrence, vice-president.

Gordon F. Carr, 135 Chapin Street, Binghamton, N. Y., and associates have organized Carr Home Appliances Co., to operate a local plant for manufacture of electrical appliances and equipment. Ralph E. Cohee, 160 Chapin Street, is also interested in new company.

Houdaille-Hershey Corporation, 537 East Delavan Avenue, Buffalo, manufacturer of shock absorbers and other automobile equipment, has concluded negotiations for purchase of Skinner Co., Ltd., Gananoque, Ont., manufacturer of automobile bumpers and kindred products, and will consolidate with organization, operating as a Canadian subsidiary. Plans are under way for expansion in present Skinner plant, including installation of additional equipment, and for new plant at Oshawa, Ont., latter reported to cost more than $150,000 with equipment. Fred V. Skinner will continue as secretary and general manager of Skinner company.

Board of Education, Rochester, N. Y., plans installation of manual training equipment in proposed three-story addition to Washington junior high school on Clifford Avenue, reported to cost about $700,000, for which bids will soon be asked on general contract. Edward S. Gordon, 311 Alexander Street, is architect.

Stewart Motor Corporation, 93 Dewey Avenue, Buffalo, manufacturer of motor trucks, parts, etc., plans rebuilding of portion of repair shop recently destroyed by fire.

South Atlantic

BALTIMORE, Aug. 20. — Flynn & Emrich Co., 301 North Holliday Street, Baltimore, manufacturer of mechanical stokers, parts, etc., is said to be planning early call for bids for one-story foundry at Grantley Avenue and Western Maryland Railroad, reported to cost $75,000 with equipment. W. S. Austin, Maryland Trust Building, is architect and engineer. James F. Turner is general manager.

Virginia Electric & Power Co., 700 East Franklin Street, Richmond, has made application for permission to construct and operate a hydroelectric power plant on the Roanoke River, to be equipped for initial capacity of 25,000 kw. and ultimate output of 42,000 kw., reported to cost more than $1,000,000 with transmission system.

Toy & Specialty Mfg. Co., Richmond, Va., has been organized to take over and consolidate Berger Specialty Mfg. Co., 2008 East Main Street, and Bruner Lumber Co., Roane Street, manufacturer of light fabricated steel and other metal products, toys, aircraft landing apparatus, etc. Consolidated company will continue production at both plants, and plans immediate expansion with installation of additional equipment.

Platnick Brothers, Bluefield, W. Va., manufacturers of mechanical products, D. M. Platnick, head, are planning construction of one-story foundry at Big Stone Gap, Va., reported to cost about $24,000 with equipment.

City Council, Columbia, S. C., will receive bids until Aug. 27, for two horizontal piston pumping units, capacity of 3,500,000 gal. per day, with accessories. W. S. Tomlinson is city engineer.

Board of Education, Winston-Salem, N. C., has approved plans for two-story and basement high school, to cost about $225,000, and plans installation of manual training equipment. Northup & O'Brien, Starbuck Building, are architects.

J. Smith Lanier, president, West Point Telephone Co., West Point, Ga., is at head of project to construct and operate hydroelectric power plant on Chattahoochee River, near city, for which Federal permission has been granted. Station will have initial capacity of 15,000 kw. and ultimate output of 30,000 kw., and is reported to cost more than $500,000 with transmission lines. McDonald & Co., Atlanta, Ga., are engineers.

Curtiss Airports, Inc., 29 West Fifty-seventh Street, New York, has awarded general contract to Stone & Webster, Inc., 120 Broadway, and 49 Federal Street, Boston, for airport at Baltimore, including hangars, repair and reconditioning shops, oil storage and distributing units, and

other field structures, reported to cost more than $1,000,000 with equipment.

Chesapeake & Ohio Railroad Co., Richmond, Va., will not proceed with engine house and terminal shops at Elk, W. Va., at present time, recently noted in these columns.

Page County School Board, Luray, Va., is said to be planning installation of manual training equipment in proposed two-story high school, to cost about $160,000, for which it is purposed to ask bids on general contract early next month. Mims, Speake & Co., Luray, are architects.

B. F. Goodrich Co., Akron, Ohio, manufacturer of automobile tires and tubes, mechanical rubber goods, etc., is reported planning new mill at Atlanta, Ga., to be equipped for initial capacity of 10,000 tires and tubes a day, estimated to cost more than $1,200,000 with machinery. Company is completing construction of tire cord mill at Silvertown, near Thomaston, Ga., to cost more than $5,000,000, and proposes to have ready for service in fall.

Philadelphia

PHILADELPHIA, Aug. 20.—Contract has been let by Philadelphia & Reading Coal & Iron Co., Reading Terminal, Philadelphia, to Stone & Webster, Inc., 49 Federal Street, Boston, for two electric-operated coal breakers for central mine service in vicinity of Locust Summit, Pa., each to be equipped for capacity of 25,000 tons daily, and for complete electrification of mining properties throughout this district, estimated to cost about $20,000,000 with equipment.

Quaker Field Corporation, Philadelphia, care of P. J. Whelan, Bankers' Trust Building, recently organized under Delaware laws by Mr. Whelan and associates, plans construction of airport on 300-acre tract of land near Llanrich golf course, about six miles from center of city, to include hangars, repair and reconditioning shops, oil storage and distributing buildings, and other mechanical field units, reported to cost more than $1,000,000 with equipment.

Stokes & Smith Co., Wakeling Street and Summerdale Road, Philadelphia, manufacturer of paper box-making machinery, etc., has awarded general contract to Robert E. Lamb Co., 841 North Nineteenth Street, for one-story addition to be equipped as a grinding mill.

Frank M. Weaver & Co., Lansdale, Pa., plan rebuilding of portion of structural steel fabricating plant recently destroyed by fire with loss reported at $20,000 including equipment.

Rundle Mfg. Co., Cleveland Street, Milwaukee, manufacturer of plumbing equipment and supplies, is completing new Eastern branch plant on River Road, Delair, near Camden, N. J., consisting of one-story foundry, 150 x 325 ft.; three-story mill unit, 68 x 70 ft.; one-story enameling shop, 20 x 80 ft., and other structures, and plans early occupancy. A large part of output will be used for export. Entire project will represent investment of about $1,000,000. R. A. Wickland & Co., 205 West Wacker Drive, Chicago, are the engineers.

Joseph Stokes Rubber Co., Taylor and Webster Streets, Trenton, N. J., manufacturer of molded hard rubber goods, has filed plans for two one-story additions, 40 x 70 ft. and 36 x 58 ft. respectively, for which general contract recently was let to N. A. K. Bugbee & Co., 206 East Hanover Street.

Commissioner of Institutions and Agencies, State Office Building, Trenton, N. J., will receive bids until Aug. 27, for steel water tower and tank at Woodbine Colony for Feeble-Minded, Woodbine, N. J. Information at office of Division of Architecture and Construction, address noted.

Kellett Aircraft Co., care of Nicholas S. Ludington, 123 South Broad Street, Philadelphia, head of Central Airport, Camden, N. J., has been formed under Delaware laws and plans construction of new plant at airport noted for manufacture of special aircraft, for which patent license has been secured from Pitcairn-Cievra Autogiro Co., Land Title Building, Philadelphia, Harold F. Pitcairn, head. Initial unit will be one story and is reported to cost more than $65,000 with equipment.

Board of Education, Royersford, Pa., is considering installation of manual training equipment in new two-story junior and senior high school to cost about $230,000, for which bids will soon be asked on general contract. W. Marshall Hughes, 147 North Fifth Street, Reading, Pa., is architect.

Individual Drinking Cup Co., Easton, Pa., manufacturer of pressed paper drinking cups, etc., has asked bids on general contract for a three-story addition, reported to cost close to $100,000 with machinery. Ballinger Co., Twelfth and Chestnut Streets, Philadelphia, is architect and engineer.

Joseph Loeffler Machine Co., Philadelphia, has leased floor in building at 132 North Fourth Street for local works and headquarters.

Cleveland

CLEVELAND, Aug. 20.—While machine tool sales show a moderate decline as compared with July, business is regarded as good for this time of the year. The Cleveland Union Terminals Co. during the week distributed orders for nearly all the machinery required for its locomotive repair shops. Its inquiry was for about 25 machines. Other buying during the week was confined to single machines. No inquiry of size is pending. Business is well distributed among various industries. Deliveries have improved on some lines of drill presses, radial drills, lathes and grinders, but are still greatly deferred on some makes of planers and shapers. On large tools, no improvement in deliveries is reported.

Hoover Co., North Canton, Ohio, manufacturer of vacuum cleaners, etc., has awarded general contract to Warren-Hoffman Co., Witters Building, for four-story addition to cost about $100,000 with equipment. L. Christman and C. Firestone, 900 Renkert Building, Canton, are architects.

Tandem Wheel Co., Warren, Ohio, will establish a branch plant at Akron, Ohio. Portion of equipment will be removed from present works and additional machinery provided for increased output.

Canton Drop Forge & Mfg. Co., Canton, Ohio, is having plans drawn for one-story addition, 90 x 550 ft., reported to cost about $100,000 with equipment.

Apex Electrical Mfg. Co., 1067 East 152nd Street, Cleveland, manufacturer of electric-operated cleaning equipment, clothes washers, etc., has acquired plant and business of Johnson Washer Co., Oakland, Cal., manufacturer of kindred equipment, and will consolidate with organization. Oakland plant will be continued in operation for Pacific Coast trade and expansion carried out.

Whiteway Stamping Co., 1201 East Fifty-fifth Street, Cleveland, manufacturer of metal stampings, has awarded general contract to Boldt-Rapp Co., 6007 Euclid Avenue, for one and two-story plant on East Seventieth Street, estimated to cost $80,000 with equipment.

Williams Alloy Products Co., Elyria, Ohio, manufacturer of bearing metals, etc., is planning expansion and improvement program, including installation of additional equipment at local plant for larger output.

Goodyear Tire & Rubber Co., Akron, Ohio, has closed plant of subsidiary organization, Marathon Tire & Rubber Co., at Cuyahoga Falls, Ohio, and will remove this division to main Akron mills, where production will be concentrated in future.

Reliance Mfg. Co., Massillon, Ohio, manufacturer of lock nuts, lock washers, etc., has authorized an expansion and improvement program, including new one-story addition totaling about 10,000 sq. ft. floor space, with installation of heat-treating equipment, cutting, polishing and other machinery to be used for manufacture of new products of allied character. Work is reported to cost more than $70,000.

Crescent Engineering Co., 1215 West Bancroft Street, Toledo, Ohio, manufacturer of mechanical equipment, is having plans drawn for one-story plant unit at Dewey and Sylvania Avenues, reported to cost close to $35,000 with equipment. R. E. Dickman is head.

New England

BOSTON, Aug. 20.—New England tool builders report a further contraction in bookings. No new inquiries of importance have come into the market. General opinion is that sales will remain small for at least another month. Dealers, however, have a sizable number of prospects to work upon when the buying movement is resumed.

Contract has been let to Temple & Crane, Inc., Boston, for construction of the new power plant at Bristol, Conn., for the New Departure Mfg. Co. The main building will be of concrete, steel and brick, about 54 x 126 ft., with basement and one story high.

Chance Vought Corporation, aircraft, has completed plans for a one-story, 320 x 672 ft., manufacturing plant at East Hartford, Conn.

W. F. Gilbert, 127 Church Street, New Haven, Conn., has started work on a coal unloading plant. A grab bucket and other handling equipment is involved.

Leland-Gifford Co., 1027 Southbridge St., Worcester, Mass., machine tools, will soon start a one-story addition, 121 x 196 ft.

Sherms, Inc., 318 Warren St., Bridgeport, Conn., novelties, closed bids Aug. 20 for a one-story, 25 x 60 ft., manufacturing unit.

Marlboro Wire Goods Co., Lincoln Street, Marlboro, Mass., has started work on a manufacturing plant addition, to cost $45,000 without equipment.

Westerly, R. I., will close bids Aug. 26 for a two-story and basement junior high school and industrial school, to cost $500,000 without equipment.

Skayeff Ball Bearing Co., 330 New Park Avenue, Hartford, Conn., closes bids

Aug. 21 for a two-story, 75 x 150 ft., manufacturing plant and for alterations to another manufacturing unit.

Strathmore Paper Co., Front Street, Mittineague, Mass., is revising plans for a 54 x 60 ft. hydroelectric plant to be built at West Springfield, Mass.

Lux Clock Mfg. Co., 95 Johnson Street, Waterbury, Conn., has completed plans for a four-story, 45 x 140 ft., manufacturing plant addition.

Taylor & Fenn Co., Arch Street, Hartford, Conn., manufacturer of milling machines, drills, etc., has awarded general contract to Allyn Wadhams Co., 15 Lewis Street, for one-story addition to foundry, 54 x 180 ft., reported to cost close to $50,000 with equipment.

Segal Lock & Hardware Co., 155 Leonard Street, New York, with main plant at Brooklyn, has completed arrangements for purchase of Norwalk Lock Co., Norwalk, Conn., manufacturer of locks, builders' hardware, etc., and will consolidate with organization. It is proposed to continue acquired plant at present location with increased output.

Holyoke Water Power Co., Holyoke, Mass., has plans nearing completion for new hydroelectric power plant on its waterway, vicinity of mill of American Writing Paper Co., reported to cost $450,000 with equipment.

United Electric Railways Co., Woonsocket, R. I., has awarded general contract to O. D. Purington Co., Providence, R. I., for one-story service, repair and garage building, 107 x 175 ft., for company motor buses, at end of Park Avenue, reported to cost close to $100,000 with equipment.

Bolta Rubber Co., care of Eaton & Chandler, Lawrence, Mass., attorneys, representatives for company, has concluded negotiations for purchase of Mill No. 3A, of local Everett Mills, five story, totaling about 70,000 sq. ft. floor space, heretofore used for textile service, and will remodel and equip new plant for manufacture of hard rubber goods. Company will be incorporated under State laws with John Bolten as president, and Milton Shaw, vice-president.

Trumbull Electric Mfg. Co., Woodland Avenue, Plainville, Conn., manufacturer of electric switches, controls, etc., affiliated with General Electric Co., Schenectady, N. Y., is reported planning new addition to cost close to $50,000 with equipment.

Plant of Connecticut Telephone & Electric Co., Meriden, Conn., manufacturer of telephone equipment, electric fixtures, etc., in receivership for more than a year, has been closed for indefinite period, and will be offered at public sale at early date.

Board of Education, Norwalk, Conn., has authorized installation of manual training department, consisting of three shop units for machine, mechanical, electrical and other work, in new junior high school to cost in excess of $250,000 for which plans will be drawn by Frank Irving Cooper Corporation, 172 Tremont Street, Boston, architect.

United-Carr Fastener Corporation, Boston, has been organized to take over and consolidate United States Fastener Corporation, with local plant on Columbia Road, and Carr Fastener Co., 31 Ames Street, Cambridge, Mass., both manufacturers of metal fasteners, automatic machines for attaching fasteners, screw machine parts, etc. New company plans expansion program for enlarged output. M. F. Carr, formerly president of Carr company, will be chairman of board, and

The Crane Market

BUILDERS of electric overhead cranes are well engaged on orders from the Middle West and have some business from the South, but the New York and New England districts are quiet. There is also a decided lull in the locomotive crane business. The S. G. Schaefer Iron Works, Edgewater, N. J., recently in the market for a locomotive crane for steel erection has purchased a used Brownhoist locomotive crane, which has been on the Pennsylvania Railroad. The International Combustion Engineering Co., 200 Madison Avenue, New York, is reported to have closed on a 25-ton locomotive crane.

In the Chicago district the Edison Electric Appliance Co., Chicago, is inquiring for a 10-ton, 60-ft. span electric traveling crane.

Among recent purchases are:

Rockford Drop Forge Co., Rockford, Ill., two 10-ton, 49-ft., 7¼-in. span, electric traveling cranes from Wisconsin builder.

Union Pacific System, 5 drop pits for roundhouse from unnamed builder.

Sinclair Weeks, heretofore president of United States Fastener Corporation, will occupy same position with consolidated organization.

Milwaukee

MILWAUKEE, Aug. 20.—All items of machine tools are still facing a heavy demand far exceeding that of any recent years and in spite of a barely noticeable recession which is considered to be merely seasonal. Deliveries have not been improved noticeably. The busiest of the metal working plants at this time appear to be the manufacturers of tractors, farm implements and electrical equipment. While automobile production has naturally fallen off, inquiries from that source promise a liberal volume of future purchases and manufacturers of automotive parts continue programs of expansion. Railroad demand has not attained volume.

Wisconsin Malleable Iron Co., 94 South Bay Street, Milwaukee, plans rebuilding and re-equipment of parts of its plant damaged by fire Aug. 14. The boiler house, pattern shop, carpenter shop, core room, annealing house and shipping room are affected. W. H. Osborne is president.

Sherwood Mfg. Co., Hudson, Wis., originally of Minneapolis, producer of washing equipment, will move to the plant of the Northern States Power Co., Chippewa Falls, Wis., occupied by that concern during the construction of its hydroelectric plant in that city. George Sherwood is president.

Specialty Brass Co., Kenosha, Wis., maker of creamery fittings and milk pumps, will move its plant in Albany, N. Y., to Kenosha to secure concentration of all production, which will be increased 30 per cent thereby. Last year, the Albany plant produced $100,000 worth of equipment. Appliances for a new milk heating device, said to be revolutionary in the dairy industry, will be an added line. C. M. Anderson is president.

Fish Rotary Oven Co., Beloit, Wis., has completed removal of plant and offices to that city from Walworth. The new plant cost above $100,000 and includes a main shop, 100 x 210 ft., and a foundry with cupola and electric traveling crane. Three to four bakers' ovens a week will constitute the initial output. G. W. Curless is president, and George K. Blakely is secretary-treasurer.

West Allis, Wis., announces that the Pittsburgh-Des Moines Steel Co., 38 South Dearborn Street, Chicago, was the low bidder for furnishing and installing 1,000,000-gal. elevated steel tank for municipal water works at a cost of $70,700.

Kiel, Wis., will take sealed bids until Aug. 29 for construction of concrete reservoir and addition to pumping station, including furnishing of one 750-gal. and one 300-gal. centrifugal pump, air compressor and air lift pump. W. G. Kirchoffer, 22 N. Carroll Street, Madison, Wis., is designing engineer.

E. H. Krueger, Twenty-fifth and Cleveland Avenues, Milwaukee, has secured permit to build a one-story machine shop addition, 60 x 120 ft., at 1123 Cleveland Avenue, to cost about $30,000.

Pittsburgh

PITTSBURGH, Aug. 20.—The machine tool business continues to be good, and the constant flow of inquiries is surprising to most dealers who ordinarily expect a quiet August. Purchases are confined largely to single tools. The Westinghouse Electric & Mfg. Co. placed a number of items last week, but still has a large part of its third quarter list to buy. The Bethlehem Steel Co. has not yet closed against its inquiries for the Johnstown, Pa., plant, but immediate action is expected.

Work is progressing rapidly on the new seamless tube mill of the National Tube Co. at McKeesport, Pa., and tools and equipment will probably be placed in the fall. The cranes for this job will likely be ordered this week. Requirements of the Austin Motor Co. for its Butler, Pa., plant are not expected to be large, as the present plans of the company call for assembling of motor cars only and the plant will be extended slowly in the early days of operation.

Aetna-Standard Engineering Co., Youngstown, Ohio, manufacturer of rolling machinery, etc., has awarded general contract to J. H. DeCarpentier & Son, 327 Falls Avenue, for two one-story additions to branch plant at Ellwood City, Pa., reported to cost about $45,000.

Kerotest Mfg. Co., 2525 Liberty Avenue, Pittsburgh, manufacturer of oil well equipment and supplies, valves, etc., has superstructure in progress for a four-story addition, reported to cost close to $100,000 with equipment.

Farman Aircraft Co., care of Harrison R. Tucker, Tulsa, Okla., recently formed as an affiliated interest of Farman Brothers, Paris, France, manufacturers of large aircraft, is planning early construction of new plant in vicinity of Wheeling, W. Va., for manufacture of aircraft, motors, parts, etc., reported to cost more than $75,000 with equipment. Company also proposes to establish eastern assembling works and has taken options on site at Central Airport, Camden, N. J., for this plant.

Fairmont Mfg. Co., Fairmont, W. Va., is said to be planning expansion in duralumin sheet manufacturing plant, primarily for metal aircraft production, to include installation of rolling mill equipment, electric furnace and auxiliary equipment, reported to cost more than $75,000.

Kelly-Claude Neon Corporation, 231 Spahr Street, Pittsburgh, has been organized to take over and consolidate Alpha-Claude Neon Light Co., address noted, and Kelly Outdoor Advertising Co., Erie, Pa., to manufacture luminous tube electric signs, lamps, etc. Expansion plans are under way for increase in present production.

United States Engineer Office, Pittsburgh, will receive bids until Sept. 9 for a hydroelectric plant for Deadman Island Locks, Ohio River.

Board of Education, Blairsville, Pa., is considering installation of manual training equipment in proposed two-story high school, reported to cost about $220,000, for which bids will soon be asked on general contract. Vans Engineering Service, Blairsville, is architect and engineer.

General Bronze Co., 3212 Smallman Street, Pittsburgh, has concluded arrangements for purchase of Guaranty Iron & Steel Co., 3847 West Lake Street, Chicago, and Wisconsin Ornamental Iron & Bronze Co., Milwaukee, and will consolidate with organization. Proposed to continue plants at present locations and will carry out expansion program for increased output. Company is making improvements at Pittsburgh works, including installation of additional equipment.

Chicago

CHICAGO, Aug. 20.—The placing of orders for the "Farmall" tractor plant of the International Harvester Co. at Rock Island, Ill., features the activity in the machine tool trade. Purchases of special purpose tools have been virtually completed and the buying of standard machines is under way. Total expenditures for machine tools will be nearly $500,000. In addition, a large outlay will be made for foundry equipment. The improvements are being made to increase the output of tractors 40 per cent and the production of gasoline engines 25 per cent.

Purchases of machine tools for tractor plants have been an important factor in the local machinery market throughout the year, accounting for 25 to 60 per cent of dealers' total sales. Although a few instances of overexpansion in the farm equipment field are reported, they are not of an alarming character. In fact, one important producer of tractors now has nearly enough foreign business to occupy its plants without depending on domestic orders.

Another important source of business in machine tools has been the rapidly increasing output of talking motion picture equipment by the Western Electric Co. Orders have not only come in large numbers from that company but from a wide range of shops to which it has been compelled to farm out work. Production of this cinema improvement is still far short of the demand.

General business in machine tools is still well diversified and in encouraging volume, although showing the effects of the vacation season. For a number of leading dealers business to date this year has been at the highest rate in history, not excepting the war period and the post-war boom. Sales of one machinery house in the first seven months were within striking distance of the total for all of 1928.

Purchases by automobile companies are confined to scattered orders for tools to round out existing equipment. Railroad buying has not been conspicuous of late, and it is common opinion that no large programs will be launched in the near future. Leading Western lines have brought their shops up to a high standard of efficiency in recent years, and the O'Fallon decision has removed a potent reason for converting extra earnings into improvements.

Chicago, Milwaukee, St. Paul & Pacific has closed for two frog and switch planers for its Milwaukee shops.

Union Pacific System has placed orders for five drop pits for roundhouses.

Continental Can Co., Chicago, is spending $1,000,000 at its plant in the Clearing district. Improvements include additions to can plant, warehouse and tin mill. A lacquering plant will also be erected.

Edison Electric Appliance Co., Chicago, will soon start work on a one-story warehouse and manufacturing plant at South Menard Avenue and Taylor Street, to cost $400,000.

International Harvester Co., Chicago, is erecting a one-story steel storage building, 188 x 199 ft., at 1015 West 120th Street, to cost $68,000.

Heuser Mfg. Co., maker of screw machine products, 231 West Illinois Street, Chicago, has purchased a two-story and basement plant building at 1638 North Paulina Street.

Hawkeye Mfg. Co., maker of portable hog houses, brooder houses and self-feeders, Belmond, Iowa, has started building a new plant, 70 x 100 ft., to replace one recently destroyed by fire.

Elgin Stove & Oven Co., Elgin, Ill., will construct an addition, 48 and 82 ft. x 124 ft., to cost $10,000.

Michiana Products Corporation, Michigan City, Ind., has been organized to take over the Chrobaltic Tool Co. and the Sheet Steel Products Co., both of Michigan City. The Chrobaltic division will continue to manufacture heat and acid-resisting alloy castings, including stainless materials, and the Sheet Steel Products division will continue to make the Hall-Winslow line of oil filters and air cleaners for truck, tractor, airplane and automobile engines, as well as pressed metal parts, tanks, equipment, etc. O. M. Carry is president of the new company, with office at Chicago. W. B. Sullivan, first vice-president and general manager, has headquarters at Michigan City.

Clark Equipment Co., Buchanan, Mich., will soon construct an addition, 100 x 220 ft., to its tubular housing department.

Midway Foundry Co., St. Paul, Minn., will erect an addition to its foundry on Raymond Avenue, at a cost of $3,300.

Dallas Brass & Copper Co., 6601 Grand Avenue, Chicago, has awarded general contract to Dahl & Stedman, 11 South LaSalle Street, for one-story addition, 126 x 329 ft., reported to cost about $500,000 with equipment. Johnch & Ehmann, 140 South Dearborn Street, are architects.

Scully Steel & Iron Co., 208 South LaSalle Street, Chicago, has let contract to Boyle & Co., 105 West Monroe Street, for one-story storage and distributing plant at 2364 South Ashland Avenue, estimated to cost more than $50,000 with equipment.

Vortex Mfg. Co., Western and Austin Avenues, Chicago, manufacturer of paper drinking cups, etc., pressed paper goods and kindred specialties, has disposed of a stock issue to total $4,579,000, a portion of proceeds to be used for expansion. P. T. Potts is president.

City Council, Grafton, N. D., has called a special election to approve a bond issue of $77,000, fund to be used for a municipal electric light and power plant. Druar & Milinowski, Globe Building, St. Paul, Minn., are engineers.

Northwestern Re-Tinning Co., Hersey and Hampden Avenues, St. Paul, Minn., has leased a one-story building to be erected at 862 Seal Street, and will occupy for a new plant, reported to cost close to $25,000 with equipment. Mather & Fleishbein, Endicott Building, are architects.

Union Pacific Railroad Co., Omaha, Neb., has plans for a new engine house with shop facilities at Cheyenne, Wyo., estimated to cost about $40,000 with equipment. L. D. Huntley, Omaha, is chief engineer.

Board of Education, Burlington, Iowa, is considering installation of manual training equipment in new two-story junior high school on Oak Street, estimated to cost $240,000, for which plans will be drawn by C. L. Ritts, Eisfeld Building, architect.

Mercil Plating Co., 1911 Fulton Street, Chicago, manufacturer of plated metal products, has awarded contract to H. N. Samuel, 53 West Jackson Boulevard, for one-story addition, 20 x 101 ft., reported to cost about $30,000 with equipment.

Rockford Drop Forge Co., Ninth Street, Rockford, Ill., has awarded contract to Linden & Sons, Inc., 1110 Tenth Street, for one-story addition, 85 x 275 ft., reported to cost close to $150,000 with equipment. Lockwood Greene Engineers, Inc., 400 North Michigan Avenue, Chicago, is architect and engineer.

Iowa Railway & Light Co., Cedar Rapids, Iowa, will build a one-story power plant at Jefferson, Iowa, reported to cost in excess of $45,000 with equipment.

Central West Public Service Co., 117 North Thirteenth Street, Omaha, Neb., operating electric light and power properties in Iowa, Minnesota, North and South Dakota, is disposing of a note issue of $1,000,000, portion of proceeds to be used for expansion in power facilities and transmission system.

St. Louis

ST. LOUIS, Aug. 20.—Plans are being considered by Eagle Motor Truck Corporation, 6150-60 Bartmer Avenue, University City, Mo., for new one-story plant for parts production and assembling, reported to cost more than $65,000 with equipment. J. P. Reis is head.

Tunnison Brothers, 1530 West Main Street, Oklahoma City, Okla., manufacturers of sheet metal products, have begun construction of new one-story plant, 100 x 300 ft., at 513 North Indiana Street, reported to cost in excess of $70,000 with equipment.

Board of Education, Crawford, Neb., is said to be planning installation of manual training equipment in proposed two-story

high school, to cost about $160,000, for which bids will be asked on general contract early in September. Meginnis & Schaumberg, Federal Trust Building, Lincoln, Neb., are architects.

Precision Machinery Co., Seattle, Wash., is considering new branch plant unit at Centralia, Mo., for manufacture of rotary pumping machinery, parts, etc. Negotiations are under way with Centralia Chamber of Commerce for suitable site.

Rex Art Casket Co., 1608 North Thirteenth Street, Kansas City, Kan., has plans for a two-story and basement addition, 50 x 125 ft., reported to cost close to $25,000 with equipment.

Cincinnati

CINCINNATI, Aug. 20.—A slight letup in the demand for machine tools during the past month is aiding district tool builders to diminish their large amount of unfilled orders, which will require about two and a half months' production to fill. Despite this easing off in demand, total fresh bookings during July were 27 per cent higher than July, 1928, and reflected the continued widening of interest in new equipment and replacements in practically all lines of industry. So far, August bookings are a trifle under those of July, although in certain quarters manufacturers report that new business this month is better than that of July. This, however, is not sufficient to affect the market generally. The Missouri and Pacific Railroad is reported to be in the market for three motor-driven lathes.

Ohio Pattern Works & Foundry Co., 2730 Spring Grove Avenue, Cincinnati, has awarded general contract to William Juergens & Son, 4434 Glenway Avenue, for one-story foundry addition, reported to cost close to $40,000 with equipment.

General Motors Corporation, General Motors Building, Detroit, has concluded negotiations for purchase of plant and business of Day-Fan Electric Co., Dayton, Ohio, manufacturer of radio equipment and parts, and will operate as unit of organization in future. Expansion is planned for increased output.

Exact Weight Scale Co., 265 West Spring Street, Columbus, Ohio, is having plans drawn for one-story plant unit on West Fifth Street, estimated to cost $65,000 with equipment. Carmichael & Milsbaugh, 8 East Long Street, are architects; bids will soon be asked on general contract.

Columbia Gas & Electric Corporation, Cincinnati, is negotiating for purchase of Binghamton Gas Works, Inc., Binghamton, N. Y., and will operate in conjunction with present properties at Olean, N. Y., and vicinity. Plans are under way for expansion in natural gas holdings in that district, including construction of pipe lines to Binghamton and neighboring districts. Columbia company has also acquired controlling interest in Cincinnati, Newport & Covington Light & Traction Co., operating at Newport and Covington, Ky., and in Cincinnati Gas Transportation Co., and plans extensions and improvements in plants and system.

Second National Garage, Inc., Nashville, Tenn., recently organized by E. B. Craig, National Life & Accident Insurance Co., 301 Seventh Avenue, and associates, has awarded general contract to John Oman, Jr., Chamber of Commerce Building, for five-story service, repair and garage building, 100 x 200 ft., at Polk Avenue and Seventh Street, estimated to cost in excess of $500,000 with equipment. Hart, Freeland & Roberts, Independent Building, are architects.

Advance Battery Mfg. Co., Louisville, has awarded general contract to National Concrete Construction Co., Louisville, for one-story addition on East Lee Street, reported to cost close to $20,000 with equipment.

Indiana

INDIANAPOLIS, Aug. 20.—Hetherington & Berner, fabricators of structural steel and manufacturers of dredging machinery, with factory in Indianapolis, has been acquired by the Berner interests, represented by Robert Berner. Mr. Berner has taken over the operation of the plant.

Extensive remodeling now is under way at the plant and the personnel of the Robert Berner Structural Steel Co. has been transferred to the Hetherington & Berner plant. The Berner plant will be sold. Hetherington & Berner plant includes structural steel fabrication plant, machine shop, pattern-making shop and foundry. Officers of the new corporation will be Mr. Berner, president; R. H. Dickson, vice-president, and F. C. Miller, secretary-treasurer.

Real estate and other property of the Wayne Machinery Co., Fort Wayne, Ind., has been sold to C. L. Schust, Walter Meyer and Clifford Kern for $24,000, subject to approval of the trustee in bankruptcy. Mr. Schust of the C. L. Schust Co. said he would move his sheet metal business to the plant and will lease a part of the building to Meyer and Kern, who will carry on business similar to that of the Wayne Machinery Co. under the name of the Indiana Machinery Co.

Land on New Haven Avenue, Fort Wayne, Ind., has been acquired by George A. Jacobs and Wendell C. Glass, former officials of the Dudlo Manufacturing Corporation there, and their new associates as the site for an industrial plant they will erect for the manufacture of wire of all kinds. An office building has been started. The first unit of the plant will be 200 x 300 ft.

Titan Electric Co., Butler, Ind., manufacturer of electrical equipment, has arranged for removal of plant to Adrian, Mich., where increased capacity will be carried out.

Auburn Automobile Co., Auburn, Ind., has secured a substantial interest in Columbia Axle Co., 850 East Seventy-second Street, Cleveland, manufacturer of automobile axles, etc., and will be active in management in future. Proposed to expand output for axles for new Cord automobile. E. L. Cord, president of Auburn company, will be chairman of board of Columbia organization, and Edwin H. Parkhurst, heretofore vice-president and manager of last-noted company, will be president.

Tokheim Oil Tank & Pump Co., 1602 Wabash Avenue, Fort Wayne, Ind., manufacturer of gasoline pumps and equipment, has asked bids on general contract for one and two-story addition, 30 x 800 ft. and 40 x 160 ft., reported to cost about $100,000 with equipment. Pohlmeyer & Pohlmeyer, Central Building, are architects.

Rubush & Hunter, American Central Life Insurance Building, Indianapolis, architects, have plans for a new seven-story automobile service, repair and garage building, 68 x 195 ft., at 147 East Market Street, estimated to cost $500,000 with equipment.

Noblitt-Sparks Industries, Inc., 603 East Washington Street, Indianapolis, manufacturer of metal products, has approved plans for an addition to plant at Glenwood, Ind., reported to cost over $50,000 with equipment.

Gulf States

BIRMINGHAM, Aug. 20.—Kansas City Southern Railroad Co., Beaumont, Tex., with main offices at Kansas City, Mo., is arranging for new terminal yards and shops at Dowling, near Beaumont, including engine house, machine shops, boiler shops and other units, entire project to cost close to $1,000,000 with equipment. Company engineering department is in charge.

Lamson & Sessions Bolt Co., 1971 West Fifty-eighth Street, Cleveland, has awarded contract to Johnson Construction Co., Marlin Building, Birmingham, for new plant at North Birmingham, consisting of several one-story units, with main mill, 160 x 240 ft., power house and other buildings, entire project to cost close to $500,000 with equipment. George S. Rider, Century Building, Cleveland, is engineer.

St. Louis & Southwestern Railroad Co., Tyler, Tex., plans rebuilding of portion of local car repair shops, recently destroyed by fire with loss reported at close to $50,000, including equipment.

Pacific Coast

SAN FRANCISCO, Aug. 20.—Plans are being completed by Neilson Steel Aircraft Co., Second and Camelia Streets, Berkeley, Cal., for two-story addition, 60 x 200 ft., reported to cost about $65,000 with equipment. Engineering department of company is in charge. Thomas Neilson is president.

Southern California Edison Co., Los Angeles, has made application for permission to issue bonds in amount of $15,000,000, portion of fund to be used in connection with extensions and improvements in electric light and power properties. Plans have been approved for a power substation at Compton to cost about $200,000 with equipment, and for similar unit at Moneta, to cost approximately $50,000.

Western Metal Products Co., 1160 Bryant Street, San Francisco, has awarded general contract to R. C. Stickle, South San Francisco, for one-story plant at South San Francisco, estimated to cost about $35,000 with equipment. Engineering department of company is in charge.

Inland Light & Power Co., Portland, Ore., has secured permission from Federal Power Commission to construct and operate a hydroelectric generating plant on Lewis River, vicinity of Woodland, Wash., to develop a total capacity of 170,000 hp., estimated to cost about $20,000,000, including steel tower transmission system.

Boeing Airplane Co., Seattle, has approved plans for extensions in plant to increase present floor area from 300,000 to about 400,000 sq. ft., new units to be used for parts production and assembling, reported to cost more than $250,000 with equipment. J. G. Johnson is president.

Heat Treatment Well Grounded in Experience But Not Yet a Science

BY JOSEPH R. MILLER*

UNDENIABLY, the earlier applications of heat treatment to metals were developed through trial and error. While it may seem from a review of the exactly formulated methods now followed in routine heat treatments that a scientific basis had been reached for the explanation and prediction of the results of heating and cooling the metals, especially steels, upon their structure and properties, the fact remains that our formulations are based upon much experimentation and upon little exact science or mathematical theory. Until we know more clearly the mechanics underlying the constitution of matter, particularly the thermal principles, we shall hardly reach a strictly scientific basis for any operations that deal with those mechanics so directly as do the operations in heat treating.

Case Similar to Colored Glazes in Ceramics

BESIDES, the finer touches of real artisanship apply in many special treatments, as in the case of tool steels and special new steels, and on larger masses and complicated shapes in the more ordinary steels as well. The case is similar to that in the production of colored decorations and glazes in ceramics which present-day science is able, through chemistry, to duplicate in a definite quality. But how shall we ever again attain the matchless beauty of the glazes and enamels of Kang Hsi or Chein Lung, for these were the products of the clever craftsman favored by friendly hills where he selected his materials. Shall we ever know those mixes?

As did this ancient artificer in the porcelains, so the heat treater, in spite of his superior sources of information, must refer to the "log" book of his trade and see what has been done on similar work in the past, improve the method as he can, and, above all, keep a careful record of both his work and its results for future reference. He can trust best his own experience. He cannot, without experience, predict or formulate a process. He cannot, without reserve, use the experience of another. This, of course, does not refer to routine treatments that are well worked out, for almost anyone can do these; they are neither art nor science, but simply formulas to follow.

Rate of Cooling a Vital Factor

WHILE we know some of the essentials of the theory of the reorganization of metal structures when heated and cooled, knowledge of the subject is broadening. From a large amount of experimentation it seems now to be fairly well determined that the point at which transformation in the metal (steel) structure takes place is determined by the rate of cooling. It is not a fixed point.

Also, it is indicated that certain microstructures heretofore thought to represent definite states of the metal are in reality different simply in fineness of structure; that is, if enough steps are taken in producing the differences, the change is a gradual one from a coarse to a fine structure of the same characteristics.

Thus on the one hand a troublesome variable is introduced in the process, while on the other we are taught to study more carefully our technique in the use of the microscope. These two developments are merely an indication of others on the way. Better than ever do we recognize the incompleteness of our present information. The facts that we need to know are very imperfectly understood, and it may be a long time before they are understood.

The limitations that surround the treatments of large masses are particularly a hardship to the heat treater. Experimentation on pieces of large size is expensive. Also costly work may be destroyed by wrong treatments and for these reasons progress is slow and results are not broadly published. Those in metallurgical charge of such work are wary in its doing and wary in what they say about it. Each approaches a new job with his records of former work before him and deviates as little as possible from what he has known to be successful on the nearest similar job. The successful conduct of such heat treatments is an art of the highest order.

X-Ray a Decided Aid

AN additional aid to the heat treater is the X-ray, for with it we may sift out and observe a little more clearly the ultimate structure that is being transformed. This seems, so far, to have best application to treatments in connection with cold working, which-at present give rise to some uncertainties. Just how much those uncertainties are due to heat treatments and how much they may be due to imperfections and variations of the steel itself is more difficult to determine than in similar complications with larger pieces not cold worked. However, it is certain that the field of adaptation of heat treatments and cold working properly combined for superior results has hardly been explored beyond the range of wire sizes.

*Pittsburgh.

Heat Treating Aluminum Alloys

Recent Progress Has Been Rapid—Views on Theory of Quenching and Aging—Uses of Heat-Treated Aluminum and Alloys

BY ROBERT J. ANDERSON, D. SC.*

HEAT-TREATMENT processes in the aluminum field may be classified broadly as follows:

1.—Annealing wrought aluminum and aluminum alloy manufactures for the purpose of softening, thereby permitting further cold work.

2.—Heating aluminum alloy castings to relieve internal strains, improve machinability, cause accelerated aging, confer permanent growth, or promote spheroidization. Heating is also applied in certain processes devised to stop leaks in castings or to improve resistance to corrosion.

3.—Quenching cast and wrought alloys after soaking at suitable temperatures to confer hardening power.

4.—Aging cast and wrought alloys for the purpose of hardening and strengthening after quenching.

Sound theory to explain the mechanism of the hardening of light aluminum alloys by quenching followed by aging had been developed by 1921. The chief difficulties of practice had been considerably overcome by 1925. In the past few years, however, much has been learned about both the theory and practice of aluminum alloy heat treatment, and recent progress has been quite noteworthy. The precipitation theory has been corroborated by ample experimental evidence. New alloys have been developed, based on metallographic study of the constitution of aluminum alloy systems. Refinements in practice have come with the application of rigid technical control and the improvement of appliances for heat treating. Moreover, valuable experience has been gained in handling a wide diversity of manufactures in production. Finally, marked increase in the uses of heat-treated aluminum alloy parts in a wide variety of fields has attended the developments just mentioned.

Theory of Quenching and Aging Heat Treatment

HEAT treatment of aluminum alloys is based on technical phenomena which are common to alloys in general. It is interesting to point out, in passing, however, that the mechanism of the aging effect was first elucidated for aluminum alloys only about 10 years ago and subsequently applied to other alloys. The present generally accepted theory which explains the hardening and strengthening of aluminum alloys on quenching followed by aging may be briefly summed up as follows:

(1) The alloying constituents which cause hardening from solid solutions with aluminum; (2) the solid solubility increases markedly with increase in temperature; and (3) the hardening is caused on aging by the precipitation of the dissolved substance in minute particles.

The aging may be carried out at the ordinary temperature or some moderately elevated temperature may be necessary.

The aging effect in quenched alloys is not an unusual phenomenon, but it is always observable in alloys which possess a transformation or a eutectoid change, or in which the solid solubility of one constituent (the solute) in another (the solvent) is increased considerably by raising the temperature. Precipitation on aging is accompanied by increase in strength, elastic limit, and hardness, and precipitation is the cause of these and other changes. Several theories have been advanced to explain why precipitation should cause hardening and other changes, but these cannot be taken up here.

Precipitation Involves Two Processes

Very recent work by Gayler and Preston indicates that precipitation from solid solution entails two processes:

(1) Rejection of the atoms of the dissolved metal from the lattice of the solid solution, accompanied by the possible formation of molecules, and (2) coagulation of the rejected atoms or molecules.

These two processes probably overlap. These investigators also find that the parameter of quenched-and-aged duralumin is measurably less than that of the annealed and slowly cooled alloy (which latter is the same as that of aluminum). In other words, the solution of copper in aluminum is attended by a (small) contraction of the aluminum lattice. That this lattice disturbance occurs on precipitation is shown by the broadening of the lines of the X-ray spectrum. Hardness is therefore said to be due to distortion of the matrix by the precipitation of highly dispersed particles. Maximum hardness has previously been ascribed to a critical dispersion of the precipitated particles.

The solid solubility of many metals in aluminum as affected by temperature has been thoroughly investigated, and the information made available by recent research has been of inestimable value in the development of alloys and in better understanding of the heat-treating processes. The application of dilatometry to the study of aging has been receiving considerable attention recently.

Annealing Governed by Certain Principles

PRINCIPLES governing the annealing of cold-worked aluminum and aluminum alloys are the same as those applying to metals in general. The object of annealing cold-worked metal is ordinarily to effect softening so that the material may be subjected to further deformation. Thus, commercial aluminum is furnished in the form of dead-soft circles for utensil drawing and as sheet and coil for forming and stamping. The demands of consumers for aluminum sheet capable of resisting severe cold drawing operations have become increasingly severe. Consequently, the aluminum sheet mill operator has had to pay special attention to the control of his annealing methods and furnish sheet to grain-size specifications.

Continuous Annealing for Aluminum Metal

Continuous methods of annealing have been developed in recent years for aluminum circles, sheet, and coil. Continuous, or so-called flash annealing, has been found ad-

*Vice-president in charge of production, Fairmont Mfg. Co., Fairmont, W. Va.

vantageous. With this process, individual pieces (or pieces stacked a few high) are passed through a heated chamber at such a rate of speed that the metal is exposed to the heat for only a short time. Grain-size control is practical and simple with continuous annealing. In mass (bulk) annealing, the question of stacking has received much attention with a view to permitting uniform and thorough circulation of the heat. Load temperatures are correlated with furnace temperatures in mass annealing. Time and temperature of exposure in annealing are now closely regulated. Mass annealing has been replaced to a considerable extent by continuous methods.

Quenching Heat Treatment for Alloys

VARIOUS aluminum alloys possess only ordinary mechanical properties as rolled or cast, but they can be heat treated to yield a wide range of properties. The tensile strength obtainable in some alloys by heat treatment is nothing short of remarkable. This also applies to the ductility and hardness. There has been considerable development of recent years in special aluminum alloys to be heat treated, both for cast and wrought manufacturers. So far, in alloys for working, nothing has been brought out that excels ordinary duralumin in all-around mechanical properties and usefulness.

Leading Proprietary Alloys

Most of the aluminum alloys used for parts to be heat treated contain copper or magnesium silicide, or both. Among the alloys claimed to be proprietary may be mentioned the following: Lautal, Carbium, Almelec, Scleron, Montegal, Aldrey, Constructal, 25S, and 51S. Lautal has attained considerable use abroad for both cast and wrought parts. The nominal composition is 94:4:2 aluminum-copper-silicon. Aldrey, also known as Wire Alloy No. 3, is typical of the compositions which have been developed abroad for use as cable for electric power transmission. This alloy contains 0.4 per cent magnesium, 0.5-0.6 per cent silicon, 0.3 per cent iron, and the remainder aluminum. There has been an influx of special heat-treated alloys for cable conductors in Europe. Mention should be made here of so-called Alclad. As usually supplied, Alclad consists of duralumin sheet coated with a thin layer of *pure* (Hoopes) aluminum. The material combines the good mechanical properties of duralumin with the corrision-resisting qualities of *pure* aluminum.

In the case of casting alloys, the following may be mentioned: 95:5, aluminum-copper: 95.8:4:0.2, aluminum-copper-magnesium, 94:5:1, aluminum-copper-silicon: 88.5:-10:1.25:0.25, aluminum-copper-iron-magnesium: and 92.5:-4:1.5:2, aluminum-copper-magnesium-nickel. The foregoing are nominal compositions, the alloys being made from aluminum containing say 0.2 to 0.3 per cent silicon and 0.3 to 0.6 per cent iron.

While many aluminum alloys are suitable for the production of cast or wrought parts to be heat treated, the bulk of present commercial requirements can readily be met with a relatively few compositions. One reason for the large number of alloys which have been developed lies in the attempts of competitors to get around patent claims.

There is a demand for alloys to be used in castings production, which, without quenching heat treatment, will age spontaneously to yield enhanced mechanical properties. Some development work has already been done in this direction. A wider field could be found for aluminum alloy castings if alloys could be developed which would harden and strengthen substantially by simple air aging for a few days, or by low temperature heating for a few hours, after casting.

Heat-Treating Equipment

EARLY equipment used for heat treating aluminum alloys was generally crude, inefficient, and poorly adapted for the work. Later, furnaces designed for steel treating were used. Today, with a more comprehensive understanding of the theoretical aspects of aluminum alloy heat treating, furnace equipment is designed to meet the special requirements of the operations to be carried out. Various types of heating equipment are still used in practice for annealing, soaking, and aging processes. Irrespective of the design of the equipment and method of heating, the chief requirements are accuracy of temperature control and uniformity of heat distribution.

In the writer's opinion, the supremacy of electric heating can hardly be questioned except on the grounds of first cost of installation and power operating costs. These higher costs may be outweighed by several advantages not obtainable with other methods of heating. The writer prefers electrically heated and automatically controlled equipment for annealing, soaking, and aging processes.

Car-type furnaces (batch or semi-continuous) are being favored over the older pan-type furnaces for the mass annealing of aluminum. In the case of continuous equipment for annealing sheet and circles, the usual construction involves a continuous moving belt or conveyor made of woven wire screen or separate wires, or bands, driven by variable speed mechanism. Such a belt passes through a relatively long chamber of restricted height. The continuous coil annealing furnace is a recent

Dr. Robert J. Anderson

FOR many years Doctor Anderson has been an investigator of aluminum. He has been identified with it from its early days as well as with other branches of the non-ferrous industry. He is the author of numerous technical articles and papers, and of a book on aluminum. At the invitation of THE IRON AGE, he has given in the accompanying article a review of recent developments in the rapidly expanding field of aluminum alloy heat treatment, as well as some ideas as to the future.

development of importance. In the operation of this, aluminum coil is unwound from a drum, passed through the heated chamber of the furnace, and wound up at the other end on a blocker. A similar furnace has been developed for annealing aluminum foil.

Continuous Electric Furnaces Preferred

Continuous belt or pusher furnaces have been built for heating and soaking castings prior to the quench, particularly for such production jobs as pistons. Continuous aging oven may be combined. With such a unit, castings are charged onto the conveyor at one end of the soaking furnace, pass through the heated chamber, discharge into the quenching tank, are picked up by the conveyor in the tank, and are discharged onto the conveyor of the continuous aging oven where the heat treatment is completed. Such a unit is practically automatic in operation. Batch type furnaces are still largely used for soaking castings, and most aging operations are conducted in batch.

Special holders and jigs are used to advantage in heat treating certain manufactures to prevent distortion on heating and handling. Forced circulation of furnace and oven atmospheres has been found advantageous in maintaining uniformity of heat distribution.

Uses to Which Heat-Treated Alloys Are Put

THE development of heat-treatment processes as applied to aluminum alloys, both cast and wrought, has greatly extended the possible uses of these materials and broadened the market for their manufacture. There have been many interesting developments of recent years which have made possible the use of heat-treated aluminum alloy parts in construction in place of malleable iron, steel, copper, brass, and bronze.

Heat treatment has made possible the production of light aluminum alloy parts with so much higher mechanical properties that such materials are now used for a wide variety of engineering purposes where it was formerly impractical to consider aluminum alloys at all. Heat-treated aluminum alloys are now in regular competition with both cuprous and ferrous alloys.

So far, the chief applications of heat-treated aluminum alloys have come in the transportation field, including aircraft, motor cars, trucks, and buses. Interesting uses have been made of heat-treated alloys in the construction of street railroad cars, steam railroad passenger cars, and parts of locomotives. Certain of these applications are in the experimental stage. Substantial increase in the use of heat-treated aluminum alloys is seen in the modern tendency to save weight and increse speed in all kinds of transport. For highly stressed parts, the unheat-treated aluminum-alloy casting has passed out of the picture. Increasing use of duralumin-type alloy sheet and shapes is seen with the tendency toward all-metal construction of aircraft, while the modern Zeppelin-type ship could not be built without the use of this material.

Future Trend Outlined

IT is significant to the future business welfare of metal producers and manufactures that the heat treatment of aluminum alloy parts is not only here to stay, but is causing radical departures in practice. While possible future developments are difficult to predict, the writer believes that the progress of the past will be overshadowed in the next ten years. The number of alloys for use in heat-treated manufactures will doubtless increase. It is quite unlikely that these alloys will be found accidentally, but rather will be developed by systematic research. Also, with more alloys available, it will be possible to select material especially suited for particular purposes. The use of heat-treated structural shapes and forgings is expected to increase greatly.

With the development of heat treatment and new alloys, in the future a large proportion of the aluminum-alloy castings consumed by the engineering trades will be of the type once regarded as special, namely, special composition and heat-treated. Heat-treatment plant is now a necessary adjunct of the modern aluminum alloy foundry. Commercial heat-treatment plants are being called on to heat treat aluminum alloy parts, both cast and wrought. If the price of aluminum should be reduced appreciably, there would be a large increase in the use of heat-treated aluminum alloy manufactures, particularly in competition with steel.

Correct Wrapping Prevents Spots on Plated Ware

W. P. BARROWS, research associate of the American Electroplaters' Society at the Bureau of Standards, has studied the causes of "crystal spots" and "stain spots" on plated ware, especially builders' hardware. His findings, published in Research Paper No. 72, Bureau of Standards, are summarized as follows:

Two distinct defects have been included under the term "spotting out." One class called crystal spots appears only on metals having an "oxidized" surface—that is, one colored with copper sulphide or other sulphides and subsequently lacquered. The other, called stain spots, appears especially on cast metals, either plain or lacquered, as discolored irregular areas, usually with a small dark spot near the center.

Crystal spots consist of cuprous sulphide growing usually between the coloring layer of cuprous sulphide on the metal and the lacquer film. Their formation is caused or accelerated by sulphur in even minute amounts, such as may be carried in the atmosphere or from rubber bands or wrapping paper or cardboard cartons. Promising remedies are (a) exclusion of sulphur from the surroundings, (b) the use of lacquers found to retard spotting, (c) the application of a thin film of a grease, such as petrolatum, to the lacquered surface, and (d) the use of wax paper for wrapping.

Stain spots are caused by acid or a chemical compound absorbed in minute cavities in the metal during the plating process. In a humid atmosphere, these chemicals absorb moisture and exude upon and stain the surface. Alkaline substances are especially difficult to remove from the metal, once it is there, and it is not practicable to eliminate alkaline substances from the cleaning and plating solutions.

Sometimes porosity of the metal may be reduced by a change in pattern or in casting conditions. No method of rinsing or neutralizing was found entirely effective to clean the surface; baking at high temperatures before lacquering is sometimes helpful.

The two most effective remedies are to induce the action by exposing the articles to a high humidity before final finishing, or to use a lacquer which retards spotting. Phenol-condensation lacquers are less permeable to moisture than nitrocellulose lacquers, and are also more effective in retarding stain spotting.

A Year's Progress in Steel Treating

From the Viewpoint of the Testing Engineer—Nitriding, High-Test Iron, Bridge Wire and Gas Carburizing Among Features

BY H. F. MOORE*

THE testing engineer is not among the pioneer workers in heat treating. His viewpoint, then, is that of one who observes tendencies as to general agreement as to theory and technique among pioneer workers, and the tendencies to the formation of "current practice" in heat treating.

General Agreement Exists as to Principles

An outstanding feature of the past year has been the tendency to a fairly general agreement as to principles of heat treating, especially heat treating of iron and steel. An excellent example of this is seen in the statement of "Principles of the Heat Treatment of Steel" prepared by the metallurgical staff of the United States Bureau of Standards and issued in the *Transactions* of the American Society for Steel Treating. In the 90 pages of this pamphlet there is presented a concise statement, intelligible to the beginner in the study of heat treatment. Of course this statement, like all similar ones of physical "laws" is not to be regarded as final, but the fact that such a statement can be made is evidence not only of the skill of the authors, but also of the growing degree of stabilization of ideas on the subject.

Nitriding a Signal Feature

ANOTHER outstanding feature of heat-treating progress during the year is the development of the nitriding process for hardening the surface of steel. The layer of hard material produced by current processes seems to be very thin, and the use of the process for *strengthening* steel parts seems not to have encroached seriously as yet on the field of the case carburizing process. However, surface hardness without distortion of a piece, and a wide range of possible heat treatments of the core without much disturbance of the surface hardness seem to be features of the nitriding process which will render it very valuable to the maker of steel parts which have to withstand abrasive action.

What further possibilities (and limitations) of the process will develop as it is used in practice are matters of prime interest to all users of steel.

Advances Made in Heat-Treating Gray Iron

CAST iron foundrymen seem to have awakened to the possibilities of their product. This was shown by a special session of the American Foundrymen's Association in April [THE IRON AGE, April 18, page 1072], devoted to high-strength cast iron, and by the symposium on cast iron at the meeting of the American Society for Testing Materials in June [THE IRON AGE, July 4, page 6].

Heat treatment and alloying of gray cast iron have been found capable of giving a much better structural material than the ordinary gray iron of former days. The long structure-weakening flakes of graphite found in ordinary cast iron can apparently be induced to take unto themselves more globular and less damaging forms. Of course, this has been possible by the malleabilizing process for a long time, but heat treatment by other, and quicker, methods give promise of usefulness, although their usefulness and limitations are not yet clearly defined.

Gas Carburizing a Tempting Field

Progress in case carburizing, as seen by the testing engineer, has been mainly along the lines of improved technique, and in the development of gas carburizing. Gas carburizing, in which there is no need of expensive and frequently-renewed carburizing boxes, is indeed a tempting field for study. The necessity of heat treatment of

*Research professor of engineering materials, University of Illinois, Urbana, Ill.

Prof. H. F. Moore

AN authority on fatigue testing, Professor Moore is widely known among steel treaters and materials engineers. At the invitation of THE IRON AGE, he has reviewed in the accompanying article the more recent events in heat treating steel. He is a past-president of the American Society for Testing Materials and active in the work of the American Society for Steel Treating, as well as in research organizations and other technical societies.

carburized steel pieces, is more and more being recognized, and the fields of carburizing, nitriding, and of heat treating without alteration of chemical content are gradually becoming defined.

Steel Rail Heat Treatment Being Developed

PROGRESS in the field of heat treating plain carbon and alloy steels has been less spectacular, but the precision of the heat-treating processes and of measurement of temperatures has gone steadily forward. The behavior peculiar to the various alloying elements,—nickel, chromium, manganese, silicon, vanadium, molybdenum, tungsten, cobalt, and perhaps others—is becoming better understood. There seems to be a fair prospect of finding ways to use the less expensive alloying elements for a good many kinds of service. Some interesting work has been done in the preliminary development of heat treatments for railroad rails.

Designers Using Steel Must Know Heat Treating

A field, vitally related to the work of the heat treater, is found in the drafting rooms and designing offices of makers of steel articles. The draftsman and designer is gradually gaining an understanding of the possibilities of heat treatment, and of its limitations. He must soon develop designing methods which shall take into account not merely the computed stresses and strains in his machine parts, but also the design of those parts so that they can be effectively heat treated without danger of destructive internal stresses.

The year has not passed without some costly lessons. Perhaps the most dramatic of these has been the troubles which have shown up in heat-treated wire for cables. Evidently here is a field requiring much study, with the possibility of the emergence to prominence of new factors which may weaken steel. The writer has heard of several conflicting theories of the cause of this trouble with wire for cables,—he is not going to advance any theory, but to urge that the progress of the investigation of this trouble, an investigation carried on by a number of laboratories—be closely watched by every steel treater and user.

Future of Tungsten Carbide

No record of the year's progress would be complete without a mention of the appearance of the new alloy, tungsten carbide, as a cutting tool—although this is not a steel at all. It was several years ago that Rosenhain in one of his addresses predicted the development of the tungsten-carbon alloys along lines roughly parallel to the development of the iron-carbon alloys. The tungsten-carbon alloys now used are a cutting-tool material rather than a structural material. What the future will bring is an intensely interesting uncertainty.

To the work and prospects of the steel treater the words of E. E. Slosson, spoken to the industrial chemists, are very true. In this field the progress of the past, instead of discouraging the hope of future progress, indicates numerous opportunities for it. In the field of heat treatment "there are as good fish in the sea as ever have been caught."

Navy Uses Color Markings for Identifying Metals

According to an announcement just made public by the Federal Standard Stock Catalog Board, Federal Co-ordinating Service, the following color designations will be used in marking the ends of metals (bar, billet, ingot and slab) for convenience in identifying:

Black (solid)—Copper, hard-drawn.
Black, with brown stripe—Steel, corrosion-resisting.
Black, with green stripe—Steel (SAE 1035), heat-treated.
Black, with lead stripe—Steel, Class A, bolt-material.
Black, with pink stripe—Steel (SAE 1035), semi-finished.
Black, with white stripe—Copper-nickel alloy.
Black, with yellow stripe—Manganese-nickel.
Blue (solid)—Bronze, rivet, medium.
Blue, with black stripe—Bronze, journal.
Brown (solid)—Steel, medium.
Brown, with black stripe—Steel, Class B, cold-rolled.
Brown, with blue stripe—Steel, nickel (SAE 2325).
Brown, with green stripe—Steel, Carbon (SAE 1035).
Brown, with lead stripe—Steel, carbon (SAE 1020).
Brown, with red stripe—Steel, carbon (SAE 1025).
Brown, with pink stripe—Steel, chrome-vanadium (SAE 6130).
Brown, with white stripe—Steel, carbon (SAE 1095).
Brown, with yellow stripe—Steel, nickel (SAE 2330).
Green (solid)—Steel, tool, carbon, Class 1.
Green, with black stripe—Steel, tool, carbon, Class 2.
Green, with blue stripe—Steel, tool, carbon, Class 3.
Green, with brown stripe—Steel, tool, carbon, Class 4.
Green, with lead stripe—Steel, tool, tungsten, Class 1.
Green, with pink stripe—Steel, tool, tungsten, Class 2.
Green, with red stripe—Steel, tool, carbon, Class 5.
Green, with white stripe—Steel, tool, carbon, Class 1, drill-rod.
Green, with yellow stripe—Steel, tool, tungsten, Class 1, drill-rod.
Lead (solid)—Aluminum.
Lead, with black stripe—Aluminum-alloy.
Pink (solid)—Brass, Naval, rolled.
Pink, with black stripe—Brass, commercial.
Pink, with lead stripe—Steel, chrome-vanadium (SAE 6145).
Pink, with red stripe—Steel, Grade P, semi-finished.
Pink, with white stripe—Steel, Grade V, semi-finished.
Red, (solid)—Steel, rivet, medium.
Red, with yellow stripe—Steel, rivet, Class B.
Red, with green stripe—Steel, spring.
Red, with white stripe—Steel, rivet, high-tensile.
White (solid)—Iron, wrought.
White, with black stripe—Steel, Class Ac, heat-treated.
White, with brown stripe—Steel, Class An, heat-treated.
White, with green stripe—Steel, Grade T, semi-finished.
White, with lead stripe—Steel, Class B, heat-treated.
White, with pink stripe—Steel, Grade N, semi-finished.
White, with red stripe—Steel, Class HG, heat-treated.
White, with yellow stripe—Steel, Grade W, semi-finished.
Yellow (solid)—Steel, machinery, cold-rolled.
Yellow, with black stripe—Steel, Grade R, semi-finished.
Yellow, with blue stripe—Steel, Class B-s (special), heat-treated.
Yellow, with brown stripe—Steel, Class C, heat-treated.
Yellow, with green stripe—Steel, Class C, semi-finished.
Yellow, with lead stripe—Steel, Class S, semi-finished.
Yellow, with pink stripe—Steel, Class B, bolt-material.
Yellow, with red stripe—Iron, cast.
Yellow, with white stripe—Steel, Class A, cold-rolled.

These colors have been used by the Navy for about fifteen years and presumably will be adopted by all departments and establishments of the Government after the issuance of the sheet of the Federal Standard Stock Catalog.

This method of identification, which represents a step in the simplification and standardization program of the Government, may be found applicable, by industry, or serve as a basis for a similar program.

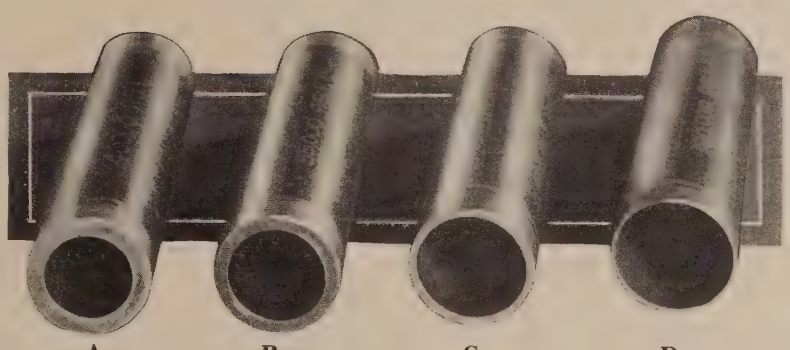
Austenitic chrome-nickel steel has been used in England for numerous seaplane parts. Cold worked wire of this type of material makes excellent springs, which have the added advantage of resisting the corrosion due to marine conditions. It also appears to be a satisfactory material for obtaining not only rustless rivets but also nuts and bolts, split pins, spar and hull fittings, skin plating and struts for floats. A modification in the composition of the austenitic nickel-chromium steels has resulted in the production of extremely satisfactory materials for exhaust manifolds and pipes.

Heat Treating Aircraft Parts

Large Electric Furnaces Handle Delicate Members Without Distortion—Exceptional Properties Obtained in Alloy Steels of Thin Section

BY HORACE C. KNERR*

HEAT treatment of delicately constructed aircraft members is one of the chief problems confronting the industry. The incorporation of steel, not heat treated, into wing spars, landing gear, struts, engine supports and sections of the fuselage, has frequently necessitated the use of fairly thick tubing—so thick, in fact, that the resulting weight was unsatisfactorily great, if not in some cases prohibitive. If these various parts could be successfully heat treated, a thinner section of tubing could be used with a saving in weight and an increase in strength and serviceability. To do this, however, without excessive distortion has hitherto been extremely difficult or impossible.



Type of Steel	Commercial Grade	Mild Carbon, Normalized	Chrome-Molybdenum, Normalized	Chrome-Molybdenum, Heat-Treated
Tube	A	B	C	D
S.A.E. No.	1015	1025	4130X	4130X
Ultimate strength, lb. per sq. in.	40,000	55,000	95,000	200,000
Breaking strength of tube, lb.	23,600	25,800	25,600	27,700
Size, dia. wall, in.	1 x 0.250	1 x 0.187	1 x 0.095	1 x 0.047
Weight per ft., lb.	2.00	1.65	0.92	0.50

A method for successfully heat treating such delicate parts has recently been perfected and has resulted in large savings in weight and improvement in strength and safety of aircraft, at the same time opening the way for more extensive and more efficient use of high-grade alloys in the construction of aircraft. It is the aim of the present article to describe how this has been accomplished.

Steel and Other Materials Compared

STEEL is the lightest of all materials of construction, when strength and weight are regarded concurrently as they should be in the design of aircraft and other structures where weight and inertia are important factors.

One of the most important considerations in determining whether a certain material should be used in aircraft construction is its strength-weight factor. This factor is obtained by dividing the ultimate strength of the material in thousand of pounds per square inch by its specific gravity. This result is, of course, purely an abstract figure, having no inherent meaning in itself, but it provides a "rating" which is easily obtained and sound in principle.

Table I gives the strength-weight factors of typical materials used in aircraft construction.

Wood is virtually obsolete as a structural material for aircraft. It is obvious, from the strength-weight factors, that metal construction is lighter than wood where design is such that the full strength of the metal is taken advantage of.

The table and accompanying cut of tubes give a forceful illustration of the weight savings possible through the use of heat-treated alloy steel of high strength. The circles represent sections through tubes of equal outside diameter, but having wall thicknesses selected so that all will have the same strength in tension or simple compression.

A duralumin tube corresponding to those of that table would have a wall thickness of 0.40 in. and would weigh 0.06 lb. per ft. Therefore it would be 20 per cent heavier than the heat-treated alloy steel tube.

It appears that unheat-treated steel cannot long survive as a material of construction for aircraft, except in those parts which act as long columns, and where structural strength is therefore determined by the modulus of elasticity of the material and not by its tensile strength.

On the basis of strength-weight efficiency, it is plain that unheat-treated steel cannot compete with duralumin, but by heat treating a suitable alloy steel to even the moderate value of 150,000 lb. per sq. in., it becomes relatively as light or lighter than duralumin.

It seems certain that both aluminum alloys and heat-treated alloy steels will have an increasing use in aircraft construction, neither one replacing the other, but each finding the application which its particular characteristics will best serve. Steel of high strength probably will be employed for landing gear, engine mounts, wing beams and fuselage structures, especially for aircraft of medium and large size, while duralumin will have its place in the structural parts of small ships and for wing surfaces, fuselage covering, engine cowling and boat hulls in gen-

*Consulting metallurgical engineer and president Metallurgical Laboratories, Inc., Philadelphia.

Table I—Strength-Weight Factors of Materials

		S.-W. Factor
Wrought metals (tension):		
Music wire (0.10 in. dia.)	400 ÷ 7.85	51
Alloy steel heat-treated (high)	200 ÷ 7.85	25
Alloy steel heat-treated (medium)	150 ÷ 7.85	19
Duralumin	55 ÷ 2.85	19
Magnesium alloy	34 ÷ 1.75	19
Alloy steel heat-treated (low)	125 ÷ 7.85	16
Alloy steel normalized	95 ÷ 7.85	12
Mild steel normalized	55 ÷ 7.85	7
Aluminum annealed	12 ÷ 2.7	4.4
Wood (compression):		
Balsa	2.2 ÷ 0.12	18
Douglas Fir	6 ÷ 0.54	11
Spruce	4.3 ÷ 0.43	10
Oak (white)	5.9 ÷ 0.74	8

eral. Both steel and aluminum alloys depend, of course, upon heat treatment for their high strength.

Properties of Chrome-Molybdenum Steel

OWING to its remarkable combination of properties, chrome-molybdenum steel, No. 4130X, is rapidly becoming the standard structural material for aircraft.

This steel (Table II) is readily worked into seamless tubing of the required diameters and thin walls, as well as into sheet and bar stock. When properly made and annealed, it will withstand severe cold forming as in the manufacture of fittings, and can be readily hot worked as in the bending of tubes or the production of forgings. It is easily machined in the annealed state, and one of its outstanding characteristics is superior machineability in comparison with other alloy steels, after heat treatment to a given high strength and hardness. It has exceptionally fine welding characteristics under the oxyacetylene flame, and also is readily welded electrically.

By means of a normalizing treatment consisting simply in heating above the critical temperature, about 1600 deg. Fahr., and allowing to cool freely in air, it develops a tensile strength of 95,000 lb. per sq. in. or over, with a yield point of 60,000 lb. per sq. in. or over, and an elongation of more than 12 per cent in 2 in.

Oil Better Than Water for Quenching

After welding, a section near the weld has unavoidably been heated to an annealing temperature. This portion has a strength of something better than 80,000 lb. per sq. in. These physical properties are satisfactory for certain parts of aircraft where the members act as "long columns" and design stresses are determined principally by the elastic modulus of the material.

One of the most satisfactory characteristics of this steel, however, is its response to heat treatment, consisting of quenching from about 1600 deg. Fahr. followed by suitable tempering. It may be quenched either in oil or in water. Various authorities (including certain Government specifications) have heretofore recommended quenching in water, but experience at the Metlab plant has shown that oil quenching is decidedly preferable for parts other than those of large or heavy cross section.

Oil produces as good or better tensile strength than water and gives a higher combination of strength and ductility. It also appears to give a higher yield point or elastic limit for a given tensile strength. At the same time there is little tendency to cause warping during the quenching operation and the liability to cracking in quenching is practically eliminated, whereas these are considerable when water is the quenching medium.

Values given in Table III are typical of the results obtained in the heat treatment of this steel by the method described in this article.

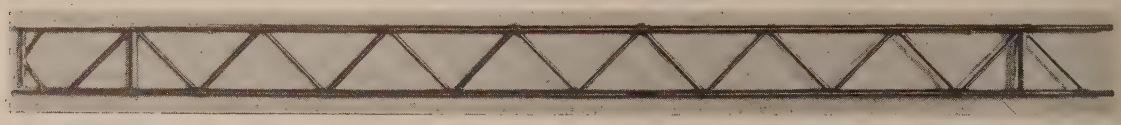
Table III—Typical Tensile Properties of Chrome-Molybdenum Steel, No. 4130X, Oil-Quenched and Tempered

	Yield Point, Lb. per Sq. In.	Ultimate Tensile, Lb. per Sq. In.	Elong. in 2 In. Min. Per Cent
Specified	110,000	125,000	11.0
Obtained	115,000	130,000	*16.0*
Specified	130,000	150,000	9.0
Obtained	140,000	155,000	*12.0*
Specified	140,000	175,000	7.0
Obtained	160,000	180,000	*10.0*
Specified	150,000	200,000	5.0
Obtained	185,000	215,000	*8.0*

Note.—Owing to geometric effects in the specimen, specified elongation must be much lower for thin specimens than for thick. The above values are corrected for thickness.

Manufacturing and Treating Problems

FABRICATION of aircraft parts consists primarily in the cutting to size and shape of sheet and tubing, bending and forming, and assembly by welding. Machining operations in the ordinary sense are restricted to a few parts requiring accurate surfaces and fit, such as axles, end fittings for struts and engine mounts and the like. Where a moderate strength is sufficient, the steel may be fabricated in the normalized condition and left so. For important structural parts which are subjected to high stresses, shock, fatigue and overload, this steel is fabricated in the annealed state, and heat treated after welding. In some cases, it is desirable to heat treat parts before assembly and then assemble by means of (tubular) rivets, instead of welding. The good machining qualities of chrome-molybdenum steel make it possible to cut, drill and otherwise machine parts prior to assembly which have been treated to a strength of 150,000 to 200,000 lb. per sq. in.



A WING Spar Made of Steel Tubing Heat Treated Successfully After Assembly. Length 10 ft. Heat treated to 135,000 lb. per sq. in. A delicate member which can be handled in a vertical furnace

Table II—Chrome-Molybdenum Steel, Composition No. 4130X Army-Navy Standard

	Per Cent
Carbon	0.25 to 0.35
Manganese	0.40 to 0.60
Phosphorus (max.)	0.040
Sulphur (max.)	0.045
Chromium	0.80 to 1.10
Molybdenum	0.15 to 0.25

Heat treatment of aircraft parts is in a class by itself. Made, as they are, of tubing and sheet ranging in thickness from about 0.035 in. to ¼ in. and varying in size, shape and length from small fittings to axles 6 or 8 ft. long, engine mounts 3 ft. sq. and wing spars 25 ft. in length, they are extraordinarily delicate at the quenching temperature and exceedingly liable to distortion. They are likely to cool prematurely and irregularly during transfer from the furnace to the quenching tank. Because of their thinness, a small amount of scale or decarburization has a large effect in reducing the strength of the members. They are often of complex form. Typical heat-treated parts are shown in some of the illustrations.

Attempts to heat treat aircraft parts by the usual methods and in the ordinary furnaces are generally disas-

trous. During heating through the critical range they sag under their own weight. On lifting out of the furnace for quenching they sag again, in other directions. Upon quenching horizontally they warp again due to side contact of the quenching medium. There are therefore three chances for distortion. Attempts to straighten after heat treatment usually result in denting or crushing, because of the thinness of the walls.

Difficulties encountered were so serious, and the failures so costly, that many aircraft engineers became discouraged and gave up the idea of using alloy steels where heat treatment was required, sacrificing lightness or using more costly or less satisfactory means of construction.

The author's contact with these problems as chief metallurgist of the Naval Aircraft Factory, Philadelphia, convinced him that the difficulties could be solved only by suspending the parts vertically during heating, in such a way as to avoid all tendency to distortion, in a furnace permitting close control of both atmosphere and temperature, and arranged for quenching the charge without rehandling it, by lowering it without other movement into a quench tank placed directly beneath. Furthermore, the charge must be kept under control during quenching, being lowered rapidly, but without swinging, out of the furnace into the quenching tank, where it must be brought to rest beneath the surface without shock. Quenching should be in oil.

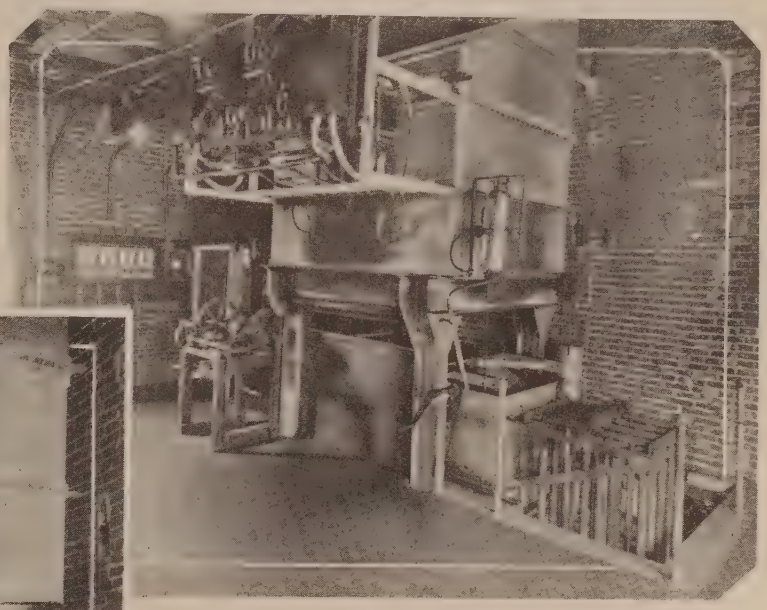
The advantages of oil as a quenching medium have been outlined, but its use entails a serious fire hazard which must be guarded against. When the oil enters hot tubular members at the moment of quenching, there is a tendency for it to break down into its more volatile constituents. These are superheated on passing upward through the tubes and issue from the open end as a mass of flame. Should a charge become stuck part way out of the oil bath, or be lowered too slowly, a very large amount of flame may be produced, with serious consequences. In obtaining the advantage of the use of oil as a quenching medium, it is necessary to overcome this danger.

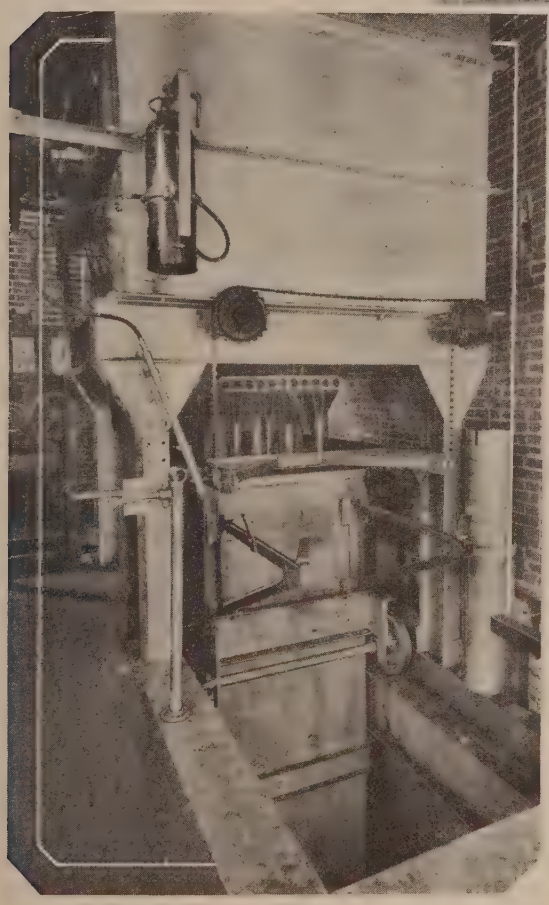
Aircraft parts may be divided roughly into four classes:

1. Fittings and other small miscellaneous parts.
2. Bulky parts such as engine mounts, fuselage sections, landing gear of the V-strut type, etc.
3. Long straight members including axles, struts and wing beams.
4. Tubing and bar stock to be fabricated after heat treatment.

For economical operation these call for three furnaces of different size and shape. A small furnace for class 1, a furnace of large section and moderately great length for class 2, and a furnace of moderate section but great length

BELOW Is Furnace 11 Ft. High and 33 in. Sq. Inside. Quench tank is directly under furnace in position it would be in for quenching. The charge is shown almost in the oil with the alloy spider just appearing below the furnace





THE General View of 10-Ft. Furnace. Furnace resting on framework in centre of picture (above). Quench tank is seen just to right of legs of furnace. A charge has been hung on the alloy spider which is resting on the rack attached to the quench tank. The next operation would be to lower the door, roll it to one side and move the tank so that rack is directly under furnace opening and pull the charge up into the furnace. The automatic controllers and recorder are seen to the left on the wall. The control relays are mounted in front of the furnace. The winch for raising and lowering the work is directly to the left of the furnace

CENTER Section Cross Tube on Bottom of Fuselage, Heat Treated to 200,000 Lb. per Sq. In.

for classes 3 and 4. Small parts may, of course, be treated in either of the furnaces intended for parts of class 2 or 3, when the quantity warrants.

Necessity for close and automatic temperature control, and the vertical position of the heating chamber favor the use of electrical heating. Electrical furnaces of the size required to handle aircraft parts of classes 2, 3 and 4 and having the necessary temperature regulating equipment and the mechanism for handling the charge are quite costly. They must have a reasonably large capacity in pounds per hour to avoid an excessive labor cost per pound of work heat treated. For anything like continuous operation they would therefore have an output far in excess of the production requirements of even the largest aircraft manufacturer today or for some time to come.

To the high first cost, maintenance, depreciation and electrical stand-by charges, there must be added the burden of overhead of a highly trained staff. The heat treatment of aircraft parts calls for specialized metallurgical knowledge on the part of the management and carefully trained operatives at the furnace.

The answer to the problem is believed to be found in the creation of a central plant with specially designed furnaces operated by specialists and fully equipped in every way, including laboratory facilities, to which aircraft manufacturers may send their parts for heat treatment. By massing the production in this way, the cost of treatment per pound is brought down to a reasonable figure. Such a plant has been established in Philadelphia, a location which probably is near the center of production of the aircraft industry and otherwise favorably situated. The plant is described in the following:

Design of the New Furnaces

TWO furnaces designed by the author constitute the major items of equipment. One has a heating chamber 3 ft. sq. and 10 ft. high, for the treatment of parts of moderate length but large width, such as landing gear, engine mounts, fuselage sections and the like. The other is capable of handling parts up to 25 ft. long and 2 ft. in diameter, such as wing beams, spars and straight tubing and bar steel. Small parts are handled in quantities in either furnace.

These furnaces are similar in construction and operation. They really should be referred to as heat-treating machines, as the furnace itself is only one unit in a relatively complex mechanism, every part of which must function correctly and with precision in order that satisfactory results may be obtained.

Each furnace has a capacity of 400 lb. of steel per hr. By operating continuously it would therefore be possible to turn out 57,600 lb. of work in either furnace in a 6-day week. This is equivalent to more than 5,000,000 lb. a year for both furnaces together, which presumably would be ample capacity for the needs of the entire aircraft industry for some time to come.

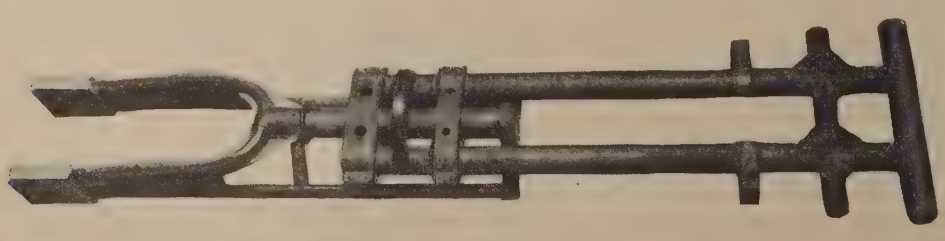
At the present time, when the demands are small in comparison with the furnace capacity, each furnace is used for quenching on one or two days only of each week. As the power stand-by charge is high, and is determined by the peak load in any month, the two furnaces are connected with the same main power switch, and used alternately, never simultaneously. The temperature controllers and recorders are arranged so that they may be connected with either one furnace or the other and so that one set suffices for both. When production increases to a point warranting the extra stand-by charges involved in operating both furnaces at once, this can easily be arranged by adding another main switch and control panel and making a few changes in wiring.

The furnace heating elements consist of nichrome ribbons suspended upon General Electric refractories. The lining is of supersilocel brick and is backed up by 13 in. or more of silocel powder insulation. The heating elements are divided into horizontal zones, the 10-ft. furnace having 4 zones and the 25-ft. furnace 6 zones. The zones nearest the top and bottom are of shorter length than the intermediate zones, in order to take care of end losses.

Each zone is automatically controlled by a Wilson-Maeulen controller. It is possible to maintain temperature uniformity throughout the heating chamber within plus or minus 10 deg. Fahr. at any temperature up to 1700 deg. Fahr. The temperature at various points in the furnace is recorded continuously on a Leeds & Northrup multiple point recorder. The recorder and controllers are on entirely independent thermocouple circuits so as to afford a check and warning should any part of either system get out of order. A fan is provided to circulate the furnace atmosphere and insure uniformity at low as well as high operating temperatures.

The two furnaces have about the same power demand, about 90 to 95 kw. and are connected with a 220 volt, three-phase line. Radiation losses are about 30 kw. at 1600 deg. Fahr. They are placed vertically side by side upon structural steel columns, and having a working space between them. The quench tanks are mounted directly beneath the furnaces on small cars having ball-bearing wheels which run on tracks attached to the columns, permitting the tanks to be moved laterally. The bottom of each furnace is fitted with a door or plug, which is first lowered and then moved to one side when charging or discharging the furnace.

The furnaces are elevated to such a height on



FRONT Landing Gear, Fabricated and Heat Treated by Metlab. Heat treated to 180,000 lb. sq. in. Overall height, 5 ft., 6 in.

the structural steel framework as to be conveniently operated from the second floor of the building, thus avoiding the necessity for a large excavation in order to accommodate the quenching tanks. The tank for the 10-ft. furnace together with its sump tank is entirely above ground level; the lower part of the tank for the 25-ft. furnace, itself 27-ft. deep, moves in a concrete lined well 12-ft. deep, the remainder being above ground.

Both furnaces are in a small building separated by a brick wall from the main building and reached through a fire door. The work is prepared in the main building and passed through the fire door for loading and back again after treatment. This arrangement removes the fire hazard from the main building, which is utilized for manufacturing purposes.

All openings in the furnace, such as power and thermocouple leads, are sealed, so that no draft occurs and the atmosphere of the heating chamber can be closely controlled. Oxidation of the work is thereby avoided.

A sump tank, which is stationary and provided with water-cooling coils, is placed on the ground directly beneath the quench tank of the 10-ft. furnace. By means of a centrifugal pump the oil is pumped from the sump tank to an inlet in the bottom of the quench tank and allowed to overflow through a manifold at the top of that tank, from where it returns through a down pipe to the sump tank. The hottest oil therefore overflows immediately and is cooled while new oil replaces it in the tank from below. This produces an ideal circulating arrangement. Additional and quite strong circulation is produced in the quench tank by means of stirring devices. The same sump tank is used for both furnaces, being connected with the circulating system of either quench tank by means of three-way valves.

Quenching and Tempering

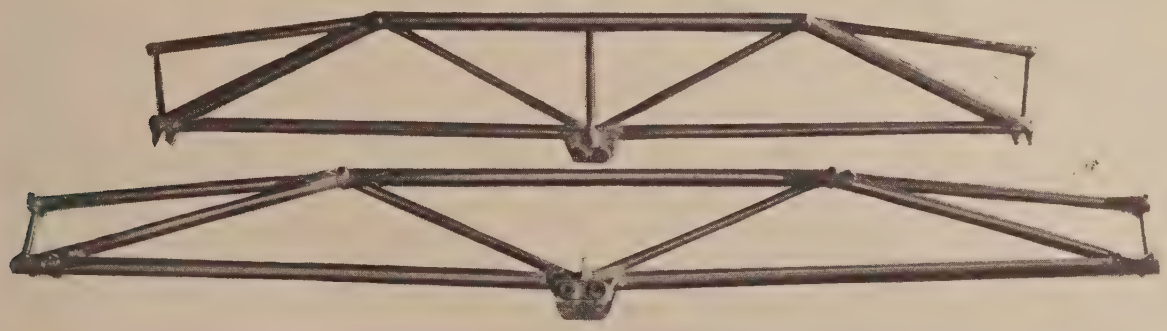
THE work to be heat treated is hung on a rack or spider of heat-resisting alloy, by means of nichrome wires or hooks. It is suspended in such a way as to be free from all tendency to sag under its own weight while hot. The spider and charge are now raised into the heating chamber where they remain suspended until ready to be quenched. The quenching tank is then brought into position directly below the opening in the bottom of the furnace, and the charge is lowered straight down into it, without other motion.

While the production demands are not great, a furnace is used for quenching on one day and for tempering on the following day. The temperature of the heating chamber has by then dropped to that required for tempering (600 to 1100 deg. Fahr.), so that only a small amount of current is needed for the latter. The operations during tempering are similar to those during quenching, except that the oil is drained from the quenching tank. When it becomes necessary to run the furnaces continuously for quenching at 1600 deg. Fahr., separate furnaces designed especially for the purpose will be installed for tempering. These will be of different and simpler construction.

Some Results Obtained

THESE furnaces have been used for about a year, in the heat treatment of a great variety of aircraft parts. The percentage of loss due to unsatisfactory treatment, including warping, has been nearly zero. The physicial properties obtained are usually far in excess of the specified values (see Table III) and in fact exceeded expectations for this grade of steel. Examples of high-tensile properties of test specimens of parts are shown in Table IV. This steel is in no sense "brittle," as specimens can be bent nearly double without cracking.

LANDING Gear, Heat Treated to 180,000 Lb. per Sq. In.



Center Section Spars, Front and Rear. Heat treated to 180,000 lb. per sq. in. Length, 8 ft.

Distortion has been reduced to a negligible point. The first wing beam treated was 10 ft. long. After treatment the deformation was less than 3/16 in. in 10 ft. and this has been bettered in the considerable number of such beams treated to date. Parts of complex form, such as shown in illustrations, have been treated without noticeable distortion.

Duralumin Treated in These Furnaces

THESE furnaces are suitable also for the heat treatment of duralumin and other aluminum alloys, either cast or wrought. These alloys, when made up into delicate and complex parts such as bulkheads for flying boats, fuel tanks, etc., have a persistent tendency to distortion

Table IV.—Typical Examples of Physical Properties Obtained by the Heat Treatment Described

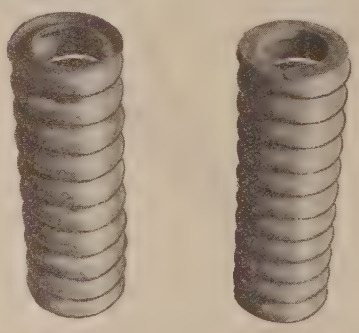
*Tube tested in full section; other flat specimens cut from wall, gage section ½ in. by 2 in.

†These values are high in view of thinness of specimen.

during heat treatment when treated in the ordinary way, even though the temperature is low, because of the great plasticity of the metal at the quenching temperature.

Such parts may be heat treated in these furnaces by suspending them with iron wires from the spider at as many points as necessary to distribute the weight evenly and avoid sag. In one case parts treated in this furnace were straightened after quenching with approximately a half hour's work, whereas it had previously taken five or six man-hours of labor to accomplish the result after quenching in water.

It has been shown that the corrosion of duralumin is influenced by the rate of cooling during the quenching operation.* Quenching in water produces a greater resistance to corrosive attack than quenching in oil or cooling in air, although the tensile properties obtained are practically the same with oil, hot or cold water, and only moderately lower with air.



COMPARISON of Springs Made from Solid Spring Stock and Chrome-Molybdenum Steel Seamless Tubing. The spring on the left, made from tubing, weighs two-thirds of the one on the right, made of solid stock, and carries a 15 per cent greater load. Heat treated to 200,000 lb. per sq. in.

water.

The new form of duralumin, known as Alclad, which has a thin coating of almost pure aluminum on its surfaces, has an immensely greater resistance to corrosion than ordinary duralumin. As this material owes its resistance to corrosion to the coating and not to the properties of the metal itself, it is probable that oil quenching would be satisfactory and would show no inferiority in its resistance to corrosion compared with Alclad quenched in water.

It has been found that oil produces very much less distortion in quenching than water. Owing to the fact that duralumin is soft immediately after quenching, it is common practice to make up parts, quench them and then do any necessary straightening while the material is still plastic. Due to the considerable distortion caused in water quenching, this straightening operation is often quite costly and tedious. It may therefore be avoided by using Alclad and quenching in oil, heating being done in an electric furnace instead of molten salt to avoid the adherence of the latter to the work. The elimination of salt as a heating medium removes another possible source of corrosion.

Other Uses for the Furnaces

These furnaces are finding many uses outside of the aircraft industry, wherever parts of relatively thin section and long length must be heat treated without distortion. For example, hollow steel rolls such as are used in the textile and linoleum industries; arbors; blades, such as are used in paper machinery; shafts, both hollow and solid, such as are used in the oil industry.

The furnaces are satisfactory for carburizing long members, such parts being packed in tubular retorts of thin wall. Heating while suspended vertically avoids the sag which usually occurs during carburizing in horizontal boxes.

Complete testing and metallographic laboratory facilities are a part of the plant equipment. Tensile test specimens representing the material are introduced with each charge and are tested immediately after heat treatment.

Aircraft manufacturers located at a distance from the plant usually find the delay incidental to shipping their parts for heat treatment and return interferes with production schedules and adds an item of expense. In connection with the heat-treating plant, a fabricating shop for aircraft parts has therefore been established in which wing beams, landing gear and other parts requiring heat treatment are made up to the aircraft manufacturer's blue prints and specifications, heat treated and shipped to the aircraft plant ready for final assembly.

*"Duralumin" *Transactions* of American Society for Steel Treating, 1922, by Horace C. Knerr.

Surface of Drilled, Reamed and Press-Finished Holes

Smoothness of interior finish of drilled, reamed, or press-finished holes has been studied by Dr. O. Schlippe (*Engineering*, July 12, 1929, page 33). The quality of the surface left in a drilled hole depends upon the metal and the speed; those drilled in harder steels and cast iron are generally smoother than in copper. Smoothness is also promoted by low speeds and small feeds. Reamers make a much better hole, if sufficient care be taken not to gouge the surface with tiny chips entrained in the cutter.

Aside from grinding and polishing, the best hole is made by press finishing, i.e., forcing a polished steel ball through a slightly undersize hole, already drilled and reamed. This gives a work hardened surface, smooth as a mirror, similar in aspect to a cleaned gun-barrel.

Doctor Schlippe's studies were made on gelatine casts of the surfaces, and are summarized in the table. The reamed holes, though much smoother than the drilled ones, have tiny and sharp corrugations which scatter the light and give a dull luster. Press finishing obviously cannot smooth out the irregularities in drilled holes in a single pass, unless the increase in radius is of the same order as the deepest groove. Several passes with increasing ball sizes may be necessary before this end is reached.

Revises Specification For Manganese Steel Welding Rod

Chemical specifications for manganese steel welding wire have been revised by the American Welding Society to read as follows:

Carbon	1.10 to 1.35 per cent
Manganese	11 to 14 per cent
Phosphorus	0.05 to 0.09 per cent
Sulphur	0.007 to 0.04 per cent
Silicon	0.10 to 0.20 per cent

Such rods are intended for use in building up surfaces where an extremely hard, tough metal is required, such as track frogs, crossing centers, switch points and dredge buckets.

Strip or open-pit mining is adapted to minerals of low market value. For instance, anthracite averages $5.60 in value a short ton and bituminous coal $2.20; copper, $2.80 to $4.40 a long ton; iron, $4.55 a long ton; bauxite, $6.15 a short ton; and pebble phosphate, $3 a long ton.

Making a Whirlwind Crankcase

Successive Steps in Machining the Castings for a Nine-Cylinder Wright Engine—Multiple Operations Performed Simultaneously or in Sequence

BY FAY LEONE FAUROTE*

MANUFACTURE of the Wright crankcase begins in the foundry with the act of making an assembly of the cores in the mold. Due to the intricate form of some of these aluminum-alloy castings, it is of the utmost importance that all cores be properly placed and the molds be well ventilated.

After pouring, the molds are shaken out, core wires removed, sprues and risers sawed off on the band-saw, the casting chipped with chisels and files, snag-ground on an emery wheel and finally sand-blasted. They are then given a general inspection on a checking fixture for the correct location of pads, bosses, etc. After being pickled long enough so that cracks, seams and other defects, if any exist, may be easily spotted, the castings are thoroughly washed in boiling water, and meticulously inspected.

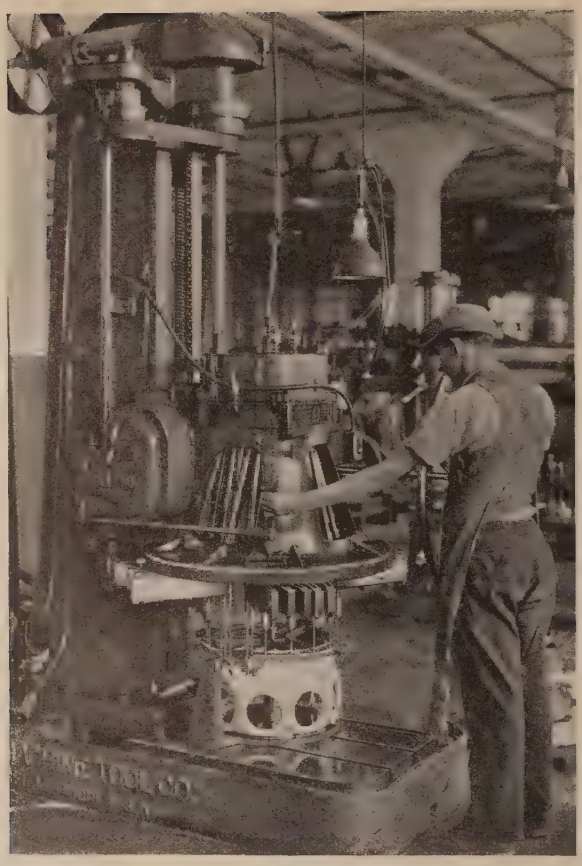
The first series of machine operations on the crankcase castings, which are performed on a 36-in. Bullard vertical turret lathe, are as follows:

Rough and Finish Face and Turn Flange, Recess and Bore

Rough face rear section flange to 6 13/16 in. from center of cylinder hole (check 3/16 in. thickness of flange).
Rough face crankshaft bearing hub to 2.297 in. ± 0.004 in. from face of flange.
Rough turn 12 9/16-in. diameter to 12⅝-in. diameter, making 2.262-in. dimension 2¼ in.
Rough form recess to 12⅝ in. diameter, holding 45-deg. angle.
Turn 12⅝-in. diameter making 2.917-in. dimension 2 29/32 in.
Rough bore 3.703-in. diameter hole to 3 41/64 in. diameter.
Rough bore 17.312-in. diameter to 17¼-in. diameter x 5/16 in. deep.
Finish face flange to 6 25/32 in. from center of cylinder holes.
Finish turn 12 9/16-in. diameter up to 2.262-in. ± 0.002-in. dimension.
Finish form recess to 12 9/16-in. diameter, turning 12 9/16-in. diameter up to 2.917 ± 0.002-in. dimension.

*Mechanical engineer, New York. In THE IRON AGE of July 18, page 148, Mr. Faurote described the airplane engines of the Wright Aeronautical Corporation. In the issue of Aug. 8, page 337, he told how the connecting rods were machined, in the issue of Aug. 15, page 402, he covered the machining of the crankshaft, and in the issue of Aug. 22, page 462, he outlined the steps in machining the cylinders. A final article will be devoted to the assembly work.

TURNING and Facing Flange, and Boring Main Bearing Hole in Crankcase, Main Section, of J-6 Series Engine



Multiple Drilling All Flange Holes in One Operation on Crankcase of J-6 Series, Nine-Cylinder Whirlwind

Finish bore 17.312 ± 0.0015-in. diameter x 5/16 in. deep, holding 1/16-in. radius and forming 1/16 in. x 45 deg. chamfer.
Finish bore 3.703 ± 0.0005-in. diameter hole.
Finish bore 3/16 in. wide x 3⅞ in. diameter recess in 3.703-in. hole, holding 1/32-in. radius in corner ⅜ in. from face of boss.

Next the front face of hub is faced, turned and chamfered on a 36-in. Bullard. The operations, after clamping casting in fixture, are as follows:

Rough face front section to 10 5/16 in. diameter overall.
Rough turn 16.249-in. diameter to 16 5/16 in. diameter x 5/16 in. long.
Finish face to 10 9/32 in. overall.
Finish turn 16.249 ± 0.0015 in. x 5/16 in. to size, holding 5/64-in. radius.
Form 1/16 in. x 45-deg. chamfer.
Rough face crankshaft bearing hub to 1.031 in. overall.
Form 1/16 in. x 45-deg. chamfer in 3.703-in. diameter hole.
Break sharp edges.

Next the 20 flange holes are drilled on a No. 2 Baush multiple drill, using a jig. Money has not been spared in securing machines which will lower production costs. The drilling has this series of operations:

Set casting in baseplate.
Set jig in place and target cylinder pads and valve tappet guide bosses.
Clamp fast.
Drill twenty 11/32-in. diameter holes through.

A 3-ft. sensitive radial drill is used for two successive operations. First it serves to drill and countersink blind holes, as follows:

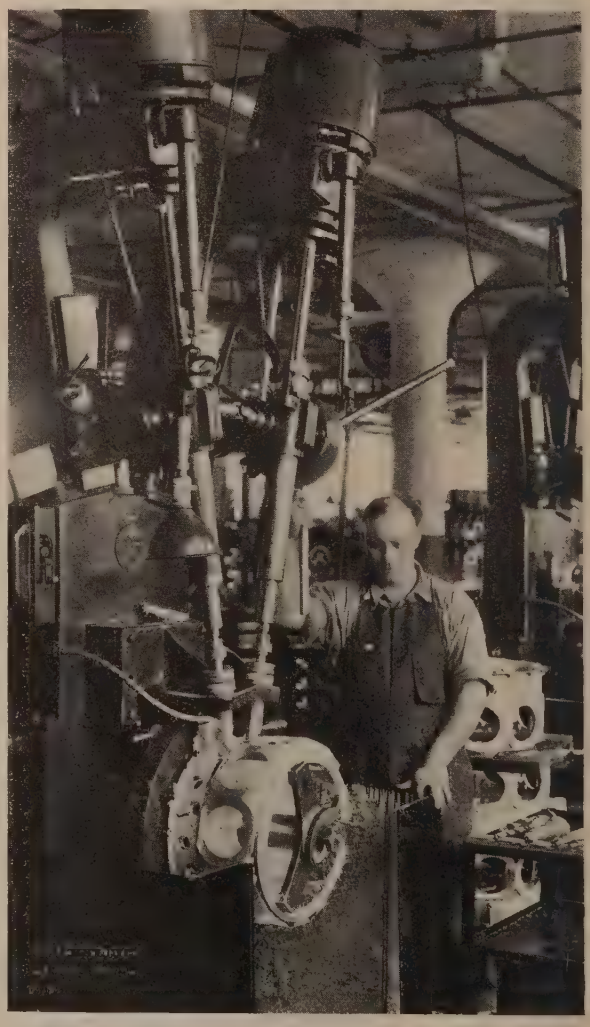
Drill three 11/32-in. diameter holes x 3/64 in. deep. (Grind point of standard drill to 7 deg.)
Remove jig.
Countersink slightly to remove burrs (flange face side only).
Use hand burring countersink.

Five holes then are drilled with the 3-ft. sensitive radial drill:

Drill two 23/64-in. diameter holes and ream to 0.375 in. ± 0.001-in. diameter through (these holes are held close, contrary to B. P., for later machining operations).
Drill three 11/32-in. diameter holes x 3/64 in. deep to point of drill. (Grind point of standard drill to 7 deg.)

Then with a Baush multiple drill, 14 "F" holes, 0.257-in. diameter x ⅞ in. deep, are drilled in front section mounting flange. The casting is next transferred to the table of the 3-ft. sensitive radial drill. Then the fourteen 5/16 in.-18P tap holes in front section mounting flange are counterbored to 21/64 in. diameter x 1/64 in. deep.

Next a 45-deg. pad is milled on a plain miller, milling a 45-deg. face, holding 2 23/32-in. dimension and 8 31/32-in. dimension.



Drilling, Reaming, Tapping Valve Guide Holes in Crankcase, Main Section, of Nine-Cylinder Engine

The oil strainer housing is milled on a No. 2 plain miller, rough and finish milling it to 12 in. from centerline. A 0.125-in. feeler is used to set for the finish cut.

The nine cylinder pads are milled on a rigid mill, being rough and finish milled to 9.000 ± 0.005 in. from center. The measure is made from center plug with flush pin gage.

Nine cylinder holes are rough and finish bored to 5.196 ± 0.005-in. diameter and then chamfered 1/16 in. x 45 deg. with a heavy-duty drill.

Valve tappet holes are drilled, bored and reamed on a Leland-Gifford two-spindle special drill. Proper position of valve tappet guides is essential for smoothly working valve actuating mechanism. The work proceeds with the following series of operations:

Drill two valve tappet holes (exhaust and intake) at 1.797 ± 0.003 in. and 2.452 ± 0.001 in. dimension from rear flange, ¾ in. diameter, through bosses and carrier ring. Index and repeat to a total of nine operations.

Step drill two valve tappet holes (exhaust and intake) 15/16 in. to 1¼-in. diameter (1¼-in. diameter to 8 3/32 in. from center). Index and repeat to total of nine operations.

Bore two valve tappet holes (exhaust and intake) 1 3/64 in. diameter and 0.900 in. diameter through. Index and repeat to total of nine operations.

Counter bore two valve tappet holes (exhaust and intake) to 1.293 ± 0.002-in. diameter to 8 1/16 in. from center. Form 1/32-in. x 45-deg. chamfer at 1 3/64-in. diameter hole. Index and repeat to total of nine operations.

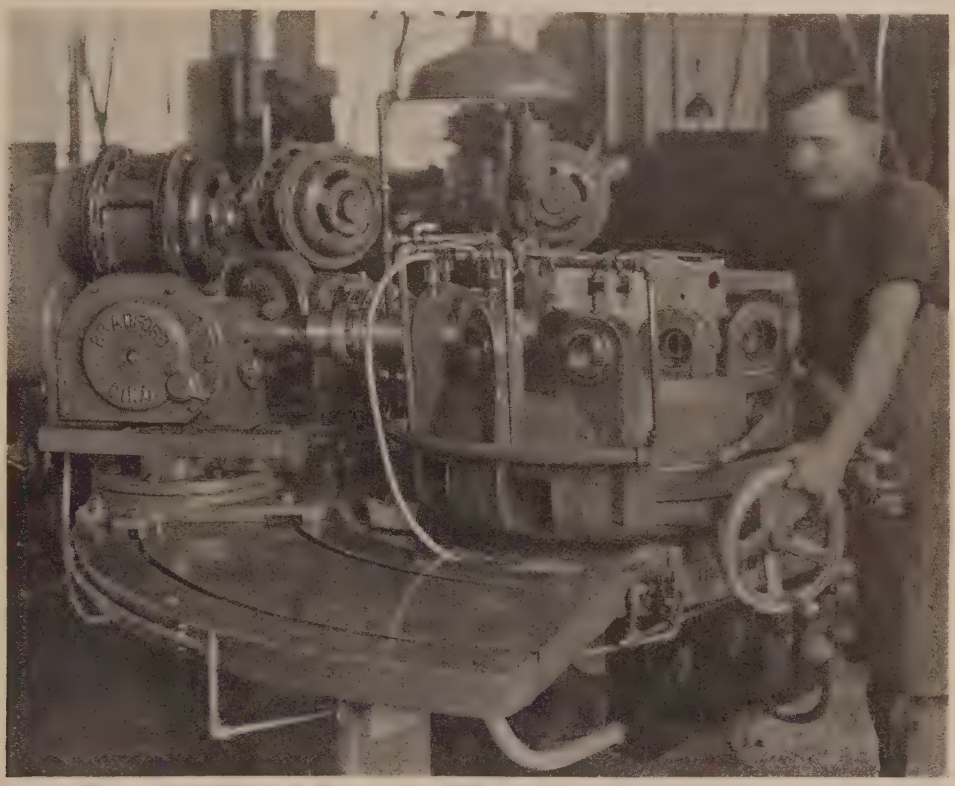
Spotface two valve tappet holes (exhaust and intake) 1½ in. diameter to 8⅝ in. dimension from center. Form 1/16-in. x 45-deg. chamfer at 1.293-in. diameter hole. Index and repeat to total of nine operations.

Line ream two valve tappet holes to 1.0625 ± 0.0005 in. and 0.916 ± 0.0005 in. diameter. Index and repeat to total of nine operations.

Tap two valve tappet holes 1⅜ in.-12P USSF to gage to ⅜ in. dimension full thread. Index and repeat to total of nine operations.

Cylinder pad holes are drilled, counterbored and tapped, using a Leland-Gifford special drill, with the following operations:

Drill eight 5/16-in. diameter holes 1 in. deep in cylinder pad.
Index and repeat for total of nine pads.
Counterbore eight holes 13/32 in. diameter x 1/64 in. deep.
Index and repeat for total of nine pads.



SPOT Facing, Boring and Tapping Intake Port Holes in Crankcase, Rear Section, of Nine-Cylinder Whirlwind Engine

Tap eight ⅜ in.-16P USSF ⅞ in. deep.
Index and repeat for total of nine pads.

Next, the bolt bosses are machined on a drill press to 5 7/16 in. diameter at cylinder pads 4, 5, 6 and 7. The next process is to drill, spotface, chamfer and tap the lifting boss and oil-strainer housing, using a radial drill:

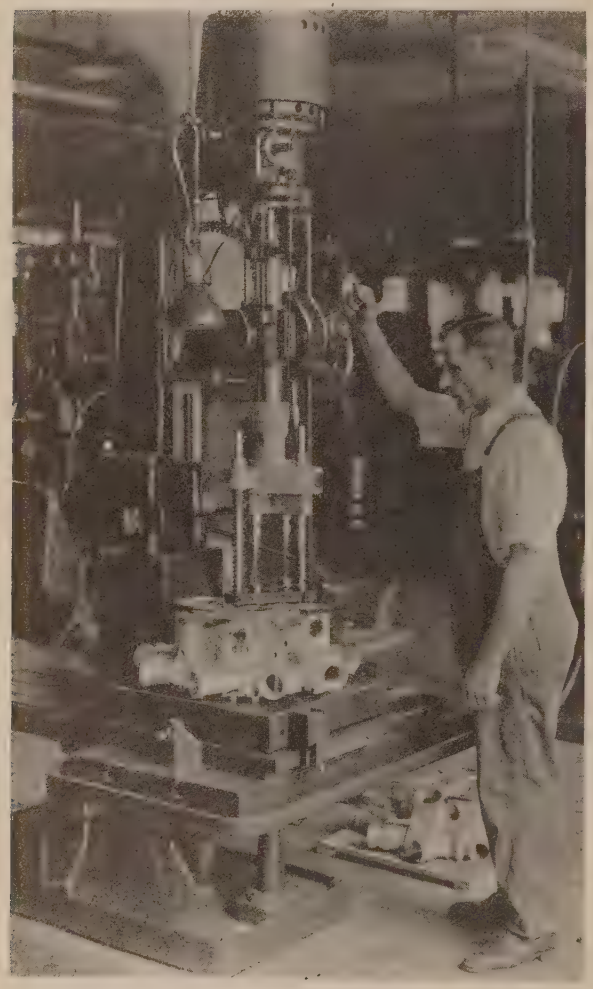
Drill 21/32-in. diameter hole in lifting eye boss 11/16 in. deep.
Spotface 1¼ in. diameter to 9¼ in. dimension from center.
Chamfer 1/16 in. x 45-deg.
Tap ¾ in.-10P USSF 9/16 in. deep full thread.
Index and repeat operation on other hole.
Index.
Drill 1 11/32-in. diameter hole in oil-strainer housing.
Redrill to 1.543 ± 0.003 in. diameter through outside wall only.
Counterbore to 1 15/32 in. diameter x 1/16 in. deep.
Chamfer outer wall 1/16 in.-45-deg.
Tap 1⅝ in.-12P USSF thread.

A 30-deg. angle hole is then bored and drilled, with the casting on the table of a drill press, and a 9/16-in. hole is bored and drilled, as follows:

Bore ⅝-in. diameter hole ½ in. deep at 2 23/32-in.

dimension, using ⅝-in. diameter two-lip end mill, holding 30-deg. angle.
Drill ⅝-in. diameter hole 1 in. deep at 2 23/32-in. dimension, holding 30-deg. angle.
Bore 9/16-in. diameter hole ½ in. deep at 8 31/32-in. dimension, using 9/16-in. diameter two-lip end mill.
Drill 9/16-in. diameter hole at 8 31/32-in. dimension.

Using a sensitive radial drill two 45-deg. stud holes are drilled and tapped, following which the outer boss



Drilling Magneto Pad Holes in Crankcase, Rear Section, Nine-Cylinder Engine. Note threading on inside of intake ports

holes are drilled, primed, reamed and tapped with the sensitive radial drill, in the following manner:

Drill two "F" (0.257-in.) diameter holes in 45-deg. face through.
Tap two 5/16 in.-18P USSF to gage.
Drill 7/32-in. diameter hole through outer boss with standard drill.
Redrill 7/32-in. diameter hole, breaking through into 3.703-in. hole.
Redrill 7/32-in. diameter hole to "F" (0.257-in.) diameter x ⅜ in. deep.
Remove jig.
Line ream 0.232 ± 0.001-in. and 0.242 ± 0.001-in. diameters.
Tap 5/16 in.-18P USSF 5/16 in. deep.

A 15-deg. oil hole is drilled with a sensitive radial drill to ¼-in. diameter and 3 19/32 in. deep.

Continuing with a sensitive radial drill, eight ⅜-in. diameter oil drains are drilled through four ribs on the inside of the crankcase. The 1⅝-in. diameter flange clearance is formed with the radial drill to 1 33/64-in. dimension from rear section flange.

Fourteen mounting flange holes ¾ in. deep are tapped with a tapping machine. After the piece is placed on the table, the 5/16-in.-18P USSF holes are tapped in front section mounting flange.

With a back spotfacing machine 20 mounting bosses are back spotfaced to ¾ in. diameter and ½ in. dimension.

A keyway is then slotted with a vertical slotter to 0.313 ± 0.001 in. wide and to 3.843 + 0.003 — 0.000 in. depth from opposite face of bore, holding 1/16-in. radii in corners.

Using a sensitive radial drill, an oil hole is drilled, counterbored and reamed:

Drill 7/64-in. diameter hole breaking into 0.232 ± 0.001-in. diameter hole.
Counterbore 9/32 in. diameter x 1/16 in. deep.
Ream to 0.123 ± 0.001 in. diameter.

Vent holes are then drilled, on the bench, in all ⅜-in.-16P stud holes which are not drilled through. The crankshaft bearing hub is finish faced on a 36-in. Bullard to 2.312 ± 0.002 in. from face of flange. The crankshaft hub is then finish faced to 1.000 ± 0.002 in. dimension, also on a 36-in. Bullard.

The crankcase is then taken to the bench, where all sharp edges caused during machining operations are removed, such as ends of threads or sharp edges of drilled or bored holes projecting on the inside of the crankcase. All cored and drilled oil passages are inspected and cleaned if necessary. Threaded holes are inspected and retapped if necessary.

Next the crankcase is washed and cleaned thoroughly in a tank, after which it is primed with a first coat of metal primer on the outside of the casting, using an air drying primer. Following this, sandpapering is done if necessary, and then the finish coat of enamel is applied and dried in air.

The crankcase is now ready for inspection, after which it is delivered to finished stock.

High Elastic Limit Steel for Ships

Ship plate and shapes heat treated for high elastic limit are being used by Alfred Holt & Co., the British shipping firm, for the entire stress-carrying portion of their newly built ships. The extra strength allows the dimensions to be reduced an average of about 12 per cent, a clear gain for the cargo capacity. Similar material is also being used for part of the superstructure of a very large liner being built for the Canadian Pacific, in order to increase the stability.

According to P. G. Rouse, writing in the *Engineer*, July 19, this steel is called "Martinel," or "Martin Elastic Limit Steel," after its proponent, F. G. Martin. It is a "special quality steel subjected after rolling to a special heat treatment which insures the formation of the micro structure most favorable to the greatest elastic limit." Micrographs are given, showing the well known banded structure of ordinary mild steel as rolled, and a fine grained mixture of pearlite and ferrite, with small traces of banding, said to be characteristic of Martinel steel. Physical properties quoted are:

	Ordinary Mild Steel	Martinel Steel
Elastic limit, lb. per sq. in.		
Minimum	9,000	33,000
Maximum	31,000	45,000
Average	19,000	37,000
Average ultimate strength	65,000	72,000
Elongation, per cent		20 to 30

Metal Exposition Opens Sept. 9

Cleveland Show Will Contain Exhibits of 250 Companies in Treating, Welding, and Making Metals— Five Societies to Hold Meetings

NEARLY 250 companies are to present exhibits at the National Metal Exposition in the Public Auditorium, Cleveland, Sept. 9 to 13, in connection with the National Metal Congress. Under the auspices of the American Society for Steel Treating, which is holding its eleventh annual convention at that time, four other societies also have arranged for technical meetings and for participation in the exposition: American Welding Society, institute of metals and iron and steel divisions of the American Institute of Mining and Metallurgical Engineers and the iron and steel division of the American Society of Mechanical Engineers.

On the following pages there is presented a list of the exhibitors, covering what each will display, who will be there and so on. In addition, there will be found illustrations of some of the special equipment which will be featured among the exhibits. There are also reproductions of photographs of 16 of the chairmen of the 37 chapters of the A.S.S.T.

On other pages will be found five special articles on heat treating and related subjects. These are offered as a contribution to parallel the stupendous efforts of the A.S.S.T. to signalize the continued advances in an industrial technology of the first magnitude.

List of Exhibitors and Their Products

A

Abrasive Co., Philadelphia. Booths 342 and 396.
Featuring Red Center snagging wheel for grinding steel castings; showing abrasive wheels of Borolon, S. B. Borolon and Electrolon in various sizes, shapes, grains and grades for such operations as cylindrical grinding, surface grinding, tool and cutter grinding, internal grinding and cutting off work. Borolon Grain for use in drawing die molds. Represented by: S. M. Hershey, sales manager; John F. Guthrie, W. A. McMillan, I. R. Blair, R. A. Shaffer, vice-president; and J. F. Fischer, assistant sales manager.

Air Reduction Sales Co., New York. Booths 252 and 331.
Airco 99.5 per cent oxygen and Airco acetylene in cylinders; Airco-Davis-Bournonville oxygen discharge manifold; Airco-Davis-Bournonville welding and cutting torches, regulators and supplies; Airco national carbide; No. 4-A Oxygraph; New No. 4 Camograph. Represented by: S. P. Fetter, G. J. Dekker, H. L. Rogers, F. E. Rogers, T. M. Hamer, C. A. Daley, R. F. Helmkamp, F. J. Maeurer, and G. Van Alstyne.

Ajax Electrothermic Corporation, Trenton, N. J. Booth 399.
Model of a 500-lb. coreless induction furnace; polished section of ingot made in high frequency induction furnace by Heppenstall Forge & Knife Co.; two small laboratory coreless induction furnaces; moving picture showing high frequency (coreless) induction furnaces in operation; and photographs of installations. Represented by: Dudley Willcox, treasurer and assistant general manager; and Robert N. Blakeslee, secretary and sales manager.

Allegheny Steel Co., Brackenridge, Pa. Booth 70.
Heat and corrosion resisting Ascoloy and Allegheny metal with examples of completed installations; semi-finished samples of Allegheny metal and Ascoloy material in process of fabrication into parts of various types of equipment. Represented by: O. M. Otte, F. S. White, and Banks E. Eudy.

Edgar Allen Steel Co., Inc., New York. Booth 284.
Imperial Major high speed steel; extra special high speed steel; special high speed steel; turning and finishing steels; Minerva air hardening steel; self hardening steel; special chisel steel; red label steel; tack knife steel; die casting steel; solid double six production steel; hollow double six production steel; Class P tool steel; class E tool steel; Stag tool steel; Talon tool steel. Represented by: Henry Sears Hoyt, president; J. King Hoyt, Jr., secretary and treasurer; V. A. Green, vice-president and general manager; C. K. Everitt, managing director Edgar Allen & Co., Ltd., Sheffield, England; E. R. Carnell, director; H. R. Adams, and R. M. Brushingham.

Allied Products Corporation, Detroit. Booth 274.
Victor Peninsular Division, cold-headed products; Indiana Lamp Division, automotive lighting equipment; and Richard Brothers Division, replaceable and interchangeable punches and dies. Represented by: T. S. Higbee and J. E. Gladden.

Aluminum Co. of America, Pittsburgh. Booths 334, 335, 336, 337.
Ingots; forgings; permanent mold castings; sand castings; die castings; magnesium products; wire; rod; bar aluminum; tubing; conduit; pipe fittings; streamline tubing; aluminum foil; seals and caps; electrical conductors; transmission cable; collapsible tubes; extruded molding and structural shapes; shingles; downspouts; gutters; flashings; corrugated roofing; radio parts of aluminum; beams; window sash; carpet frames; aluminum doors; screw machine products; aluminum paint and bronze powder; welded chemical vessels; permanent mold cast and stamped cooking utensils; equipment for demonstrating the deflection of aluminum and steel; aluminum chairs; ladders; waste-baskets; and costumers, etc. This exhibit is comprehensive and attempts to trace the manufacture of aluminum from the crude ore to the finished product. Represented by: F. C. Shoupe and others.

American Brass Co., Waterbury, Conn. Booth 235.
Charles Gallo, welding expert, will demonstrate Tobin bronze and other Anaconda copper alloy welding rods; display of Everdur metal, a copper-silicon-manganese alloy; collection of various iron and steel pieces welded with Anaconda copper alloy welding rods. Represented by: W. H. Dowd, W. C. Swift, T. S. Foote, H. M. Paxon, G. E. Newton, and C. G. Goodman.

American Car & Foundry Co., New York. Booth 318.
No. 3 three-electrode heater for heating rivets; No. 3 one-electrode two-path heater for heating material for forging or upsetting. Represented by: F. C. Cheston, John S. Helt and Harold C. Cheston.

American Electric Furnace Co., Boston. Booths 402 and 439.
Model HB-1, 8 x 16-in. high speed furnace and B-2, 12 x 24-in. box furnace will be in full operation, showing the patented atmospheric control feature. The following models are also on exhibition: P-3, 12-in. pot furnace; P-7, 16-in. pot furnace; 18-in. tilting pot furnace; and nitriding furnace. Represented by: K. A. Juthe, president; S. N. Juthe, vice-president; A. J. Hanson, chief engineer; John C. Juthe, sales manager; A. B. Beach, E. E. Bolds, A. A. Anderson, A. D. Heath, L. A. McCalla, L. A. Smith, W. P. Barba and W. T. Haggas.

American Engineering Co., Philadelphia. Booth 398.

American Gas Association, New York. Gas Section.
Industrial gas section is again sponsoring a combined exhibit of the leading manufacturers of industrial gas furnaces and accessory equipment. The equipment being displayed by each of these manufacturers is described elsewhere. A control laboratory is being operated under the direction of W. E. Jominy, research fellow of the association at the University of Michigan. Represented by: E. D. Milener, industrial research representative and C. W. Berghorn, secretary industrial gas section of the American Gas Association; A. M. Apmann, chairman, and Karl Emmerling, vice-chairman, committee on display and contact with national industrial organizations; and J. C. Shanks, industrial gas representative, East Ohio Gas Co.

American Gas Furnace Co., Elizabeth, N. J. Gas Section.
Continuous rotary retort heating machine for hardening, annealing or tempering bolts, rivets, chain links, pins of various kinds; mesh wire conveyor heating machine; reciprocating hearth heating machine for hardening and annealing all kinds of small and medium sized articles, such as flat and coil springs, stamped and pressed metal parts; heating machine for tempering, temper coloring, gun metal finishing and all work requiring temperatures below 1000 deg. Fahr.; melter for gold and silver, also for coal ash fusion point determination; rotary brass melter; high speed oven furnace; large oven furnace for heat treating; rotary retort; carburizer; vertical retort gas carburizer. Represented by: P. C. Osterman, vice-president; Elmer C. Cook, Theodore Farwick, Sr., John Mehrman, William H. Kelsey, William J. Barenscheer and O. T. Muehlemeyer.

American Steel & Wire Co., Chicago, New York and Cleveland. Booth 265.
Premier-tested welding wire and rods in various grades for use in practically every welding need in the electrical and gas field; cold-rolled strip steel; springs; screw stock; coated and plain wire nails; and various manufacturing wires. Represented by: F. Connell, G. S. Rose, A. G. Bussman, W. E. Mackley, E. S. Humphrys, C. J. McGregor, R. C. Fisher, W. H. Cordes, E. E. Louis, A. T. Merriman and P. G. Gilroy.

Ampco Twist Drill Co., Jackson, Mich. Booth 312.
Two Melling Mill-Drill-Matics in operation; milling, drilling, reaming and burring standard S.A.E. 5/16-in. yoke ends at a production speed; also drill display board showing the complete line of small tools manufactured; new patented mandrel which is being marketed under the trade names of 4 in 1. Represented by: O. Monrad, president; E. Loy, secretary and general manager; E. Leypoldt, R. Rice, D. O'Brien, Fred E. Kelley, F. J. Sikorovsky, George Melling.

Anchor Drawn Steel Co., Latrobe, Pa. Booths 10, 12, 39 and 41.
Gold Anchor drill rod; Blue Anchor carbon steel drill rod; Red Anchor carbon steel drill rod; and special cold drawn shapes of high speed, stainless, carbon and alloy tool steels. Represented by: R. C. McKenna, president; Floyd Rose, vice-president; and George Morrison.

Armstrong-Blum Mfg. Co., Chicago. Booth 383.
Marvel metal band saw; Marvel automatic high speed saw; Marvel hack sawing machines; two entirely new hack saw machines, Marvel Nos. 6 and 6-A shown for the first time. Marvel high speed edge hack saw blades. Represented by: Harry J. Blum, secretary; Stanley A. Woleben, Joseph C. Fletcher, Walter S. Ryan, Allan M. Andrews, Harry A. Welch and John E. Van Doren.

Armstrong Brothers Tool Co., Chicago. Booth 381.
Lathe, planer and shaper tools; drop forged lathe dogs; clamps; ratchet drills; drilling posts; drop forged wrenches; stocks and dies; pipe vises; pipe cutters; pipe wrenches and machine shop specialties. Represented by: Paul L. Armstrong, A. Arbogast, George Nufer and W. Welter.

Armstrong Cork & Insulation Co., Lancaster, Pa. Booth 98.
Armstrong's corkboard insulation for cold storage and constant temperature rooms and for the walls and roofs of buildings; Armstrong's cork covering for the insulation of low temperature lines and tanks; Armstrong's insulating brick and Nonpareil insulating brick for the insulation of boiler settings, heat treating furnaces and other high temperature furnaces, ovens, kilns, etc., Armstrong's cork machinery isolation for sound deadening and vibration absorption under machines. Represented by. H. B. Gates.

Automatic Nut-Thread Corporation, Philadelphia. Booth 304.
No. 3 Threadnut automatic nut tapping machine, newly redesigned; No. 2 Threadnut automatic nut tapping machine, newly re-designed with cabinet base; and No. 1 Threadnut hand operated tapping machine, using bent shank tap and continuous tapping. Represented by: Erie M. de Sherbinin, president; Robert B. Webster, secretary-treasurer; Christian S. Sorensen, general manager; Fred D. Creasop, Victor E. Pearson, Joseph T. Ramella.

Automatic Temperature Control Co., Inc., Philadelphia. Booth 351.
Two balancing three-position controllers with anticipating features; one three-position single motor controller; one two-position single motor controller; three-position slow motion controller operating 8-in. air and 1-in. oil valves. A proportional hand control operating oil and air valves as a unit; a self-cleaning oil valve with adjustable orifices designed for hand operation; an electric heater controller designed to save power as compared with rheostat operation of small electric furnaces; a time lag relay. Represented by: G. S. Frazee, Ivan Johanson, R. A. Smart and J. D. Andrews, sales manager.

B

W. O. Barnes Co., Inc., Detroit. Booth 406.
Hack saw machine (motor driven) using Barnes red arrow high-speed steel hack saws, cutting different metals. Represented by: W. O. Barnes, president; J. H. Flavell, secretary-treasurer; F. M. Shaw, eastern sales manager; Roy Schindley, A. G. Young, J. M. Munro, C. B. Cecil, western sales manager; L. Robertson, manager, W. Robertson Machine & Foundry Co.

Bastian Blessing Co., Chicago. Booth 239.
Oxyacetylene welding and cutting torches and regulators; oxygen and acetylene manifolds; acetylene generator; high pressure forged fittings; drum valves and accessories; featuring oxyacetylene welding as applied to piping systems. Represented by: E. L. Mills, sales manager; E. N. Stevens, assistant sales manager; and Earl M. Evleth.

Bausch & Lomb Optical Co., Rochester, N. Y. Booths 7 and 9.
Wide field binocular microscope suitable for viewing opaque specimen; magnifiers and readers; microtomes; colorimeters and other optical and measuring instruments; toolmaker's microscope; photomicrographic and projection apparatus; metallographic equipment. Represented by: I. L. Nixon, M. H. Stevens, H. L. Shippy and A. R. Farmer.

Bell & Gossett Co., Chicago. Booths 344 and 345.
(See Case Hardening Service Co. listing.)

Bellis Heat Treating Co., Branford, Conn. Booth 352.
Lavite & Lavite furnaces; electric furnaces tempering Lavite, for tempering temperatures 270-1200 degrees Fahr.; carbon Lavite, for hardening and annealing temperatures 1000-2000 degrees Fahr.; high speed Lavite, for temperatures 2000 to 2500 degrees Fahr. Represented by: A. E. Bellis, president; C. E. Wister and J. W. Black.

Bellevue Industrial Furnace Co., Detroit. Booth 393.
Twenty-five kw. electric furnace for hardening and carburizing, also preheating of high-speed steel, 1600 to 1800 deg. Fahr.; 40 kw. high temperature furnace for hardening high-speed steel, equipped with Globar non-metallic heating elements for 2450 deg. Fahr. Represented by: Walter E. Hinz, president; Louis J. Raymo, sales manager; and Arnold Pfau, Jr.

Bethlehem Steel Co., Bethlehem, Pa. Booths 44, 46, 65 and 67.
Airplane steels; forgings; test specimens pertinent to airplane

engine building; tool steels; Mayari iron; Silvery Mayari; sheets and structural sections. Represented by: T. F. Fitzgibbons, F. H. Baldwin, J. H. Bateman, E. A. Buxton, G. P. Witteman, H. R. Weeman, D. C. Roscoe, H. W. Hibshman, W. E. Titus, R. S. Tucker, H. E. Graffin, G. Cushman, J. W. Codding, F. E. Fisher, R. MacDonald, W. B. Pritchard, W. R. Shimer, J. H. Stoll, A. P. Spooner, P. E. McKinney and J. F. Gaffney.

Binghamton Flexible Shaft Co., Binghamton, N. Y. Booth 365.

Bliss & Laughlin, Inc., Harvey, Ill., and Buffalo. Booth 72.
Cold drawn steel, turned and polished shafting, turned and ground shafting and special finished steel. Represented by: Walter R. Howell, vice-president and general manager; W. P. Mitchell, general sales manager; C. L. Huff, George Spaulding, C. H. Beach and T. D. Taylor.

Botfield Refractories Co., Philadelphia. Booth 210.
Adamant fire brick cement; Adachrome fines; Adachrome aggregate; Adamant gun; and Adapatch. Represented by: A. H. Engstron, sales manager; and W. B. Smith.

Bourne-Fuller Co., Cleveland. Booths 25 and 27.
Specimens of steel sections rolled in alloy and carbon steels, bolts, nuts and rivets—standard and special for aircraft, automotive, railroad and other industries. Represented by: H. H. Pleasance, C. F. Newpher, N. C. Bolton, R. C. Klemm, H. D. Burket and R. D. Titus.

Bristol Co, Waterbury, Conn. Booth 386.
Bristol's pyrometer controller, indicating pyrometer, recording pyrometers and all types of automatic temperature control equipment; new line of automatic temperature controller, including motor valves for gas, oil, air and steam, of the floating type; special pyrometer controller for automatically controlling hot blast temperatures on blast furnaces in operation; Bristol safety set screws and belt lacing. Represented by: H. L. Griggs, general sales manager; R. M. Walker, H. W. Moss, L. G. Bean, E. L. Stillson, Mr. Trumbull and W. F. Emery.

Brown Instrument Co., Philadelphia. Booth 272.
Pyrometers, indicating, recording, controlling, signalling; flow meters, indicating and recording; thermometers, recording and controlling; CO_2 meters, indicating and recording; pressure gauges, recording and controlling; automatic control valves; and thermocouples and protecting tubes. Represented by: R. P. Brown, president; C. H. Kerr, vice-president and general manager; G. W. Keller, vice-president and general sales manager; J. P. Goheen, secretary; G. W. W. Cornman, treasurer; O. B. Wilson, G. L. Clapper, J. L. Whitten, L. C. Wilson and H. G. Hoffman.

Brown Lynch Scott Co., Monmouth, Ill. Booth 388.
New style carburizing compound cleaner and grader. Represented by: J. A. Scott, secretary and general manager; W. B. Lynch and S. W. Perry.

C

Calorizing Co., Pittsburgh. Booth 324.
Calite alloys—group of miscellaneous castings used in the heat treating trade such as carburizing boxes, cyanide pots, hearth plates, rollers for continuous furnace operation, etc.; Calorized steel parts such as oil still tubes, cyanide and salt pots, pyrometer protection tubes, bolts and nuts, etc. Represented by: B. J. Sayles, president and general manager; D. T. Downes, chief engineer; H. Schultz, N. E. Ward, R. S. Brown and N. A. Milmine.

Andrew C. Campbell, Inc., Bridgeport, Conn. Booth 403.
Three Campbell nibbling machines, actually doing work of cutting metal of varied thickness, etc. Represented by: H. R. Powell and J. Johnson.

Carboloy Co., Inc., New York. Booths 255 and 325.
A Warner & Swasey No. 3A universal hollow-hexagonal turret lathe equipped throughout with Carboloy cutting tools and operated at high production speeds and output on various steels, irons, bronzes, and other materials; a large exhibit of Carboloy tools of various shapes and styles. There is also exhibited Carboloy wire drawing dies and specimens of drawn wire. Represented by: P. R. Mallory, president; E. H. Wilkinson, vice-president; A. R. Howell, sales manager; G. V. Rockey, G. N. Sieger, and Zay Jeffries, A. A. Merry, W. G. Robbins, W. W. Fullager, W. J. Lindner, P. Petroff, W. H. Martin and W. S. Huson.

Carborundum Co,, refractory division, Perth Amboy, N. J. Booths 347 and 387.
Complete assortment of standard shapes of refractory materials (Carbofrax and Aloxite) including brick, tile and special shapes; Infrax insulating brick and high temperature refractory cements; silicon carbide grain and Carborundum firesand; Globar-equipped electric furnace; Carbo-

radiant chamber. Represented by: W. M. Smith, sales manager furnace department; R. A. Beverly, S. A. Fenno, J. A. King, R. A. Barr, and W. C. Thiess.

Carborundum Co., Niagara Falls, N. Y. Booths 347, 387, 346 and 389.
Abrasive Division—Complete line of Carborundum and Aloxite wheels in Redmanol and rubber bonds; Globar Division—Globar furnace and Globar heating elements and terminals. Represented by: S. F. Courter, general sales manager; G. W. Chormann, B. H. Work, E. C. Christensen, W. U. Parrott, H. W. Collinson and J. C. Rice.

Carpenter Steel Co., Reading, Pa. Booth 81.
Carpenter stainless steel No. 5. Represented by: F. A. Bigelow, president; J. H. Parker, vice-president; R. V. Mann, F. R. Palmer, B. H. DeLong, G. V. Luerssen, P. B. Greenawald, G. H. Edmonds, W. M. Loos, C. A Heil, R. L. Williams, K. L. Crickman, V. W. Gardner, H. G. Roodhuyzen, J. S. Bailey, C. H. Breed and E. von Hambach.

Case Hardening Service Co., Cleveland. Booths 344 and 345.
Hardening room materials and equipment: Bohnite; Caseite; Cyanide; Drawite; Bathite; Ni-Cro-Al, nickel-chromium-aluminum alloy pots and boxes; Cleancoat; Non-Case; pressed steel pots; B and G oil coolers; Hevi-Duty electric furnaces in operation. Represented by: W. C. Bell, president; E. J. Gossett, vice-president; J. S. Ayling, sales manager; and B. C. Cleveland.

Central Alloy Steel Corporation, Massillon, Ohio. Booths 14, 16, 43 and 45.
Applications of Agathon Alloy steels; Toncon copper-molybdenum iron; Enduro Nirosta steel; and Agathon Nitralloy. Represented by: B. F. Fairless, president; J. M. Schlendorf, vice-president in charge of sales; W. M. Garrigues, general sales manager; M. J. R. Morris, F. L. Gibbons, A. Schaeffer and D. B. Carson.

Char Products Co., Indianapolis. Booth 377.
Full line of carburizing compounds and carbon products giving particular attention to the unusual physical properties of some of the products. Demonstrating the non-burning qualities of the non-burning type of Char carburizers and the resistance of this type of material to abrasive action. Represented by C. Q. Swenson, C. B. Edwards, and William Higburg, sales manager.

Chemical Rubber Co., Cleveland. Booth 283.
Laboratory equipment. Represented by: A. Friedman, president; E. Hartle and I. W. Brandel.

Chicago Steel & Wire Co., Chicago. Booths 315 and 317.

Chicago Steel Foundry Co., Chicago. Booths 285 and 287.
Chrome-nickel alloy castings for use at high temperatures; boxes; pots; and furnace parts; sheet alloy fabricated parts; special high strength chrome-nickel castings. Represented by: David Evans, president; C. M. Evans, assistant to president; Herman Georgen, sales manager; J. W. Frank, William J. Chapin, Gordon McMillan.

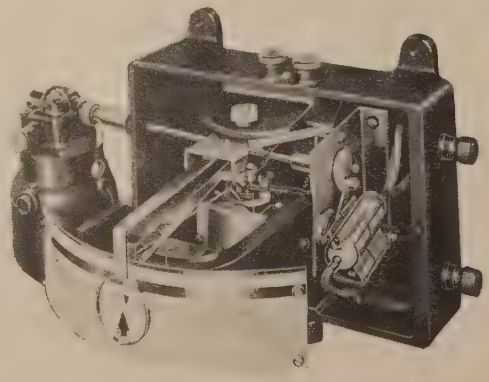
Chrobaltic Tool Co., Michigan City, Ind. Booth 204.
Heat resisting and acid resisting castings, including Fire Armor and Zorite alloy. Represented by: W. B. Sullivan,

Heat-Treating Furnaces

A COOL front furnace, as produced by the W. S. Rockwell Co., 50 Church St., New York, will be on exhibition at the company's booth at the National Metal Exposition. A battery of such furnaces is here illustrated. The cool front serves to provide improved working conditions and better heating results over a wide range of heat-treating operations.

A New Mild Steel Electrode

MARKETED as the new Yellow Jacket electrode, the Fusion Welding Corporation, 103rd Street and Torrence Avenue, Chicago, will exhibit at the National Metal Exposition details of this new product and some of its results. It is designed to throw a preponderance of heat into the work, producing what welders call extremely deep penetration. Its field of application is heavy welding, such as structural welding, heavy pipe, etc. The accompanying illustration shows pipe welded with this electrode in a wide excavation.



A New Control Pyrometer

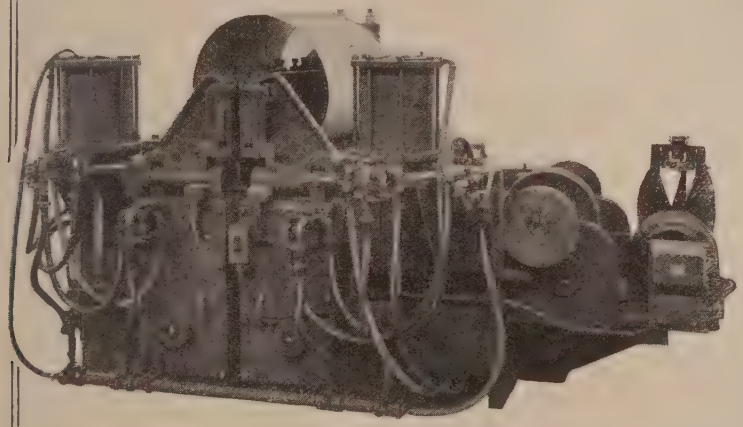
AS the opening gun of a campaign announcing a development of large importance to all steel treaters the Republic Flow Meters Co., Chicago, will exhibit at the National Metal Exposition a control pyrometer which eliminates the use of auxiliary relays.

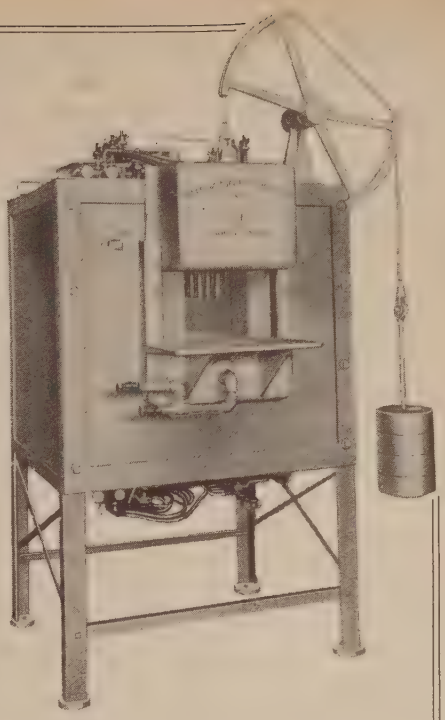
Electric High-Speed Furnace

AT the booth of the American Electric Furnace Co., Boston, the furnace illustrated will be in operation, as well as one of the company's box furnaces. This high-speed furnace is known as Model HB-1 and is 8 in. by 16 in. The high-speed furnaces are designed to eliminate direct intense radiation and have automatic control.

Barrel Welder

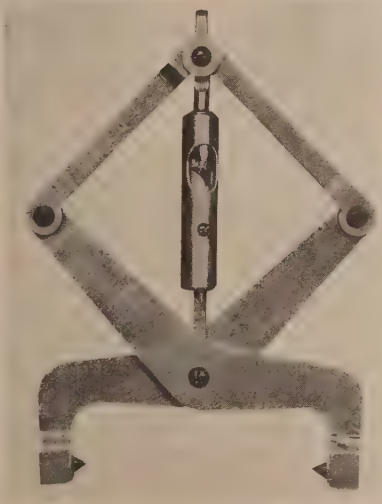
A WELDER for the flash butt welding of the seams of steel barrels has been developed by the Federal Machine & Welder Co., Warren, Ohio. The illustration shows it in operation. It is rated to weld a seam 40 in. long in No. 12-gage metal and, by means of a regulating coil, to weld the same length seam equally well in No. 24, or any intermediate gage. It can handle barrels or tanks from a minimum diameter of 14½ in. at a rate of 60 to 100 an hour.





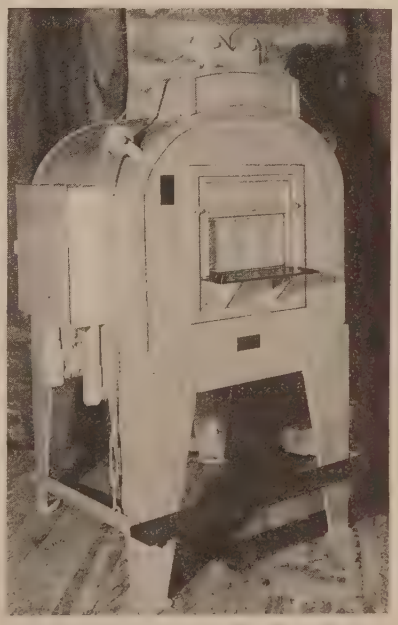
Electric Heat-Treating Furnace

ONE of the new furnaces, brought out by the Century Co., Taunton, Mass., No. 3 Model HS furnace, is here illustrated. It will be exhibited at the company's booth during the National Metal Congress. Temperatures for which it is rated range between 1200 and 2400 deg. Fahr. Features include the manner of wall insulation, door construction and terminal design.



Tongs Without Any Parts

THE tongs here illustrated, for hot and cold steel ingots, molds, slabs, etc., and for handling large bales, are made by the Heppenstall Forge & Knife Co. of Pittsburgh, from heat-treated alloy steel. They can be suspended from a hoist by single rope by means of which they are manipulated. They can also be operated by the crane man.



vice-president and general manager; L. H. Whiteside, C. M. Conner, J. F. Sweeney, A. A. Cash, O. G. Voss, T. A. Meyer, Charles Peterson, H. Klouman, E. Whiteside.

James Clark, Jr., Electric Co., Louisville, Ky. Booth 365.

Clark Tructractor Co., Battle Creek, Mich. Booth 102.
Clark 5-ton Truclift, gas powered industrial lift truck; Clarktor Tructractor, 4-wheeled, gas powered factory tractor, equipped with self-starter, generator, lights, etc.; Clarkat Tructractor, 3-wheeled, small tractor with turning radius of 51 in.; Whale auto end dump Tructractor, capacity 30 cu. ft. or two tons. Represented by: C. E. Staninger, Everett M. Sharp, R. J. Burrows, president; C. I. Ucker, G. A. Smith, special representative.

Cleveland Twist Drill Co., Cleveland. Booths 408, 409, 425 and 427.
Two high speed drill presses demonstrating Cle-forge high speed drills at various speeds and feeds; complete display of tools including high-speed drills and reamers tipped with tungsten carbide. Represented by: W. E. Caldwell, J. B. Dillard, H. P. Jenson, H. G. Smith, W. C. Weidig, G. Burkhardt, Alfred Jacquin, T. F. Mummery, H. E. Bergquist, Thomas Thomas, E. P. Horan, I. P. Farnum, R. D. Boltey, D. D. Burdett, C. F. Petzinger, T. Skove.

Climax Molybdenum Co., New York. Booth 4.
Molybdenum in all forms. Represented by: B. F. Phillipson, president; J. B. Thorpe, assistant to president; W. P. Woodside, J. Kent Smith, H. P. Furlong, R. L. Rolf, George O. Loeffler, Alan Kissock.

Clipper Belt Lacer Co., Grand Rapids, Mich. Booth 80.
Clipper belt lacers, all models, including the new Clipper speed lacers, Clipper belt cutters with safety features, Clipper belt hooks, electrically operated Clipper ship. Represented by: Earl H. Forsyth.

Coats Machine Tool Co., Inc., New York. Booth 29.
Complete line of Krupp Mikrotast gages made by the Krupp Steel Works of Germany, for internal and external gaging; light contact Krupp Mikrotast for gaging fine wire exhibited for the first time in United States, Krupp Mikrotast grinding gages for use on cylindrical grinders while in operation. Represented by: Charles E. Coats, treasurer.

Colonial Steel Co., Pittsburgh. Booths 10, 12, 39 and 41.
Ohio, a new high-carbon high-chromium air hardening die steel; Colonial No. 7, a special carbon-vanadium crucible-made tool steel; Red Star, a carbon tool steel; stainless irons and steels; high-speed, alloy and carbon tool steel sheets; high-speed, alloy and carbon tool steel rings, disks and special forgings; copper-clad, ground rods and line material; hot rolled special shapes; plow steel, soft center; jail bar and safe steel; mining drill steel, solid and hollow; special die blocks. Represented by: R. C. McKenna, president; Floyd Rose, vice-president; Lawrence Wood, sales manager; J. P. Gill, N. B. Hoffman, H. M. Bray, George Morrison, F. L. Stevenson, R. W. Harris, Charles Schnibble.

Colt's Patent Fire Arms Mfg. Co., Hartford, Conn. Booth 437.
Two types of Colt Autosan. A two-tank conveyor machine as furnished for a nationally known bearing manufacturer, embodies many outstanding Colt Autosan features. Represented by: George Webb, H. S. Seiferman, C. M. Jackson, G. E. MacMannus, F. R. Murphy.

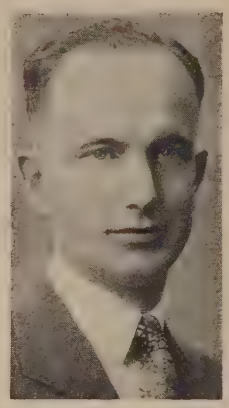
Columbia Tool Steel Co., Chicago Heights, Ill. Booth 62.
Alloys, tool steel, ingots, etc. Represented by: Arthur T. Clarage, president; G. C. Beebe, W. G. Sonderman, E. D. Roberts, E. W. Luecht.

Crucible Steel Co. of America, New York. Booths 38, 40, 42 and 63.
Corrosion-resisting articles, indicating the possibilities of this type of material for various purposes. Represented by: B. F. Hufnagel, president; J. A. Mathews, A. T. Galbraith and J. M. McComb, vice-presidents; H. L. Gellinger, auditor; R. Michener, general sales agent; R. E. Christie, assistant general sales agent; J. P. Jayme, E. P. Gaffney, R. H. Heatley, F. E. Phelps, R. W. Crane, M. S. Dravo, R. C. Webster, J. T. Carroll.

D

Dardelet Threadlock Corporation, New York. Booth 276.
Vibrating machine; bolt threader; nut tapper; test specimens; samples of taps and dies; exhibition of various uses of the Dardelet thread; samples of nuts and bolts. Represented by: A. Morris Thomson, vice-president; Charles J. Gass, Major William E. Hoke, Norman C. McLoud.

Darwin and Milner, Inc., Cleveland. Booths 66 and 87.
Full line of tool steels with specimens of dies and samples of work done; cast dies, etc., made from patent Cobaltcrom steel; full line of magnets made from cobalt magnet steel; hacksaw blades; other special steels, etc., from English works, Darwins, Ltd., Sheffield, England; Darwin safety razor blades made from patent Cobaltcrom tool steel. Represented by: Victor F. J. Tlach, John C. Koch, Harry L. Harrison, C. F. Lear, Max Opp, Herman O. Baberadt, H. J. Burnett, C. A. Bowman, H. R. Bowman, Jr.



H. B. KNOWLTON
Chairman
Fort Wayne Group

GEORGE M. NAUSS
Chairman
Washington-Baltimore Chapter

Dearborn Chemical Co., Chicago. Booth 92.
Samples and literature pertaining to No-Ox-Id rust preventive; Dearborn cleaners; Dearborn feed water treatment. Represented by: E. M. Converse, C. A. Remsen, J. A. Crenner, C. I. Loudenback, E. H. Ruhlman.

A. P. De Sanno & Son, Philadelphia. Booth 376.
Radiac cut-off machines for cutting materials with the use of an abrasive wheel; No. 1 machine for solid stock up to 1¼ in. in diameter; No. 1A machine for solid stock up to 2 in. in diameter. Represented by: A. P. De Sanno, Sr., Alphonso De Burnay, Benjamin G. Hardy, L. C. Buckingham.

Detroit Alloy Steel Co., Detroit. Booth 326A.
Wood patterns used in manufacturing Dasco alloy tool castings; Dasco alloy tool steel castings as cast; and pressed metal dies made of Dasco alloy tool steel. Represented by: Hugh Martin, president; H. H. Wyatt, secretary-treasurer; H. F. Kluender and W. A. Spindler.

DeWalt Products Corporation, Leola, Pa. Booth 320.
DeWalt "Wonder-Worker," a portable electric woodworker for maintenance and general construction, also for specialized woodworking operations such as cross-cutting, ripping, dadoing, mitering, tenoning, shaping, etc.; DeWalt "Wonder Metal Worker," the new circular saw method of cutting seamless and welded steel tubing and formed metal products; DeWalt jointer, a 6-in. jointer with 44-in. table. Represented by: Paul Gardner, president; Robert H. Mulch, general sales manager; L. J. McLaughlin, J. C. Mann.

Donner Steel Co., Inc., Buffalo. Booth 412.
Cold drawn bars and die rolled parts. Represented by: W. F. Vosmer, vice-president; A. G. Greenamyer, general superintendent; C. A. Cherry, assistant to vice-president; D. G. Baxter, assistant general superintendent; R. E. Sherlock, W. C. Peterson, L. C. Miller, F. H. Lammert, P. M. Guba, H. C. Richardson, E. D. Pumphrey.

Driver-Harris Co., Harrison, N. J. Booths 64 and 65.
Nichrome castings, retorts, carburizing boxes, pots, pyrometer tubes, furnace parts and other castings for heat resisting purposes; Nichrome B for addition to cast iron; Nichrome sheet carburizing containers; samples of intricate castings made of Nichrome; Nichrome wire for use as elements in industrial furnaces and other heat-resisting applications. Represented by: F. L. Driver, Jr., president; S. M. Tracy, treasurer; Harry D. McKinney, general sales manager; G. A. Lennox, assistant sales manager; W. E. Blythe, L. H. Waldrip, J. C. Bilek, J. C. Henderson, J. B. Shelby.

Duraloy Co., Pittsburgh. Booth 208.
Recuperator on rod heating furnace; typical Duraloy-Sklovsky units operating with gas; model of Kathner normalizing furnace and Conklin sheet piler; section of typical sheath-type shaft; Y-valves; miscellaneous pipe fittings; cast impeller; hearth plate; rolling mill guides. Represented by:

Chairman
Worcester Chapter

C. P. Mills, chief engineer; E. S. Lawrence, metallurgist; and H. Hobbs, district representative.

Duriron Co., Inc., Dayton, Ohio. Booth 359.
New No. 80 Duriron centrifugal pump operating to show self-priming feature; new Duriron "Y" valve, plunger release valve, Duriron-Nordstrom valve, standard valve, Duriron pipe and fittings, Duriron fan, Duriron circulating steam jet, tank outlets, etc.; Durimet welded tank for pickling and Durimet material in the form of sheet and bars. Represented by: E. B. Thacker, W. B. Earnshaw, M. W. Smith, R. Rourke, E. D. Brauns.

E

Eastman Kodak Co., Rochester, N. Y. Booth 5.
X-ray negatives and photographs of castings showing internal flaws detected by the use of X-rays in the examination of these materials. Represented by: E. E. Smith.

Eclipse Fuel Engineering Co., Rockford, Ill. Gas section.
No. 245 oven furnace, hearth 24 x 48 in. complete single valve control and automatic temperature control, gas operated; injectors and burners of various kinds for gas; gas forge; high pressure gas; gas high-speed steel furnace; blast boiler; automatic shop room furnace; several gas-fired automatic boilers; and pressed steel pot display. Represented by: O. M. Olsen, sales manager; Kurt A. Scharban, works manager; D. A. Campbell, O. N. Sellers, E. A. Stoner.

Birger Egeberg, Meriden, Conn. Booth 410.
Volumetric carbon determination apparatus—determinations to be made in 3½ min.; optical pyrometer, vest-pocket size; and quick acting laboratory balance. Represented by: Birger Egeberg, manager.

Electric Steel Founders' Research Group, Chicago. Booths 89, 91, 93.
Representative small and medium-sized steel castings of carbon or common steels, and alloy or special steels, made in electric furnaces; physical test specimens, physical test report data; and photographs showing group plant equipment and operations. Represented by: R. A. Bull, director; C. N. Ring, assistant director; and representatives of group companies.

Electro Alloys Co., Elyria, Ohio. Booths 348 and 385.
Thermalloy castings of various types such as used in electric furnace construction and heat treating department equipment. Represented by: W. J. Hansen, H. P. Miller, A. M. Miller, Jr., J. W. Henry; J. B. Thomas, treasurer; A. L. Garford, president; W. C. Whyte, vice-president.

Electro Refractories Corporation, Buffalo. Booth 15.
Silicon carbide brick, in various shapes; high temperature cement; and Mag-NO-Spall brick (new electrically fused non-spalling magnesite brick); Tercod crucibles; Buffalo patch cement. Represented by: L. U. Milward, president; and C. A. Asher, vice-president; G. S. Diamond, works manager; C. L. Miller, C. F. Leitten, C. B. Davis, Jr., T. W. Campbell, D. B. Milward.

Elkon, Inc., Division of P. R. Mallory Co., Inc., Indianapolis. Booths 259 and 260.
Welded Ford A chassis on which are 1139 welds, 95 per cent of which are made with Elkonite dies and electrodes; Elkonite tip for the Brewster etchograph machine in demonstration. Represented by: A. O. Brauen, general sales manager; E. W. Brewer, L. F. Crease, C. R. Frede, J. F. Jenks, E. O. Oberdick, G. V. Rocky, G. N. Sieger, J. A. Tolelk, R. R. Tomkins, J. A. Weiger.

Ellwood Ivins' Steel Tube Works, Philadelphia. Booth 410.
Seamless steel tubing; seamless aluminum tubing; seamless duralumin tubing; and seamless alloy tubing. Represented by: Horace S. Kircher, vice-president; Stanley Jeffries, Henry W. Avery.

Endicott Forging & Mfg. Co., Inc., Endicott, N. Y. Booth 90.
Steel drop forgings used in airplane, automobile and machinery fabrication. Represented by: S. J. Marshall, president; T. B. Kelday, superintendent; George B. Reed, sales manager.

Enduro Nirosta Committee. Booth 11.
Applications of Krupp Nirosta steel in various fabricated forms. Represented by: Central Alloy Steel Corporation, Massillon, Ohio; Ludlum Steel Co., Watervliet, N. Y.; and Babcock & Wilcox Tube Co., New York City.

Evans-Wallower Zinc Co., New York. Booth 397.

F

Falls Electric Furnace Corporation, Buffalo. Booth 341.
General heat treating furnaces of box type for temperatures up to 2000 deg. Fahr., one for operation from tool room bench and one hearth type of larger size cold for inspection; sample sections of Falls full-formed radiating sheet units. Represented by: H. J. McCauley, president; J. R. Eves, vice-president; and T. J. Llewellyn, salesman.

Federal Machine & Welder Co., Warren, Ohio. Booths 226 and 228.
One standard No. 1 portable butt welder which can be used in standard 110-volt circuit for welding up to 1/16 gage wire; one semi-automatic type 2-A butt welder capable of welding up to ⅝-in. round or equivalent cross section; one automatic type No. 60 butt welder capable of welding up to 1¼-in. round or equivalent cross section; one automatic Junior spot welder, a standard production machine on light gage material making from 60 to 120 spots per min.; 1-612-B heavy duty full automatic spot or projection welder. Represented by: H. L. McCreery, J R. Kilpatrick, sales manager.

R. Y. Ferner Co., (United States and Canadian representatives of Societe Genevoise d'Instruments de Physique, of Geneva, Switzerland), Washington, D. C. Booth 374.
Swiss jig borer No. 4; Micro-indicator tubes and stands for high-precision measurements in inspection work; universal measuring machine; measuring microscopies of high precision. Represented by: R. Y. Ferner, proprietor; Fernand Turrettini, director general of Societe Genevoise; Walter S. Ryan, John Cetrule, Lambert Neff and Charles T. Ameel.

Ferry Cap & Set Screw Co., Cleveland. Booth 211.
Hardened and ground spring bolts; alloy steel parts used in automobile engines; special automatic screw machine parts; standard cap and set screws; and Ferry patent acorn nuts. Represented by: H. D. North, vice-president; H. B. Pulsifer, E. W. Ferry, E. G. Greene, H. A. Keith, William Murphy.

A. Finkl & Sons Co., Chicago. Booth 77.
Photographs of plant equipment and products. Represented by: E. H. Graham, T. P. Wallace, J. M. Curley, W. H. Rieger, J. C. Vance, C. E. Finkl, general manager; Fred Finkl, secretary; Frank Finkl, general superintendent; William Finkl and M. R. Chase.

Firth-Sterling Steel Co., McKeesport, Pa. Booths 69 and 71.
Special lathe designed for operating at exceptionally high speeds on which cutting demonstrations with Dimondite, the new tungsten carbide cutting material, are being carried on. Represented by: L. Gerald Firth, general manager; D. G. Clark, director of sales; Robert S. Stevick, works manager; G. J. Comstock, O. K. Parmiter, A. S. Martin, C. G. Thoma, A. E. Barker, O. T. Smith, H. I. Moore, E. T. Jackman, G. A. Jacobs, W. C Royce, W. J. MacFarland, J. V. Little, R. F. Kimber, F. N. Mead, I. Olsen, Harry Jarvis, Fred Jarvis, G. R. Bunting, J. Johnson and W. A. Ruppel.

Flannery Mfg. Co., Pittsburgh. Booth 366.
Various sizes of Niclad pots for use in the heat treating, annealing and cyaniding of steels. Represented by: J. Rogers Flannery, president; E. G. Flannery, H. D. Tietz, G. R. Greenslade, and John J. Kenney.

J. B. Ford Co., Wyandotte, Mich. Booth 76.
Wyandotte metal cleaners for cleaning before all finishing

operations; metal cleaners for cleaning before handling, assembling and inspection, and for removing japan, lacquer, paint, etc.; metals cleaned with Wyandotte metal cleaners will also be exhibited. Represented by: B. N. Goodell, W. M. Cole, George J. Lawrence, S. H. Renton, C. S. Tomkins, L. C. Warden, and C. R. Beaubien.

Fort Pitt Steel Castings Co., McKeesport, Pa. Booths 89 and 91.
Electric steel castings.

Fusion Welding Corporation, Chicago. Booths 315 and 317.
Line of equipment and supplies for fusion welding and cutting. Demonstrations will be conducted continuously, showing the work which can be done with the various special wires in the extensive Weldite line of welding rods. Various types of Fuzon arc welders will be shown in operation. Many unusual welding operations will be presented, such as the production of abrasion resistant deposits, corrosion resisting deposits, high speed work and high strength. The Carbo-Flux process of welding will be demonstrated. Represented by: J. B. Green, president; L. F. Collins, sales manager; E. J. Shuler, R. W. Holt, J. W. Wolcott, F. O. Weber, Jack McLean and R. F. Beazell.

G

Garlock Packing Co., Palmyra, N. Y. Booth 339.
Complete line of mechanical packings. Represented by: R. W. Perkins, B. B. Franklin and C. E. Hermansader.

Gas Products Co., Cleveland. Booth 239.
Oxygen and acetylene gas supplies and welding supplies. Represented by: S. M. Wells, manager.

Gathmann Engineering Co., Baltimore. Booth 1.
Ingot mold designs for improving surface of ingots; etched ingot sections; motion pictures illustrating ingot solidification. Represented by Emil Gathmann, president; G. A. Dornin and Mark Gathmann.

Gehnrich Oven Co., Inc., Long Island City, N. Y. Gas Section.
Automatic conveyor oven for japanning and enameling. This unit has a two-strand return pass conveyor provided with dip tank and drain board and heated by Gehnrich indirect gas system. Represented by C. L. Gehnrich, president; A. V. Maday, vice-president; W. Gehnrich, vice-president; H. P. Rasmussen and Herman Gehnrich.

General Alloys Co., Boston. Booths 32 and 53.
Full line of nickel-chromium heat treating containers and furnace parts made from Q-Alloys; carburizing boxes; cast, all sheet, combination cast bottom sheet body, combination corrugated sheet sides and cast corners (Patented); carburizing tubes; lead, salt and cyanide pots; supporting rings; cyaniding baskets; grid trays; full line of Link-Belt Q-Alloy chain for operation at high temperatures; also Q-Alloy point bars for vitreous enameling. Represented by: H. H. Harris, president; W. K. Leach, general manager; G. C. McCormick, chief engineer; W. R. Blair, F. J. Blaney, J. J. Baum, J. J. Donovan, W. A. Toohill, A. L. Grinell, J. H. Abbott, R. M. Kirk, Ralph Hare, H. G. Chase, E. R. Dougherty, C. E. Malley, J. C. Van Arman and R. N. Graves.

General Electric Co., Schenectady, N. Y. Booths 256, 257, 258, and 319, 321, 323.

Gibb Welding Machines Co., Bay City, Mich. Booth 237.
Spot welders; welding presses and Gibseamers (electric seam welders). Announcement and display of several new principles never before applied to electric spot and seam welding. Represented by: W. H. Gibb, president; C. E. Shearer and W. O. Little.

Globar Corporation, Niagara Falls, N. Y.
Ten kw. high temperature electric heating elements in actual operation in a special furnace constructed for the purpose. Represented by: A. H. Heyroth, general manager; K. E. Rogers, sales manager; B. A. Bovee, chief engineer; W. S. Evans and N. H. Berry.

H

Halcomb Steel Co., Syracuse, N. Y. Booths 59 and 61.
Aircraft parts; tool alloy; non-corrosive and special steels and alloys. Represented by H. A. Pardee, H. J. Stagg, J. T. Leyden, S. C. Spalding, J. F. Kirwan, Arthur Schroeder, Howard Hinkley, T. F. Wood, Harold Barlow, Allan Fraser, Leslie Hawkridge and Lee Evans.

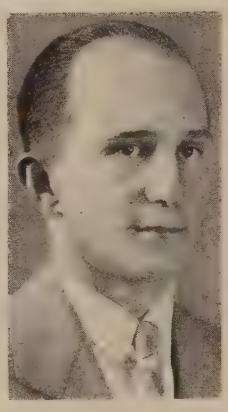
Harrington Co., Philadelphia. Booth 433.
Harrington hoists and trolleys; Peerless spur geared hoists; Harrington screw hoists; Harrington differential hoists; Harrington electric hoists. Represented by: R. E. Bishop, secretary and sales manager; I. E. Bauer and J. A. Slaughter.

Harris Calorific Co., Cleveland. Booth 234.
Multi-stage welding regulators; approved welding torches of various designs and models; gas welding and cutting equipment; high temperature gas apparatus of various kinds; complete line of general accessories for welding and cutting metals. Represented by: J. M. Mathews, secretary and general sales manager; S. A. Oviatt, W. J. Krull and Otto Fathauer.

C. I. Hayes, Inc., Providence, R. I. Booth 390-A.
Electric Globar furnace for heat treating high-speed steel tools and equipped with attachment for furnace atmosphere control. Represented by: C. I. Hayes, chief engineer; J. E. Hines, sales manager; and C. G. Paulson.

Haynes Stellite Co., Kokomo, Ind. Booth 230.
Haynes Stellite cutting tools; demonstrations of Stelliting with Haynes Stellite welding rod; and Haystellite cutting tools. Represented by: F. P. Gormely, vice-president and general manager; F. T. McCurdy, assistant superintendent; W. A. Moore and E. E. Gordon.

Heppenstall Forge & Knife Co., Pittsburgh. Booth 82.
Complete working model of Gellert lifting tongs especially designed for the lifting of die blocks without the assistance of a man guiding the operation; shear knives; section of split ingot showing hard quality in EIS steel; Hardtem die block. Represented by: C. W. Heppenstall, president; B. B. Weinberg, vice-president; J. A. Succop; R. B. Heppenstall, vice-president; George I. Allen; F. C. Moyer, vice-president Heppenstall Steel Co.; George O. Desautels; Carl J. Sauer, manager Heppenstall Forge Co., Bridgeport, Conn.; A. J. Porter, Jr., sales manager Heppenstall Forge Co.; A. L. Wurster and L. A. Daines.



ADAM M. STEEVER
Chairman
Chicago Chapter

R. H. PATCH
Chairman
Philadelphia Chapter

E. F. Houghton & Co., Philadelphia. Booths 354, 355, 371 and 373.

I

Illinois Steel Co., Chicago. Booths 58 and 79.
Motion picture showing the basic processes of making steel and illustrating in detail the operations of the electric furnace and alloy steel departments at the South Chicago plant. Represented by: W. I. Howland, Jr., assistant general manager of sales; R. Korsan, J. H. McKown, A. R. Williard, R. G. Glass, F. B. Mulvaney, E. Davidson, Fred W. Bendell, C. R. Moffat, James R. Mills, manager of sales, Cleveland; G. A. Price, G. Landrus, J. Hornbrook, W. H. Brainard, C. E. McIntyre, R. C. O'Neill, H. W. Parker, W. S. Saylor, C. T. Siebert.

Index Machinery Corporation, Cincinnati. Booth 360.
Huster filing and sawing machine, a tool especially designed

THE IRON AGE will occupy booth 372 at the Steel Treaters' Exposition. Members of the editorial, advertising, sales promotion and subscription departments will be present. Copies of THE IRON AGE and reprints will be available.

for the making of dies and odd shaped parts. Represented by: Joseph F. Geers, president and general manager; James J. Dillon, Max A. Knorpp.

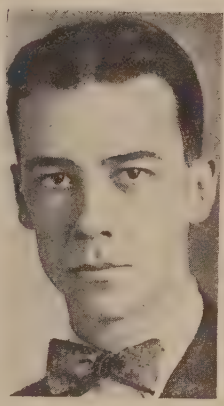
International Nickel Co., Inc., New York. Booth 94.
Display material to illustrate the use of nickel and nickel alloys in industrial applications. Represented by: T. H. Wickenden, Charles McKnight, H. J. French, N. B. Pilling, F. B. Coyle, J. S. Vanick, C. A. Crawford, R. J. McKay, T. J. Wood, O. B. J. Fraser, J. W. Sands, A. L. Roberts, D. E. Ackerman, R. L. Suhl, R. A. Wheeler, L. Muller-Thym, E. J. Bothwell, H. C. Armstrong.

Interstate Iron & Steel Co., Chicago. Booths 52 and 73.

Irwin Lumber Co., Erie, Pa. Booth 338.

J

William Jessop & Sons, Inc., New York. Booth 23.
Reception, description and distribution of matter pertaining to product of company. Represented by: F. C. A. H. Lantsberry, president; Robert Ross, secretary; C. L. Bailey, Hans Johnson, G. J. MacQuarrie, H. S. Norman, L. H. Cummings.



A. W. GROSVENOR
Chairman
St. Louis Chapter

WALTER L. TRUMBAUER
Chairman
Lehigh Valley Chapter

Jessop Steel Co., Washington, Pa. Booth 8.
Tool steel bars; fractured pieces and microscope for examination; finished dies and parts made for our tool steels; display boards of cold rolled strip steel, razor blade steel; stainless steel articles and parts; finished cutlery display boards both stainless and carbon steel of Jessop manufacture; evolution of finished saws, displaying various steps from the raw material to the finished tool. Represented by: S. A. Grayson, president; R. E. Emery, vice-president; F. T. Youngman, secretary-treasurer; R. J. Murray, V. M. Wellman, D. J. Hanna, A. G. Lambert, W. A. Salt, C. M. Cunningham, W. J. Frederick, and J. C. Dawson.

Johns-Manville Corporation, New York. Booth 395.
With the merger of the Johns-Manville Corporation and Celite Products Co., insulation display covers the complete field in high temperature and low temperature insulation. Display includes building materials, such as asbestos shingles, Transite, industrial flooring, etc., and a complete line of packings. Represented by: Eugene Dowling, G. E. Grimshaw, J. W. Blenmker, R. S. Hemmingson.

Jones & Laughlin Steel Corporation, Pittsburgh. Booths 55 and 57.
Hot-rolled and cold-finished steels, including Jalcase steel parts, cold-finished steel sections, light weight channels, junior beams, steel piling, tubular products and other items of interest. Represented by: W. B. Todd, manager of sales, cold-finished sales department; J. D. Allen, C. C. Henning, J. H. Flaherty, W. R. K. Scott, H. W. Graham, E. A. France, J. G. Hutchinson, A. A. Wagner, assistant manager of sales, hot-rolled sales department. From Higgins-Bothwell Co., Detroit: W. J. Bothwell, J. T. Ferris, J. W. Robinson, R. W. Light, W. E. Danz.

K

K-G Welding & Cutting Co., Inc., New York. Booth 262.
Generators, oil burning equipment; all types of welding, gas welding and cutting torches; new style "K" oxygen and acetylene regulators. Represented by: William D. Flannery, E. Brass, H. H. Kress, William Munn, P. Noren, John Evans, A. W. Carr.

Keller Mechanical Engineering Corporation, Brooklyn. Booths 407 and 429.
A type BL Keller full automatic tool room machine, equipped with two-template rigging and attachment for locating and jig boring; a type R-6 Keller cutter and radium grinder; a KELLocatER complete unit with overarm and improved spindle (power feed); the line of Kellerflex flexible shaft machines, including the new 1 HP outfit. Represented by: S. A. Keller, treasurer; A. S. Keller, advertising manager; Henry Schreiber, Charles Bitter, P. C. Renno, W. L. MacRae, E. D. Ashley, Arthur Jenner, Paul Loewenberg.

J. W. Kelley Co., Cleveland. Booth 68.
Beacon brand products including carburizing compounds; lead pot carbon; annealing carbon; quenching oil; tempering oil; industrial oil; heat treating salts; and tempering salts; Greene quenching and washing machine. Represented by: J. W. Kelley, president; J. E. Burns, vice-president; H. B. Northrup, secretary; P. E. Holder, H. M. Webb, P. J. Myall, J. H. Hopp, C. F. Boyd.

Kelley-Koett Mfg. Co., Covington, Ky. Booth 314.
X-ray apparatus for fluoroscopic and radiographic study of metals, also assortment of films showing results of radiographic tests. Represented by: W. S. Werner, secretary and chief engineer; Dr. Hahn and H. C. Steadman.

C. M. Kemp Mfg. Co., Baltimore. Gas Section.
Improved Kemp system for the industrial utilization of natural or artificial gas, burner equipment adaptable to all industrial process heating supplied by this Kemp system is displayed; Nash motor operated similar to the "block test" at the Racine plant is also shown. Represented by W. M. Ponder, R. S. Van Note, W. S. Bassett, F. H. Andrews, William Hunt and E. B. Dunkak, sales manager.

Charles F. Kenworthy, Inc., Waterbury, Conn. Booth 327.
Pictures of various installations; and samples of annealed products. Represented by: C. F. Kenworthy, president; H. A. Kenworthy, general manager; R. E. Worthington, R. N. Griswold.

Keystone Lubricating Co., Philadelphia. Booth 3.
Keystone safety lubricating system including the new Keystone pneumalectric lubricating system, which provides for completely automatic operation. The pressure is maintained by a motor compressor set which delivers grease to a rotary distributor, from which lines lead to the various bearings of a machine unit. Represented by: G. W. Hall, Philip King, Vic. Berguson, R. McDaniel, M. C. Schwenk.

L

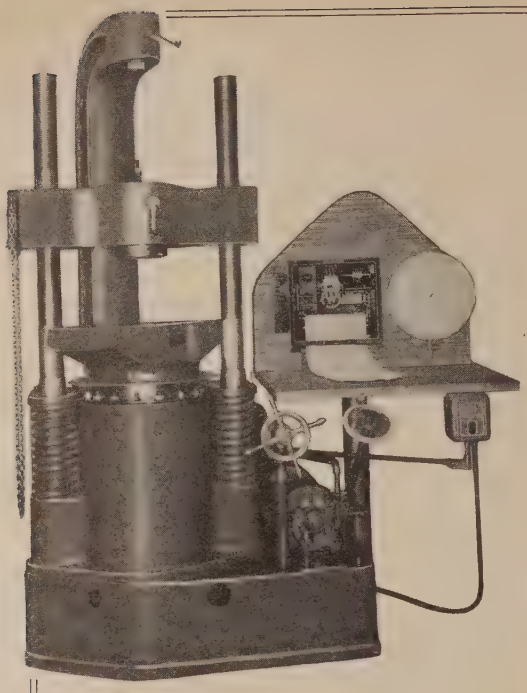
Lakeside Steel Improvement Co., Cleveland. Booth 6.
Photomicrographs and fractures of various grades of steel treated and untreated; heat treated parts, such as motor blocks, drive shafts, axle shafts, connecting rods, pistons, skid chain, bolts and nuts and various automotive parts, besides a collection of airplane parts which were heat treated at the plant of the Lakeside Steel Improvement Co., such as connecting rods, airplane struts, boomracks, ratchets, clevises and turn buckles. Represented by: C. W. Derhammer, president; R. T. Morrow, vice-president; R. L. Rolf, secretary and metallurgical engineer; John Hume, Jr., assistant metallurgical engineer.

Lava Crucible Co. of Pittsburgh, Pittsburgh. Booth 60.
Full line of the various types of super-refractories in standard brick, standard tile, special shapes, plastics, cement and graphite crucibles. Represented by: Furman South, Jr., president; H. E. White, D. E. MacLean, R. P. South, C. H. Knappenberger.

E. J. Lavino & Co., Philadelphia. Booths 349 and 350.
Many varieties and grades of chrome ores from all parts of the world, in the crude and ground form; "Lavino" chrome, magnesite and silica brick; Kromepatch, multi-bond refractory cement; Neutragrog, a chemically neutral aggregate for monolithic construction; plastic K-N chrome, a prepared chrome product ready for molding in place. Represented by: R. E. Griffith, A. DeMacedo, J. B. Luckie, R. C. Hanson, W. C. Holzworth, H. W. Pigott, P. S. Haserodt.

Lebanon Steel Foundry, Lebanon, Pa. Booths 89 and 91.
Electric steel castings.

Leeds & Northrup Co., Philadelphia. Booths 353 and 375.
Automatic temperature controllers; pyrometers; temperature recorders; temperature indicators; portable precision potentiometers; portable temperature indicators; thermocouples; miniature Hump furnace and Leeds and Northrup potentiometer; miniature Homo furnace and Leeds and Northrup potentiometer pyrometer. Represented by: H. Brewer, A. F.

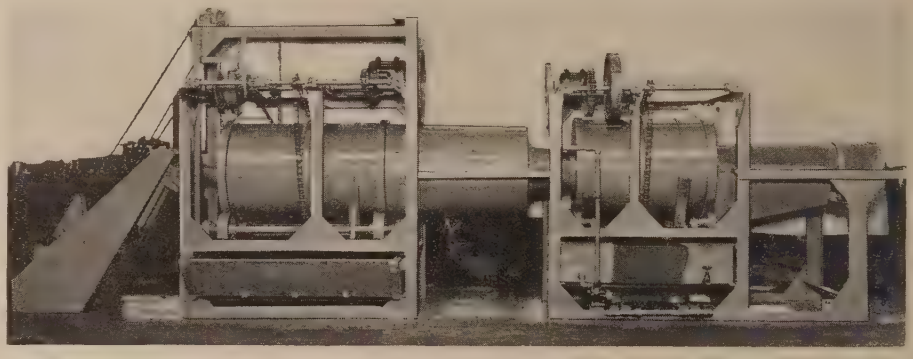


Testing-Machine Recorder

A NEW testing-machine recorder has been developed by the Southwark Foundry & Machine Co., Philadelphia, in conjunction with the Leeds & Northrup Co., also of Philadelphia. This equipment, as illustrated, draws on an enlarged scale an accurate stress-strain diagram of materials tests, showing the critical points in great detail. The range of the recorder may be varied by changing the voltage of the electrical circuits. Both stress and strain are picked up by electric telemeters and transmitted through wires to the remote potentiometer recorder which is, in reality, a double recorder. Its initial appearance will be at the National Metal Exposition.

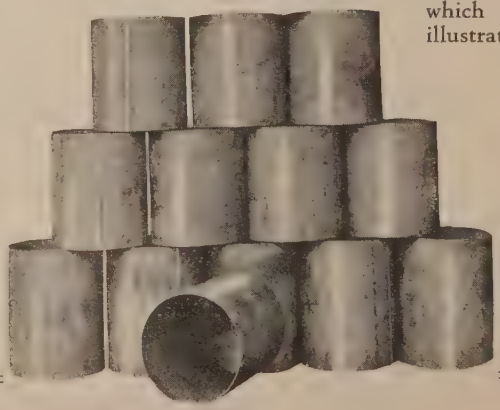
Ideal Acid Flotation Process Tumbler

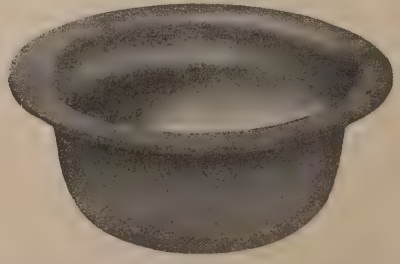
FOR removing scale from forgings, stampings and similar parts, N. Ransohoff, Inc., Cincinnati, will exhibit at its booth at the National Metal Exposition an acid flotation tumbling equipment.



Heat-Resisting Alloys

IN its booth at the National Metal Exposition, the Chicago Steel Foundry Co. of Chicago will exhibit its heat-resisting alloy known as Pyrasteel in the shape of castings designed for special purposes and old castings which have rendered exceptionally long service. The illustrations show some of the shapes in which the alloy containers for heat treating are made.



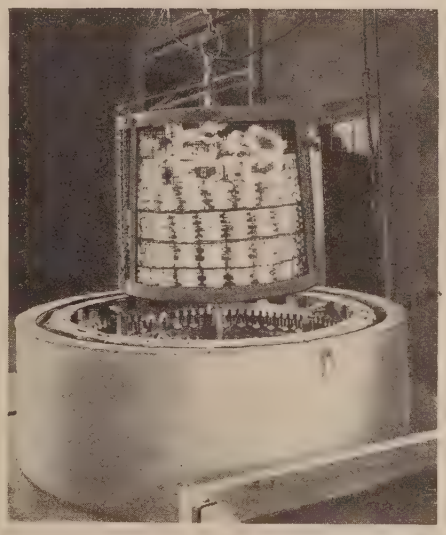


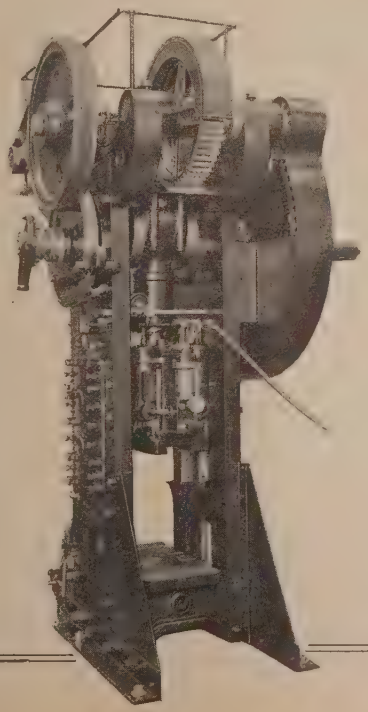
Electric Heat-Treating Department

FOR the manufacture of precision twist drills, reamers, cutters, etc., Whitman & Barnes, Inc., Detroit, has a heat-treating department here illustrated. Temperature and time are controlled automatically from a central station. The various tools are tested for hardness, and actual performance tests are run. A research department is also maintained.

Electric Furnace for Heat Treating Aluminum Alloys

A NEW furnace has been recently announced by the General Electric Co., Schenectady, N. Y., for heat treating aluminum alloys. It is a pit type, cylindrical unit. In a typical application of this furnace, shown in the illustration, a run of castings, weighing approximately 500 lb., plus a basket weight of 700 lb., both at room temperature, was placed in a furnace at a temperature of 900 deg. Fahr. In 1½ hr. the center of the charge was at the heat-treating temperature. The working dimensions are a diameter of 4 ft. and a depth of 6 ft.





A New Hydraulic Eccentric Press

AN eccentric press with a hydraulic pressure regulating device has been installed in a drop forging plant in the Chicago territory by Henry Pels & Co., 90 West Street, New York. The regulating device is designed to release the pressure automatically as soon as the permissible maximum is reached, which, on this particular machine, is 330 tons. The compression fluid will escape into the overflow tanks, the plunger will continue its movement without forcing the ram any further and, upon its return stroke, will draw the compression fluid back into the cylinder by suction, so that the machine can continue to work without interruption even after the overload protection device has operated. The press has been used for straightening automobile crank shafts.

Moranty, E. G. Estabrook, P. H. Taylor, G. W. Tall, A. E. Tarr, J. E. Korp, and T. C. Smith.

E. Leitz, Inc., New York. Booths 74 and 95.
Leitz micro-metallograph; Leitz metallurscope; Guthrie-Leitz grinding and polishing machine; line of Leitz microscopes of smaller size and numerous accessories. Represented by: R. Tvestmann, O. Soetbeer, S. Borell.

Lincoln Electric Co., Cleveland. Booth 224.
The new improved Lincoln "Stable-Arc" welder and the latest type of welding accessories and supplies. During exhibition, range boilers automatically arc-welded by the Electronic Tornado process of carbon arc welding. Represented by: A. F. Davis, vice-president; Maurice Taylor, T. P. Tarbell, B. F. Kessler, O. P. Hanchette, R. B. Tuhey, A. T. Smith.

Linde Air Products Co., New York. Booths 225, 227 and 229.
Complete line oxyacetylene welding and cutting apparatus and supplies; complete line welding generators; Carbic flood lights. Represented by: H. F. Buckley, T. C. Fetherston, H. H. Griffith, H. H. Dya, De W. Endicott.

Ludlum Steel Co., Watervliet, N. Y. Booths 22 and 51.
Enduro KA2 steel; nitralloy steel; tool steels; carbon and alloy; high-speed, die, chisel, non-shrinking oil-hardening, carburizing, ball bearing, permanent magnet, and heat-resisting steels; forgings, drill rods; shown in finished forms; rustless iron and steel; shown in finished forms; Straus metal, tungsten carbide cutting material, manufactured under license agreement with Carboloy Co. and under direct supervision and with benefit of original Krupp experience. Represented by: H. G. Batcheller, vice-president; F. B. Lounsberry, vice-president; J. E. Polhemus, A. F. Dohn, C. B. Templeton, H. A. DeFries, J. T. Norton, Ralph DeVries, A. K. Martin, C. W. Lindemuth, W. H. Vrooman, C. B. Boyne, K. G. Reynolds, W. Westover, W. H. White, T. C. Sherman, H. I. Askew, J. C. Gearhardt, H. Hardwicke, P. E. Floyd, G. F. Wilson, G. Peterson, G. D. Sleeth, W. P. Ehrenberg, P. R. Thurston, W. Kinsey, G. D. Howk, J. E. Jones, E. E. Sanborn.

M

Paul Maehler Co., Chicago. Booth 206.

Mahr Mfg. Co., Minneapolis, Minn. Booth 356.
Enlarged photographs, photostats and prints illustrating outstanding continuous furnaces, car-type furnaces and batch-type furnaces of standard and special design, installed in leading industrial plants of the country. Represented by: W. G. Barstow, sales manager; O. E. Ertl, chief engineer; D. H. Ruhnke, A. J. Nordenson, Minneapolis; B. G. Harmon, R. G. White, A. E. Stenzel, R. A. Ledebur, A. F. Tenney.

Manhattan Rubber Mfg. Co., Abrasive Wheel Department, Passaic, N. J. Booth 361.
Typical examples of parts ground with Manhattan rubber-bonded wheels. These include products of many large and well known manufacturers. They range from the rougher classes of work, such as manganese steel track castings, high speed billets, forgings, etc., to the finer operations such as cutlery, thin circular knives and high grade ball bearings. Represented by: W. H. Steinberg, C. M. Lawton, C. A. Fox, C. E. Forney, R. G. Brinkerhoff, Howard Pyle.

Marburg Brothers, Inc., New York. Booth 203.
Thiel precision die filing and sawing machines. Represented by: Theodore H. Marburg, president; O. P. Brett, Richard Krause, Herbert Zimmerman.

McCann-Harrison Corporation, Cleveland. Booths 273 and 289.
One model continuous conveyor beam furnace. Represented by: H. P. McCann, president; Robert L. Corbett, sales manager; Edward Busch and Charles L. Stuart.

Metal & Thermit Corporation, New York. Booth 236.
Heavy thermit welding samples and metal samples. Represented by: Henry D. Kelley.

Michigan Steel Casting Co., Detroit. Booths 87, 89 and 91.
Misco alloys in the form of castings, rolled bars, wire, and sheets—to show the possibilities of fabrication using the afore-mentioned, several fabricated pieces are shown, such as Misco combination cast base sheet wall carburizing boxes, dipping baskets, dipping racks, Hump furnace racks, etc. Represented by: F. J. Stanley, general manager; E. D. Flintermann, sales manager; J. D. Corfield, A. A. Gould.

Michiana Products Corporation—Chrobaltic Tool Co. Division, Michigan City, Ind. Booth 204.
Heat resisting and acid resisting castings, including the Fire Armor and Zorite alloy. Represented by: W. B. Sullivan, vice-president and general manager; L. H. Whiteside, C. M. Conner, J. F. Sweeney, A. A. Cash, O. G. Voss, T. A. Meyer, Charles Peterson, H. Klouman, E. Whiteside.

Midvale Co., Philadelphia. Booths 54 and 75.
Miscellaneous forgings, tool steel products and alloy steel

Schenectady Chapter

products. Represented by: A. C. Dinkey, president; Stuart Hazlewood, vice-president in charge of sales; H. L. Frevert, vice-president in charge of operations; Howard Myers, engineer of tests; J. R. Adams, superintendent special products; Francis B. Foley, research engineer; Henry Ziesing, assistant general sales manager; H. E. Rowe, bar steel sales manager; Walter B. Smyth, Fred W. Sager, Harvey Garrett, Robert M. Bird, Thomas Besom, Herbert Cox, J. H. Glass, L. C. Berkey, Harry Teel.

A. Milne & Co., New York. Booth 284.
Milne tool and die steels; hollow drill steel; solid drill steel; auger drill steel; special sections; MR Swedish Lancashire iron; Swedelec cold drawn electrical iron; Nohab anvils; forged tools; Wardlow's file steel; Wardlow's cutlery sheets; Prince ball bearing steel; Reynolds aircraft tubing. Represented by: V. A. Greene, general sales manager; Henry Sears Hoyt and J. King Hoyt, Jr., members of the firm; A. G. Reid, B. Brower, Miss K. E. McDonald, H. R. Adams.

Milwaukee Die Casting Co., Milwaukee. Booth 47.
Many sizes and shapes of tin, lead, zinc, and aluminum-base alloy die castings; also a die showing how die castings are made; working model demonstrating die cast gears are also in operation. Represented by: C. H. Frantz, sales engineer, and H. F. Schroeder, vice-president.

Morse Twist Drill & Machine Co., New Bedford, Mass. Booth 56.
High speed and carbon twist drills; reamers; milling cutters; taps and dies. Represented by: W. T. Read, vice-president and treasurer; F. O. Lincoln, vice-president, in charge of sales; R. F. Chase.

N

National Electric Light Association, New York. Booths 448, 449, 450, 451 and 452.
Photographs illustrating applications of electric furnaces to steel heat treating; this exhibit is sponsored by the industrial heating committee, and is of an educational nature. Represented by: J. L. Faden, chairman, industrial heating committee; Robert M. Keeney, vice-chairman; R. T. Kaighin, secretary; James H. Faulkner, Charles E. Russell, O. Wilhelmy, H. J. Hall, C. P. Yoder.

New Jersey Zinc Co., New York. Booth 414.
Endless chain of approximately 40 die castings of small and intricate design moving along front wall of booth. On center back wall is theater having about eight particularly interesting die castings of larger size. Also rolled zinc chromium plated and nickel plated, which is being used in many industries. Represented by: C. R. Maxon, S. E Maxon, R. M. Curts, R. Davidson, W. J. Keuhn, W. P. Hardenbergh, Jr.

Northwestern Mfg. Co., Milwaukee. Booth 234.
One 300-ampere arc welder; and one non-operating gasoline engine driven arc welder; also welding parts. Represented by: K. L. Hansen, F. A. Wilch, A. H. Friese.

Norton Co., Worcester, Mass. Booths 288 and 290.
High-speed grinding equipment; American electric furnace; Norton abrasive products; and Norton heavy refractories. Represented by: Robert Kirkpatrick, sales manager, refrac-

H. L. HOPKINS
Chairman
Case Group

H. F. DAVIS
Chairman
Ontario Chapter

tories division; H. A. Blackburn, K. H. Bird, A. R. Sandine, R. H. Cannon, A. T. Douglas, H. R. Swanberg.

Nugent Steel Castings Co., Chicago. Booths 89 and 91.
Electric steel castings.

O

Ohio Steel Foundry Co., Springfield, Ohio. Booth 278.
Fahrite, a heat resisting alloy for temperature up to 2200 deg. Fahr. Produced in a complete range of nickel-chromium and iron-chromium base alloys. Represented by: W. J. Gilmore, vice-president; W. J. Hayes, Jesse F. Monfils.

Tinius Olsen Testing Machine Co., Philadelphia. Booth 48.
A 100,000-lb. capacity Olsen 3-screw rotating gear nut-type automatic and autographic universal testing machine with automotive quick change eight-speed reverse gear box drive, complete with attachments for various forms of tests and latest extensometer equipment; Olsen combined impact tension and cantilever type (Izod type) of impact tester; Haight alternate stress testing machine for determining fatigue limit in tension and compression; Olsen direct motor-driven production type Brinell hardness tester; Herbert pendulum hardness tester with operating stand; Herbert direct motor driven production type "Cloudburst" hardness tester for hardness testing and also arranged for superhardening steel parts; Olsen direct motor driven production type ductility testing machine for determining the drawing quality of sheet metal; Olsen proving or verifying rings of various capacities; various types of strain gages and measuring instruments used in connection with testing equipment; Olsen-Lundgren dynamic balancing machine operating on centrifugal high tension spark principle; Olsen-Lundgren automatic weighting static balancing machine for statically balancing rotating parts. Represented by: T. Y. Olsen; R. B. Lewis; Jacob Lundgren; and Bruce L. Lewis.

P

Page Steel & Wire Co., New York. Booth 311.
Testing machines showing De Forest magnetic method of testing Page Armco welding wire for gas and electric welding. This machine is a development of the research department of the company and is a rapid non-destructive test method. Represented by: W. T. Kyle, J. J. Flaherty, C. A. McCune and W. L. Walsh.

Park Chemical Co., Detroit. Booth 15.
Case hardening compounds; cyaniding compounds; drawing salts; re-heating salts; lead pot covering; carbon preventer; lacquer rubbing compounds; masking compounds; and quenching and drawing oils. Represented by: Joseph N. Bourg, vice-president and general manager; J. C. Thompson, F. W. Faery.

Henry Pels & Co., Inc., New York. Booths 203, 205, and 207.
Type FV-55 big billet shear—capacity 5¼-in. cold steel bars; Type STAQ-16 gate shear—capacity 80-in. x ⅝-in. steel plate; Type Pg. 35 closed throat press—capacity 220 tons—equipped with dies for manufacture of spring leaves; Type BLUEFGA-22sp. combination punch, plate shear, angle, bar and tee cutter, with extra high punch throat for large H-columns and Bethlehem beams; Type MAE-16 combination punch, plate shear, angle, bar and tee cutter with built-in notcher—for medium capacities; Type ME-10 combination punch, plate shear, angle, bar and tee cutter with built-in Coper—for lighter capacities; Type EFG-16 angle, bar and tee cutter—capacity 6 x 4-in. angles, etc. Represented by: C. L. Martin, vice-president; T. F. Kane, E. E. Tailfer, and J. A. Weigand.

Permutit Co., New York. Booth 370.
Water softening and filtering equipment for industrial plants; Ranarex instruments for recording gas density, ammonia gas, etc. Represented by: H. M. Danner and H. M. Olson.

Pittsburgh Instrument & Machine Co., Pittsburgh. Booth 96.
Testing machines, Brinell testers—precision, production, power-driven and hand-operated; impact testing machine; sheet metal tester; metallographic grinder; Brinell microscope; depth indicator; proving ring; and for the first time direct-reading Brinell instrument attached to Brinell machine showing the diameter of ball impressions on a ground glass plate while the test load is applied. Represented by: Charles Trueg and Walter Kammerer.

Pressed Steel Co., Wilkes-Barre, Pa. Booth 410-A.
Complete line of Lite-Wate Rezistal carburizing and annealing boxes; welded and seamless formed containers. Seamless formed stampings of various grades of chrome and chrome-nickel alloys. Represented by J. H. MacVeigh, vice-president and sales manager; F. A. Schmidt, works manager.

Production Machine Co., Greenfield, Mass. Booth 306.
Type "A" centerless polishing and finishing machine (heavy duty); type "S" centerless polishing and finishing buffing machine; and type "R" combined disk-grinder and polishing machine. Represented by: W. S. Howe, president; A. H. Behnke, vice-president and sales manager; T. A. Welsh, superintendent.

Thomas Prosser & Son, New York. Booth 401.
Commercial tool grinder; Monarch lathe; Widia tungsten carbide lathe tools, planer tools, shaper tools, drills, reamers, milling cutters, boring and special tools. Widia tungsten carbide tools will be demonstrated cutting various materials at high speeds, speeding up production with corresponding reduction in costs. Represented by: R. D. Prosser, general manager; W. E. Guild, sales manager; E. R. S. Reeder, J. A. Deakin, J. Hugo Smith, H. B. Spaulding, H. E. Berry, L. N. Hall.

R

N. Ransohoff, Inc., Cincinnati. Booth 392.
Star return tumbling barrel; enlarged photographs of various jobs for descaling forgings, cleaning stampings, etc.; samples of work done by this equipment. Represented by: N. Ransohoff and D. M. Powers.

Reeves Pulley Co., Columbus, Ind. Booth 316.
Several different designs of the Reeves variable speed transmission, a compact, mechanical unit which is used in conjunction with any type of production machine or conveyor to provide the ability to secure infinite speed variation and adjustability. Represented by: Carl M. Reeves, vice-president, and C. L. Irwin.

George P. Reintjes Co., Kansas City, Mo. Booth 279.
Interlocking arch tile consisting of shapes that completely build any varying spans of roof and door arches over forging and heat treating furnaces. Represented by: George P. Reintjes.

Republic Flow Meters Co., Chicago. Booth 275.
New Republic control pyrometer; also complete exhibit of Republic flow meters, CO_2 meter and gas meters. Represented by: K. B. Roudebush, C. H. Tate, T. E. Bell, C. E. Pritchett, R. C. Ascher, E. Schneider.

Riehle Brothers Testing Machine Co., Philadelphia. Booth 100.
Vickers hardness tester; calibrating rings; Brinell machine; mirror extensometer reading to one hundred thousandth of an inch; and similar apparatus. Represented by: A. Fuller Riehle, vice-president and superintendent.

Stanley P. Rockwell Co., Hartford, Conn. Booth 404.
Rockwell dilatometer with inclosed panel attached to pit type electric furnace. The furnace is operated to demonstrate the simplicity of heat treatment by the Volcrit method. Portable quenching tank agitator which can be attached to practically any quenching tank as desired, and produces swirling action in the quenching medium or jet against the work being quenched. Represented by: Stanley P. Rockwell, president; and William A. Stumpf, sales manager.

John A. Roebling's Sons Co., Trenton, N. J. Booth 234.
Samples of welding wire. Represented by: R. R. Newell.

Roessler & Hasslacher Chemical Co., New York. Booths 19 and 21.
Complete line of chemicals used in the case hardening, heat

treatment, and heat coloring of steel; complete line of chemicals used in the electroplating of metals; demonstration of electroplating of copper, cadmium and zinc on steel; a demonstration of heat coloring of steel; demonstration of a new method for the approximate determination of cyanide in case hardening baths. Represented by: Walter M. Gager, Charles H. Proctor, Carl Dittmar and Carl Hamann.

Rotor Air Tool Co., Cleveland. Booth 343.
Portable pneumatic drills; grinders; sanders; and buffers. Represented by: H. P. Bailey, president; K. L. Pohlman, vice-president; W. G. Baily and C. B. Scott.

Ruemelin Mfg. Co., Milwaukee. Booth 326-A.
Sanitary sand blast cabinet complete; No. 5 exhaust-type fan; midget sand blast gun; operator's sand blast helmet; Junior sand blast generator. Represented by: H. A. Flitz and T. C. Tipper.

Rustless Iron Corporation of America, New York. Booth 93.
Articles made from rustless iron, such as automobile parts, bars, strip, sheets, wire, tubes, etc.; raw material—chrome ore. Represented by: Dr. M. H. Sommer and A. L. Grinell.

Ryan, Scully & Co., Philadelphia. Booth 348.
New type of automatic control valve that contains features of program control and multiple stage adjustment and is to be known as multiple stage control; new type of continuous belt, which weighs less than 4 lb. a sq. ft., is made of alloy links of patented character and is capable of carrying 90 lb. a sq. ft.; miscellaneous types burner equipment. Represented by: F. J. Ryan, president; Gordon A. Webb, A. H. Kruger and J. Kniveton.

Joseph T. Ryerson & Son, Inc., Chicago. Booth 368.
Samples of general steel products; cold-rolled steel products; tool and alloy steels; and rust and heat resisting alloys. Represented by: H. B. Ressler, general manager of sales; Fred Doran, G. Van Dyke, A. Y. Sawyer and Charles Kehr.

S

Safety Equipment Service, Cleveland. Booth 233.
Safety equipment and devices; Super-drednaut goggles for chippers, grinders, welders and all industrial uses; Dr. Wood respirators; "Safety Service" clothing made of asbestos, leather, fire resisting duck, water resisting duck, acid proof cloth, rubber and other materials; "Safety Service" safety shoes; sand blast and dust hoods; welding helmets; gas masks; safety and danger signs; first aid kits and supplies. Represented by: Buel W. Nutt, president; Harry F. Lea, Andrew Evers, F. C. Blake and E. C. Lyon.

Selas Co., Philadelphia. Booth—Gas Section.
Selas gas mixing machines operating various industrial gas appliances, such as brazing torches, self-heating solder irons, burner tips for japanning, wire ovens, etc.; needle flame burners for can manufacturing, wire fusing, etc. Selas-fired industrial gas furnace and various furnace burners and bunsens. Represented by: Fred Hess, manager; and E. A. Furkert.

George Scherr Co., Inc., New York. Booth 200.
Carl Zeiss precision measuring machines and instruments; Taylor rotary cutting-off machine; Schuchardt & Schutte thread milling machine demonstrated with thread holes. Represented by: George Scherr, president and manager; Fritz Konig, vice-president; George Kaner and George Van Daplank.

Sentry Co., Taunton, Mass. Booth 391.
Sentry size No. 2 model H S and size No. 1 model L furnaces with control, also high-speed steel hardening using the Sentry diamond block method. Represented by: F. B. Crocker and A. A. Haryer.

Shakeproof Lock Washer Co., Chicago. Booth 357.
Entire line of standard lock washers and locking terminals; large exhibit of the Shakeproof locking principle and the actual locking of the washers practically demonstrated. Represented by: Herbert M. Howison and Jack M. Gribbie, sales manager.

Shawinigan Products Corporation, New York. Booth 239.
Carbide and carbide packages. Represented by: W. P. Chur.

Shore Instrument & Mfg. Co., Jamaica, N. Y. Booth 17.
Regular line of hardness testing instruments consisting of C-2 scleroscope, bulb type; "D" scleroscope, dial type; Shore monotron; rubber testing instruments; optical pyrometers, Pyroscope, types A and B; Localcase and Localhard are shown with samples of their usage. Represented by: F. G. Kendall, sales manager; and J. M. Kendall.

Simonds Saw & Steel Co., Fitchburg, Mass. Booth 342.
Metal-cutting circular and band saws; files, hack saw blades; high-speed, carbon, magnet and special tool steels. Represented by: C. R. Pafenbach, steel sales manager; George T. Curtis and Harry P. Baumann.

Sivyer Steel Casting Co., Milwaukee. Booths 89 and 91.
Electric steel castings.

David H. Smith & Sons, Inc., Brooklyn. Booth 438.
Smith billet shears; Smith angle bending rolls; and Smith model 91 size 16 special. Represented by: William H. Kay, manager machinery sales; Dudley J. Smith, vice-president; Olaf Olsen, and Cleveland Tool & Supply Co., salesmen.

Snap-On Wrench Co., Chicago. Booth 280.

Southern Manganese Steel Co., St. Louis. Booth 18.
Fahralloy high temperature and corrosion resisting products. Represented by: F. A. Fahrenwald, A. W. Daniels, general sales manager; Russell J. Williams, assistant sales manager; and D. M. Powers.

Southwark Foundry & Machine Co., Philadelphia. Booth 31.
Southwark-Emery universal testing machine; 40,000-lb. hydraulic testing machine for field tests of welded-joint development in combination with Union Carbide & Carbon Research Laboratories; McCollum-Peters electric telemeter in operating exhibit showing the remote recording of stress, strain and pressure; Whittemore strain gage; Huggenberger tensometer. Represented by: F. G. Tatnall, manager, testing equipment division; H. A. Weaver and H. J. Ruch.

Spencer Turbine Co., Hartford, Conn. Booth 291.
Spencer turbo-compressors which are used for supplying air in connection with oil and gas burning industrial furnaces, foundry cupolas, etc. Represented by S. E. Phillips, president; F. A. Wright, F. E. Warnke and R. A. Brackett.

Square D Co., Detroit. Booth 332.

William K. Stamets, Cleveland. Booths 205, 205-A and 207.

Standard Alloy Co., Inc., Cleveland. Booth 33.
Standard alloy lead pots; cyanide pots; normalizing and pack heating furnace discs and spacers; insulated shaft assembly for normalizer; enameling burning racks; chain grate castings for heat resisting service; furnace trays and shoes; roller rails; skid rails and shoes; pump casings and impellers; furnace parts and miscellaneous heat and acid resisting castings covering in general the heat treating and chemical field. Represented by: Harvey M. Smith, sales manager; Frank F. Jackson, superintendent; Emerson M. Williams, secretary; Charles D. Cutting, H. A. Cutting, W. D. Mann, George S. McFarland and A. D. Darragh.

Standard Equipment Co., Inc., New Haven, Conn. Booth 379.
Photographs showing installations of the Standard patent scouring machine now in operation removing scale from hot-rolled and annealed strip steel and allied equipment such as pulling rolls, compressed air controlled, winders with independent foot treadle clutch control on each reel; new type of collapsible take-up reel with quick adjustable flange. Represented by: Charles A. Dreisbach, president; and Burton L. Hoskins, director.

Steel City Testing Laboratory, Detroit. Booth 102.

Stoody Co., Whittier, Cal. Booth 241.
Various welding rods and welding equipment, including grinders and electrode holders. Represented by: Robert L. Ozias and C. E. Phillips.

Strong, Carlisle & Hammond Co., Cleveland. Booth 209.
No. 659 Duralumin treating furnace having a connected load of 15 kw. single phase 110 volts, operating through a tapped transformer having three reduced capacity taps under 110 volts at 99, 88 and 77 volts. Element, ribbon resistor of low watt density. Leeds & Northrup automatic temperature control. Represented by: G. S. Peterson, sales manager furnace department; Jacob Weintz and A. B. Lindsay.

D. A. Stuart & Co., Chicago. Booth 78.
Various parts machined with new type metal working oils; Bottles containing samples of principal well-known Stuart products, this list including Stuart's Thred-Kut oil, Super-Kool base oil; Codol liquid grinding compound, Kleen-Kut soluble oil, Drawsol deep drawing compound, No. 34 soluble quenching oil. Represented by: C. H. Baker, G. A. Dudley, W. M. Duncan, W. H. Huelster, T. B. Langdon, director of sales; and W. H. Oldacre, director of engineering and research.

Sullivan Machinery Co., Chicago. Gas Section.

Surface Combustion Co., Toledo. Gas Section.
Heat treating furnace equipment with automatic temperature control; surface combustion burners and inspirators and their application; newly-designed forging furnace. Represented by F. H. Adams, vice-president and general manager; C. B. Phillips, vice-president and general sales manager; C. H. Blesch, A. L. Hollinger, W. O. Owen, Eugene A

Weaver, F. H. Trembly, S. R. Anderson, J. M. Brown and O. R. Olson.

T

Taylor-Winfield Corporation, Warren, Ohio. Booth 244.
Both spot and butt welding equipment and a portable type of spot welding machine. Represented by: F. C. Terry and engineers from main plant.

Thompson Grinder Co., Springfield, Ohio. Booth 378.
R. R. Moore fatigue testing machine running tests on various metals and their alloys. Specimens will be exhibited from parts taken from actual service failures, such as aeroplane propellers, struts, crank shafts, oil tubes, etc. The effect of various shapes of specimens such as grooves, threads, fillets, will be illustrated by the test run. Represented by W. G. Baldenhofer and R. R. Baldenhofer.

Timken Steel & Tube Co., Canton, Ohio. Booths 24 and 36.
Moving exhibit illustrating the use of Timken steel and the services available through the Timken company. Represented by: M. T. Lothrop, president; A. J. Sanford, vice-president in charge of sales; W. G. Hildorf, chief metallurgist; R. L. Wilson, Robert Atkinson and Walter Wiewel.

Toledo Scale Co., Toledo, Ohio. Booth 328.

Tomkins-Johnson Co., Jackson, Mich. Booth 369.
Die sinking milling cutters; air-operated chucks and cylinders. Represented by: R. B. McDonald, sales manager; A. R. Johnson, treasurer; and H. A. Tomkins, president.

Torchweld Equipment Co., Chicago. Booth 264.
Torchweld hand welding torches; Torchweld machine welding torches; Torchweld hand cutting torches; Torchweld machine cutting torches; Torchweld decarburizing equipment; Torchweld leadburning equipment; Torchweld acetylene generators; Torchweld gas pressure regulators; and accessories and supplies. Represented by: W. A. Slack, president; R. M. Smith, assistant sales manager; H. G. Larisch, C. E. Davis and W. E. Lyons.

Harold E. Trent Co., Philadelphia. Booth 341.
Electric furnaces and temperature control for heat treating, pit type, pot type, oil quench type furnaces. Represented by: H. E. Trent.

U

Una Welding & Bonding Co., Cleveland. Booth 261.
Una welders, both AC-dc and DC-dc types. Una automatic welding head; complete line of Una welding rods for manual and automatic welding. Represented by: E. R. Alexander, E. W. Kronbach, A. A. Probeck, H. P. Blum, W. J. Bushea, L. S. Burgett and J. P. Austin.

United Engineering Society (Endowment Committee), New York. Booth 435.
Large photographs and diagrams.

V

Vanadium Alloys Steel Co., Latrobe, Pa. Booths 10, 12, 39 and 41.
Red Cut superior high-speed steel; Non-shrinkable die steel; Marvel hot working die steel; choice hot working die steel; Colhed, a new steel recently developed for cold heading; Crocar, a new high carbon high chromium steel; fractures and tools of above. Represented by: R. C. McKenna, president; Floyd Rose, vice-president; L. D. Bowman, works manger; J. P. Gill, R. B. George, W. R. Mau, W. D. Fisher, T. J. Van de Motter and C. V. Reilly.

Vanadium Corporation of America, New York. Booths 20 and 49.
Ferro-vanadium, ferro-chromium, ferro-silicon, and other steel-making alloys; ores; oxides; chemical compounds of vanadium, tungsten, molybdenum, chromium, and other rare and semi-rare metals; Vanadium steel forgings and castings. Represented by: J. A. Miller, general manager of sales; H. T. Chandler, N. Petinot, C. N. Dawe, C. B. Woodworth, T. N. Bourke, B. D. Saklatwalla, vice-president; Jerome Strauss, G. L. Norris and A. W. Demmler.

Van Dorn Electric Tool Co., Cleveland. Booth 35.
Portable electric drills; grinders; reamers; tappers; screw drivers; nut setters; stationary grinders; electric socket wrenches; and portable electric hammers. Represented by: F. Schneider, president; F. H. Zulauf, vice-president and general manager; R. W. Procter, sales manager; E. W. Waechter, assistant sales manager; S. S. Waters, L. L. Charnicky, F. R. Du Guay and F. H. Schell.

Victor-Peninsular Division, Detroit. Booth 274.

Victor X-Ray Corporation, Chicago. Booth 322.
Extensive display of X-ray negatives, showing imperfections in materials, such as castings, welding and assemblies. Illustrating the value of X-ray in determining necessary changes in processes and the effects caused by such changes, as well as effects caused by the personal factor of the operators. Represented by: E. W. Page.

W

Water Treatment Co. of America, Pittsburgh. Booth 227.
Reception and literature. Represented by: Harry L. Baer, president; and George Neilson, vice-president.

Weidemann Machine Co., Philadelphia. Booth 6.
New patented spring winder; new forged steel vise; Eda multiple punch-press. Represented by: O. F. Weidemann and G. A. Hancock.

Weldit Acetylene Co., Detroit. Booth 242.
Welding and cutting (oxyacetylene) equipment and Gasavers. Represented by: O. L. Smith, president; J. B. Manor and J. Bronson.

Westinghouse Electric & Mfg. Co., East Pittsburgh. Booth 305.
Weldomatic automatic welding outfit shown for the first time, including the new type head, the control and the operator's panel. This set is in operation on pipe seam welding, and a 400-amp. welding set will supply the current to this automatic welding set; pipe handling tool which adjusts the pipe for automatic welding; 200-amp. portable motor-driven welding set; 200-amp. portable gas engine-driven welding set; 400-amp. portable motor-driven welding set. Represented by: W. W. Reddie, R. L. Cronemeyer, G. H. Koch, F. M. Bernard, W. G. Pearson, C. W. Babcock and P. H. Grunnagle.

Wheeling Mold & Foundry Co., Wheeling, W. Va. Booth 400.
Model steam hammer showing application of steel and alloy steel castings, dies and die blocks; representative test specimens; and sections of alloy rolls and castings. Represented by: H. E. Field, president; E. A. Balsley, vice-president; R. C. Heaslett, D. Wyman and George Chandler.

Wheelock, Lovejoy & Co., Inc., Cambridge, Mass. Booths 84, 86 and 88.
Moving pictures of various activities in different warehouses, such as loading, cutting, testing, heat treating, etc. Represented by: A. Oram Fulton, president; Frederick H. Lovejoy, vice-president; George S. Longley, Jr., Edward C. Bartlett, Stanley W. Parker, C. Robert Jenks, Murray N. Allison, George A. Baron, Henry A. Bischoff, A. Reed Townsend and Floyd J. DeVan.

Whitman & Barnes, Inc., Detroit. Booth 83.
Complete line of drills, reamers, milling cutters and end mills, mounted on display boards. Represented by: Fred J. Smith and E. T. Oliver.

Wickwire Spencer Steel Co., New York. Booths 238 and 240.
Wisscoloy spiral conveyor belt traveling through an electric furnace operating at from 1800 to 2000 deg. Fahr. Samples of Wissco oil-tempered valve spring wire and a special valve spring wire made from an imported Swedish stock will be tested in a Tinius Olsen testing machine. Samples of a special tempering wire and music wire will also be tested. Represented by: F. W. Hale, sales manager, wire conveyor belts department; Dwight Granger, chief engineer; Jay R. Worsfold, sales manager; E. C. Stout, sales manager, spring department; R. H. Clapp, sales manager, wire department; U. V. Westover, G. W. Nelson, V. C. King, M. G. Werme, E. F. Early, R. R. Tatnall, R. C. Jordan and F. J. Connors.

Williams & Co., Inc., Cleveland. Booth 243.
Williams gas and electric and Wilson Welder & Metal Co. Colortipt welding rods. Metals which may be observed in welding operation are soft, medium and high carbon steels, cast iron, brass, bronze and copper, monel metal, nickel and aluminum. Represented by: E. C. Edmundson, general manager; W. J. Lyons, N. J. Carbis, J. H. Penske, Jr., K. J. Burkholder, B. F. Prentiss, H. M. Turner, Wilson Welder & Metals Co., engineers.

Willson Products, Inc., Reading, Pa. Booth 251.
Perfection of its glass in its ability to stop harmful rays by means of a galvanometer and thermocouple is shown. Represented by: F. H. Klein.

Wilson-Maeulen Co., Inc., New York. Booth 405.
Indicating pyrometers; recording pyrometers; automatic temperature controllers; electric resistance thermometers; and Rockwell hardness testers. Represented by: John P. Roberts, Harvey Lee, G. B. Duff, M. A. Schreiner, F. Walter and C. E. Hellenberg.

Z

Ziv Steel & Wire Co., Chicago. Booths 66 and 87.

Twenty Years of Alloy Steels

Last Year's Output Nearly 3¼ Million Tons—Electric Alloy Castings a Feature—Some Factors in Establishing Alloy Industry

BY EDWIN F. CONE*

EXCEEDING for the first time 3,000,000 gross tons, American production of alloy steels in 1928 made some unusual records. At 3,214,909 tons, it was larger than the previous year's total, which was a record, by over 683,100 tons, or 27 per cent. With the exception of the year 1922, following the depression in 1921, this is the largest expansion for any one year in the industry's history. In a 20-yr. period, a new industry has been created. This large growth has been signalized by a large expansion in electric alloy steel, particularly electric alloy castings.

In 1924 it was regarded as noteworthy that the total of alloy steel passed 5 per cent of the country's entire steel production. In 1928 the proportion went over 6 per cent, or to 6.23 per cent. The figures are shown in Table I.

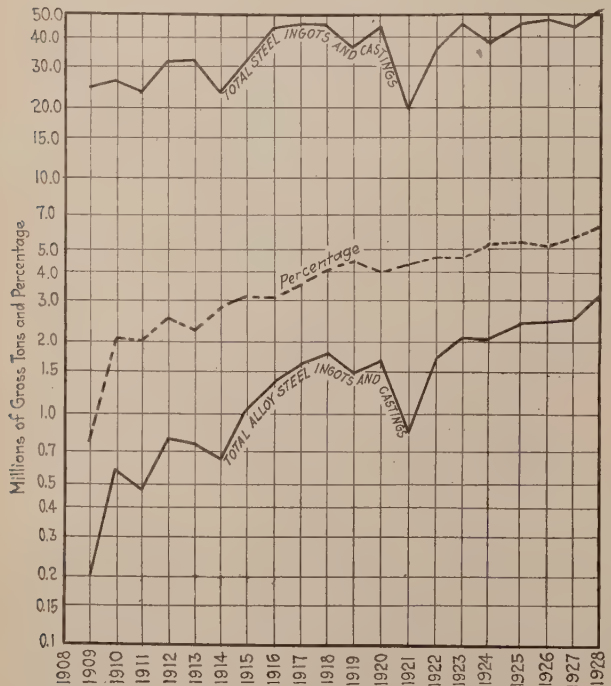
More Electric Alloy Steel Castings

AS to electric alloy steel castings, the expansion which started in 1921 and to which attention was called in an article similar to this, in THE IRON AGE of Sept. 3, 1925, has continued on a rapidly rising scale. From 10,084 tons in 1921 it went to 28,821 tons in 1924, and advanced last year to 79,434 tons, as shown in Table IV. In round numbers, output was 15 per cent of all the electric alloy steel in 1924, and 18 per cent in 1928. It trebled in the three years from 1921 to 1924 and was eight times as much in 1928 as in 1921.

One cause for the expansion, and operative for some years, continues—greater use of heat-treated electric alloy castings for such service as is performed by forgings. Other factors are increased demand for manganese electric castings and for rustless iron and similar castings. Ability to heat treat these has been a development in quite recent years, resulting also in a broadening demand. Quenching steel castings, recently thought impossible, is now regular practice in some foundries.

As to electric alloy steel as a whole, the last four years has been featured by largely augmented consumption. In 1924 the production of alloy steel (Table III) made in electric furnaces was 188,563 tons, or 9.3 per cent of all

*Associate editor, THE IRON AGE, New York.



HOW the Proportion of Alloy Steel to the Total Steel Produced Has Been Gradually Increasing. This ratio chart makes the rates of fluctuation truly comparable

Table I—Production of Alloy Steel Ingots and Castings in the United States

	Alloy Steel, Gross Tons	Total Steel, Gross Tons	Alloy Steel of the Total, Per Cent	Tons of Total Steel to 1 Ton Alloy Steel
1909.....	181,980	23,955,021	0.75	131.6
1910.....	567,819	26,094,919	2.17	45.9
1911.....	481,459	23,676,106	2.03	49.1

the alloy steel. In 1928 it had expanded over 2¼ times to 433,096 tons, or 13.47 per cent of the total, which in the same time had increased 58.5 per cent. In each of the last three years more alloy steel was made in electric furnaces than in 1918, while 20 years ago no electric alloy steel was reported.

Larger Demand for Alloy Castings

RECENT expansion in alloy steel castings, which includes electric, open-hearth and others, has been gradual but pronounced. At 169,684 tons in 1928, the total was nearly twice that of 1924 and the largest on record.

This review, based on data of the American Iron and Steel Institute, covers 20 years. At the beginning of that period practically no alloy steel was made on a commercial scale. The tonnage of high-speed steel was small. Last year not far from 3¼ million tons was made, with the possibility that this year it will approximate 3¾ millions.

Factors in 20 Years' Development

IN 20 years a large new industry has become flourishing, for today many various types of alloy steel are indispensable to other industries. These steels have helped to make possible the present day automobile. They are the basis for the high development of today's airplane. They are essential in the design and building of corrosion-resisting material of many kinds and have contributed to the revolution in certain methods of manufacture, such as nitric acid, oil cracking and so on. Their incorporation in the modern locomotive is of economic and engineering importance.

To the electric furnace we are indebted for ferroalloys and thus new steels, and for the melting of high-grade steels and the production of difficult ones; also for the efficient heat treatment of all types of steel. To heat-treating processes and equipment we are indebted for means to develop the best qualities in both old and new steels, carbon as well as alloy.

Progress in the last 20 years has been phenomenal. Heat treaters, who are celebrating next month, at a convention of a great society, eleven years of development, have even greater developments to look forward to—not only in steel, but also in aluminum and its alloys. In the latter field heat treatment is creating new products and a new industry.

Features of 20 Years' Progress in Alloy Steels

- In 1928 only 16 Tons of Total Steel to 1 Ton of Alloy: In 1909 this Ratio was 131.6 to 1.
- In 1928 over 3,000,000 Tons of Alloy Steels Produced: In 1909 About 182,000 Tons.
- In 1928 Electric Alloy Steel Castings Made Up Over 18 Per Cent of Total Electric Alloy Steel: In 1909 None Was Reported.

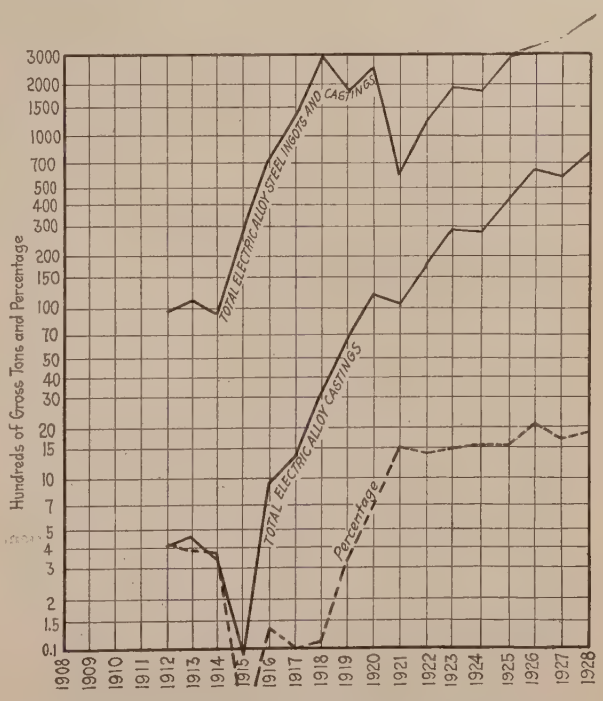
Hard wearing metal, to replace worn surfaces of rails, conveyor flights, gear teeth and the like, is deposited by the electric arc (according to a process developed by Alloy Welding Processes, Ltd., of England), using a mild steel electrode, covered with a proper compound of manganese. Alloying into a hard, tough, manganese steel occurs simultaneously with deposition of the weld material.



CASTINGS of Electric Alloy Steel Have Been Increasing Rapidly in Tonnage and in the Percentage of All Alloy Steel Made in Electric Furnaces

Calculations for Bending Rolls

Establishing Diameter with Definite Deflection and Unit Stresses, and Determination of the Limiting Conditions

BY RENE TILKIN*

METHODS generally used for calculating the diameters of the rolls of a bending machine, to bend a certain plate to a given diameter, are of the cut-and-try type. The results obtained are far from accurate. Our purpose is to elaborate formulas which will permit calculating those diameters with great accuracy, and with little expenditure of time.

When establishing a series of rational bending machines the starting point for calculating the diameters of the rolls is not the stress in the metal, but rather the deflection per unit of length of the rolls, due to the application of the bending force to the plate. The deflection of the rolls should be small enough so that the resulting deformations of the plate are not prejudicial to their use.

Some specialists have tried to avoid the effect of the deflection by giving the contour of the rolls a form approximately like the curve caused by the deflection. It is doubtful if this practice is justified. It gives rolls of such a form that the side in contact with the plate becomes a straight line at the end of the bending operation, when rolling the thickest and widest plate for which the machine is calculated.

At any other moment of the rolling, and for all other dimensions of plates, the curve remains in the rolls, thus causing the plate to bear on one point only on each roll; the driving is incorrect and deformations are unavoidable. Moreover, finishing the rolls to an exact shape is rather difficult, and the increased labor costs more than offset the benefits derived from a decreased weight of the rolls. Furthermore, the thinner plates will be handled with the least deformation on machines provided with rolls having a very small deflection, and this is the most frequent requirement.

Having thus stated the conditions of the problem, we will solve it for a bending machine with three rolls disposed as in Fig. 1. The factors which apply to these types of machines are:

1. Elastic limit of the metal of the plate to be rolled: 32,000 lb. to the square inch (for steel).

2. Maximum stress in the plate at the end of rolling: 45,000 lb. to the square inch (for steel).

3. Modulus of elasticity of the roll metal: 29,000,000.

4. Smallest diameter to which the plate may be rolled: 1½ times the diameter of the roll around which the plate wraps itself.

All calculations are made for the moment of greatest stress, such moment being obtained when rolling the heaviest plate to the smallest diameter. The load on the upper roll then is equal to the force required to bend the plate in its middle point, the plate being supported by the bottom rolls at points which are tangential points of the bent plate in the rolls.

The curvature of the plate modifies that load a little, but the difference may safely be ignored. We may neglect also the deflection due to the weight of the rolls, as well as the small difference (clearance) between the width of the greatest plate to be rolled and the length of the rolls. In the figures the plate is supposed without thickness and represented by a line.

Fixed Relations Established

MR. TILKIN'S equations establish a series of relationships between the main dimensions of the rolls used in bending steel plates. Summarized, these are as follows:

Diameter of single (upper) roll is 1.136 times that of each of the two lower rolls.

Distance between bearing lines of plate on lower rolls is 0.945 of the diameter of the lower rolls, when the latter are 1.5 diameters apart.

Stresses induced in the rolls are a function of the thickness and the width of the plate being bent. Critical conditions, explained in the text, are found when the width reaches 79 times the thickness, and again at 109 times the thickness.

Bending Machine With Three Rolls

For three-roll machines the distance between the center-lines of the lower rolls may be taken equal to 1½ times their diameter. We may allow a deflection of 0.012 in. for each foot length of the rolls. The flexure stress of the rolls should not exceed 17,000 lb. to the square inch. The following symbols will be used hereafter:

Diameter of the bottom rolls	d (inches)
Diameter of the upper roll	D (inches)
Thickness of the plates to be rolled	E (inches)
Moment of inertia of the bottom rolls	i
Moment of inertia of the upper roll	I
Stress in the bottom rolls	r (lb. per sq. in.)
Stress in the upper roll	R (lb. per sq. in.)
Length of the rolls (this length being supposed equal to the width of the greatest plate)	L (inches)
Bending force required on each bottom roll	f (pounds)
Bending force required on the upper roll	F (pounds)

Ratio of the Diameters of the Rolls

It may be shown that the ratio D/d of the diameters of the upper and bottom rolls is a constant, if we assume the deflection to be the same on all rolls. The value of this constant depends only on the distance between the center-lines of the bottom rolls, and on the minimum diameter to be rolled on the machine. If $\frac{D}{d}$ is α, then $D = \alpha d$.

*329 Rue des Vennes, Liège, Belgium.

Let us analyze force F (Fig. 2) with its components f f on the bottom rolls. The distance $M\,O$, between center of curvature of plate and center of each bottom roll, is $0.5\,d + 0.75\,\alpha\,d$.

Then $$\frac{F}{f} = \frac{y}{0.5\,d + 0.75\,\alpha\,d} = \frac{y}{d\,(0.5 + 0.75\,\alpha)} \qquad (1)$$

On the other hand, in triangle MOB,

$$\left(\frac{y}{2}\right)^2 = (0.5\,d + 0.75\,\alpha\,d)^2 - (0.75\,d)^2$$

whence $y = 2\,d\,\sqrt{0.5625\,\alpha^2 + 0.75\,\alpha - 0.3125}$

Introducing this value of y in equation (1),

$$\frac{F}{f} = \frac{2\,\sqrt{0.5625\,\alpha^2 + 0.75\,\alpha - 0.3125}}{0.5 + 0.75\,\alpha} \qquad (2)$$

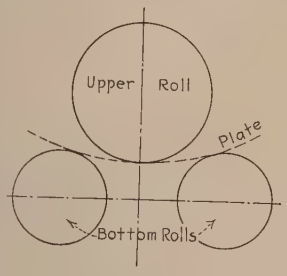


Fig. 1 — General Relations of the Three Rolls Constituting a Set and the Plate Being Bent

The condition for having the same deflection on all rolls is:

$$\frac{5\,F\,L^3}{384\,E\,I} = \frac{5\,f\,L^3}{384\,E\,i} \qquad (3)$$

Which, by simplifying, becomes

$$\frac{F}{f} = \frac{I}{i} \qquad (4)$$

But for a circle $I = \frac{\pi\,(\alpha d)^4}{64}$ and $i = \frac{\pi d^4}{64}$; hence $\frac{F}{f} = \alpha^4$

Introducing this value for $\frac{F}{f}$ in equation (2), we obtain:

$$\alpha^4 = \frac{2\,\sqrt{0.5625\,\alpha^2 + 0.75\,\alpha - 0.3125}}{0.5 + 0.75\,\alpha}$$

from which $\alpha = 1.136$.

The problem now is simplified, since we need only calculate the diameter of the bottom rolls. Multiplying this value by 1.136 will give the diameter of the upper roll.

Diameter of the Bottom Rolls

To find the diameter of the bottom rolls we must first establish the equation of the following three conditions, the unknown quantity being the diameter d:

(1) Force F required on the upper roll.

(2) Stress of the metal per unit of surface on the upper roll, R.

(3) Maximum deflection in the middle of the upper roll.

We should first find x, the distance (see Fig. 2) between the bearing points on lower rolls of the heaviest plate when it is rolled to the smallest diameter.

$$\frac{x}{1.5\,d} = \frac{0.75\,\alpha\,d}{0.75\,\alpha\,d + 0.5\,d}$$

Substituting 1.136 in place of α,

$$x = 0.945\,d$$

We now can write the equations:

$$\frac{0.945\,d\,F}{4} = \frac{L\,e^2}{6} \times (45{,}000) \qquad (5)$$

$$\frac{F\,L}{8} = \frac{3.14\,(1.136\,d)^3}{32} \times R \qquad (6)$$

$$\frac{0.012\,L}{12} = \frac{5\,R\,L^2}{24 \times 29{,}000{,}000 \times 1.136\,d} \qquad (7)$$

from (5), $F = \frac{31{,}750\,L\,e^2}{d}$ or $F\,d = 31{,}750\,L\,e^2$ (8)

from (6), $F\,L = 1.152\,d^3\,R$ (9)

from (7), $R = \frac{158{,}100\,d}{L}$ (10)

If, in equation (9), R is replaced by its value as found in (10),

$$F\,L^2 = 182{,}000\,d^4 \qquad (11)$$

and dividing equation (8) by (11),

$$\frac{d}{L^2} = \frac{31{,}750\,L\,e^2}{182{,}000\,d^4}$$

whence:

$$d^5 = 0.174\,L^3\,e^2 \qquad (12)$$

Taking the logarithmic value of both members of equation (12),

$$\log d = \frac{3\log L + 2\log e - 0.76}{5} \qquad (13)$$

This formula enables us to calculate the diameter of bottom rolls of a bending machine for rolling a steel plate of all lengths and thicknesses, under the conditions set forth above.

It is, however, necessary to check the stress R of the metal of the upper roll and r of the bottom roll, in case their values should exceed the permissible limit. First will be found the ratio R/r. The general formula for the stress of a beam uniformly loaded gives the system:

$$\begin{cases} \frac{F\,L}{8} = \frac{3.14\,(1.136\,d)^3\,R}{32} \\ \frac{f\,L}{8} = \frac{3.14\,d^3\,r}{32} \end{cases}$$

Dividing the first equation by the second,

$$\frac{F}{f} = \frac{(1.136)^3\,R}{r} \qquad (14)$$

but, according to equation (2), replacing α by its value 1.136 gives

$$\frac{F}{f} = \frac{2\,\sqrt{0.5625 \times (1.136)^2 + 0.75 \times 1.136 - 0.3125}}{0.5 + 0.75 \times 1.136} = 1.664$$

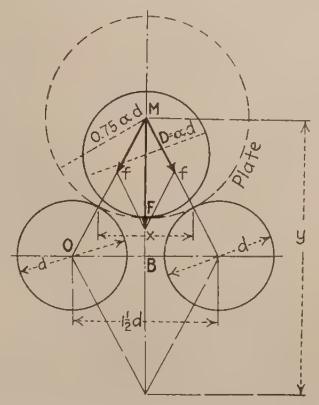

Fig. 2 — Schematic Arrangement of Rolls and Plate, with Relative Dimensions and Clearances as Explained in the Text

and replacing $\frac{F}{f}$ by its value as found in (14)

$$\frac{R}{r} = \frac{1.664}{1.466} = 1.136 \text{ or } r = 0.88\,R \qquad (15)$$

The value of R is found by using equation (10).

Cases When the Stress of the Rolls Is Too Great

When checking the values of r and R by means of equations (10) and (15) it is often found that the limit of 17,000 lb. to the square inch is exceeded for one or both of these values. That would be the case for the upper roll when the ratio $\frac{L}{d}$ is below $\frac{158{,}100}{17{,}000} = 9.3$ (see equation 10). It would be the case for the three rolls when the ratio $\frac{L}{d}$ is below $\frac{158{,}100 \times 0.88}{17{,}000} = 8.18$ (see equation 10, combined with 15).

From equation (12),

$$\frac{d^5}{L^5} = 0.174\,\frac{e^2}{L^2} \text{ or } \frac{L^5}{d^5} = \frac{5.76\,L^2}{e^2}$$

From $5.76\,\frac{L^2}{e^2} = (9.3)^5$, we find $L = 109\,e$

From $5.76\,\frac{L^2}{e^2} = (8.18)^5$, we find $L = 79\,e$

Thus it follows that:

(Case 1) If the width of the plate is equal to (or greater than) 109 times its thickness, formula (13) may be used as it is.

(Case 2) If the width of the plate is between 109 and 79 times its thickness, the diameter of the upper roll must be increased to reduce the stress in the metal.

(Case 3) If the width of the plate is equal to (or smaller than) 79 times its thickness, the diameters of all three rolls should be increased.

Special Formulas for Case 2

To determine the diameter of the upper roll, the equation of the diameter should be found as a function of the stress of the metal only. From equation (5),

$$F = 31{,}750\,\frac{L\,e^2}{d}$$

Replacing F by this value and $1.136\,d$ by D in equation (6),

$$31{,}750\,\frac{L\,e^2\,L}{d\,8} = \frac{3.14\,D^3\,R}{32}$$

$$\text{or } D^3 = 2.39\,\frac{L^2\,e^2}{d} \text{ and } D = 1.335\,\sqrt[3]{\frac{L^2\,e^2}{d}} \qquad (16)$$

Special Formulas for Case 3

When the stress in all three rolls exceeds the permissible stress, one must try to find the diameters without taking into account the deflection per unit of length of the rolls. The results obtained with equation (15) are too great, and the deflection of the rolls will be diminished by increasing their diameter. The diameters must be found with respect to an equal stress in all three rolls, rather than with respect to equal deflection. This will be done by the same method as was used to establish the principal equation (13).

Ratio of the Diameter of the Rolls

In the case of an equal stress, the ratio $\frac{D}{d}$ is a constant when the distance of the center-lines of the bottom rolls is $1\frac{1}{2}\,d$, and when the smallest diameter of the bend of the plate is $1\frac{1}{2}$ times the diameter of the upper roll.

Let us write $\frac{D}{d} = \phi$, then $D = \phi\,d$.

From Fig. 2, the conditions for writing equation (2) are still the same, thus:

$$\frac{F}{f} = \frac{2\,\sqrt{0.5625\,\phi^2 + 0.75\,\phi - 0.3125}}{0.5 + 0.75\,\phi}$$

The stress in the upper roll is given by equation

$$\frac{F\,L}{8} = \frac{3.14\,D^3}{32}\,R, \text{ which gives } R = \frac{32\,F\,L}{8 \times 3.14\,D^3}$$

The stress in the bottom rolls is

$$\frac{f\,L}{8} = \frac{3.14\,d^3}{32}\,r, \text{ which gives } r = \frac{32\,f\,L}{8 \times 3.14\,d^3}$$

But, for the condition $R = r$,

$$\frac{32\,F\,L}{8 \times 3.14\,D^3} = \frac{32\,f\,L}{8 \times 3.14\,d^3}, \text{ which gives } \frac{F}{f} = \frac{D^3}{d^3} \qquad (17)$$

and replacing $\frac{F}{f}$ and D^3 by their values,

$$\phi^3 = \frac{2\,\sqrt{0.5625\,\phi^2 + 0.75\,\phi - 0.3125}}{0.5 + 0.75\,\phi}$$

This latter equation gives as the constant

$$\phi = 1.19$$

Research for the Bottom Rolls

To find the diameters of the bottom rolls we may consider the following two conditions under the form of algebraic equations, the unknown quantity being the diameter d:

1. Force required on the upper roll.

2. Stress of the metal per unit of area of the upper roll. To find x for $\phi = 1.19$:

$$x = \frac{0.75\,\phi \times 1.5\,d}{0.75\,\phi + 0.5} = 0.953\,d$$

The two equations may be written

$$\text{A)}\ \frac{0.953\,d\,F}{4} = \frac{L\,e^2}{6} \times 45{,}000$$

$$\text{B)}\ \frac{F\,L}{8} = \frac{3.14\,(1.19\,d)^3 \times 17{,}000}{32}$$

From (A), $F = \frac{L\,e^2 \times 45{,}000 \times 4}{6 \times 0.953\,d} = \frac{31{,}500\,L\,e^2}{d}$

and substituting in (B),

$$\frac{31{,}500\,L^2\,e^2}{8\,d} = \frac{3.14 \times 1.566\,d^3 \times 17{,}000}{32}$$

or $d^4 = 1.507\,L^2\,e^2$, whence $d = 1.108\,\sqrt{L\,e}$ (18)

Examples

We shall examine the following three cases:

1. Thickness of the plate ½ in.; width 6 ft.; ratio $\frac{L}{2} > 109$

2. Thickness of the plate ¾ in.; width 5 ft. 6 in.; ratio $109 > \frac{L}{e} > 79$

3. Thickness of the plate 1 in.; width 5 ft.; ratio $\frac{L}{e} < 79$

Case 1. Applying equation (13),

$$\log d = \frac{3\,\log 72 + 2\,\log 0.5 - 0.76}{5} = 0.8418$$

whence $d = 7$ in.; we derive from it $D = a\,d = 1.136 \times 7 = 8$ in.

$$\text{and } R = \frac{158{,}100\,d}{L} = \frac{158{,}100 \times 7}{72}$$

= 15,400 lb. to the square inch.

Case 2. Applying equation (13) for the bottom rolls,

$$\log d = \frac{3\,\log 66 + 2\,\log 0.75 - 0.76}{5} = 0.89$$

whence $d = 7\frac{3}{4}$ in.

Applying equation (15) for the upper roll,

$$D = 1.325\,\sqrt{\frac{66^2 \times 0.75^2}{7.75}} = 9.1 \text{ in.}$$

$R = 17{,}000$ lb. to the square inch and

$$r = 0.88 \times \frac{158{,}100 \times 7.75}{66} = 16{,}340 \text{ lb. to the square inch.}$$

Case 3. Applying equation (18) for the bottom rolls, $d = 1.108\,\sqrt{60 \times 1} = 8.58$ in. and $D = 1.19\,d = 10.21$ in. we have $r = R = 17{,}000$ lb. to the square inch.

High-Strength Brass Made in England

A high-tensile alloy, called P. M. G. brass, has been developed by Vickers-Armstrong, according to the *Engineer*, June 14. It contains no low-melting metals, and is comparable in cost to gun-metal, but of superior physical properties, as shown by the following figures:

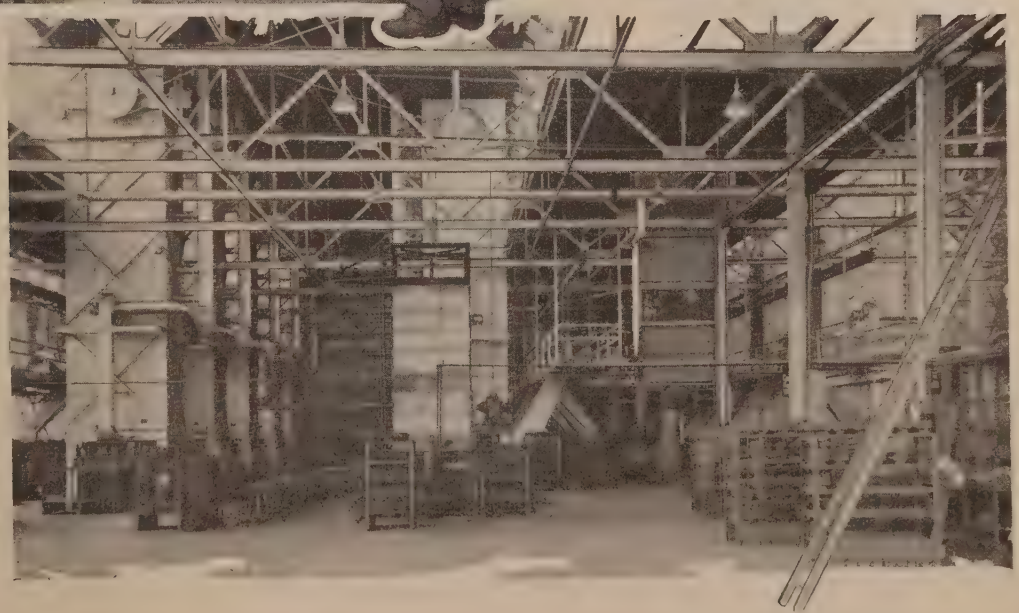
	Cast P.M.G. Brass	*Forged or Extruded P.M.G. Brass*	*Cast Gun-metal*
Specific gravity	8.39	....	8.82
Yield point lb. per sq. in.	24,500 to 30,000	45,000 to 50,000	18,000
Ultimate, lb. per sq. in.	40,000 to 50,000	75,000 max.	36,000 to 50,000
Elongation in 2 in.	18 to 8	42 to 38	28 to 8
Brinell hardness	100 to 115	....	75 to 95
Izod toughness ft.-lb.	20	36	14

Castings machined to wall thickness of ⅜ in. are watertight at 2000 lb. per sq. in. pressure. Strength is affected by elevated temperature less than gun-metal.

Cores Baked in Vertical Ovens

SIXTEEN vertical core ovens, 45 ft. high, are used in the Oakland foundry at Pontiac, Mich. These save a great amount of space in comparison with the horizontal type. Two illustrations show the making of crankcase cores and placing them on the trays of the oven. The third picture gives an indication of the great capacity of this unit and shows, at the same time, the unusual cleanliness of the room. Cores of this type are made two at a time on a roll-over machine. The cores are loaded four abreast in two rows on the trays, being placed there by the core-makers themselves, whose work is done closely around the oven. This eliminates use of racks and all necessity for aisles.

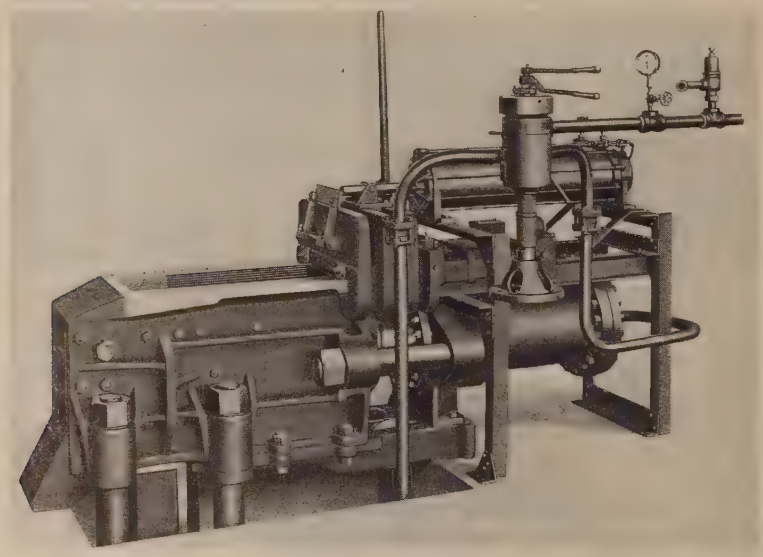
EACH Core-Maker Loads His Own Cores on the Furnace Trays. To this end the core-making benches are grouped closely around the furnaces



SEVERAL Vertical Core Furnaces Can Be Placed in the Space Which a Single Horizontal Furnace of Same Capacity Would Demand

Machine for Baling Forge Flashings

FORGE flashings and similar heavy material may be compressed into bales measuring 12 x 12 x 18 in. and weighing from 300 to 500 lb., on the heavy-duty hydraulic baling press illustrated, which has been brought out by the Galland-Henning Mfg. Co., Milwaukee.



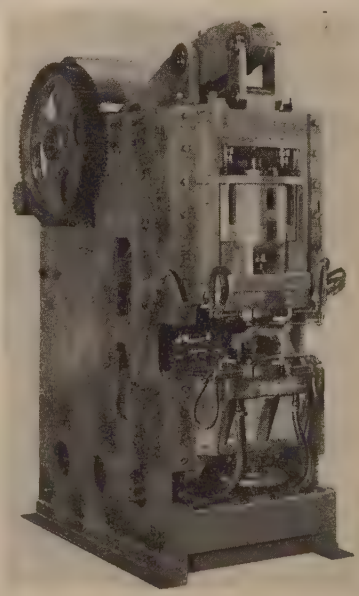
Flashings Are Compressed Into 12x12x18-In. Bales Weighing from 300 to 500 Lb.

The box into which the scrap is put is 48 in. long 18 in. wide and 36 in. deep. It is equipped with heat-treated steel liner plates to protect it from the cutting effect of the material to be baled, which is compressed under heavy lateral pressure. The rams are made large; the low-pressure or horizontal ram is of forged steel and the high-pressure or vertical ram is made of a special chilled material to eliminate scoring. The cover is air operated, a pneumatic hoist placed horizontally on the structural steel framework of the press being employed. The entire equipment is operated through a Nopak hydraulic valve, which requires no packing and makes use of an accumulator unnecessary. The lateral operating principle of this valve is said to assure effective operation and eliminate tendency of pounding, while under high pressure.

Heavy-Duty Power-Driven Vertical Welder

FOR welding light structural steel shapes and for multiple projection welding of medium and heavy stampings and forgings the Thomson Electric Welding Co., Lynn, Mass., is offering a new power-driven vertical machine.

The transformer is rated at 350 kva. Movement of the upper slide is obtained through a heavy rocking arm or lever actuated by cam. The camshaft is driven by a 4½-hp. four-speed motor through a speed reducer, the motor having push button control. The cam is large and has an insert that furnishes the final pressure on the weld. This insert is removable and can be shaped to suit various conditions. Dual pressure arrangement consisting of three springs, two light springs set in the upper slide head with a heavy spring between them, is said to permit lower welding currents than with one heavy spring. The light springs apply pressure at the time the current is turned on, and the heavy spring provides a positive bump or blow as the weld is finished, the pressure exerted by all three springs being adjustable. Mounting the springs directly over the work is intended to provide more sensitive pressure arrangement than otherwise.



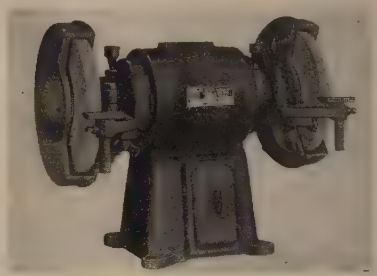
Welder for Light Shapes, Forgings and Stampings

The knee of the machine is adjustable vertically to compensate for die wear or to accommodate work of different thicknesses. With the exception of the lower slide, upper terminal block and upper slide, all frame parts are made from arc welded steel plate and bar stock, the various units thus fabricated being either bolted or welded together. The weight of the machine, which is designated as the model 290, is approximately 10,000 lb.

Bench Grinder for General Shop Use

AN improved 1-hp. bench grinder equipped with either alternating or direct current motor that is controlled by a safety type switch located in the base of the machine is being manufactured by the Schauer Machine Co., Cincinnati.

The motor is entirely inclosed so that the machine may be used either for wet or dry grinding. With d.c. motor the 10 x 1-in. grinding wheels operate at 2000 r.p.m. and with an a.c. motor, at 1750 r.p.m. Wheel guards are of improved type, and the tool rests are mounted so that they may be adjusted readily to any position. End bells are designed to provide maximum working space between the motor housings and the wheels. The shaft is mounted in solid race double-row ball bearings that are inclosed in dust-proof housings and run in grease. The height from the base to the center of the wheels is 11 in. The weight of the machine is 162 lb.



The Bench Machine May Be Used for Wet as Well as Dry Grinding

Tool Steel Makers for 25 Years

The Columbia Tool Steel Co., Chicago Heights, Ill., celebrated the twenty-fifth anniversary of its incorporation on Aug. 25. Founders were E. T. Clarage, A. R. Waters and A. J. Scheid. A. R. Waters, who is still a resident of Chicago Heights, assumed the general managership of the company from the beginning and at the death of E. T. Clarage succeeded him as president. Mr. Waters retired from that post in 1925 and was succeeded by A. T. Clarage, son of the first president.

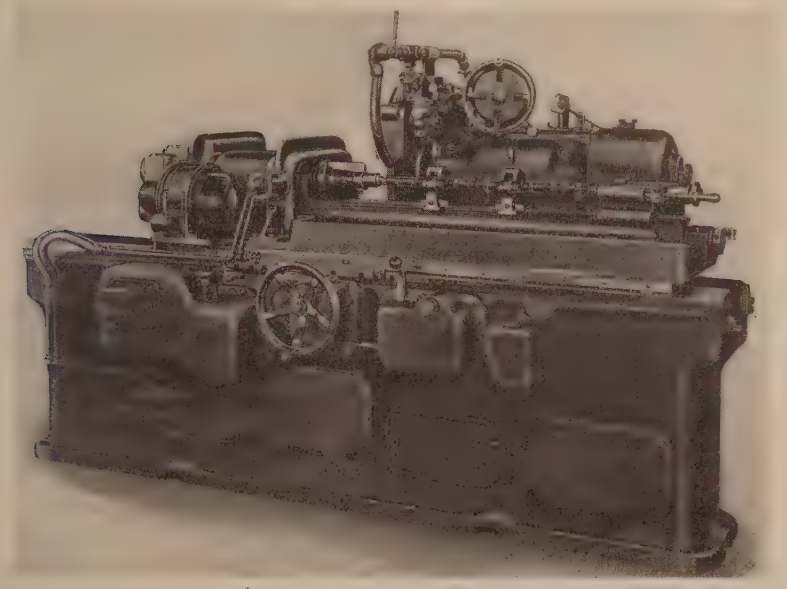
New Hydraulic Cam Grinder

Features Include Hydraulically-Controlled Timing Mechanism and Slow Down Work-Drive-Motor Control

TO meet the demand for a cam grinder having automatic features that permit one operator to attend three or four machines, the Landis Tool Co., Waynesboro, Pa., has brought out the 5 x 40-in. grinder here illustrated. In addition to the timing mechanism, the work carriage traverse, wheel feed, work cradle and diamond wheel truing device are hydraulically actuated.

Although designated as semi-automatic, the machine is full-automatic after the grinding cycle for the first cam has begun. The operator simply dogs the cam shaft, places it in the machine, throws the quick-acting work-rest jaws into position, moves a lever to start the work rotating, and then throws the main control lever. The latter causes the work carriage to move, bringing the first cam to the grinding position, at which point the latch on the front of the bed drops into the first notch of a hardened plate on the front of the carriage. The oil pressure is immediately cut off from the carriage-traversing cylinder, and oil enters the hydraulic straight infeed cylinder, causing the wheel base to feed in rapidly. At the same time the oil pressure in the work crade cylinder is reversed, swinging the cradle back until the master cam comes in contact with the roller. By this time the grinding wheel has made contact with the work and the feeding-in movement has slowed down to the predetermined grinding speed. The wheel feed continues at the predetermined rate until the wheel-base comes against a positive stop, indicating that the work has been ground to size. Shortly before the end of the cut, the work speed slows down automatically, but the fast work speed is resumed again as soon as the cam is finished.

By the time the first cam has been ground to size, the timing cam has made one revolution, whereupon it trips the latch that causes the wheel-base to move backward rapidly to its starting position. The cradle then swings forward and the table traverses, bringing the second cam on the shaft into grinding position, where it stops as the latch enters the second notch in the notched plate. As the table brings the second cam to the grinding position, the master cam roller automatically indexes on its shaft so as to bring it in line with the second cam on the master. From this point on the cycle of operations is the same as with the first cam on the shaft, the cycle being automatically repeated for each cam, including the fuel pump cam, if that is used.



One Operator Can Attend Three or Four of the Cam Grinders

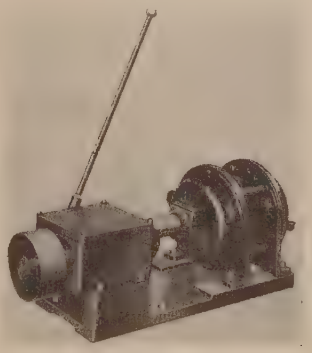
After the last cam on the shaft is finished the wheel-base moves to its extreme backward position, the work cradle swings away from the roller and the carriage moves a short distance and throws the main control lever, which stops all movements except work rotation. The arrangement is such that if the first shaft is ground from left to right, the second shaft may be ground from right to left, the automatic movements functioning the same with the work carriage traversing in either direction. The hydraulically driven wheel-truing device is arranged to permit quick truing of the wheel without disturbing the work.

Heavy and rigid construction together with accurate timing of the grinding cycle slow down work drive motor control and the other feature of the machine is said to result in work of unusual accuracy and finish. A 24-in. grinding wheel is employed, and end drive to the grinding wheel spindle is through multiple V-belts. A 15-hp. constant-speed motor is used for the main drive and a ½-hp. variable-speed motor for the work drive. The net weight of the machine, with both motors, is 10,000 lb. A d.c. generator may be mounted on the machine when direct current is not otherwise available.

Roller-Bearing Speed Box for Garvin Tappers

TO increase the production and range of the Garvin No. 1 automatic tapping machine, the Western Machine Tool Works, Holland, Mich., has designed a Timken tapered roller bearing equipped speed box that provides three selective speeds. The unit may be obtained for either direct-connected motor drive or for single pulley drive, and may be adapted to any machine now in use.

Gears are made of chrome-nickel steel, heat treated and hardened, are of coarse pitch and run in a bath of oil. The ends of the gear teeth are rounded to facilitate engagement. The sliding cone gear has a long bearing on the shaft to prevent chattering and provide easy shifting. All shafts are ground and are equipped with fine thread nuts for close adjustment of the Timken bearings, which adjustment may be made from the outside of the box. Bearings, shafts, and shifter forks are lubricated by oil bath.



Motor-Driven Speed Box for Garvin Tapper

With a 12-in. driven pulley spindle speeds of 300, 400 and 600 r.p.m. are obtainable; with an 8-in. pulley, the speeds are 450, 600 and 900 r.p.m. For the motor-driven speed box a 1-hp. 1200 r.p.m. motor is recommended.

Hardinge Sales Co., Inc., New York, has been appointed exclusive distributer in the New York metropolitan area for the shop furniture division of the New Britain Machine Co., New Britain, Conn., manufacturer of pressed steel factory equipment.

Drop Forging Institute to Meet in September

The fall meeting of the American Drop Forging Institute will be held at Buckwood Inn, Shawnee-on-Delaware, Sept. 25, 26 and 27. A. C. Johnson, secretary of the Rockford Drop Forge Co., is president of the institute. The meeting will be addressed by Charles F. Abbott, executive director of the American Institute of Steel Construction, on the subject, "Rationalization of Production," and also by Dr. Zay Jeffries, director of research, United States Aluminum Co., on the subject, "Looking Toward the Future." There will also be papers on forging problems by some of its members.

C. H. Smith, president Steel Improvement & Forge Co., Cleveland, is chairman of the convention committee.

Gray Iron Institute Meets in October

The annual meeting of the Gray Iron Institute will be held at the Hotel Cleveland, Cleveland, Oct. 16. The various officers and committees will present plans for future procedure and discussions of various topics will be included in the program. Five directors will be elected for a three-year period and proposed changes in the by-laws will be voted upon. A group luncheon will be served at noon and the annual dinner will take place in the evening. A program is being arranged to follow the dinner.

On Oct. 15 the various committees and board of directors will hold meetings. Any member interested in the work of any of the committees is welcome to attend either the committee meetings or the meeting of the board of directors.

Ohio Foundrymen to Hold Sectional Meetings

Sectional meetings for the discussion of foundry problems will be held by the Ohio Foundrymen's Association, Inc., in place of the annual meetings, which have been held for a number of years. It is planned to hold four sectional meetings in different parts of the State at different times during the year. These sessions will take the form of luncheon meetings, and it is aimed to secure good speakers to talk on various subjects. After the talks there will be round table discussions to take up the remainder of the afternoon.

The meetings will be open to all members of the foundry industry throughout the State and also to foundrymen from neighboring States. The largest attendance naturally will come from the section in which the meeting is held. By having sectional meetings in different parts of the State it is expected that a larger attendance will be secured than at an annual meeting with a two-day session.

The first meeting will be held in Toledo late in September or early in October. With the adoption of this plan by the board of administration, the proposed plan of holding a two-day meeting on an Ohio River boat during a trip from Cincinnati has been abandoned.

27 Steel Vessels Under Construction

Steel vessels to the number of 27 were under construction in the United States on June 30, according to Lloyd's Register of Shipping. These represented a total of 119,098 gross register tons, a figure exceeded by construction under way in France, Germany, Great Britain, Japan, Netherlands and Russia.

Of the American ships building, one is of over 20,000 tons, two of between 10,000 and 15,000 tons, six between 8000 and 10,000 tons, four between 2000 and 4000 tons and nine under 2000 tons. The remaining five are barges averaging 1160 tons. Four of the ships, totaling 11,000 tons, are tankers, and 11, totaling 25,200 tons, are motorships.

Sees Active Business for Some Time

"Industrial and trade activity should continue at the present high rate for some time," the Conference of Statisticians in Industry, operating under the auspices of the National Industrial Conference Board, declares in its August report. The conference analysis emphasizes the improvement in building construction, which established a new high monthly record owing to extensive undertakings in public works, and points out that, although agriculture suffered considerable losses in certain sections, these were nearly balanced by bumper crops in other sections, so that the total purchasing power of agriculture for the year should come close to that of last year.

Exceptional activity in both industry and trade continued throughout the midsummer season, new July production records having been made in both the iron and steel and automobile industries, and building activity increased in spite of the fact that a seasonal decline would have been in order. Distribution as indicated by freight car loadings continued on the upgrade, increases being noticeable for all commodities excepting livestock during July.

The Davison Coke & Iron Co., Pittsburgh, on Aug. 1 fired the first battery of coke ovens at its Neville Island plant and will begin actual production of by-product coke within 60 days. The second battery of ovens will be lighted in about four weeks. The coke will be used as blast furnace fuel at the company's Neville stack and the furnace will supply slag to a nearby cement plant.

Industrial Analysis of Puget Sound District

Markets, manufacturing costs, supplies of raw materials and legal matters covering the Puget Sound district are taken up in some detail in a 48-page booklet recently issued by the Seattle Chamber of Commerce. The area specifically covered consists of the States of Washington, Oregon, Idaho and Montana.

In the booklet are shown the population and industrial growth of the district, production and purchasing power, transportation facilities, mineral output and the foreign trade. Under the heading of manufacturing costs are taken up, in order, problems of labor, power, fuel, taxes, and the question of factory sites and structures. Raw materials are briefly discussed, lumber being the largest manufacturing industry.

Minimum wages, interest rates, industrial insurance, securities acts and general laws covering corporations are discussed in several pages, while living conditions and certain miscellaneous data finish the work. All in all it gives a good picture of conditions in the district surveyed, and indicates possibilities lying ahead for manufacture and commerce.

Writes on Public Ownership

With the contention that public ownership means management by men inexperienced in business, Edward N. Hurley, chairman of the board, Hurley Machine Co., Chicago, and former chairman, Federal Trade Commission, war chairman, United States Shipping Board, and member World War Debt Commission, has prepared a brief monograph devoted to private and public ownership.

"I have observed," writes he, "that as a rule even poorly-managed private enterprises are better directed than are public concerns. The mental attitude of Americans expressed in continual complaint about city government and school administrations is significant evidence on this point. The fact that taxes go up, year after year, while the prices of many services decrease, as industries increase their efficiency, proves that 'hard facts' justify our chronic political grouch.

"A few years ago automobiles, radio sets and such things were luxuries, even for rich men. Now they are in reach of nearly every purse. But schooling costs more to the taxpayer and renter; justice in our courts is more and more a luxury."

A copy of Mr. Hurley's little article can probably be obtained from the Illinois Manufacturers' Association, 120 South La Salle Street, Chicago.

The Edward G. Budd Mfg. Co. Philadelphia has received a contract for all-steel bodies amounting to $30,000,000 or $35,000,000.

Railroads Want Reopening of Rate Case

Carriers Ask Commerce Commission for Reconsideration of Decision—Also Say Time Allowed Is Insufficient

WASHINGTON, Aug. 27.—Railroads have informed the Interstate Commerce Commission that they will seek a reopening of the general Eastern steel rate case, affecting rates on manufactured iron and steel throughout Official Classification territory, decided under the Hoch-Smith resolution. This step will be taken for the purpose of reargument and reconsideration respecting the level of the prescribed mileage scales and the port differentials. Also, they declared in a statement filed last week with the commission, they intend to file a revised petition for permanent fourth section (short haul) relief.

In their memorandum they declared that, owing to alleged contradictions and conflicts in the fourth section phase of the decision, they are unable to publish a mileage scale of rates without adequate fourth section relief, and request was made for postponement of the effective date, which the commission fixed at not later than Oct. 20.

Speaking through their tariff agents, the railroads said that the fourth section order incorporated in the decision was intended to establish rates over the direct routes and that if it were not possible to publish concurrently the rates over the indirect routes the old basis of rates might remain effective over the indirect routes for a period of six months after Oct. 20. It was stated that it would be impossible to publish the new rates over the direct and indirect routes within the time required.

The carriers said that the new fourth section order does not even grant temporary relief over the indirect lines in order to establish and maintain the new adjustments. Aside from what was termed "the chaotic and discriminatory situation" that would result from compliance with both the rate and fourth section order," which, it seems, would be equally as objectionable to the shipping public as it is to the carriers," the petitioners said that it would be impossible, even over certain direct routes, to publish and make effective, as prescribed, the scale of rates ordered or any other scale. It was stated that "there is 'irreconcilable' conflict between the rate making formula prescribed and the fourth section limitations imposed."

The claim was made that compliance with the fourth section order would disrupt and distort the scale of rates prescribed. To support this contention the petition said that there are instances where there will be fourth section departures on the only open working routes and that likewise there doubtless would be instances where there will be complication "even over the most direct working routes between two points."

The contention was set up that it was obviously in the public interest that the new rate structure be made effective simultaneously over all established routes. The time afforded was declared to be insufficient to permit such a course, even assuming that the restrictions could be otherwise complied with.

The commission, according to the petition, had entered a permanent fourth section order totally unadapted to and inconsistent with the rate structure prescribed without having had the hearing and full investigation recited in the permanent order. By reason of the alleged contradictory situation regarding the fourth section order, the agents said they were preparing a new fourth section application in order to make the relief adaptable to and consistent with the distance scales. The petition said that the carriers were not able to publish any mileage scale of rates without having adequate fourth section relief.

Review of the case also is to be asked, it was said, by petitions to be filed by shipper organizations.

Chicago-Milwaukee Reduced Steel Rate Suspended

WASHINGTON, Aug. 27.—The Interstate Commerce Commission has suspended from Aug. 23 to March 23, schedules of the Chicago & North Western, Elgin, Joliet & Eastern and Chicago, Milwaukee, St. Paul & Pacific railroads reducing rates on iron and steel products from the Chicago district to the Milwaukee district from 9.5c. to 8c. a 100 lb. The action followed protests from the East Side Manufacturers' Association, Granite City, Ill., the Laclede Steel Co., with plant at Alton, Ill.; the American Rolling Mill Co., Middletown, Ohio, and the Green Bay Association of Commerce, Green Bay, Wis. The protesting interests charged that the schedules would increase the advantage of iron and steel producers in the Chicago and Milwaukee districts.

The East Side Manufacturers' Association declared that through years of effort and expense its members had built up a material business at Milwaukee, Kenosha and Racine, Wis., despite the advantage of location enjoyed by competitors in the Chicago district. Prior to the decision in the Jones & Laughlin case, it was stated, Chicago possessed a rate advantage of 13.5c. but the finding in that proceeding increased Chicago's advantage to 15.5c. The proposed schedules, if permitted to become effective, it was contended, would set up a spread of 17c. against the East St. Louis district.

Under the decision in the general Eastern steel rate case, affecting all of Official Classification territory, the association pointed out that the disadvantage of the East St. Louis district would be 14.5c., exceeding by 5c. the disadvantage of that district under rates voluntarily established prior to the Jones & Laughlin decision. It was declared that the plan to increase the spread to 17c. would exclude East St. Louis producers from the Milwaukee market. Similar points were made by the Laclede Steel Co.

The American Rolling Mill Co. said the existing Chicago-Milwaukee rate of 9.5c. is unreasonable in view of the fact that under the C. F. A. scale the haul called for a rate of 18c. while under the Eastern rate case it would be 14c. This point also was made by the Green Bay Association of Commerce.

In defending their position, the railroads declared that the cut in the rate was necessary in order to meet fourth sections situations and that unless the rate were reduced steel would move from the Chicago district to the Milwaukee district by water. The carriers stated that it had been shown that the boats would take the traffic at 8c. a 100 lb.

Suggestions Invited for Manufactures Census

WASHINGTON, Aug. 27.—With a view to making the forthcoming census of manufactures as responsive as possible to the need of industry for accurate information concerning its own activities, the special advisory committee designated by Secretary of Commerce Lamont has requested manufacturing organizations, trade associations, and individual manufacturers for advice and suggestions as to the form of the schedule to be used in the enumeration.

The subjects covered by the schedule used in the 1927 census are: Description of establishment; character of industry; time in operation; persons engaged; salaries, wages, and materials; products; power; coal consumed. The committee has invited suggestions concerning the form of questions under all of these subjects except production, which will be taken up directly by the Bureau of the Census with the industrial associations.

In view of the fact that it will be necessary to begin the printing of the general schedule early next month, comments on the general schedule should be sent to the secretary of the committee, Thomas W. Howard, 1615 H Street, Northwest, Washington, as promptly as possible in order that they may be given consideration by the committee preparatory to recommending the revision of the schedule.

Not Much Activity in European Markets

British Holidays Slow Down Business—German Use of Machinery Increasing—Russia to Foster Manganese Ore Output

(*By Cable*)

LONDON, ENGLAND, Aug. 26.

CLEVELAND pig iron delivery delays are shorter as a result of the small holiday demand and increasing output. It is now possible to place orders for foundry grades for delivery in the second half of September. The fall outlook is still regarded favorably and prices are unlikely to recede, as raw material prices are firm. Hematite has a strong undertone, but selling prices are still less than production costs.

Finished steel is firm and most works on the Northeast Coast are resuming operations after the holiday with fair order books. Some apprehension, however, has been created by the weakness in Continental prices.

Tin plate is steady and mills are better engaged following some recent good buying and the accumulation of orders during the holiday stoppages. Most Welsh mills have now resumed operations and many are not prepared to accept less than 18s. 6d. ($4.49) per base box, f.o.b. works port. Further sales of tin plate have been made to the Continent and to South America, and Far Eastern users are interested. Galvanized sheets are quiet, but prices are steady. The black sheet market is dull.

The Buttweld Proprietary Co., with capital stock of £1,000,000, has been formed at Melbourne, Australia, to manufacture steel tubes by arrangement with Stewarts & Lloyds, Ltd., and the Broken Hill Proprietary Co.

Continental steel markets are easier and there is some pessimism among mills. French works are active on domestic orders, but Belgian, Luxemburg and German makers are seeking more business. The market is evidently affected by the holidays and the increase in output authorized by the International Steel Cartel.

The next meeting of the International Tube Cartel will be at Paris, Sept. 25 and 26. Despite dissolution of the European Hoop Iron and Tube Strip Cartel, the strip steel mills are still cooperating on prices for large contracts, and efforts are being made to renew the cartel.

Belgian output in July was 347,000 tons of pig iron and 345,000 tons of steel.

Holidays Affect British Market

Pig Iron Consumers Delay Fall Buying—Steel Export Quiet and Drop in Shipbuilding Contracts

LONDON, ENGLAND, Aug. 15.—August being a holiday month here, business generally is quiet and conditions can hardly be considered normal. This week, for example, is the recognized holiday in the Cleveland district, and although there appears to have been a demand for prompt shipment pig iron, consumers' stocks being depleted, inquiry generally has been sluggish. Users are inclined to delay committing themselves for fall requirements. The furnaces in that district, however, are preparing for further expansion of output in the belief that a heavy demand will develop before the winter. East Coast hematite prices are firmer, makers having little to sell for early delivery. Although there have lately been heavier imports of foreign ore into the Tees, a severe ore shortage is not yet impossible.

While there has been some foreign semi-finished steel bought, domestic output is still good. Some mills are fairly well engaged on orders and it is expected that before long some good tonnages will be placed. In finished iron and steel, apart from holiday interruptions, domestic demand continues moderate, but export inquiry is slack except for some business from India.

Some shipbuilding contracts have been made lately. Armstrong-Whitworth & Co. have taken two motor-driven tank ships of 9000

British and Continental European Export prices per gross ton, f.o.b. United Kingdom Ports, Hamburg and Antwerp with the £ at $4.85

Wire nails, base	7	10½				$1.63	per keg	
Wire nails, assortments, 1 to 6-in. keg	10	6½				2.23		

*Open-hearth steel, 10s. ($2.42) per ton extra.

tons each for Norwegian interests; builders on the Humber River have received orders for three steam trawlers, and Yarrow & Co., Ltd., Glasgow, have secured an order from the Jugoslavian Government for the construction of a powerful flotilla leader. They have also received instructions from the Colombian Government to build three shallow draft gunboats. Generally, however, shipbuilding has not improved, recent orders being inadequate to replace vessels being completed. Orders for new merchant ships are small and the Government's decision to suspend work on its program of naval construction will exercise an important influence on the industry.

Germany Second as User of Machinery

HAMBURG, GERMANY, Aug. 12.—Per capita use of machinery in various countries has recently been investigated by the German Federation of Machinery Manufacturers. The investigation shows that Germany's total investment in machinery in 1924 was only 27 m. ($6.43) per capita, but it increased to 36.20 m. ($8.62) in 1925 and to 47.50 m. ($11.30) per capita in 1928. Although the 1928 figure was in excess of the British per capita use of machinery, it was far less than in the United States.

According to the Federation statistics, the per capita use of machinery in 1925 was 99.40 m. ($23.66) in the United States, 98.50 m. ($23.44) in Canada, 42.80 m. ($10.19) in Australia, 36.20 m. ($8.62) in Germany, 14.50 m. ($3.45) in France, 14.10 m. ($3.36) in South Africa, 13.10 m. ($3.12) in Czechoslavakia, 4.1 m. ($0.96) in Russia, 6. 70 m. ($1.59) in Japan, 0.70 m. ($0.16) in India and 0.20 m. ($0.05) in China.

World figures on per capita use of machinery in 1928 are being compiled by the German Federation of Machinery Manufacturers, but are not yet completed. Preliminary statistics show use at 47.50 m. ($11.30) per capita in Germany, 46.30 m. ($11.02) in Great Britain and 17.90 ($4.26) in France.

South African Manganese Ore Agent Appointed

The Manganese Corporation, Ltd., with headquarters in London and administrative offices in Johannesburg, South Africa, has appointed William H. Muller & Co., 122 East Forty-second Street, New York, agent for the United States in the sale of its manganese ore. The property of the company is in Postmasburg, South Africa, and will be connected with main line railroad early next year, so that sizable shipments are expected to begin in April, 1930. The ore, it is stated, has a minimum of 52 per cent manganese and a maximum of 0.15 per cent phosphorus.

Polish Wages Under Dollar a Day

Workers, However, Receive Coal and Other Allowances—American Capital in Eight Steel Producing Works

IN a report on the steel industry of Poland, W. H. Myer, assistant chief, Iron and Steel Division, Department of Commerce, says in part: "The recent acquisition by American interests of important holdings in some of the major units of the Polish iron and steel industry has focused attention on this situation in Europe and the United States."

Poland's position as a nation producing and exporting iron and steel is outlined. The Polish attitude toward the International Steel Cartel is explained and the agreements with Germany on pipe and scrap are described. At present four large Polish mills are members of the International Tube Cartel. These are the Bismarckhütte, Krolewska and Laura foundries, Bank foundry and the Sosnowiec Pipe Works. The mutual territorial protection afforded to members of the Cartel includes the Polish companies. Polish domestic sales are not limited but export quotas are determined.

Of employment and wages in Poland, the report continues: "The firms making up the membership of the Union of Polish Iron Foundries employed 39,480 workers at the end of January, 1927. The number had increased to 44,716 at the end of December of that year. By the end of December, 1928, employment had risen to 52,753 workers.

"The question of wages has such an important bearing on production costs that it seems worth while to give in some detail the earnings of workers in the Polish industry, as officially stated by the Union of Polish Iron Foundries. The following figures are all for 1927, as the 1928 report is not yet available.

"In the whole Polish industry the average cash daily earnings per worker, including overtime pay, were: In blast furnaces, 8.22 Zloty ($0.925) per day; in steel mills, 8.10 Zloty ($0.911); in rolling mills, 8.81 Zloty ($0.991).

"Workers in the plants in the Kielce and Krakow provinces received less than the above figures, while wages in Polish Upper Silesia were higher than the average for the whole country. These figures are the average for all workers, including skilled and unskilled.

"Some idea of the wages paid to skilled workers may be gained from the following average cash earnings per day: Blast furnaces, firemen, 11.58 Zloty ($1.303); steel works, firemen, 11.69 Zloty ($1.315); rolling mills, skilled operators, 12.66 Zloty ($1.424). The highest average wages were those paid to steel works 'firemen' in Polish Upper Silesia, which were 15.22 Zloty ($1.712) per day.

"In addition to wages paid in cash, it is customary for workers to receive coal allowances and other payments in kind. However, the total value of these additional wages amounted to only 3.1 per cent of cash payments, so that it is not difficult to see that the actual wage scale is low, according to American ideas.

"It is further interesting to note that reductions were made from workers' earnings to the extent of slightly more than 7 per cent of total wages. These deductions were for sickness benefit societies, unemployment fund, workers' common fund, income tax, and certain other statutory deductions.

American Investments

"Within recent months, press announcements have been made concerning substantial investments of American capital in the shares of some of the most important operating companies. These are the Bismarckhütte and the United Krolewska and Laura Foundries. Bismarckhütte operates the Bismarck and the Bethlen Falva works. It also owns all stock of the Katowice Mining & Metal Co. which operates the Marta and Hubertus plants. The Silesia company, also owned by Bismarckhütte, operates the Silesia works. The United Krolewska and Laura Foundries operate the Krolewska, the Laura and the Zgoda works.

"There are thus eight operating plants in which American capital has been invested. The importance of these can be judged by the percentage of total Polish production emanating from them, which is as follows: Pig iron, 39.82 per cent; steel ingots and castings, 50.01 per cent; rolled products, 39.37 per cent; iron and steel pipe, 56.48 per cent."

Russia Plans to Increase Manganese Ore Output

MOSCOW, RUSSIA, Aug. 11.—The Government's five-year plan of industrial development, to be completed by the business year 1932-1933, contemplates considerable expansion in manganese ore production at both the Nikopal and Tchiaturi deposits. It is also planned to erect a blast furnace at the mines at a cost of 25,000,000 rubles, for the production of ferromanganese. An effort will also be made to increase output at both the Nikopol and Tchiaturi mines, production will be centralized and modern equipment installed and the port of Poti, Georgia, on the Black Sea will be modernized.

It is estimated that the output of ore per employee at the mines can be increased 74 per cent by modernization and that production costs can be reduced 35.5 per cent. The program

calls for a production of 2,290,000 tons of manganese ore at Tchiaturi by 1932-1933. It is noteworthy that the combined exports of Tchiaturi and Nikopol in 1913 were 1,193,800 tons, but had declined to 784,600 tons in the business year 1926 to 1927 and to 498,800 tons in 1927 to 1928. The supply at Tchiaturi is 200,000,000 tons of 40 to 50 per cent manganese ore.

Prior to the war these deposits furnished 52 per cent of the world demand for manganese ore, but in 1928 they supplied only 21.4 per cent. Although exports of Tchiaturi ore are considerably smaller than in prewar years, exports of ore from the Nikopol mines are larger. It was the rapid development of the Nikopol mines that is reported by the Government to have been a factor in the relinquishment of the Harriman concession, which was at Tchiaturi. The entire export of Georgian manganese ore is now controlled by Manganexport, with main sales offices in Berlin, Germany. At present, according to Government engineers, the prices quoted for Russian manganese ore are unremunerative, but losses are accepted so that foreign exchange may be accumulated.

British to Study Design of Steel Structures

LONDON, ENGLAND, Aug. 17.—The Department of Scientific and Industrial Research has completed arrangements for an investigation, to begin in the early autumn, into the application of modern theory of structures to the design of steel structures.

The suggestion to hold the inquiry was made by the British Steelwork Association, a recently formed organization, which comprises practically all British fabricating firms and rollers of structural steel, and has for its objective the promotion of new and extended uses of steel.

The association invited the Department of Scientific and Industrial Research to organize an investigation into the problem, and it offered a financial contribution of £2,000 a year for five years, which will cover about one-half the estimated cost.

To insure the ready acceptance of the results of the investigations, the department has appointed a committee composed of representatives of the association, the Institution of Civil Engineers, and nominees of the department, under the chairmanship of Sir Clement Hindley.

Germany Divides with Saar Reparations Orders

HAMBURG, GERMANY, Aug. 12.—An agreement has been made between the German and Saar steel industries, by which about 10 per cent of all orders for rails, track supplies and steel for bridges to be booked to reparations account will be placed with mills in the Saar. The agreement is effective until 1935.

Would Make Canada Independent in Steel

Ontario Government Prepared to Pay Bounty on Ore—Electric Furnace Reduction Planned

A MOVEMENT to make Canada independent of other countries for its supplies of iron ores was announced on Aug. 24 in Sault Ste. Marie, Ont., by Hon. G. H. Ferguson, prime minister of Ontario. He stated that the provincial Government was prepared to pay a bounty of 1c. a unit, which in the case of the ores concerned is estimated will run from 50c. to 75c. a ton of ore.

Ore consumed in Ontario steel mills is brought from the Lake Superior district mines in the United States. It is stated that the bounty will make it possible to compete favorably with the imported ores, as it will amply cover the increased cost entailed in the use of the Ontario iron ores.

In commenting on the announcement, J. D. Jones, vice-president Algoma Steel Corporation, Sault Ste. Marie, stated at the meeting where the Prime Minister made this announcement:

"There are in Canada immense reserves of iron ores of excellent metallurgical quality, and large tonnages of these are contiguous to the Great Lakes water system. The Lake Superior ores are divided into two classes, siderite and magnetite. The beneficiation of these ores has been successfully accomplished.

"The cost of production of beneficiated ores is, of course, greater than the cost at which the American Lake Superior ores can be laid down on Canadian furnace docks, and, therefore, Government assistance in the way of bounties will be required to establish firmly the Canadian iron ore industry.

"The cost of producing iron ore is largely a matter of sustained tonnage production, and no assistance can be definitely established until Canada's furnaces are put in a position where they can be assured of a reasonable tonnage production. With reasonable tonnage production assured it will be possible to turn our attention to the production of Canadian ores and thereby permit the economical working of our iron ore problem."

Plans to Make Sponge Iron

Robert Turnbull, president Volta Mfg. Co., Welland, Ont., spoke of the development of a new electric furnace, especially adaptable to the reduction of Canadian ores. Mr. Turnbull was formerly associated with Dr. Heroult and assisted in the installation of the first electric steel melting furnaces in the United States.

Mr. Turnbull stated: "Furnaces are now being built and installed in Canada which will produce steel ingots at a cost considerably lower than that of the imported article, and the time is not far distant when Canada will be completely independent of other nations for the steel ingot supply, providing a certain condition is met. That is the substitution, or rather, the adding to the tonnage of the steel scrap supply of some other basic raw material, because as the tonnage of manufactured steel increases, there will not be sufficient steel scrap in the country to meet the demand.

"After considering the matter some time I came to the conclusion, as others, I believe, have done, that there was only one answer to the problem, and that was to develop an economical method for the production of sponge iron, and at the same time use such a process in solving the problem of utilizing Canadian ores exclusively in the manufacture of iron and steel in electric furnaces.

"The cycle of operations in our proposed process for the production of sponge iron is as follows: The ore to be treated is crushed, then mixed with a reducing agent, carbon, and pressed into a briquette of special form. These briquettes are then automatically conveyed to the furnace and charged through a hopper into the preheating chamber, and from there to the first reducing chamber, where a partial reduction of the ores takes place.

"The charge is then passed automatically through the second chamber, where are located the resistors supplying the electric heat. This chamber is kept at a constant temperature by automatic regulation, the reduced iron leaving the furnace automatically. This is again crushed, passed over a magnetic separator where the iron is removed from the gangue, then to a press, where the iron, which is in granular form like fine sand, is pressed into any desirable shape. Then the product is ready for the open-hearth or electric furnace to be melted into steel.

"The entire operation as outlined is automatic, and labor cost should be extremely low. A new furnace is now being completed, and if successful a commercial unit will be built at some point where cheap electric power and iron ore are available."

Diesel Engine Driven Plane Flies 15 Hours

HAMBURG, GERMANY, Aug. 12.—The German aircraft builder Junkerswerke at Dessau has improved its Diesel engine for airplanes so that in a recent test an airplane equipped with a Diesel engine remained in the air for 15 hr. It is believed that the German commercial air service will equip some planes with Diesel engines in an effort to reduce operating costs.

This Issue in Brief

Heat treating is an art of the highest order. In formulating a new process, the heat treater can trust best his own experience. He cannot, without reserve, use the experience of others. Rate of cooling is a vital factor in heat treating and X-ray is a decided aid.—Page 513.

* * *

Successive steps in machining the crankcase of the nine-cylinder Wright Whirlwind engine include multiple operations, which are performed simultaneously or in sequence. In one case, 20 flange holes are drilled simultaneously on a multiple drill.—Page 525.

* * *

Aluminum alloys can be heat treated to yield a wide range of properties. The tensile strength obtainable in some alloys by heat treatment is remarkable. This also applies to ductility and hardness. Heat treating department is now a necessary adjunct to the modern aluminum alloy foundry.—Page 515.

* * *

Substantial savings in weight and improvement in strength and safety of aircraft result from using delicately constructed steel alloy parts heat treated by a new process. Parts are handled without distortion in large electric furnaces. Cost of heat treating has been reduced by establishing centrally-located plant for the industry, where work may be done on a production basis.—Page 519.

* * *

Products and personnel of 250 exhibitors indicate in part the commercial and technical promise of the metal exposition in Cleveland in the week of Sept. 9. —Page 529.

Exports of iron and steel products in first seven months of 1929 were the largest for any corresponding period since 1921. In rolled and finished steel, the gain over 1928 was 19 per cent.—Page 583.

* * *

American output of alloy steels in 1928 exceeded 3,000,000 gross tons for the first time. Expansion in production of electric alloy steel castings has been rapid.—Page 544.

* * *

Sixteen vertical core ovens, 45 ft. high, save much space in comparison with the horizontal type in Michigan automobile foundry. Each core-maker loads his own cores on furnace trays. This eliminates the use of racks and the necessity for aisles.—Page 549.

* * *

Remedies for crystal spots on plated ware, especially builders' hardware, are the exclusion of sulphur from the surroundings, the use of lacquers which retard spotting, application of a thin film of grease to the lacquered surface and the use of wax paper for wrapping.—Page 516.

* * *

United States Navy uses standard colors to mark ends of bars, billets and other metals for identification. This system probably will be adopted by all departments of the Government.—Page 518.

* * *

Machinery exports in July were the second highest ever recorded. The total for the first seven months of the year reached a new high level for that period, amounting to more than $362,000,000.—Page 585.

Long structure - weakening flakes of graphite found in ordinary cast iron can apparently be induced to take more globular and less damaging forms. Although this has been done by the malleabilizing process, heat treatment by other and quicker methods gives promise of usefulness.—Page 517.

* * *

Diameter of single (upper) roll used in bending steel plates is 1.136 times that of each of the two lower rolls. Stresses induced in the rolls are a function of the thickness and the width of the plate being bent. Critical conditions are found when the width reaches 79 times the thickness and again at 109 times the thickness.—Page 546.

* * *

Progress in case carburizing, as seen by the testing engineer, has been mainly along the lines of improved technique and in the development of gas carburizing. Since there is no need for expensive and frequently-renewed carburizing boxes in gas carburizing, this field is especially tempting for further study.—Page 517.

* * *

Metal construction is lighter than wood for aircraft parts where the design is such that the full strength of the metal is taken advantage of. Wood is virtually obsolete as a structural material for aircraft.—Page 519.

* * *

Trend toward a fairly general agreement as to principles of heat treating and the development of the nitriding process for hardening steel surfaces are outstanding features of steel treating in the past year, states authority.—Page 517.

THE IRON AGE

W. W. MACON
Managing Editor

ESTABLISHED 1855

Is There Inflation?

WRITING in the current bulletin of his company, Col. Leonard P. Ayres, vice-president of the Cleveland Trust Co., points out that up to the end of 1928 stock prices had risen to 55 per cent above normal, and so far in 1929 they have continued up until they are now about 76 per cent above normal. He proceeds to explain that "the generally vigorous and persistent advance in the earnings of the leading industrial corporations during the last five years probably constitutes the most important single cause behind this unprecedented advance in stock prices. Investors are buying stocks, instead of bonds and mortgages, because they realize that, if corporate earnings continue to advance, the yields will eventually become adequate."

Colonel Ayres's explanation is sound in so far as it goes, but manifestly it does not go far enough. For one thing we need to understand better the reason for the advance in corporate earnings. Anyway, we shall feel considerably more comfortable if we understand it.

In the first place we have had a steady increase in population and have made no economic mistakes leading to extensive unemployment. In other words, an increasing number of workers has been working as nearly to full time as seasonal conditions and their own wishes permit, and at the same time their number has been swelled in effect by greater mechanization and improved organization. The earnings of the railroads and other public services were bound to be increased by such conditions if by nothing else.

At the same time numerous corporations have been engaged in doing new things. There have been phenomenal developments in the chemical industry, in the production of rayon, and in the conquest of the air. Also the public appetite for amusement has led to great earnings by the purveyors to that demand in radio-telephony, in theatrical shows, and most lately in the phono-cinema. The interest in automobiling has waxed, not waned, and the earnings originating through it spread to the production of iron and steel, petroleum, copper, cement, and so on. On the other hand there have been some reverses. The fertilizer manufacturing concerns have not done well. The desire of the women of the world to wear their skirts supra-knee high has played mischief with the textile industry except in its rayon branch, which has supplied the girls with the material for their stockings and underwear.

At the present time we have right before us the development of a new group of copper deposits in Rhodesia that give sound promise of proving to be the greatest occurrence of copper the world has known. By the time their copper is ready to come on the market it will be needed for more telephone, light and power lines, more electrical machinery, etc. It is entirely reasonable that the stocks of those companies should be bid up even if they are making no present return and indeed are absorbing capital and credit for their equipment.

All of this fails, however, to explain the rapidity and violence of the rise in corporate securities, running to 76 per cent in the space of two or three years and bringing the grand total of quotational value up to something in excess of 200 billion dollars, according to one estimate. Any such figure is to be viewed with reservation, for among other things there are duplications from one listed company's ownership of stock in others. Nevertheless, we may easily accept that the aggregate of the quotational value of corporate shares, listed and unlisted, eliminating all duplication, has attained an enormous total and one that is out of all reasonable proportion to our national wealth if computed on the basis of 1913 prices. Heretofore we have suggested that our national wealth if uniformly written up would be far in excess of what the Census and other authorities have estimated.

Now, the probability is that this is just the process that has been lately going on. We had previously written up our real estate and some other things, but had not done so with our railroads and mines and many of our factories. The process that has been going on has been characterized by some financiers as inflation. It creates, indeed, an expanded basis for credit and such use has been made of it, to the despair of the Federal Reserve Board. However, it is certainly not a general inflation, but rather it is in the way of being an equalization in inflation. We have been inflated to about 160 per cent in our general index of price level. We have been bringing our national capitalization up to the same figure or something like it.

So we will answer our captional interrogation in the affirmative, and will agree that we are having inflation, but so have we been ever since the index of general price level began to rise sharply, about 1916. However, we are certainly not experiencing any currency inflation or anything that has to do with the quantitative theory of money. Nor are we overproducing commodities and building up accumulations in which credit is being frozen. And somehow we fail to become alarmed about the inflation that has been blossoming in the stock market.

Heat Treatment as a Science

FOR many years the old-fashioned tool maker has been able, and still is, to bestow a fine cutting edge of long life on a rough piece of steel. His eye and experience tell him just when the tool has reached the proper heat for forging and quenching. He knows not the reasons why. Similarly the blacksmith fashions out of a crude piece of metal a hard, serviceable product. Science is not recognizable in these accomplishments.

The last fifteen years have been a marvel of progress in the heat treatment of metals. Expansion of the steel treaters' organization from a small beginning to a great technical society in eleven years is impressive witness to the fact. In this issue of THE IRON AGE, which especially emphasizes this progress, one writer observes that not yet have operations in this field been brought under scientific control. Too many uncertainties remain to be cleared up. Yet each year records progress in organizing our knowledge.

A leading testing engineer, whose researches in fatigue of metals are known internationally, points out on another page that lately general agreement has been reached as to the principles of heat treatment, also that advances in gray iron are signal. Another writer, who has specialized in aluminum alloys, tells of their rapidly growing uses, under heat treatment. They promise soon to figure in the construction of street railroad cars, steam railroad passenger cars and parts of locomotives, as they are already doing in the building of aircraft, motor cars, trucks and buses—such is the modern demand for saving in weight and increase in speed.

We need not doubt that heat treatment will yet be known as a science in the full three-fold sense of exact knowledge of facts, exact knowledge of laws, and exact knowledge of proximate causes. But, as is indicated on the first reading page of this issue, that goal is some distance ahead.

Automotive Industry's Earnings

TWO years ago General Motors attracted much attention by having earnings in the first half of the year 42 per cent in excess of Steel Corporation earnings. In the first half of this year there was only 15 per cent excess. Yet the automobile industry has been extremely active, even more so than the steel industry. *Automotive Industries* compiles a comparison of earnings of ten representative passenger car companies, showing first-half earnings totaling $203,732,321 for last year and $206,586,527 for this year, making only 1.4 per cent increase. General Motors, representing about three-fourths of the total, decreased 6 per cent. Peerless had an increased loss, Pierce-Arrow converted a loss into a very substantial profit, and some others had large decreases in earnings.

Large earnings in the first half of 1927 were not difficult to understand. Total production was only 11½ per cent under the record first half and as Ford production disappeared entirely before the end of the half year, non-Ford production had a large increase.

The small gain this year over last in automobile industry earnings, when activity has been so great and when nearly all other industries have shown large gains, affords food for thought, there being basis for making some plausible guesses.

The most interesting comparison is between steel and automobiles. The steel companies have had a larger increase in earnings than in tonnage, there being a substantial increase in earnings per ton, yet without any really material increase in realized prices. The explanation is that with full operation the extra tonnage produced cost less per ton, general running expenses not increasing in anything like the same proportion as tonnage.

It was not thus with the automobile industry, whose profits per car evidently decreased. On account of changes in models and specifications direct comparison of costs and list prices cannot be made, but it is not difficult to form a conception of the general merchandizing situation in the industry. At the opening of this year capacity was far in excess of any previous production and clearly it was a case of finding out who would survive. For eventual success a large turnover was absolutely essential. Any car that went down in sales would lose ground, no matter how much profit there were per car, because the public would lose interest.

The automobile industry knew that it was entering a year of intense competition, in all probability a crucial year for not a few of the individual producers. There has been intensive sales effort. While the steel industry sold its extra tonnage this year at practically no additional expense—and its selling expense is always relatively low—the automobile industry, it being understood that Ford is not included in this discussion at all, went to much expense to sell its extra quantity. It is a detail whether the extra expense was in pricing cars low relative to cost or in extra selling expense, including advertising, unusual commissions and other special allowances. While the public no doubt has been really anxious to buy automobiles it has been given a great deal of expensive encouragement.

Here, then, is the great difference between steel and automobiles. An additional tonnage of steel has been sold at almost no expense, while an additional number of automobiles has been sold at a very high expense. Nobody is particularly to blame; the circumstances were simply laid out by the march of events.

More Pig Iron to Steel in Europe

LAST year the steel ingots and castings produced in the United States weighed 35.1 per cent more than the pig iron produced. For Europe, including the United Kingdom, the excess was only about 17.4 per cent. There is quite a difference. Why? As the United States is a relatively new country one would rather expect the divergence to be in the other direction.

It is necessary to get clearly in mind in the first place that the apparent excess of steel over pig iron is not a real excess. The major part of the scrap used in any steel works is the scrap the works produces itself in converting steel ingots into merchantable material. Last year the United States produced 50,325,393 tons of steel ingots, but only 37,177,939 tons

of rolled steel, the difference being chiefly works scrap; and through conversion of skelp into pipe, rods into wire, etc., the merchantable material as shipped was less than the rolled steel. The production of pig iron and ferroalloys was 38,155,714 tons, showing a slight excess over the merchantable steel. That excess, plus the pig iron used in making iron and steel castings was, in a rough way, the measure of the outside scrap, whether old material or industrial scrap, used by the steel works.

We cannot assume that European makers crop their ingots less by reason of making better ingots than we do. In the present consideration practice must be taken as much the same here and abroad. We cannot study the different countries in detail, because much pig iron moves from one country to another. Poland made more than twice as much steel as pig iron and Italy three and a half times as much, but that was due to importing pig iron. Both France and Luxemburg made only 93 per cent as much steel as pig iron, which was due to exporting pig iron.

The question will naturally arise, whether these much older countries, long producers, are originating more old material than we are. Assuming, for illustration, that material comes back as scrap a quarter century after it is made, we were making 25 years ago only half as much pig iron, while Europe was making fully four-fifths as much as at the present time. It might be concluded that the relative outcome of old material should therefore be greater in Europe than in the United States.

We can be sure, however, that this is not the case. Europeans have not gone in so much as we for steel structures and other things that can be wrecked in time and the material reclaimed, nor if they did would they abandon the things so soon for bigger things. The per capita consumption being smaller, the material is more widely dissipated.

In addition to this consideration, we may be reasonably certain that Europe as a whole puts a larger proportion of its pig iron into iron castings than we do. It is a notable fact that our production of iron castings has not grown in the last 20 years. Precise statistics would probably show a decrease. One can only estimate by observing that the production of pig iron for foundry work has not increased, while the proportion of scrap used in foundries has probably decreased.

These two considerations fit into one general conclusion, that the United States, although new, has progressed beyond Europe, replacing its steel after shorter periods of service, and using on a larger scale rolled steel and forgings in preference to iron castings.

Bolts, Bearings and Profits

BEARINGS and bolts are relatively inconspicuous machine elements and they get less attention from the designer and constructor than moving parts like cranks, gears and shafting, or shock-resisting details like springs or cutting tools. Yet they are of major importance in operation, as many a maintenance man can testify. In this age when machinery does everything that can be done without human labor, the machine owner makes money only when the machine runs. And it runs on bearings and is held together by bolts. Operators therefore call down blessings on the man who provided generous bearings and ample lubrication to the journals, and properly objurgate the unknown designer who skimped material in studs, bolts and rivets.

Everyone knows that there have been important advances in the methods of lubrication. We see fewer greasy mechanics with long-spout oilers, sprinkling oozy liquid on everything surrounding the elusive oil hole. Much complicated machinery has an oil circulating system built into it, supplying every rubbing surface with a generous and constant supply of cool, filtered oil. In other equipment the oil-can nuisance has been scotched by grease cups or by periodically forcing into the bearings grease under pressure. The use of high-grade roller and ball bearings and a better knowledge of the manufacture and properties of bearing bronzes and other alloys have also improved the operating efficiency of much machinery.

As a notable case in point we have in mind one entire rolling mill which is equipped with a force-feed system of lubrication reaching every bearing—on motors, drive, roll housings, tables, manipulators and all auxiliaries. Oil is circulated, cooled, filtered and reused. Oil supply is so interlocked with main control circuits that if the circulation should be interrupted for any cause the entire mill closes down. The excellence of this system is such that make-up oil amounts to about 30 cents a day, or as much as one oiler might waste in an hour.

But the greatest profit from such a well designed system comes from the fact that the machinery is always ready to operate. Generous design in all parts, and especially in bearings and bolts, enabled this same mill to operate throughout 1928 with total delays chargeable to failures in equipment amounting to 19 minutes. It is not a brand new mill, either—just built right and maintained right. Ability to run when wanted is the ideal.

Another citation: This ability to run when wanted is one of the greatest advantages of the oil-electric locomotive. One sizable steel plant requiring five steam locomotives for switching service has been able to replace them with four oil-electrics, because the old equipment was down such a large percentage of the time for cleaning boilers, fires and grates, for loading coal or water, or for repairs and inspection. Of course, the oil-electrics do not operate 100 per cent of the time; they must load oil and also undergo inspection and repairs. But the general quality of material, workmanship and design in the newer equipment is so much better than in the old that such delays are hardly 5 per cent of the time. To say nothing of the smoke nuisance and fire hazard, such an "ability to serve" means much in reducing repair gangs, auxiliary repair equipment and even in some instances operating labor.

These instances are cited to substantiate the original proposition that machines make money only when they operate, that they operate on bearings and are tied together with bolts, and that money spent in generous proportions and intelligent design will pay good dividends in operating economies. And these propositions hold for entire establishments as well as individual machines.

CORRESPONDENCE

American Costs of Concentrating Manganese Ores

To the Editor: Referring to your discussion (THE IRON AGE, Aug. 8) of the Bradley manganese leaching process:

You comment on the ammonia leaching process of Mr. Benedict of the Calumet & Hecla; but it is not necessary to do much guessing as to the cost of that process. The company gives the cost of the copper recovered as around 7c. per lb.; and if the recovery is 12 lb. per ton of sand, that means an operating cost of 84c. a ton, which includes smelting the precipitate to refined copper.

The Bradley process is the type of process adapted to American production, the basic law being that means must be devised that do away with hand labor. It makes no difference how complicated a process may be (if it succeeds in its object) if the labor cost is low, and the labor costs in such processes as this are low. That is the whole story.

The great successes in American mining today are in those cases where there is a large tonnage that can be extracted cheaply and then subjected to concentrating processes. The matter of grade of ore is nothing or next to nothing, if there is plenty of it and if modern technology is applied, with low labor cost.

If there is a duty, where the Bradley process and other processes will meet their trials is in competition with natural deposits of good grades of manganese ore here. There are those who assume to know so much of creation that they know there is practically no manganese ore in the United States. This is highly absurd. Nobody knows anything about the actual resources of manganese in the United States. It is known, however, from a great number of researches that the chemical composition of the continents of the earth is much the same, as anybody can ascertain by referring to the reports of exhaustive researches given by Dr. F. W. Clarke of the U. S. Geological Survey in Bulletin 770, "The Data of Geochemistry."

It is also well known by competent geologists that the supposed ore-forming processes have been much the same in the different continents and it is a fair and safe conclusion that the United States has its share of both high-grade and low-grade manganese ores. What the United States lacks, when it comes to producing tin and tungsten, manganese and chrome, and most minerals, is labor at 10 cents a day and 25 cents a day. There are probably 500 known manganese ore deposits in the Appalachian ranges alone that could be immediately operated at a good profit if there were a supply of cheap coolie labor to dig the dirt and pick out the lumps of manganese.

Any analogies in the consideration of manganese which it is attempted to apply to American production and Indian production are entirely unsafe. Methods of production must be adapted to conditions and these are highly variable. When a native population in Africa, estimated at 200,000,000, with access to natural resources on a grander scale than in this country, has been put into action, larger interests than those in manganese—such as iron, steel, copper, corn and cotton—will find out something about paying $4 a day for labor and trying to compete with 10-cent labor.

ANSON G. BETTS.

West Cummington, Mass., Aug. 15.

Republic to Acquire Union Drawn Steel Co.

CLEVELAND, Aug. 27.—The Republic Iron & Steel Co., Youngstown, and the Union Drawn Steel Co., Beaver Falls, Pa., have agreed upon terms by which the Union Drawn company is to be acquired by the Republic organization, according to a statement by Cleveland financial interests who have been negotiating the deal. The Union Drawn company, which is the largest independent maker of cold drawn steel products in the country, operates three plants at Beaver Falls and one each at Gary, Ind., Hartford, Conn., Massillon, Ohio, and Hamilton, Ont.

Terms of the proposed sale have not been made public and will be subject to approval of stockholders of Union Drawn company.

Low Expansion Alloy for Gas Engine Pistons

A new alloy, developed by Aluminum Co. of America is being used by Reo Motor Car Co. for pistons. Reo engineers think it is better than the former plain skirt aluminum piston, which has been so successful in the past. The new material is called Low-Ex and has a thermal expansion rate 12 to 15 per cent less than that of previously used alloys, while the heat conductivity is 15 to 20 per cent greater. As a result, piston clearance is reduced 0.003 in., which means longer piston life due to greater wearing margin.

Whitcomb Company to Make Oil Electric Engines

The George D. Whitcomb Co., manufacturer of industrial and railroad locomotives, has broken ground for the construction of a new factory unit. The expansion is for oil-electric locomotives from 20 to 100 tons.

Program for Iron and Steel Institute's Fall Meeting

The autumn meeting of the (British) Iron and Steel Institute will be held at Newcastle-upon-Tyne, England, in the Festival Hall of the North-East Coast Exhibition, Sept. 10 to 12. The following is the list of the technical papers scheduled:

"Notes on Wire for Mining Ropes," by A. T. Adam.

"The Solubility of Carbide in Ferrite," by H. A. Dickie.

"Electrical Conductivity of Magnesite and Some Other Refractory Materials in Relation to the Temperature and Their Other Properties," by E. Diepschlag and F. Wulfestieg.

"Notes on the Damping-Down and Re-Starting of Blast Furnaces," by C. S. Gill.

"The Hardening of Superhardened Steel by Magnetism—The Lattice Resonance Hypothesis," by E. G. Herbert.

"Crystallization and Segregation Phenomena in 1.10-Per Cent Carbon Steel Ingots of Smaller Sizes," by A. Hultgren.

"High Elastic Limit Structural Steels," by J. A. Jones.

"The Hardness of Vacuum-Annealed Crystals of Iron," by H. O'Neill.

"Iron in Antiquity," by T. A. Rickard.

"The Correlation of Fatigue and Overstress," by J. H. Smith, C. A. Connor and F. H. Armstrong.

"The Coalescence of Pearlite," by J. H. Whiteley.

"Iron-Silicon-Carbon Alloys—Constitutional Diagrams and Magnetic Properties," by T. D. Yensen.

Bar Mill Rate Unchanged

For September-October, tonnage rates for boilers and finishers in midwestern mills continue without change from the July-August rate. At the bi-monthly examination of sales sheets, the average selling price of bar iron shipped during the 60 days ended Aug. 20 was disclosed as 2c. a lb., or unchanged from the previous settlement.

Grefco chrome high temperature cement and Standard silica bonding cement, products of the General Refractories Co., Philadelphia, are now being sold through dealers.

Iron and Steel Markets

Output Reduced in Some Products

Rollings of Rails, Tin Plate, Bars and Strip Steel Lower— Ingot Production of Leading Companies Still High— Large Sales of Southern Pig Iron

REDUCED mill operations in rails, tin plate, merchant and alloy steel bars and strip steel are offset to some extent by continued large output of other products, notably plates, structural material and sheets.

The larger producers, including the Steel Corporation and at least two of the leading independents, having diversified lines, are still maintaining ingot output at 90 to 95 per cent of capacity, while some of the smaller companies average about 85 per cent.

New business and specifications for nearly all steel products except plates and sheets have been in smaller volume than shipments this month, resulting in a reduction in backlogs and shortening of deliveries.

The lull in demand is regarded as merely the seasonal expectation that has come much later in the year than usual. The decline in the requirements of the automobile industry is partly responsible, although other factors are at work, such as a setback in farm implement manufacturing.

Ingot production this month should show a slight loss from that of July. Last year the low point came in June, with each succeeding month bringing an increase up to the last two of the year. Indications point to the present volume of ingot output holding fairly well for another month, by which time the trend of fall business will have become apparent.

Prospects as to the extent of the possible recovery in automobile manufacturing and revival of railroad car buying are still in doubt. A fall buying movement in rails and tin plate is regarded as certain to revive declining rollings of those items.

Automobile output in August will be slightly larger than in July, which was the low month since February, but steel orders from the motor car builders have increased very slowly. Ford production this month is expected to reach 200,000 units, but Chevrolet's schedule is well below its recent peak. Other motor car companies, some of which had sharply reduced their August programs, are expected to manufacture on a greater scale next month.

Demand for sheets has held up surprisingly well in spite of the decline in automobile demand. Orders this month have been almost equal to shipments. At the beginning of August independent mills had unfilled orders for a month and a half, while the leading interest has two months' bookings and is again operating this week just under 100 per cent.

This is an in-between season for rails and tin plate and both have had sharp curtailment in rollings. The rail buying movement is expected to get started earlier than usual this year, and 20,000 tons is already mentioned as a possible purchase before Sept. 15 for fall delivery. Meanwhile, some rail mills have reached the end of their obligations. This is true of one at Chicago, though the other there has a 75 per cent schedule arranged into October, while the Ensley mill of the Tennessee Coal, Iron & Railroad Co. has been shut down, together with four open-hearth furnaces which were supplying it with steel.

Tin plate operations have declined to an average of 80 per cent or less. Though the leading producer is at better than 85 per cent, output of independent mills ranges from 50 to 75 per cent. Within a month, however, mills will begin rolling on next year's business.

Structural steel demand during August has been heavy, on top of a seven months' total which exceeded that for the same period last year by 16 per cent. Although the week's awards dropped to 22,000 tons from more than 50,000 tons in the preceding week, fresh inquiries totaled 58,000 tons, of which 27,000 tons is for bridges, one at Cleveland calling for 15,000 tons.

Plate mills are still operating at close to capacity. Plates are the only steel product in which deliveries have not been materially cut down. Among new requirements is 30,000 tons for four ships.

Railroad equipment orders, totaling nearly 1800 cars, of which 1393 are for the Lackawanna road, were the largest in any week since June.

Steel prices are holding remarkably well despite lessened demand. The fact that a fourth-quarter contract for black sheets has been made at the present quotation of 2.85c. a lb., Pittsburgh, points to a continuance of current prices to the end of the year, notwithstanding talk of an advance.

Heavy sales of Southern pig iron have placed producers in that district in a somewhat more favorable position. One company, which has sold upward of 50,000 tons in the North in the week, has withdrawn from the market, and the others show a tendency to stiffen their quotations, although much of the week's business was taken at prices ranging from $12 to $13.50, Birmingham. Sales included 20,000 tons to two Delaware River cast iron pipe makers, 10,000 tons of basic to an Illinois steel company and 10,000 tons of foundry iron to other Chicago district consumers.

Northern iron remains fairly steady in the face of the Southern competition, though prices have given way 50c. a ton at St. Louis, and Buffalo iron is lower in New England.

THE IRON AGE pig iron composite price has dropped to $18.25 a gross ton, the year's low, from $18.42 last week. Finished steel remains at 2.398c. a lb. for the third week.

On export business there are frequent variations from the above prices. Also, in domestic business, there is at times a range of prices on various products, as shown in our market reports on other pages.

Pittsburgh

Industry Marking Time to Discover Trend of Demand, Meanwhile Operating Close to 95 Per Cent

PITTSBURGH, Aug. 27.—The steel industry in the Pittsburgh and tributary producing districts is marking time and it will be another month before the trend for the fourth quarter will be clearly discernible. New business and shipping orders on all products except plates and some finishes of sheets are far from sufficient to sustain present operating schedules and backlogs are already considerably reduced in some lines.

Nevertheless, the Steel Corporation subsidiaries and the leading independent producer in the immediate Pittsburgh district are still able to utilize capacity ingot output in their various finishing departments and have not yet begun to accumulate raw steel to any marked extent for their reserve stocks. For this reason it will be another month before any decided curtailment in the rate of steel making will be necessary and present operations, which are still not far below 95 per cent of the theoretical top, are not expected to decline immediately. And during that month improved demand from leading consuming industries may change this decline into an increase.

The present lull in demand is entirely natural and not alarming in its proportions. Fortunately, it finds the leading companies so well supplied with old business that new tonnage is not immediately necessary to sustain activity. However, rollings against old rail contracts have now been largely completed and it will be several weeks until new orders are placed.

The same is true with regard to tin plate, specifications for which have receded sharply this month. Leading independent makers of tin plate have reduced their operations to an average of not more than 65 per cent of capacity, although the Steel Corporation subsidiary is still above 85 per cent.

The decline in demand from the automotive industry has affected steel most seriously. Only one or two of the large makers of automobiles have begun to specify steel for new models and others, particularly manufacturers of cars in the low priced field, have practically withdrawn from the consuming market. The Ford company is the one exception. Its requirements are as large as ever.

This curtailment has forced makers of strip steel, who have been operating on a hand-to-mouth basis for some time, to slow down their mills, with prospects of even lighter schedules before demand again develops. Sheet makers, however, who are favored with unusually heavy commitments, report a sustained demand from other consuming industries and still have sufficient shipping orders for several weeks' work.

Prices are holding remarkably well despite declining demand, and no further weakness has developed during the last week. Galvanized sheets are still soft, but leading independents are taking a firmer price stand and there is talk of an advance in quotations. At least one fourth quarter contract for black sheets has been closed at 2.85c., Pittsburgh.

The pig iron and scrap markets are

quiet. A few small fourth quarter pig iron inquiries are coming out, but buying is confined to small spot tonnages. Heavy melting steel is not quotably weaker, although there has been no buying to give it strength.

Pig Iron.—Fourth-quarter inquiries are beginning to reach the trade, although no sizable tonnages are reported. Spot sales are being made regularly and leading sellers believe that foundries in the district will have their stocks and contract tonnages completely used up by the end of the next month. Consequently heavy fourth-quarter buying is expected, particularly if conditions throughout the industry are sustained at recent levels. The firmness of the price is regarded very favorably by both the producers and consumers of iron, as the uncertainty of the market in recent summers has been disturbing to both. Southern iron is rather effectively barred from this territory by freight rates, although existing levels permit competition to a few points not ordinarily serviced by Valley furnaces. However, furnaces in that district have lost no business to Birmingham producers. Present quotations of $18.50, Valley, on foundry and basic iron and $19 on malleable and Bessemer are likely to be retained in the fourth quarter.

Prices per gross ton, f.o.b. Valley furnace:

Basic	$18.50
Bessemer	19.00
Gray forge	18.00
No. 2 foundry	18.50
No. 3 foundry	18.00
Malleable	19.00
Low phos., copper free	27.00

Freight rate to Pittsburgh or Cleveland district, $1.76.

Prices per gross ton, f.o.b. Pittsburgh district furnace:

Basic	$19.00
No. 2 foundry	19.00
No. 3 foundry	18.50
Malleable	19.50

Freight rates to points in Pittsburgh district range from 63c. to $1.13.

Semi-Finished Steel.—The smaller integrated steel companies in this and nearby districts are now beginning to replenish their stocks of semi-finished steel which were badly depleted during the spring. These same companies have also curtailed their steel production and, as a group, are not operating at more than 85 per cent of capacity. However, the Steel Corporation subsidiaries and the largest independent producers are still finding use for capacity output in their various finishing departments and are running their open-hearth furnaces and blooming and billet mills at close to theoretical capacity. Careful allocation of tonnage leaves little surplus for accumulation. Open-market transactions in billets, slabs and sheet bars are uncommon and the price on small tonnages of all three products seems definitely established at $35 a ton, Pittsburgh or Youngstown. It is conceded that considerable billet and slab contract tonnage is moving at lower figures and fourth quarter prices are a matter of conjecture. Wire rods are firm at $42, Pittsburgh and Cleveland, and shipments are holding up well for this time of the year.

Bars, Shapes and Plates.—The well sustained demand for the heavy hot-rolled products has long since ceased to be a surprise to the industry, and local offices find nothing unusual in the limited curtailment which is occurring at this time in bars and shapes. During the greater part of the year demand has been well diversified and now the only falling off in bars has been from mills serving the automobile industry. During August backlogs on bars and shapes have been drawn on to a certain extent, but at present it is difficult to get shipments in less than two or three weeks. On reinforcing bars the time must be extended to four weeks. Fabricating shops in the district are well engaged, but will again be in need of business by the end of the quarter. Present inquiry indicates that such business will be forthcoming. During the week the Pittsburgh and West Virginia Railroad took 2100 tons of shapes for viaducts on its Connellsville extension. Plate demand seems to be as strong as ever. This district is still feeling the pressure for deliveries in the Chicago area and, although little business from that territory has actually been placed with nearby mills, they have greatly extended their normal Western territory in many instances. Requirements from barge builders are heavy, and present orders on the books of these companies will keep them busy until November. The same cannot be said of railroad car builders, who will need orders by the end of the quarter if their shops are to be kept busy.

Rails and Track Supplies.—This market is very quiet, and it will be several weeks before any improvement in demand can be looked for. The Atlantic Coast Line is inquiring for 10,000 kegs of railroad spikes, but otherwise sizable inquiries for accessories are lacking.

Bolts, Nuts and Rivets.—This industry is operating at 75 per cent of capacity, although there is a growing tendency toward curtailment. Jobber demand has held up well during the summer and heavy shipments are going to fabricating shops, the barge builders and to makers of railroad equipments. The railroads themselves have also been good buyers, but demand from this source has declined seasonably in recent weeks. Prices are generally well maintained.

Wire Products.—August business in manufacturers' wire is going to show a decided improvement over the same month last year and will be ahead of the month just passed with one maker. However, specifications from jobbers are off and business has not been improved by price weakness on products going to that trade. Fencing and wire nails are quiet, with prices apparently checked at recently quoted levels.

Tubular Goods.—Steady demand for seamless and lap-weld tubing is fully sufficient to sustain operations at a rate unchanged from last week, or approximately 65 per cent of full theoretical capacity. Some makers notice a slight improvement in the movement of oil country products in the last few days, but this may be only temporary. Shipments of butt-weld pipe are rather light, but higher building operations in some parts of the country are expected to lead to a stronger demand. Specifications for mechanical and boiler tubing have been declining this month and the tendency has not yet been checked.

Sheets.—The sheet business is holding its own in spite of curtailed automobile demand. A few companies which make automobile body sheets

Mill Prices of Finished Iron and Steel Products

Iron and Steel Bars

Soft Steel

	Base per Lb.
F.o.b. Pittsburgh mill	1.95c.
F.o.b. Chicago	2.05c.
Del'd Philadelphia	2.27c.
Del'd New York	2.29c.
Del'd Cleveland	1.92½c. to 1.95c.
F.o.b. Cleveland	1.90c. to 1.95c.
F.o.b. Lackawanna	2.05c.
F.o.b. Birmingham	2.20c.
C.i.f. Pacific ports	2.35c.
F.o.b. San Francisco mills	2.35c. to 2.40c.

Billet Steel Reinforcing

F.o.b. Pittsburgh mills, 40, 50, 60-ft.	2.05c.
F.o.b. Pittsburgh mills, cut lengths	2.30c.
F.o.b. Birmingham, mill lengths	2.20c.

Rail Steel

F.o.b. mills, east of Chicago dist.	1.85c. to 1.90c.
F.o.b. Chicago Heights mill	1.95c.
Del'd Philadelphia	2.27c.

Iron

Common iron, f.o.b. Chicago	2.05c.
Refined iron, f.o.b. P'gh mills	2.75c.
Common iron, del'd Philadelphia	2.12c.
Common iron, del'd New York	2.14c.

Tank Plates

	Base per Lb.
F.o.b. Pittsburgh mill	1.95c.
F.o.b. Chicago	2.05c.
F.o.b. Birmingham	2.20c.
Del'd Cleveland	2.14c.
Del'd Philadelphia	2.15c.
F.o.b. Coatesville	2.05c.
F.o.b. Sparrow Point	2.05c.
F.o.b. Lackawanna	2.05c.
Del'd New York	2.22½c.
C.i.f. Pacific ports	2.35c.

Structural Shapes

	Base per Lb.
F.o.b. Pittsburgh mill	1.95c.
F.o.b. Chicago	2.05c.
F.o.b. Birmingham	2.20c.
F.o.b. Lackawanna	2.05c.
F.o.b. Bethlehem	2.05c.
Del'd Cleveland	2.14c.
Del'd Philadelphia	2.01c. to 2.06c.
Del'd New York	2.14½c.
C.i.f. Pacific ports	2.35c.

Hot-Rolled Hoops, Bands and Strips

	Base per Lb.
6 in. and narrower, P'gh	2.00c.
Wider than 6 in., P'gh	1.90c.
6 in. and narrower, Chicago	2.20c.
Wider than 6 in., Chicago	2.10c.
Cooperage stock, P'gh	2.20c.
Cooperage stock, Chicago	2.30c.

Cold-Finished Steel

	Base per Lb.
Bars, f.o.b. Pittsburgh mill	2.30c.
Bars, f.o.b. Chicago	2.30c.
Bars, Cleveland	2.35c.
Shafting, ground, f.o.b. mill	*2.65c. to 3.60c.
Strips, P'gh	2.75c. to 2.85c.
Strips, Cleveland	2.75c. to 2.85c.
Strips, del'd Chicago	3.05c. to 3.15c.
Strips, Worcester	2.90c. to 3.00c.
Fender stock, No. 20 gage, Pittsburgh or Cleveland	4.25c.

*According to size.

Wire Products

(Carload lots, f.o.b. Pittsburgh and Cleveland, to jobbers and retailers.)

	Base per Keg
Wire nails	$2.55 to $2.65
Galvanized nails	4.55 to 4.65
Galvanized staples	3.25 to 3.35
Polished staples	3c. to 3.10c.
Cement coated nails	$2.55 to $2.65
	Base per 100 Lb.
Bright plain wire, No. 6 to No. 9 gage	$2.40 to $2.50
Annealed fence wire	2.55 to 2.65
Spring wire	3.50 to 3.60
Galv'd wire, No. 9	3.00 to 3.10
Barbed wire, galv'd	3.20 to 3.30
Barbed wire, painted	2.95 to 3.05
Woven wire fence (per net ton to retailers)	65.00

Chicago district mill and delivered Chicago prices are $1 per ton above the foregoing. Birmingham mill prices $3 a ton higher; Worcester, Mass. (wire), mill $3 a ton higher on production of that plant; Duluth, Minn., mill $2 a ton higher; Anderson, Ind., $1 higher.

Cut Nails

	Per 100 Lb.
Carloads, Wheeling, Reading or Northumberland, Pa.	$2.70
Less carloads, Wheeling or Reading	2.80

Light Plates

No. 10, blue annealed, f.o.b. P'gh	2.10c. to 2.20c.
No. 10, blue annealed, f.o.b. Chicago dist.	2.30c.
No. 10, blue annealed, del'd Phila.	2.42c. to 2.52c.
No. 10, blue annealed, B'ham	2.35c.

Sheets

Blue Annealed

	Base per Lb.
No. 13, f.o.b. P'gh	2.25c. to 2.35c.
No. 13, f.o.b. Chicago dist.	2.45c.
No. 13, del'd Philadelphia	2.67c.
No. 13, blue annealed, B'ham	2.50c.

Box Annealed, One Pass Cold Rolled

No. 24, f.o.b. Pittsburgh	2.85c.
No. 24, f.o.b. Chicago dist. mill	2.95c. to 3.00c.
No. 24, del'd Philadelphia	3.17c. to 3.27c.
No. 24, f.o.b. Birmingham	3.10c.

Metal Furniture Sheets

No. 24, f.o.b. P'gh	4.10c. to 4.20c.

Galvanized

No. 24, f.o.b. Pittsburgh	3.50c. to 3.60c.
No. 24, f.o.b. Chicago dist. mill	3.60c. to 3.70c.
No. 24, del'd Cleveland	3.59c. to 3.69c.
No. 24, del'd Philadelphia	3.92c. to 4.02c.
No. 24, f.o.b. Birmingham	3.75c.

Tin Mill Black Plate

No. 28, f.o.b. Pittsburgh	2.90c. to 3.00c.
No. 28, f.o.b. Chicago dist. mill	3.00c. to 3.10c.

Automobile Body Sheets

No. 20, f.o.b. Pittsburgh	4.00c. to 4.10c.

Long Ternes

No. 24, 8-lb. coating, f.o.b. mill	4.00c.

Vitreous Enameling Stock

No. 24, f.o.b. Pittsburgh	3.90c

Tin Plate

	Per Base Box
Standard cokes, f.o.b. P'gh district mills	$5.35
Standard cokes, f.o.b. Gary	5.45

Terne Plate

(*F.o.b. Morgantown or Pittsburgh*)
(Per Package, 20 x 28 in.)

8-lb. coating I.C.	$11.20
15-lb. coating I.C.	14.00
20-lb. coating I.C.	15.30
25-lb. coating I.C.	$16.70
30-lb. coating I.C.	17.75
40-lb. coating I.C.	19.85

Alloy Steel Bars

(F.o.b. makers' mill)

Alloy Quality Bar Base, 2.65c. to 2.75c. per Lb.

S.A.E. Series Numbers		Alloy Differential
2000	(½% Nickel)	0.25
2100	(1½% Nickel)	0.55
2300	(3½% Nickel)	1.50
2500	(5% Nickel)	2.25
3100	Nickel Chromium	0.55
3200	Nickel Chromium	1.35
3300	Nickel Chromium	3.80
3400	Nickel Chromium	3.20
4100	Chromium Molybdenum (0.15 to 0.25 Molybdenum)	0.50
4100	Chromium Molybdenum (0.25 to 0.40 Molybdenum)	0.70
4600	Nickel Molybdenum (0.20 to 0.30 Molybdenum, 1.25 to 1.75 Nickel)	1.05
5100	Chromium Steel (0.60 to 0.90 Chromium)	0.35
5100	Chromium Steel (0.80 to 1.10 Chromium)	0.45
5100	Chromium Spring Steel	0.20
6100	Chromium Vanadium Bars	1.20
6100	Chromium Vanadium Spring Steel	0.95
9250	Silicon Manganese Spring Steel (flats)	0.25
	Rounds and squares	0.50
	Chromium Nickel Vanadium	1.50
	Carbon Vanadium	0.95

Above prices are for hot rolled steel bars, forging quality. The differential for cold-drawn bars is ¾c. a lb. higher, with standard classification for cold-finished alloy steel bars applying. For billets 4 x 4 to 10 x 10 in., the price for a gross ton is the net price for bars of the same analysis.

Billets under 4 x 4 in. carry the steel bar base. Slabs with a sectional area of 16 in. or over carry the billet price. Slabs with sectional area of less than 16 in. or less than 2½ in. thick, regardless of sectional area, take the bar price.

Rails

	Per Gross Ton
Standard, f.o.b. mill	$43.00
Light (from billets), f.o.b. mill	36.00
Light (from rail steel), f.o.b. mill	34.00
Light (from billets), f.o.b. Ch'go mill	36.00

Track Equipment

	Base per 100 Lb.
Spikes, ⅝ in. and larger	$2.80
Spikes, ½ in. and smaller	2.80
Spikes, boat and barge	3.00
Tie plate, steel	2.15
Angle bars	$2.75
Track bolts, to steam railroads	$3.80 to 4.00
Track bolts, to jobbers, all sizes, per 100 count	70 per cent off list

Welded Pipe

Base Discounts, f.o.b. Pittsburgh District and Lorain, Ohio, Mills

Butt Weld

Steel Inches	Black	Galv.	*Iron* Inches	Black	Galv.
⅛	45	19½	¼ and ⅜	+11	+36
¼ to ⅜	51	25½	½	23	5
½	56	42½	¾	28	11
¾	60	48½	1 and 1¼	31	15
1 to 3	62	50½	1½ and 2	35	18

Lap Weld

2	55	43½	2	23	9
2½ to 6	59	47½	2½ to 3½	28	13
7 and 8	56	43½	4 to 6	30	17
9 and 10	54	42½	7 and 8	29	16
11 and 12	53	40½	9 to 12	26	11

Butt Weld, extra strong, plain ends

⅛	41	24½	¼ and ⅜	+13	+48
¼ to ⅜	47	30½	½	23	7
½	53	42½	¾	28	12
¾	58	47½	1 to 2	34	18
1 to 1½	60	49½			
2 to 3	61	50½			

Lap Weld, extra strong, plain ends

2	53	42½	½	29	13
2½ to 4	57	46½	2½ to 4	34	20
4½ to 6	56	45½	4½ to 6	33	19
7 to 8	52	39½	7 and 8	31	17
9 and 10	45	32½	9 to 12	21	8
11 and 12	44	31½			

On carloads the above discounts on steel pipe are increased on block by one point, with supplementary discount of 5%, and on galvanized by 1½ points, with supplementary discount of 5%. On iron pipe, both black and galvanized, the above discounts are increased to jobbers by one point with supplementary discounts of 5 and 2½%.

Note.—Chicago district mills have a base two points less than the above discounts. Chicago delivered base is 2½ points less. Freight is figured from Pittsburgh, Lorain, Ohio, and Chicago district mills, the billing being from the point producing the lowest price to destination.

Boiler Tubes

Base Discounts, f.o.b. Pittsburgh

Steel		*Charcoal Iron*	
2 in. and 2¼ in.	40	1½ in.	1
2½ in.—2¾ in.	48	1¾ in.	8
3 in.	54	2 in.—2¼ in.	13
3¼ in.—3¾ in.	56	2½ in.—2¾ in.	16
4 in.	59	3 in.	17
4½ in. to 6 in.	48	3¼ in. to 3½ in.	18
		4 in.	20
		4½ in.	21

On lots of a carload or more, the above base discounts are subject to a preferential of two fives on steel and of 10 per cent on charcoal iron tubes. Smaller quantities are subject to the following modifications from the base discounts:

Lap Welded Steel—Under 10,000 lb., 6 points under base and one five; 10,000 lb. to carload, 4 points under base and two fives. Charcoal Iron—Under 10,000 lb., 2 points under base; 10,000 lb. to carload, base and one five.

Standard Commercial Seamless Boiler Tubes

Cold Drawn

1 in.	63	3 in.	48
1¼ to 1½ in.	55	3¼ to 3½ in.	50
1¾ in.	39	4 in.	53
2 to 2¼ in.	34	4½, 5 and 6 in.	42
2½ to 2¾ in.	42		

Hot Rolled

2 and 2¼ in.	40	3¼ to 3½ in.	56
2½ and 2¾ in.	48	4 in.	59
3 in.	54	4½, 5 and 6 in.	48

Beyond the above base discounts a preferential discount of 5 per cent is allowed on carload lots. On less than carloads to 10,000 lb., base discounts are reduced 4 points with 5 per cent preferential; on less than 10,000 lb., base discounts are reduced 6 points, with no preferential. No extra for lengths up to and including 24 ft. Sizes smaller than 1 in. and lighter than standard gage take mechanical tube list and discounts. Intermediate sizes and gages not listed take price of next larger outside diameter and heavier gage.

Seamless Mechanical Tubing

	Per Cent Off List
Carbon, 0.10% to 0.30%, base (carloads)	55
Carbon, 0.30% to 0.40%, base	50

Plus differentials for lengths over 18 ft. and for commercial exact lengths. Warehouse discounts on small lots are less than the above.

principally are rapidly reducing their backlogs, but others report specifications fully equal to July and almost sufficient to maintain the present high operating rate. The leading interest has scheduled its mills again this week at slightly under 100 per cent of capacity and has enough tonnage in the aggregate on its books to assure a high operating rate for about two months. Insistent pressure for deliveries is still being encountered frequently, and even on galvanized sheets, on which price competition is the keenest, delivery promises average about four weeks. Prices show little change. Talk of advances by leading independents has not materialized. Fourth quarter business on black sheets has been closed at 2.85c., Pittsburgh, although no producer has officially opened its books for that period. On current business, concessions from this figure have practically disappeared and blue annealed sheets seem to be steady at 2.35c., Pittsburgh, for the No. 13 gage. Occasional shading on light plates where wide strip competition is encountered is reported. On galvanized sheets, price conditions are still rather chaotic, although some makers continue to adhere to a 3.60c. price. A large part of current tonnages is being taken at figures about $2 under this. Automobile body sheets are being sold at 4c. to 4.10c., and metal furniture sheets at 4.10c. to 4.20c., Pittsburgh, with demand for the latter exceedingly strong.

Tin Plate.—Mill operations continue to decline, and, although the leading interest operated last week at between 85 and 90 per cent of capacity, the average for the industry was considerably lower. The larger independents report operating rates of from 50 to 75 per cent, and the lightness of specifications coming in just now promises little improvement for at least a month. By that time advance business for the coming season will begin to come out and mills will soon begin rolling on tonnage for the next year. Crop conditions are not promising, and the California fruit pack is no larger than was predicted.

Strip Steel.—Strip demand has declined to the point where sharp curtailment in mill operations can no longer be avoided, and practically all of the leading makers began the present week with reduced schedules. This condition is not expected to last much longer than the middle of September, when heavier requirements are expected from the automotive industry. August specifications for hot-rolled strip are expected to fall at least 25 per cent behind July and cold-rolled tonnage will also show a decline, although less pronounced. Some mills still have enough tonnage of the latter material on their books to last for three or four weeks. In the face of reduced demand prices are holding extraordinarily well. On hot-rolled material, no deviations from the full quoted schedules have been reported and cold-rolled is now well established at 2.75c. to 2.85c., Pittsburgh or Cleveland.

Coal and Coke.—With demand for furnace coke declining much more rapidly than production, prices have weakened, and this grade is now quotable at $2.65 to $2.75, Connellsville, a decline of 10c. a ton from recent minimums. At least 2500 ovens are still running in the coke region. This price weakness is expected to be only temporary, as demand is bound to improve in the fall and producers would be unwilling to make future commitments at the above figures. Foundry coke is not quotably weaker, although the market is very dull. The premium grades are not affected by the present weakness, although reduced shipments are also reported by makers of these brands. Coal prices show no tendency to become stabilized, although domestic demand is improving seasonably.

Old Material.—Sales to mills during the week have been negligible and such transactions as are reported do not justify any changes in the quotable market on No. 1 heavy melting steel. One mill in the district is reported to have bought at $18.50 but other small sales of first grade material have commanded as high as $19.25 and $19.50. Hydraulic compressed sheets are still very scarce in this district and sales are lacking. Dealers have been able to buy this material in the Pittsburgh district at $18.25 and less, and the market is now quoted at $18.25 to $18.75. Machine shop and short shoveling steel turnings are still bringing a good price from dealers who are covering on recent high priced sales, and small tonnages of steel turnings were sold during the week at $14. Machine shop turnings are quotable at $12.75 to $13.25 and are unchanged from the previous week. They were erroneously shown in this column last week at a price $1 a ton under this figure. The scrap market in general is awaiting the trend of steel operations, and will probably turn definitely either upward or downward after Labor Day. If there is any tendency at present, it is in the direction of weakness, and this trend will probably show itself in the bids on the Pennsylvania Railroad list, which are to be opened on Sept. 4. The list is an unusually large one, containing a total of 70,000 tons, of which 10,000 tons is No. 1 heavy melting steel and 13,400 tons rails.

Warehouse Prices, fo.b. Pittsburgh

	Base per Lb.
Plates	3.00c.
Structural shapes	3.00c.
Soft steel bars and small shapes	2.90c.
Reinforcing steel bars	2.75c.
Cold-finished and screw stock—	
Rounds and hexagons	3.60c.
Squares and flats	4.10c.
Bands	3.25c.
Hoops	4.25c.
Black sheets (No. 24), 25 or more bundles	3.80c.
Galv. sheets (No. 24), 25 or more bundles	4.55c.
Light plates, blue ann'l'd (No. 10), 1 to 10 plates	3.45c.
Blue annealed sheets (No. 13), 1 to 10 sheets	3.60c.
Galv. corrug. sheets (No. 28), per square	$4.43
Spikes, large	3.40c.
Small	3.80c. to 5.25c.
Boat	3.80c.
Track bolts, all sizes, per 100 count,	60 per cent off list
Machine bolts, 100 count,	60 per cent off list
Carriage bolts, 100 count,	60 per cent off list
Nuts, all styles, 100 count,	60 per cent off list
Large rivets, base per 100 lb.	$3.50
Wire, black soft, ann'l'd, base per 100 lb.	$3.00 to 3.10
Wire, galv. soft, base per 100 lb.	3.00 to 3.10
Common wire nails, per keg	2.90 to 3.00
Cement coated nails, per keg	3.05

Prices per gross ton delivered consumers' yards in Pittsburgh and points taking the Pittsburgh district freight rate:

Basic Open-Hearth Grades:	
No. 1 heavy melting steel	$18.50 to $19.50
No. 2 heavy melting steel	16.50 to 17.00
Scrap rails	18.00 to 18.50
Compressed sheet steel	18.25 to 18.75
Bundled sheets, sides and ends	17.00 to 17.50
Cast iron carwheels	16.50 to 17.00
Sheet bar crops, ordinary	20.00 to 20.50
Heavy breakable cast	13.00 to 13.50
No. 2 railroad wrought	19.00 to 19.50
Hvy. steel axle turnings	16.50 to 17.00
Machine shop turnings	12.75 to 13.25
Acid Open-Hearth Grades:	
Railr. knuckles and couplers	21.75 to 22.25
Railr. coil and leaf springs	21.75 to 22.25
Rolled steel wheels	21.75 to 22.25
Low phos. billet and bloom ends	22.50 to 23.00
Low phos., mill plates	22.50 to 23.00
Low phos., light grades	20.50 to 21.50
Low phos., sheet bar crops	20.50 to 21.50
Heavy steel axle turnings	16.50 to 17.00
Electric Furnace Grades:	
Low phos., punchings	20.00 to 21.00
Hvy. steel axle turnings	16.50 to 17.00
Blast Furnace Grades:	
Short shoveling steel turnings	13.50 to 14.00
Short mixed borings and turnings	12.50 to 13.00
Cast iron borings	12.50 to 13.00
Rolling Mill Grades:	
Steel car axles	21.50 to 22.00
Cupola Grades:	
No. 1 cast	15.00 to 16.00
Rails 3 ft. and under	20.00 to 21.00

Sales Prices of Ingot Brass in August

CHICAGO, Aug. 27.—The Non-Ferrous Ingot Metal Institute reports the average prices per pound received by its membership on commercial grades of the six principal mixtures of ingot brass during the 28-day period ended Aug. 16, as listed below. As there are, as yet, no generally accepted specifications for ingot brass, it must be understood that each item is a compilation representing numerous sales of metal known to the trade by the designation shown, but each item, in reality, includes many variations in formulae. Until the program of standardizing the principal specifications, now progressing in cooperation with the American Society for Testing Materials, is completed, the following specifications will be understood to refer to "commercial grades."

	C. per Lb.
Commercial 80-10-10 (1 per cent impurities)	17.011
Commercial 78 per cent metal	15.094
Commercial 81 per cent metal	15.386
Commercial 83 per cent metal	15.826
Commercial 85-5-5-5 metal	15.897
Commercial No. 1 yellow brass ingot	12.882

The Swedish Iron & Steel Corporation, 64 Rutledge Street, Brooklyn, N. Y., has removed its general offices to 17 Battery Place, New York.

Semi-Finished Steel, Raw Materials, Bolts and Rivets

Mill Prices of Semi-Finished Steel

Billets and Blooms

	Per Gross Ton
Rerolling, 4-in. and under 10 in., Pittsburgh	$35.00
Rerolling, 4-in. and under 10 in., Youngstown	35.00
Rerolling, 4-in. and under 10 in., Cleveland	35.00
Rerolling, 4-in. and under 10 in., Chicago	37.00
Forging quality, Pittsburgh	$40.00 to 41.00

Sheet Bars

(Open Hearth or Bessemer)

	Per Gross Ton
Pittsburgh	$35.00
Youngstown	35.00
Cleveland	35.00

Slabs

(8 in. x 2 in. and under 10 in. x 10 in.)

	Per Gross Ton
Pittsburgh	$35.00
Youngstown	35.00
Cleveland	35.00

Skelp

(F.o.b. Pittsburgh or Youngstown)

	Per Lb.
Grooved	1.85c. to 1.90c.
Universal	1.85c. to 1.90c.
Sheared	1.85c. to 1.90c.

Wire Rods

(Common soft, base)

	Per Gross Ton
Pittsburgh	$42.00
Cleveland	42.00
Chicago	43.00

Prices of Raw Material

Ores

Lake Superior Ores, Delivered Lower Lake Ports

	Per Gross Ton
Old range Bessemer, 51.50% iron	$4.80
Old range non-Bessemer, 51.50% iron	4.65
Mesabi Bessemer, 51.50% iron	4.65
Mesabi non-Bessemer, 51.50% iron	4.50
High phosphorus, 51.50% iron	4.40

Foreign Ore, c.i.f. Philadelphia or Baltimore

	Per Unit
Iron ore, low phos., copper free, 55 to 58% iron in dry Spanish or Algerian	12.00c.
Iron ore, low phos., Swedish, average 68% iron	12.50c.
Iron ore, basis Swedish, average 65% iron	11.00c.
Manganese ore, washed, 52% manganese, from the Caucasus	32.00c. to 33.00c.
Manganese ore, Brazilian, African or Indian, basic 50%	33.00c.
Tungsten ore, high grade, per unit, in 60% concentrates	$16.25 to $16.50

	Per Gross Ton
Chrome ore, 45 to 50% Cr_2O_3, crude, c.i.f. Atlantic seaboard	$22.00 to $24.00

	Per Lb.
Molybdenum ore, 85% concentrates of MoS_2, delivered	50c. to 55c.

Coke

	Per Net Ton
Furnace, f.o.b. Connellsville prompt	$2.65 to $2.75
Foundry, f.o.b. Connellsville prompt	$3.75 to 4.75
Foundry, by-product, Ch'go ovens	8.00
Foundry, by-product, New England, del'd	11.00
Foundry, by-product, Newark or Jersey City, delivered	9.00 to 9.40
Foundry, by-product, Phila.	9.00
Foundry, Birmingham	5.00
Foundry, by-product, St. Louis, f.o.b. ovens	8.00
Foundry by-prod., del'd St. Louis	9.00

Coal

	Per Net Ton
Mine run steam coal, f.o.b. W. Pa. mines	$1.25 to $1.75
Mine run coking coal, f.o.b. W. Pa. mines	1.50 to 1.75
Gas coal, ¾-in. f.o.b. Pa. mines	1.90 to 2.00
Mine run gas coal, f.o.b. Pa. mines	1.65 to 1.75
Steam slack, f.o.b. W. Pa. mines	80c. to 90c.
Gas slack, f.o.b. W. Pa. mines	1.00 to 1.10

Ferromanganese

	Per Gross Ton
Domestic, 80%, seaboard	$105.00
Foreign, 80%, Atlantic or Gulf port, duty paid	105.00

Spiegeleisen

	Per Gross Ton Furnace
Domestic, 19 to 21%	$31.00 to $34.00
Domestic, 16 to 19%	29.00 to 32.00

Electric Ferrosilicon

	Per Gross Ton Delivered
50%	$83.50
75%	130.00

	Per Gross Ton Furnace		*Per Gross Ton Furnace*
10%	$35.00	12%	$39.00
11%	37.00	14 to 16%	45.00

Bessemer Ferrosilicon

Other Ferroalloys

Ferrotungsten, per lb. contained metal del'd	$1.40 to $1.50
Ferrochromium, 4 to 6% carbon and up, 65 to 70% Cr., per lb. contained Cr. delivered, in carloads	11.00c.
Ferrovanadium, per lb. contained vanadium, f.o.b. furnace	$3.15 to $3.65
Ferrocarbontitanium, 15 to 18%, per net ton, f.o.b. furnace, in carloads	$160.00
Ferrophosphorus, electric or blast furnace material, in carloads, 18%, Rockdale, Tenn., base, per gross ton	$91.00
Ferrophosphorus, electric 24%, f.o.b. Anniston, Ala., per gross ton	$122.50

Fluxes and Refractories

Fluorspar

	Per Net Ton
Domestic, 85% and over calcium fluoride, not over 5% silicon, gravel, f.o.b. Illinois and Kentucky mines	$18.00
No. 2 lump, Illinois and Kentucky mines	20.00
Foreign, 85% calcium fluoride, not over 5% silica, c.i.f. Atlantic port, duty paid	$18.25 to $18.75
Domestic, No. 1 ground bulk, 95 to 98% calcium fluoride, not over 2½% silica, f.o.b. Illinois and Kentucky mines	32.50

Fire Clay Brick

	Per 1000 f.o.b. Works	
	High-Heat Duty Brick	Intermediate Heavy Duty Brick
Pennsylvania	$43.00 to $46.00	$35.00 to $38.00
Maryland	43.00 to 46.00	35.00 to 38.00
New Jersey	50.00 to 65.00	.....
Ohio	43.00 to 46.00	35.00 to 38.00
Kentucky	43.00 to 46.00	35.00 to 38.00
Missouri	43.00 to 46.00	35.00 to 38.00
Illinois	43.00 to 46.00	35.00 to 38.00
Ground fire clay, per ton	7.00	

Silica Brick

	Per 1000 f.o.b. Works
Pennsylvania	$43.00
Chicago	52.00
Birmingham	50.00
Silica clay, per ton	$8.50 to 10.00

Magnesite Brick

	Per Net Ton
Standard sizes, f.o.b. Baltimore and Chester, Pa.	$65.00
Grain magnesite, f.o.b. Baltimore and Chester, Pa.	40.00
Standard size	45.00

Chrome Brick

	Per Net Ton
Standard size	$45.00

Mill Prices of Bolts, Nuts, Rivets and Set Screws

Bolts and Nuts

Per 100 Pieces

(F.o.b. Pittsburgh, Cleveland, Birmingham or Chicago)

	Per Cent Off List
†Machine bolts	70
†Carriage bolts	70
Lag bolts	70
Plow bolts, Nos. 1, 2, 3 and 7 heads	70

Milled headless set screws, cut thread	75 and 10
Upset hex. head cap screws, U.S.S. thread	85
Upset hex. cap screws, S.A.E. thread	85
Upset set screws	80, 10 and 5
Milled studs	70

Chicago

Production at Near-Capacity Rate, But Bookings Continue to Taper—10,000 Tons Southern Iron Bought

CHICAGO, Aug. 27.—Steel ingot production in this district remains at a near-capacity rate, but it is headed for a definite recession. The extent of the decline cannot be predicted because it will depend in part upon unknown quantities.

Opinions vary widely as to prospects in the automobile industry. Motor car output is believed to have increased slightly in August and will probably show a further gain next month. However, some well informed observers expect the September total to be the highest of any of the remaining months of the year. Another period of reduced activity in the final quarter would be in keeping with the belief that a recession is due to compensate for the extraordinary output of the first half of the year. It would also be in line with performance in previous years.

A fall rail buying movement is sure and there are indications that it may set in earlier than usual. The volume of railroad equipment business that will come out, on the other hand, is still uncertain. The Santa Fe, Illinois Central, Rock Island and Burlington are mentioned as probable buyers of large numbers of cars, but no definite information regarding such programs has yet been given out by the railroads themselves. Even if large equipment orders were placed at the present time, a number of important Western car shops would still face shutdowns of two to three months, since it takes that long to assemble materials. In fact, any cars placed in September will be for first-quarter delivery. The only cars actually pending in this market are 1000 for the St. Paul, 550 for the Central of Georgia and 400 for the Pacific Fruit Express. Figures have gone in on the cars for the last two roads, so that orders may be placed in a week or two.

Among the other large outlets for steel, the Milwaukee fabricator of pipe continues to take large quantities, although no additional pipe line business has been reported for some time.

Prospects in structural steel are regarded bright, but at current writing fabricators are estimating on very little work.

Farm equipment plants are still busy, although they have experienced a setback, described by some as a seasonal lull. A year ago they operated through the summer with virtually no curtailment of schedules. Business in combines has not been up to expectations and bookings in some types of tractors have declined. Among the reasons given for the recession in farm equipment business are the severe drought in Canada and the American Northwest and a cloudburst in Kansas. In the one case the crop yield was sharply reduced and in the other crops were destroyed.

Mill bookings continue to taper and deliveries are shortening. Books have not yet been opened for fourth quarter, except on cold-rolled strip, and there is little talk of changes in prices. Some producers will take advantage of the two days over Sunday and Labor Day to make impera-

tive repairs on mill motors, postponed from July 4.

Pig Iron.—Sales of Southern iron in this district during the week totaled more than 10,000 tons. An Illinois sewing machine manufacturer bought 2000 tons and three Michigan stove companies closed for 7300 tons. One prominent Alabama producer has withdrawn from the market, but at least two others are still quoting $12.50, base, Birmingham, on foundry iron, and in at least one instance differentials in the higher silicon ranges have been waived. An inquiry for 1500 tons from a Wisconsin farm equipment maker is about to be closed. Prices on Northern iron are unchanged. Local furnaces have good backlogs and are booking a fair amount of fourth-quarter business. They are also receiving numerous orders for fill-in tonnages for the remainder of this quarter. The amount of spot business is testimony to the continued caution of users. There has been no overbuying and foundry stocks have been consistently at low level. Melt is well sustained and in some directions, notably among automotive foundries, shows signs of expanding. Shipments from Chicago furnaces in August are expected to show a slight gain over those of July, with the likelihood that they will equal those of June. The Iroquois and Federal furnaces now being repaired will be ready to relight soon. There is also the possibility of some local steel works pig iron reaching the market in September. Steel works blast furnaces have had little or no surplus iron thus far this year.

Prices per gross ton at Chicago:

N'th'n No. 2 fdy., sil. 1.75 to 2.25	$20.00
N'th'n No. 1 fdy., sil. 2.25 to 2.75	20.50
Malleable, not over 2.25 sil.	20.00
High phosphorus	20.00
Lake Super. charcoal, sil. 1.50	27.04
So'th'n No. 2 fdy. (all rail)	$18.51 to 19.01
Low phos., sil. 1 to 2, copper free	29.50
Silvery, sil. 8 per cent	29.79
Bess. ferrosilicon, 14-15 per cent	46.29

Prices are delivered consumers' yards except on Northern foundry, high phosphorus and malleable, which are f.o.b. local furnace, not including an average switching charge of 61c. per gross ton.

Ferroalloys.—Activity is confined to spot sales of small lots. The trade is speculating on the effect that the proposed reduction in duty on ferromanganese, as recommended by the Senate Committee on Finance, will have on prices.

Prices delivered Chicago: 80 per cent ferromanganese, $112.56; 50 per cent ferrosilicon, $83.50 to $88.50; spiegeleisen, 19 to 21 per cent, $39.76 to $41.76.

Semi-Finished Steel.—While the leading interest has little semi-finished steel to offer in view of the large aggregate requirements of its own mills and its affiliated companies, material can be obtained without much difficulty from other producers. Moreover, some interests that recently scoured the open market for extra requirements are now piling steel from their own mills.

Warehouse Business.—Demand has declined no more than was to be expected at this time of month and at this season of the year. Business is still much better than that of twelve months ago.

Plates.—Deliveries continue to improve, though they still range from four to 10 weeks. Activity in railroad equipment is still at low ebb, but predictions are freely made that 10,000 to 12,000 cars will come into the market between now and Oct. 15. Demand for oil storage tanks has declined. Awards for the week total 2500 tons and new inquiries call for about the same tonnage. Mill prices on plates are unchanged at 2.05c., Chicago.

Sheets.—Specifications have shown some improvement. Deliveries range from four to five weeks and mill output from 80 to 85 per cent. Prices on blue annealed are holding, but weakness persists in galvanized.

Base prices per lb., deliv'd from mill in Chicago: No. 24 black sheets, 3c. to 3.05c.; No. 24 galv., 3.65c. to 3.75c.; No. 10 blue ann'l'd, 2.35c. Deliv'd prices at other Western points are equal to the freight from Gary, plus the mill prices, which are 5c. per 100 lb. lower than Chicago delivered prices.

Bolts, Nuts and Rivets.—Specifications for bolts and nuts are in keeping with the seasonal lull in the farm equipment industry. Releases first showed a drop in July, although specifications for that month still proved 15 per cent higher than in July, 1928. Specifications in August have shown a further decline, but have been virtually equal to those of the corresponding month last year. Current business is sufficient to justify operations of 65 to 75 per cent in Western bolt and nut plants, although some companies are able to run at a higher rate by building up depleted stocks. For mill prices see page 565.

Bars.—Diminishing backlogs are reflected in easier deliveries, which range from four to six weeks for one local mill to three to four weeks for others. Farm equipment plants are not taking as much steel as 90 days ago, but on the whole are still very busy. The falling off in tractor production has been confined mainly to the large models, output of small tractors remaining heavy. The recession in activity is ascribed to the drought in Canada and the American Northwest. Mill prices on soft steel

bars are unchanged at 2.05c., Chicago. Demand for alloy steel bars is in keeping with conditions in the automobile industry. Reports received here indicate that motor car output may show appreciable recovery after the middle of September. Specifications for rail steel bars from the farm equipment makers have tapered somewhat, but releases from bed companies show no decline. One prominent bed maker expects his last half output to show a gain of 33 to 50 per cent over that for the first six months of 1929.

Rails and Track Supplies.—One local rail mill has virtually disposed of its obligations, but the other is still operating at 75 per cent and, following recent additions to existing contracts, will probably maintain that rate until October. The railroads are preparing their budgets earlier this year and there are some indications, possibly because of unavoidable delays in deliveries during the current year, that the fall buying movement will get under way sooner than usual. In certain quarters it is believed that inquiries for 20,000 tons of rails for shipment this year will come out before Sept. 15. The customary run of specifications in track supplies has been augmented by tonnages supplementing recent additions to rail contracts. Light rails are inactive.

Prices f.o.b. mill, per gross ton: Standard section open-hearth and Bess. rails, $43; light rails, rolled from billets, $36. *Per lb.:* Standard railroad spikes, 2.80c.; track bolts with square nuts, 3.80c.; steel tie plates, 2.15c.; angle bars, 2.75c.

Structural Material. — There has been further shortening of deliveries on plain material, with one mill offering shipments in three to four weeks and another in three to seven weeks. Construction prospects, however, are regarded as promising. Bridge work and industrial plant projects are a feature of current and pending activity. One of the rapidly growing new outlets for fabricated steel is the commercial airport. Five hangars taking an average of 1000 tons apiece have been placed in various parts of the country within the past 60 days. In the past week the Wayne County airport hanger, near Detroit, 1100 tons, was awarded to the R. C. Mahon Co. Fabricators in this district are short of work and bids on current jobs are highly competitive. Mill prices on plain material remain at 2.05c., Chicago.

Mill prices on plain material, per lb.: 2.05c. base, Chicago.

Reinforcing Bars.—A few large individual tonnages have been placed recently, but business in the aggregate shows no improvement and bending shop operations continue to range from 60 to 70 per cent of capacity. With the approach of fall, however, the desirability of getting projects under way before winter is becoming a factor, and the trade expects the next six weeks to be more active than any corresponding period so far this year. Prices are still flexible. The Kalman Steel Co. will supply 1000 tons for a Barrington, Ill., building of the Jewel Tea Co.

Cast Iron Pipe.—Aside from a fair run of business from contracts and scattered orders from public utilities, the market is quiet. Municipal buying remains light. Royal Oak, Mich., has awarded 450 tons of 6 and 8-in. pipe to the Lynchburg Foundry Co. Dearborn Township, Mich., has placed 30,000 ft. of 6 and 8-in. with the American Cast Iron Pipe Co. New Haven, Mo., has let 150 tons of 4, 6 and 8-in. to the McWane Cast Iron Pipe Co.

Prices per net ton, del'd Chicago: Water pipe, 6-in. and over, $45.20 to $46.20; 4-in., $49.20 to $50.20; Class A and gas pipe, $3 extra.

Cold-Rolled Strip.—Demand from the automobile industry has shown no particular improvement, possibly because of stocks still in the hands of consumers, but motor car production is increasing and for the month of August will show a gain over July. The August output of the Ford Motor Co. is expected to reach 200,000 vehicles, a gain of 25,000 over the July total. Production of the Chevrolet Motor Co. has declined and for the month may not exceed 110,000 cars, compared with nearly 138,000 in July. This company expects to produce an average of 100,000 cars monthly during the rest of the year, which will bring the total output for the first year of its six-cylinder model to 1,400,000. This figure will surpass that for the first twelve months' production of the present Ford model. The leading producer of cold-rolled strip has opened books for the fourth quarter at 2.75c. to 2.85c., Cleveland or Pittsburgh, or 3.05c. to 3.15c., delivered Chicago, the prices now ruling.

Wire Products.—Jobbers' specifications have increased somewhat, but the current volume of business is still considerably below that of a year ago. Mills have not yet opened books for fourth quarter. Production remains at 65 per cent of capacity. Mill prices, which have shown no significant change, are printed on page 565.

Hot-Rolled Strip.—Mill operations have dropped materially in the last few weeks in accord with the recent decline in automobile production. Mill capacity in this district will be expanded by the construction of a new mill at Gary, now under way, and the revamping of the other mills at that plant.

Old Material. — The week has brought out no further important consumer purchases of basic open-hearth grades. The failure of the market to advance to $16 or higher on the mill orders for heavy melting steel placed a week ago was a surprise, in view of high prices recently paid by dealers, but there is no doubt that steel companies have become less concerned about supplies because of probable curtailment in their open-hearth operations next month. Other grades continue to show evidences of strength, with aggregate demand still large and prices firm or rising. The St. Paul took bids on 5000 tons yesterday.

Prices deliv'd Chicago district consumers:

Per Gross Ton

Basic Open-Hearth Grades:	
Heavy melting steel	$15.25 to $15.75
Shoveling steel	15.25 to 15.75
Frogs, switches and guards, cut apart, and misc. rails	16.75 to 17.25
Hydraul. compressed sheets	13.75 to 14.25
Drop forge flashings	10.75 to 11.25
No. 1 busheling	13.25 to 13.75
Forg'd cast and r'l'd steel carwheels	18.75 to 19.25
Railroad tires, charg. box size	18.75 to 19.25
Railroad leaf springs cut apart	18.75 to 19.25
Acid Open-Hearth Grades:	
Steel couplers and knuckles	17.00 to 17.50
Coil springs	19.00 to 19.50
Electric Furnace Grades:	
Axle turnings	14.50 to 15.00
Low phos. punchings	17.00 to 17.50
Low phos. plates, 12 in. and under	17.00 to 17.50
Blast Furnace Grades:	
Axle turnings	13.00 to 13.50
Cast iron borings	10.50 to 11.00
Short shoveling turnings	10.50 to 11.00
Machine shop turnings	7.50 to 8.00
Rolling Mill Grades:	
Iron rails	16.00 to 16.50
Rerolling rails	18.00 to 18.50
Cupola Grades:	
Steel rails less than 3 ft.	17.50 to 18.50
Steel rails less than 2 ft.	20.00 to 20.50
Angle bars, steel	17.00 to 17.50
Cast iron carwheels	14.00 to 14.50
Malleable Grades:	
Railroad	17.00 to 17.50
Agricultural	15.50 to 16.00
Miscellaneous:	
*Relaying rails, 56 to 60 lb.	23.00 to 25.00
*Relaying rails, 65 lb. and heav.	26.00 to 31.00

Per Net Ton

Rolling Mill Grades:	
Iron angle and splice bars	15.00 to 15.50
Iron arch bars and transoms	21.50 to 22.00
Iron car axles	26.50 to 27.00
Steel car axles	17.50 to 18.00
No. 1 railroad wrought	14.00 to 14.50
No. 2 railroad wrought	13.75 to 14.25
No. 1 busheling	9.00 to 9.50
No. 2 busheling	7.00 to 7.50
Locomotive tires, smooth	14.50 to 15.00
Pipes and flues	10.00 to 10.50
Cupola Grades:	
No. 1 machinery cast	14.50 to 15.00
No. 1 railroad cast	14.00 to 14.50
No. 1 agricultural cast	13.25 to 13.75
Stove plates	12.25 to 12.75
Grate bars	11.75 to 12.25
Brake shoes	11.50 to 12.00

*Relaying rails, including angle bars to match, are quoted f.o.b. dealers' yards.

Warehouse Prices, f.o.b. Chicago

Cement c't'd nails, base per keg	3.20

New York

Pig Iron Sales Gain with Southern Sellers Extending Activity—August Steel Buying Below That of July

NEW YORK, Aug. 27.—Sales of pig iron in the past week showed a considerable increase, with a total in excess of 17,000 tons. Some sizable single orders included about 1000 tons for a New Jersey consumer, placed with a northern New York producer, but most of the 17,000 tons was made up of small lots, some for third quarter, but largely for last quarter delivery. Consumers' stocks of foundry iron are not heavy, and some of the present buying is attributed to the activity of Southern sellers offering the foundry grade at $13 to $13.50 a ton, Birmingham, which stimulates consumers to obtain comparative prices from their usual sources of supply and results often in an order for a small tonnage of either Northern or Southern iron. Of the total business in the past week, it is estimated that about 3000 tons was sold by Southern furnaces. Northern producers have good backlogs on their books, but competition from the South makes the price situation somewhat irregular. In one instance, a Birmingham furnace quoted $20 a ton, delivered to northern New Jersey, for No. 1X foundry iron. Buffalo sellers are quoting $18 a ton, furnace, for foundry iron, but $17.50 a ton is still obtainable by buyers when a sizable tonnage is involved, or there is competition from Southern iron. Eastern Pennsylvania producers occasionally meet this competition. Southern sellers are quoting $13 to $13.50 a ton for foundry grade. Recent inquiries include 4,000 to 5,000 tons of various grades of foundry iron and 180 tons of low phosphorus iron for plants of the General Electric Co. Manning, Maxwell & Moore, Inc., New York, is in the market for 150 tons of foundry iron for Fitchburg, Mass. No. 2 furnace at Port Henry, N. Y., went out of blast Aug. 21 for relining, but will be blown in early in October.

Prices per gross ton, delivered New York district:

Buffalo No. 2 fdy., sil. 1.75 to 2.25	$22.41 to $22.91
*Buf. No. 2, del'd east. N. J.	20.78 to 21.28
East, Pa. No. 2 fdy., sil. 1.75 to 2.25	20.39 to 21.52
East. Pa. No. 2X fdy., sil. 2.25 to 2.75	20.89 to 22.02

Freight rates: $4.91 from Buffalo, $1.39 to $2.52 from eastern Pennsylvania.
*Prices delivered to New Jersey cities having rate of $3.28 a ton from Buffalo.

Warehouse Business.—Buying from stock has been light in the past week and not much improvement is expected until after Labor Day. Black and galvanized sheet prices are still subject to concessions of $1 to $2 a ton, and blue annealed sheet prices are also shaded. Structural material is not being bought at present, but fall buying is expected early next month.

Cast Iron Pipe.—Business is in most cases limited to small lots for private buyers, with some municipal orders pending. Bids have been opened by the Department of Water Supply, Gas and Electricity, New York, on contracts requiring about 1100 tons of 20-in. and 24-in. water pipe. Ogdensburg, N. Y., will open bids Aug. 28 on 75 tons of 3-in. to 12-in. pipe and fittings, and Montclair, N. J., has opened bids on 35 tons of 6-in., Class B pipe. At the recent opening of bids on 150 tons of Class C, 6-in. pipe by Bloomfield, N. J., the low bid was $34.50 a net ton, delivered, quoted by R. D. Wood & Co., Florence, N. J.

Prices per net ton deliv'd New York: Water pipe, 6-in. and larger, $33.60 to $34.60; 4-in. and 5-in., $36.60 to $37.60; 3-in., $43.60 to $44.60. Class A and gas pipe, $3 extra.

Reinforcing Bars. — The Kalman Steel Co. has been awarded 450 tons of bars for an industrial plant at Rensselaer, N. Y. The Taylor-Davis Co. will supply 1200 tons for a hosiery factory at Philadelphia. Bids are being taken on about 1500 tons of bars for a Pennsylvania Railroad warehouse in Jersey City. The volume of work ranging from 100 tons downward continues plentiful. Quotations are firm and unchanged.

Billet steel reinforcing bars in 40, 50 and 60-ft. lengths, 2.05c. per lb., Pittsburgh, and 2.30c. per lb., Pittsburgh warehouse, for cut lengths. Out of New York warehouse, 2.90c. per lb. for lots of 5 tons or more, 3.05c. for lots of 2 to 5 tons and 3.30c. for less than 2 tons, all delivered at job.

Finished Steel.—From the standpoint of fresh bookings, August has failed to keep pace with July, and in some cases the recession has been of considerable proportions. Sales of bars, shapes and plates have consisted mostly of small tonnages to companies in widely diversified manufacturing lines. The quietness in the market is attributed partly to the effects of the vacation season. Prices are steady and there are no indications of a change in the immediate future. Sellers are of the opinion that the volume of business will turn upward early in September. Lessened activity is noted in structural steel, but the amount of pending work is large. The most important award of the week was 1700 tons for a highway bridge in New Jersey. A commissary building on 161st Street, New York, for the New York Central Railroad will require 3000 tons of steel. The placing of 13,200 tons for a subway section in Queens is not expected until after Sept. 9. District offices of sheet steel makers report a slight gain in specifications and orders. Substantial tonnages of galvanized sheets for roofing purposes have been sold in the South, and the roofing season in that district has been fully up to normal. Prices have not changed, with galvanized stock selling at 3.50c., Pittsburgh, black at 2.85c. and blue annealed at 2.35c. for No. 13 gage. Quotations of wire goods have continued rather soft. Mills are understood to be taking

Warehouse Prices, f.o.b. New York

orders for common wire nails at $2.55 a keg, Pittsburgh, or lower, and for plain wire at $2.40 a 100 lb., Pittsburgh.

Mill prices per lb., deliv'd New York: Soft steel bars, 2.29c.; plates, 2.22½c.; structural shapes, 2.19½c.; bar iron, 2.14c.

Coke.—Standard furnace coke is inactive and the price is unchanged at $2.75 to $2.85 per net ton, Connellsville. Special brands of beehive foundry coke are quoted at $4.85 per net ton, ovens, or $8.56 a net ton, delivered to northern New Jersey, Jersey City and Newark, and $9.44 to New York and Brooklyn. By-product coke is quoted at $9 to $9.40 a net ton, Newark or Jersey City, and $10.06, New York or Brooklyn.

Old Material.—A large eastern Pennsylvania consumer has closed on about 25,000 tons of No. 1 heavy melting steel at $16.50 a ton, delivered, the same price as was paid by this consumer on its last previous purchase. Brokers are paying $16 to $16.50 a ton, delivered eastern Pennsylvania for No. 1 steel, the price depending upon the shipment. A shortage of good No. 2 heavy melting steel is reported by some brokers shipping to eastern Pennsylvania, but this is attributed to the increased tonnage of this grade being shipped to the consumer at Bethlehem, which accepts No. 2 steel at $1.50 to $2 a ton less than the price for No. 1 heavy melting steel.

Dealers' buying prices per gross ton, f.o.b. New York:

No. 1 heavy melting steel	$12.75 to $13.35
Heavy melting steel (yard)	8.00 to 9.75
No. 1 hvy. breakable cast.	10.75 to 11.75
Stove plate (steel works).	8.00 to 8.25
Locomotive grate bars....	8.25 to 8.75
Machine shop turnings....	7.75 to 8.00
Short shoveling turnings..	8.00 to 9.00
Cast borings (blast furn. or steel works).....	7.00 to 7.75
Mixed borings and turnings	6.75 to 7.75
Steel car axles	19.50 to 20.00
Iron car axles	24.00 to 25.00
Iron and steel pipe (1 in. dia., not under 2 ft. long)	10.75
Forge fire	9.75 to 10.25
No. 1 railroad wrought...	12.00 to 12.50
No. 1 yard wrought, long..	11.00 to 11.50

Cleveland

Prompt Deliveries of Steel Possible and Backlogs Being Reduced—Steady Volume of Pig Iron Buying

CLEVELAND, Aug. 27.—The volume of business in finished steel declined somewhat last week. With the slowing down during the previous week orders for the last half of August will be somewhat less than those for the first half. However, some of the mills have booked more tonnage at a higher rate this month than in July. Backlogs on most products are being gradually reduced and fairly prompt deliveries can now be made. Some mills need orders for full finished sheets and for hot and cold strip steel. So far there has been little curtailment in mill operations, although some sheet mills are no longer running at capacity.

The automotive industry has further curtailed production and its specifications for steel. The Chevrolet Motor Co. is understood to have greatly reduced its orders for steel preparatory to cleaning up stocks and bringing out new models in October. Several other motor car companies have not yet got under production on new models and those with new designs are placing specifications rather sparingly. However, the Ford Motor Co. is keeping up its daily output of 8000 cars. Forge shops in this territory making automotive parts are reported to be operating at 35 to 60 per cent of capacity. Automobile stamping plants have also materially reduced their operations.

The agricultural implement industry continues in good operation. While there has been some curtailment of other metal-working industries, they generally are operating well for this time of the year. Consumers are as yet showing no interest in fourth quarter contracts and there is no discussion of prices for that delivery.

Iron Ore.—Lake Superior iron ore is still being consumed at a rate of close to 6,000,000 tons a month. The amount used in July was 5,808,473 tons, a gain of 131,821 tons over June, which had one less day, according to the monthly report of the Lake Superior Iron Ore Association. The amount used in July last year was 4,632,907 tons. Ore at furnaces Aug. 1 amounted to 24,245,139 tons. The total at furnaces and Lake Erie docks Aug. 1 was 28,697,239 tons, as compared with 27,208,622 tons on the same day a year ago. Central district furnaces during July consumed 2,901,232 tons, an increase of 46,491 tons over June. Lake front furnaces, including Canadian furnaces, used 2,585,411 tons, a gain of 73,222 tons. Eastern furnaces consumed 151,448 tons, an increase of 7459 tons, and all-rail furnaces smelted 170,382 tons, a gain of 4649 tons. There were 196 furnaces in blast using Lake ore July 31, a decrease of one for the month.

Pig Iron.—Furnaces continue to sell a moderate volume of foundry and malleable iron, mostly in small lots for delivery usually extending through the remainder of the year. Business taken by Cleveland interests during the week aggregated 23,000 tons, as compared with 20,000 tons during the previous week. There is more activity in the Buffalo than in the northern Ohio or Michigan territories. Shipments are fair for this season of the year, although they will not be quite as heavy this month as in July. The automotive industry, which cut its shipping schedule sharply in July, has not increased its orders this month and, in fact, some motor car foundries are taking less iron than in July. Recent low prices on Southern foundry iron have been withdrawn and producers are quoting this iron at $14.50, Birmingham. While the price cut had a sentimental effect on the market, the lower prices do not appear to have brought out any business in the northern Ohio territory, as the reduction did not seem enough inducement for consumers to use a different grade of iron than they had been accustomed to for some time. Prices of Northern foundry iron are steady at $18.50, Cleveland, for outside shipment, $19 for local delivery, and $20, Lake furnace, for shipment to Michigan points.

Prices per gross ton at Cleveland:

N'th'n fdy., sil. 1.75 to 2.25	$19.50
S'th'n fdy., 1.75 to 2.25....	$20.00 to 20.50
Malleable	19.50
Ohio silvery, 8 per cent...	28.00
Basic Valley furnace.....	18.50
Stand. low phos., Valley..	26.50 to 27.00

Prices except on basic and low phosphorus are delivered Cleveland. Freight rates: 50c. from local furnaces; $3 from Jackson, Ohio; $6 from Birmingham.

Steel Bars, Plates and Structural Material.—Specifications declined the past week, the falling off being most noticeable in steel bars, which is due to the lessened demand from the automotive industry. Most of the bar mills are now in position to make fairly prompt shipments. Specifications for alloy steel bars are light and there is not much demand for reinforcing bars. Plate deliveries by some mills are easier but with others no improvement is noted. Demand for structural shapes is holding up fairly well. Little inquiry came from the building field during the week, although several good sized jobs are pending. The Lorain-Central bridge, Cleveland, is expected to come out for bids next month. This will require 15,000 to 18,000 tons of structural steel. No deviation is reported from regular prices, which are 1.90c. to 1.95c., Cleveland, for steel bars, and 1.95c., Pittsburgh, for plates and shapes.

Sheets.—New demand was light the past week. Deliveries have further improved, particularly on full fashioned sheets, and some mills need orders for that grade. However, pro-

ducers still have good backlogs of black sheets, with fall commitments as high as six weeks. Orders from the steel barrel industry have shown an improvement and the demand from other industries outside of the automotive field is holding up well. Prices are fairly steady. Black sheets are firm at 2.85c., Pittsburgh. While not common, there are still reports of $2 a ton concessions to 2.25c., for blue annealed and 2.10c. for light blue annealed plates.

Wire Products. — Manufacturers' wire is in fair demand and appears to be holding to 2.50c. in Cleveland, but 2.40c. is commonly quoted outside, and local jobbers are buying plain wire at the lower price. The nail situation continues very unsatisfactory in volume and price.

Cold-Finished Steel Bars.—Demand has declined sharply this month, as screw machine and upsetting plants have reduced operations owing to lack of orders from the automotive industry. The 2.35c., Cleveland, price is being maintained.

Warehouse Business. — Demand is fair, although not so good as in July. While orders are plentiful, they are mostly for small lots. Plates and blue annealed sheets are among the more active items. Prices are firm.

Strip Steel.—Specifications for hot and cold-rolled strip, which fell off with the curtailment of the automotive industry, have not picked up this month. While mills are getting a fair amount of business against contracts, shipments are in excess of incoming orders. Some mills still have a six weeks' backlog in wide strip orders, but need tonnage in narrow material, while others still have good backlogs of narrow strip, but need orders for wide material. The need of orders for cold-rolled strip has become more pronounced. While most mills are now quoting this at 2.85c., Cleveland and Pittsburgh, the 2.75c. price has not disappeared.

Coke. — Ohio by-product foundry coke has been reestablished at $8.25, ovens, for September shipment. The volume of business is good for this time of the year. Connellsville foundry coke is quiet and prices are unchanged. Producers continue to sell by-product coke for domestic use in good volume for fall shipment. The market appears firm at $4.50, ovens, for egg coke and $4 for nut.

Bolts, Nuts and Rivets.—Specifications for bolts and nuts are coming out in about the same volume as last month and are good from jobbers and from manufacturing industries except the automotive field. Rivets are moving slightly better than last month. Attempts are still being made to secure concessions from the $3.10 price for large rivets, but apparently without success.

Old Material—Scrap is coming out more freely than recently, but is fairly firm except on blast furnace grades. While local mills are taking a moderate amount of scrap on contract, they are not making any new purchases. There is a fair volume of activity among dealers. No. 1 railroad steel is bringing $17 a ton from dealers for local delivery, an advance of 50c. a ton, and dealers would probably pay $17.25 for a round tonnage. Dealers are paying $15.25 to $15.50 for ordinary heavy melting steel scrap for delivery to another local consumer. Short shoveling turnings have advanced 50c. a ton. A local mill paid $12.50 for a small lot. Dealers are paying $10.50 for machine shop turnings for Youngstown delivery. Blast furnace scrap is being freely offered at $10.50.

Prices per gross ton delivered consumers' yards:

Basic Open-Hearth Grades:	
No. 1 heavy melting steel	$15.25 to $15.50
No. 2 heavy melting steel	14.50 to 14.75
Compressed sheet steel	15.50 to 16.00
Light bundled sheet stampings	12.00 to 12.50
Drop forge flashings	13.00 to 13.25
Machine shop turnings	9.75 to 10.25
Short shoveling turnings	11.75 to 12.25
No. 1 railroad wrought	13.50 to 14.00
No. 2 railroad wrought	16.00 to 16.50

Philadelphia

Steel Specifications Curtailed By Holiday — Pipe Shops Buy 20,000 Tons of Southern Iron

PHILADELPHIA, Aug. 27.—Steel and pig iron buying has been temporarily delayed in many cases by the approach of Labor Day, but steel mills are maintaining high operating rates, and current and prospective business in plates is large, with close to 50,000 tons of business in prospect for car and ship building. Shape mills are also maintaining good operating rates, but shape prices show no tendency to advance.

Pig iron is active and, with Birmingham producers curtailing operations, eastern Pennsylvania furnaces foresee a more stable market.

Reinforcing bar prices are irregular and both billet and rail steel bar makers are granting considerable concessions on desirable business.

Pig Iron.—A good volume of inquiry for foundry iron to be delivered in the third and last quarter has accumulated in the past week and a substantial tonnage of foundry iron has been closed, most of the orders going to Southern furnaces. One interest in the Birmingham district has sold about 50,000 tons of iron to various districts in the past week and withdrawn from the market, blowing out its furnace. Sales of Birmingham iron in this district have included 15,000 tons to a Florence, N. J., pipe foundry and 5000 tons to a Burlington, N. J., pipe interest. Quotations on Southern foundry iron continue at $13 to $13.50 a ton, furnace. The American Engineering Co., Philadelphia, has not yet closed on 500 tons of foundry iron and purchase is not expected for a fortnight or more. The Coatesville Boiler Works, Coatesville, Pa., has closed on 250 tons of No. 2X foundry iron with an eastern Pennsylvania producer. Foundry iron is quoted by eastern Pennsylvania furnaces at $21, base, and any concession from this price would be only on sizable tonnages.

Prices per gross ton at Philadelphia:

East. Pa. No. 2, 1.75 to 2.25 sil.	$21.26 to $21.76
East. Pa. No. 2X, 2.25 to 2.75 sil.	21.76 to 22.26
East. Pa. No. 1X	22.26 to 22.76
Basic (del'd east. Pa.)	19.75 to 20.25
Gray forge	20.00 to 20.50
Malleable	21.25 to 21.75
Stand. low phos. (f.o.b. N. Y. State furnace)	22.00 to 23.00
Cop. br'g low phos. (f.o.b. furnace)	23.50 to 24.00
Va. No. 2 plain, 1.75 to 2.25 sil.	24.04
Va. No. 2X, 2.25 to 2.75 sil.	24.54

Prices, except as specified otherwise, are deliv'd Philadelphia. Freight rates: 76c. to $1.64 from eastern Pennsylvania furnaces; $4.54 from Virginia furnaces.

Bars.—Mill deliveries are fairly prompt, but operating rates are still high and prices firm at 1.95c. per lb., Pittsburgh, or 2.27c., delivered Philadelphia.

Reinforcing Bars.—Competition between billet and rail steel bars has become unusually keen with distributers of billet steel bars meeting the

rail steel bar quotation of 1.95c., Franklin, Pa., or Tonawanda, N. Y., or 2.27c., delivered Philadelphia, which has forced some rail steel bar sellers to offer considerable concessions to obtain any business. Occasionally distributers, who have quoted on a project to furnish rail steel bars, find it advantageous to furnish billet steel. The Farm Show Building in Harrisburg, requiring 800 tons of reinforcing bars, brought out a low bid of $1,840,000, but all bids were rejected as only $1,000,000 is available for the project. Billet steel bars are quoted at 1.95c. to 2c., Pittsburgh, or 2.27c. to 2.32c., delivered Philadelphia, with the $5 extra for cutting to length sometimes disregarded by the seller.

Shapes.—A substantial tonnage of business is being booked and mills are as well engaged as during July. Prices, however, are unchanged at 1.95c. to 2.05c., nearest mill to consumer, or 2.01c. to 2.11c., delivered Philadelphia. Some good business is in prospect for ships to be built by the New York Ship Building Corporation, Camden, N. J., and for railroad cars to be constructed by the American Car & Foundry Co., probably at Berwick, Pa.

Plates.—Mills are fully engaged and have in prospect about 30,000 tons of plates for four ships for the Export Steamship Corporation and 5000 tons of plates in a cruiser for the United States Navy to be built by the New York Ship Building Corporation at Camden, N. J. A substantial tonnage of plates will be required for the 1000 freight cars for the Delaware, Lackawanna & Western Railroad, which will probably be built at Berwick, Pa. Recently, universal mills have been operated at a higher rate than for some time and a plate mill in the Pittsburgh district, which produces pipe, is almost out of the market on universal plate skelp. Plate prices are unchanged at 2.05c., Coatesville, or 2.15c., delivered Philadelphia.

Sheets.—Blue annealed sheet prices are unchanged at 2.35c., Pittsburgh, or 2.67c., delivered Philadelphia, for No. 13 gage and light plates, blue annealed, No. 10 gage, are quoted at 2.20c., Pittsburgh, or 2.52c., delivered Philadelphia. The New York Ship Building Corporation, Camden, N. J., is inquiring for a carload or more of black sheets for the United States Navy cruiser, which it is building. Black sheets are unchanged at 2.85c., Pittsburgh, or 3.17c., delivered Philadelphia. Galvanized sheets are in good demand and prices range from 3.55c. to 3.60c., Pittsburgh, or 3.87c. to 3.92c., delivered Philadelphia.

Imports.—In the week ended Aug. 24, a total of 1332 tons of pig iron arrived at this port, of which 1230 tons was from British India and 102 tons from Norway. Steel imports consisted of 102 tons of structural shapes and 15 tons of steel scrap from Germany and 497 tons of structural shapes, 75 tons of steel bands and 47 tons of steel bars from Belgium.

Old Material.—Available supplies of good No. 2 heavy melting steel are not large and with a heavy tonnage of this grade moving to the consumer at Bethlehem, Pa., dealers report some difficulty in securing material to fill orders at Conshohocken, Phoenixville and Harrisburg, Pa. The consumer at Bethlehem, Pa., has closed on 25,000 tons of No. 1 heavy melting steel at $16.50 a ton, delivered. Short shoveling turnings have been bought by dealers at $12.50 a ton, delivered eastern Pennsylvania and the market on cast borings is firmer. Heavy breakable cast is quiet and buyers are unwilling to pay more than $14.50 a ton, while sellers are asking $15, delivered.

Prices per gross ton delivered consumers' yards, Philadelphia district:

No. 1 heavy melting steel	$16.50 to $17.00
Scrap T rails	16.00 to 16.50
No. 2 heavy melting steel	12.50 to 14.50
No. 1 railroad wrought	16.00 to 16.50
Bundled sheets (for steel works)	11.50
Hydraulic compressed, new	14.50 to 15.50
Hydraulic compressed, old	12.00 to 12.50
Machine shop turnings (for steel works)	12.00
Heavy axle turnings (or equiv.)	14.00 to 14.50
Cast borings (for steel works and roll. mill)	11.00 to 11.75
Heavy breakable cast (for steel works)	15.00
Railroad grate bars	12.00 to 12.50
Stove plate (for steel works)	12.00 to 12.50
No. 1 low phos., hvy., 0.04% and under	22.00 to 23.00
Couplers and knuckles	19.50 to 20.50
Rolled steel wheels	19.50 to 20.50
No. 1 blast f'nace scrap	10.50 to 11.00
Wrot. iron and soft steel pipes and tubes (new specific.)	15.00
Shafting	19.00 to 20.00
Steel axles	23.00 to 23.50
No. 1 forge fire	14.00
Cast iron carwheels	16.50 to 17.00
No. 1 cast	16.50 to 17.00
Cast borings (for chem. plant)	14.50
Steel rails for rolling	16.50 to 17.00

Steel Corporation Retires Subsidiary Bonds

The United States Steel Corporation has recommended that bonds of two of its subsidiaries be called for redemption on Nov. 1. They are bonds of the Indiana Steel Co. (first mortgage 5 per cent bonds due 1952) of a face value of $20,979,000 and the National Tube Co. (first mortgage 5 per cent bonds due 1952) of $10,971,000.

The operation calls for an aggregate sum of $33,358,500, funds for which have been provided from current resources. "It is estimated that through the retirement of these two issues of bonds the net cash saving in interest and sinking fund requirements will amount to approximately $730,000 annually," says Corporation's statement.

Will Make Electric Furnaces

The Bellevue Industrial Furnace Co., Detroit, has added an electric furnace division, thus to make a complete line of combustion furnaces.

Arnold Pfau, formerly connected in a consulting capacity with the Globar Corporation, has taken charge of the electric furnace division.

Canada

No Let Up in Sight in Dominion Business

TORONTO, ONT., Aug. 27.—Despite the fact that mills and foundries and other concerns associated with the iron and steel industry have been operating at almost capacity from the first of the year, there is little prospect of curtailed production among the various plants in the immediate future. Foundries and rolling mills continue at capacity, with the majority reporting backlogs sufficient to maintain present operations to the end of the year.

Pig Iron.—The general tone of the market is steadily becoming brighter. While no large orders have been closed during the week, individual tonnages are being stepped up to some extent and total sales are improving each week. Foundry iron has a strong call in the Toronto and Montreal districts for spot delivery. Shipments against contracts continue in good volume. Inquiries for fourth quarter are appearing. Prices are firm but unchanged.

Prices per gross ton:

Delivered Toronto	
No. 1 fdy., sil. 2.25 to 2.75	$24.60
No. 2 fdy., sil. 1.75 to 2.25	24.10
Malleable	24.60
Delivered Montreal	
No. 1 fdy., sil. 2.25 to 2.75	$26.00
No. 2 fdy., sil. 1.75 to 2.25	25.50
Malleable	26.00
Basic	24.50
Imported Iron, Montreal Warehouse	
Summerlee	$33.50
Carron	33.00

Old Material.—More active trading is reported by local dealers. The demand is mostly for small lots for spot delivery, but total sales for the week were in greater tonnage than those of earlier summer weeks.

Dealers' buying prices:

	Per Gross Ton	
	Toronto	Montreal
Heavy melting steel	$10.00	$8.50
Rails, scrap	11.00	9.00
No. 1 wrought	10.00	12.00
Machine shop turnings	7.50	5.00
Boiler plate	7.50	6.00
Heavy axle turnings	8.00	7.50
Cast borings	7.50	5.00
Steel turnings	7.50	6.50
Wrought pipe	6.00	6.00
Steel axles	15.00	20.00
Axles, wrought iron	17.00	22.00
No. 1 machinery cast	....	17.00
Stove plate	....	13.00
Standard carwheels	....	16.00

Per Net Ton		
No. 1 mach'ry cast	$16.00	....
Stove plate	12.00	....
Standard carwheels	15.00	....
Malleable scrap	14.00	....

Russia Buys German Plates

HAMBURG, GERMANY, Aug. 12.—The Vereinigte Stahlwerke A. G., Düsseldorf, has received a contract from the Russian Government to supply all ship plates and structural material needed by Russian shipyards during 1930. The shipbuilding program of these yards is reported as eight to ten vessels.

Pacific Coast

Steel Prices Well Maintained—Bridge Takes 1150 Tons of Bars—Another Requires 8000 Tons of Shapes

SAN FRANCISCO, Aug. 24 (*By Air Mail*).—Movement of iron and steel products during the past week was confined, with few exceptions, to unimportant tonnages, and few new inquiries for tonnage lots came up for figures. The outstanding award of the week went to the Northwest Steel Rolling Mills and called for 1150 tons of reinforcing steel bars for the West Garfield Street bridge, Seattle. Bids were opened on 8000 tons of structural shapes for a bridge at Portland and on 1385 tons of cast iron pipe for Oakland, Cal. The price structure appears to be well maintained.

Pig Iron. — Little of real importance transpired in the pig iron market, sales and inquiries having been limited to small lots. Prices are unchanged.

Prices per gross ton at San Francisco:

*Utah basic	$25.00 to $26.00
*Utah fdy., sil. 2.75 to 3.25	25.00 to 26.00
**Indian fdy., sil. 2.75 to 3.25	25.00 to 26.00

*Delivered San Francisco.
**Duty paid, f.o.b. cars San Francisco.

Bars. — Demand for reinforcing steel bars is by no means heavy, the majority of lettings calling for lots ranging from 30 to 60 tons. The Soule Steel Co. took 100 tons for a college building in Pasadena, Cal. Several fair-sized tonnages are pending, including 2300 tons for a wharf at Ninth Street, Oakland, 285 tons for paving work in Marin County, Cal., and 210 tons for a wharf at Fourteenth Street, Oakland. Out-of-stock quotations continue on a fairly firm basis in the San Francisco district at 2.30c., base, on carload lots and at 2.60c. on smaller tonnages. In Los Angeles, carload quantities are being quoted at 2.40c., base, and 2.70c. applies on less-than-carload lots. Movement of merchant bar steel is restricted to unimportant lots composed of numerous sizes. On this class of material, 2.35c., c.i.f., prevails.

Plates.—No large bookings were reported this week, and few inquiries of importance are before fabricators for figures. No action has yet been taken on 3000 tons for a pipe line at Bremerton, Wash. Bids will be opened next week on 10,000 tons for a riveted pipe line at Everett, Wash. Prices appear to be firm at 2.35c., c.i.f. Coast ports.

Shapes. — Most of the structural lettings this week called for lots of less than 100 tons. The McClintic-Marshall Co. took 140 tons for an apartment building on Pacific Street, San Francisco. Bids were opened this week on 8000 tons for a bridge in Portland and on 1000 tons for a hotel in Oakland. New inquiries include 738 tons for a bridge near Yreka, Cal., bids on which are to be opened Sept. 11. Domestic shapes continue firm at 2.35c., c.i.f.

Cast Iron Pipe.—Awards of cast iron pipe, with two exceptions, were confined to lots of less than 100 tons. The Heafey-Moore Co., Oakland, secured 199 tons of 4 to 8-in. Class B pipe for Alturas, Cal. An unnamed interest took 162 tons of 6 and 8-in. Class B pipe for Great Falls, Mont. Bids were opened this week on 1385 tons of 6 to 12-in. Class B pipe for the East Bay Municipal Utility District, Oakland. Los Angeles will open bids on Aug. 27 for 192 tons of 2-in. Class B pipe. Anaheim, Cal., opened bids this week on 377 tons of 6 to 10-in. Class B pipe. On Aug. 26 Coquille, Ore., will open bids on 303 tons of 10-in. Class B pipe.

Steel Pipe.—Demand for oil country goods has improved during the past week or two and, while few large lots have been reported, distributers are ordering replacements, which in the aggregate have involved large tonnages, one interest reporting orders totaling over 2000 tons during the past 10 days. The Pacific Gas & Electric Co., San Francisco, has withdrawn its inquiry for 2263 tons of 8⅝-in. O. D. gas pipe for installation in Monterey, Salinas and Gilroy. This company has an inquiry out for 38,000 ft. of 8⅝-in. O. D. plain end pipe weighing 24.496 lb. per ft. involving 465 tons and also another inquiry for 260 tons of 1¼ to 4-in. standard pipe.

Warehouse Prices, f.o.b. San Francisco

	Base per Lb.
Plates and struc. shapes	3.15c.
Soft steel bars	3.15c.
Small angles, ¼-in. and over	3.15c.
Small angles, under ¼-in.	3.55c.
Small channels and tees, ¾-in. to 2¾-in.	3.75c.
Spring steel, ¼-in. and thicker	5.00c.
Black sheets (No. 24)	4.90c.
Blue ann'l'd sheets (No. 10)	3.80c.
Galv. sheets (No. 24)	5.30c.
Struct. rivets, ½-in. and larger	5.65c.
Com. wire nails, base per keg	$3.40
Cement c't'd nails, 100 lb. keg	3.40

Birmingham

Sales of Iron as Low as $12 Reported—Ensley Rail Mill Shuts Down

BIRMINGHAM, Aug. 27.—Southern sales of pig iron have been light, owing to previous placement of requirements. Most of the important buyers had covered their needs for August when the month began and they have, likewise, bought through September. However, next month's melt will require more iron than has been booked at this time and additional buying is looked for within the next two weeks. The daily run of small business continues at an even rate. Southern demand during the remainder of the quarter will just about take care of current production, while the aggressive bidding for tonnage in the Eastern and Middle Western markets will result in the moving of yard stocks. Shipments this month by the three merchant producers in the Birmingham district have been ahead of their make. Quotations in the Southern market continue on the $14.50 base, but various concessions are being made at competitive points, and prices as low as $12 are reported. The Tennessee company last week banked Bessemer No. 4, which has been on recarburizing iron. Central Iron & Coal Co., at Holt, Ala., also blew out its stack. This furnace, on foundry iron, had been in operation for 39 months on the same lining, and will be out for several months because of the present condition of the market. It will be relined, but work is not to be started immediately. The Tennessee company also changed Ensley No. 1 and No. 3 from basic to foundry, as a result of the closing down of the Ensley rail mill. After being on foundry for one week, the Gulf States Steel stack at Alabama City was changed back to basic. Fourteen furnaces are now in blast in Alabama, five on basic and nine on foundry. There has been a reduction in active furnaces during the month of three.

Prices per gross ton, f.o.b. Birmingham dist. furnaces:

No. 2 fdy., 1.75 to 2.25 sil.	$14.50
No. 1 fdy., 2.25 to 2.75 sil.	15.00
Basic	14.50

Finished Steel. — New tonnage in structural shapes, plates, bars, sheets and miscellaneous lines continues at the high level of the past few months, with an increase shown in sheets. There is very little rail tonnage left on the books of the Tennessee company and its Ensley rail mill was closed down last week. The remaining business is being handled by the small Fairfield mill. New business of the structural steel and bar fabricators consisted only of small orders, with the exception of the structural steel contract for the new plant of the Brown Paper Mill Co., at Monroe, La., amounting to 2000 tons and secured by the Virginia Bridge & Iron Co. With the closing of the rail mill at Ensley, the Tennessee company decreased open-hearth operations to three of nine furnaces. Seven out of eight open-hearths are being run at Fairfield. The Gulf States Steel Co. has all six of its open-hearths at Alabama City in operation.

Cast Iron Pipe. — Pressure pipe manufacturers report only a fair amount of routine business, with no

large orders during the last week. One company accumulated about 2000 tons, while another ran slightly ahead of that figure. Shipments continue at a rate equaling production. Prices remain at $37 to $38 a net ton, Birmingham, for 6-in. and larger diameters.

Coke.—There is very little new business in foundry coke. Movement on contract is steady and ahead of that at this time last year. Quotations remain at $5 for both spot and contract.

Old Material.—The gradual improvement of the past several weeks is being maintained and the outlook is better than at any other time since early spring. There have been no changes in quotations since two weeks ago, when a number of grades advanced.

Prices per gross ton, deliv'd Birmingham dist. consumers' yards:

Heavy melting steel	$13.00 to $13.50
Scrap steel rails	14.00
Short shoveling turnings	9.00
Cast iron borings	9.00
Stove plate	$11.50 to 12.00
Steel axles	21.00
Iron axles	23.00
No. 1 railroad wrought	10.00 to 10.50
Rails for rolling	15.50
No. 1 cast	13.50
Tramcar wheels	13.50
Cast iron carwheels	13.00 to 13.50
Cast iron borings, chem.	13.50 to 14.00

St. Louis

Steel Plant Buys 10,000 Tons of Southern Basic—Scrap Scarcity Strengthens Market

ST. LOUIS, Aug. 27.—The sale of 10,000 tons of Southern basic iron to a Peoria melter was the outstanding development in the pig iron situation in this district during the week. The buyer, the Keystone Steel & Wire Co., has heretofore used no iron of this description, and the purchase was made for use as a substitute for scrap, which is scarce and expensive. Sales otherwise consisted of foundry and malleable grades, totaling about 4000 tons, divided between Northern and Southern iron. Leading users are well supplied, but the smaller concerns are holding off, and still have considerable buying to do for the rest of the year. Prices remain uneven. The Southern basic sold is believed to have gone at a price figuring below $13, furnace. The melt holds up well and shipments continue in good volume.

Prices per gross ton at St. Louis:

No. 2 fdy., sil. 1.75 to 2.25, f.o.b. Granite City, Ill.	$19.50 to $20.00
Malleable, f.o.b. Granite City	20.50
N'th'n No. 2 fdy., deliv'd St. Louis	22.16
Southern No. 2 fdy., deliv'd	$16.92 to 18.92
Northern malleable, deliv'd	22.16
Northern basic, deliv'd	22.16

Freight rates: 75c. (average) Granite City to St. Louis; $2.16 from Chicago; $4.42 from Birmingham.

Finished Steel.—Numerous small lots of reinforcing concrete bars are being taken, mainly for road and river improvement work. The only letting of size was 1600 tons for a storage sewage disposal plant at Peoria, Ill., to the Laclede Steel Co. Warehouse business is fairly active, with a better demand than heretofore for fencing, roofing and the lines used in the rural areas. Makers and distributers of sheets report satisfactory conditions. The leading district producer is operating all sections at capacity. Specifying by car and automobile builders has tapered off.

Coke.—Deliveries of metallurgical coke on contract are in considerable volume, reflecting a melt of greater than ordinary seasonal proportions. New buying, however, lags, and is confined to immediate needs. A slight revival in domestic sizes has been noted since Aug. 15. Demand for industrial grades is about normal for this time of year. Prices are unchanged.

Old Material. — Strength marks scrap iron and steel in this district. There is a scarcity of material, most pronounced in steel works scrap. Steel grades are wanted and are difficult to obtain at prices the mills are willing to offer. Yard stocks are not of sufficient size to alleviate the situation and arrivals from the country are light. The carriers, much preoccupied with a grain movement of record size, have neither time nor facilities to increase their old material deliveries. Interest is being taken in malleable grades, and a slightly firmer tone prevails in cast items than heretofore. Railroad lists before the trade include: Nashville, Chattanooga & St. Louis, 13 cars; Pullman Co., 1 car; Union Pacific, 3900 tons; Nickel Plate, 54 cars; Frisco, 71 cars; Chicago, Milwaukee, St. Paul & Pacific, 127 cars, and Chicago & Eastern Illinois, 6 cars.

Dealers' buying prices per gross ton, f.o.b. St. Louis district:

No. 1 heavy melting or shoveling steel	$14.75 to $15.25
No. 2 heavy melting or shoveling steel	14.50 to 15.00
No. 1 locomotive tires	15.00 to 15.50
Miscel. stand.-sec. rails including frogs, switches and guards, cut apart	17.00 to 17.50
Railroad springs	19.00 to 19.50
Bundled sheets	10.50 to 11.00
No. 2 railroad wrought	15.00 to 15.50
No. 1 busheling	10.00 to 10.50
Cast iron borings and shoveling turnings	9.50 to 10.00
Iron rails	15.00 to 15.50
Rails for rolling	17.25 to 17.75
Machine shop turnings	7.00 to 7.50
Heavy turnings	10.00 to 10.50
Steel car axles	19.50 to 20.00
Iron car axles	26.50 to 27.00
Wrot. iron bars and trans.	21.50 to 22.00
No. 1 railroad wrought	13.75 to 14.25
Steel rails, less than 3 ft.	18.00 to 18.50
Steel angle bars	15.25 to 15.75
Cast iron carwheels	15.00 to 15.50
No. 1 machinery cast	15.25 to 15.75
Railroad malleable	15.50 to 16.00
No. 1 railroad cast	14.75 to 15.25
Stove plate	12.50 to 13.00
Agricult. malleable	15.25 to 15.75
Relay. rails, 60 lb. and under	20.50 to 23.50
Relay. rails, 70 lb. and over	26.50 to 29.00

Buffalo

Boat Shipments of Pig Iron Going to Chicago and Detroit—Steel Mills Maintain High Output

BUFFALO, Aug. 27.—The pig iron market continues strong, with considerable booking of small lots, principally for the fourth quarter. Buffalo producers are shipping a good deal of iron to Chicago and Detroit, where they have little difficulty in realizing a price equivalent to $18.50, Buffalo, for No. 2 plain. The westward shipments are being made by boat. The General Electric Co. is in the market for 500 tons of No. 1 foundry for its Schenectady plant and the New York Air Brake Co., which had been in the market for 500 tons of foundry and malleable, has covered for part of its requirements for its Watertown plant. One inquiry for basic has been received from the East and is for 2,000 to 3,000 tons. Most of the business taken in the East is at a minimum of $18, with $18.50 applying on much of it.

Prices per gross ton, f.o.b. furnace:

No. 2 fdy., sil. 1.75 to 2.25	$19.50
No. 2X fdy., sil. 2.25 to 2.75	20.00
No. 1 fdy., sil. 2.75 to 3.25	21.00
Malleable, sil. up to 2.25	20.00
Basic	18.50
Lake Superior charcoal	27.28

Finished Iron and Steel.—Operations of local steel mills continue at an unchanged pace, and demand for all lines is good. The General Electric Co. has awarded 3,000 tons for a new powerhouse at Tonawanda, N. Y., and the State has let 200 tons for a new cell building at Auburn prison, Auburn, N. Y. Bates & Rogers are low on the general con-

tract for a viaduct over the New York Central tracks at Harlem avenue, Buffalo, which will require 200 to 300 tons of reinforcing bars and 300 tons of structural steel. School No. 67, Buffalo, calls for 600 tons of structural steel and 150 tons of reinforcing bars. A considerable volume of small reinforcing bar business has been placed.

Old Material. — There is little change in the market, though some disposition to spottiness has developed. Dealers are expecting momentarily an increased demand for No. 1 machinery cast and stove plate, which may be quite apparent by Sept. 1. Dealers are paying up to $17.75 against a recent order of No. 1 heavy melting steel taken at $18, and it develops that an order of No. 1 heavy melting steel was placed at $17 shortly after the $18 purchase, at a plant where inspections give the dealers slightly more leeway. Some sales of cast iron borings are reported at the current quotations. The demand for specialties has improved, and sales of short rails at $19.50 and railroad knuckles and couplers at $19.50 are reported. The market for machine shop turnings has strengthened, with sales reported at $9 to $9.50.

Prices per gross ton. f.o.b. Buffalo consumers' plants:

Basic Open-Hearth Grades:	
No. 1 heavy melting steel	$17.50 to $18.00
No. 2 heavy melting steel	14.75 to 15.00
Scrap rails	16.50 to 17.00
Hydraul. comp. sheets	14.50 to 14.75
Hand bundled sheets	12.00 to 12.50
Drop forge flashings	14.25 to 14.50
No. 1 busheling	15.50 to 16.50
Hvy. steel axle turnings	14.00 to 14.50
Machine shop turnings	9.00 to 9.50
No. 1 railroad wrought	13.00 to 13.50
Acid Open-Hearth Grades:	
Knuckles and couplers	19.50 to 19.75
Coil and leaf springs	19.00 to 19.50
Rolled steel wheels	19.00 to 19.50
Low phos. billet and bloom ends	20.00 to 20.50
Electric Furnace Grades:	
Short shov. steel turnings	12.00 to 12.50
Blast Furnace Grades:	
Short mixed borings and turnings	10.50 to 11.50
Cast iron borings	10.50 to 11.50
No. 2 busheling	10.00 to 10.50
Rolling Mill Grades:	
Steel car axles	18.75 to 19.25
Iron axles	21.00 to 22.00
Cupola Grades:	
No. 1 machinery cast	16.00 to 17.00
Stove plate	13.00 to 13.50
Locomotive grate bars	12.50 to 13.00
Steel rails, 3 ft. and under	19.50 to 19.75
Cast iron carwheels	14.00 to 14.50
Malleable Grades:	
Industrial	18.00 to 18.50
Railroad	18.00 to 18.50
Agricultural	18.00 to 18.50
Special Grades:	
Chemical borings	12.50 to 13.50

Warehouse Prices, f.o.b. Buffalo

Boston

Buffalo Pig Iron Now at $17 to $18 Range—Scrap Prices Firmer—Coke Shipments Heavy

BOSTON, Aug. 27.—Pig iron sales the past week ran close to 6000 tons. The largest transaction was 1000 tons of No. 2X and No. 1X to a Massachusetts textile machinery manufacturer by the Mystic Iron Works. Most of the business otherwise was in small tonnages, with Connecticut foundries the principal buyers. Third quarter contracting is virtually over, and quite a few foundries are covered for fourth quarter. A Massachusetts textile machinery maker is in the market for an indefinite tonnage, but probably will purchase about 2000 tons. There are no other open inquiries of size. Southern iron is still available at $14 a ton, base furnace. One Buffalo stack has accepted business at $17 a ton, base furnace, but others in that district maintain a base price of $18 a ton. No. 2X Indian iron is available at $21.75 to $22 a ton, on dock here, duty paid. All recent sales except one made by the Everett, Mass., furnace were at $20 to about $22 a ton, furnace, for No. 2X and No. 1X. The exception was a small tonnage of No. 2X at $19.50 a ton, furnace, on a high freight and in active competition.

Foundry iron prices per gross ton deliv'd to most New England points:

†Buffalo, sil. 1.75 to 2.25	$21.28 to $22.28
†Buffalo, sil. 2.25 to 2.75	21.78 to 22.78
*Buffalo, sil. 1.75 to 2.25	21.91 to 22.91
*Buffalo, sil. 2.25 to 2.75	22.41 to 23.41
East. Penn., sil. 1.75 to 2.25	22.65 to 23.15
East. Penn., sil. 2.25 to 2.75	23.15 to 23.65
Va., sil. 1.75 to 2.25	25.21
Va., sil. 2.25 to 2.75	25.71
*Ala., sil. 1.75 to 2.25	23.61
*Ala., sil. 2.25 to 2.75	24.11
†Ala., sil. 1.75 to 2.25	19.75 to 20.25
†Ala., sil. 2.25 to 2.75	20.25 to 20.75

Freight rates: $4.91 all rail from Buffalo, and $4.28 rail and water; $3.65 all rail from eastern Pennsylvania; $5.21 all rail from Virginia; $9.61 all rail from Alabama and $5.75 rail and water from Alabama to New England seaboard.
*All rail rate.
†Rail and water rate.

Reinforcing Steel.—The sale of 300 tons of billet steel bars for a Waltham, Mass., hospital and a grist of smaller tonnages brought New England sales the past week up to about 1000 tons, the largest amount in any similar period in a long time. About 1500 tons in large and small jobs is pending. With the speeding up of business there is less inclination to make price concessions, particularly on lots of less than 100 tons, and 2.66½c. a lb., base, from stock prevails. The market for rail steel bars is a little more active, with 2.26½c. a lb., base, delivered common Boston freight rate points, the openly quoted price.

Cast Iron Pipe.—The only open municipal business in sight is 1½ miles of 6, 8, 10 and 12-in. pipe for Putnam, Conn. Private business is holding up well. Prices quoted openly on domestic pipe are: 4-in., $46.10 to $47.10 a ton, delivered common Boston freight rate points; 6 to 12-in., $40.10 to $41.10; 16 to 20-in., $39.10. A $3 differential is asked on Class A and gas pipe.

Warehouse Business. — The closing days of August have brought a rather pronounced betterment in the movement of iron and steel and kindred products out of warehouses. Wire nails have been reduced 10c. to $3.40 per keg, base, out of warehouse, and to $2.65 per keg, base Pittsburgh, on direct mill shipments. This reduction, according to warehouses, is confined to Atlantic seaboard points and is due to the influx of German nails at Boston and elsewhere.

Coke.—Specifications against last half by-product foundry coke contracts have materially stepped up, and indications are that August billings will be exceptionally large for a midsummer month. The price remains at $11 a ton, delivered within a $3.10 freight rate zone. The New England Coal & Coke Co's. 1929 domestic coke sales will be far in excess of those for any previous year in the history of the company. The Providence Gas Co. expects to have its new battery of 25 ovens in operation by Dec. 1, next, which will about double its coke supply.

Old Material.—Old material prices are firmer than a week ago, but with one exception no higher, although outside quotations are being paid by brokers more often than inside. Numerous sales of steel turnings at $7.50 a ton, on cars shipping point, are reported, whereas a week ago $7.25 was the top price. While No. 1 heavy melting steel transactions the past week were within a range of $12.25 to $12.75 a ton, most business was at $12.50 to $12.75, with $12.75

predominating. The long bundled skeleton market is quite active for Worcester, Mass., consumption. Although by no means active, the market for specification pipe is more so than it has been the past two months. There is also quite an improvement in the demand for No. 1 railroad wrought at $11 a ton, on cars shipping point. New England foundries are buying larger quantities of machinery cast, but largely from local or nearby yards. During the next six weeks the United Electric Railway Co., Providence, R. I., will produce about one car a day of scrap metal from obsolete trolley cars, in addition to steel wheels, axles, trolley stands and other equipment.

Buying prices per gross ton, f.o.b. Boston rate shipping points:

No. 1 heavy melting steel	$12.25 to $12.75
Scrap T rails	11.50 to 12.00
Scrap girder rails	10.50 to 11.00
No. 1 railroad wrought	11.00 to 11.50
No. 1 yard wrought	9.00 to 9.50
Machine shop turnings	7.00 to 7.50
Cast iron borings (steel works and rolling mill)	6.50 to 6.75
Bundled skeleton, long	10.00 to 10.50
Forge flashings	10.50 to 10.75
Blast furnace borings and turnings	6.00 to 6.25
Forge scrap	9.00 to 9.25
Shafting	14.00 to 14.75
Steel car axles	18.00 to 18.50
Wrought pipe 1 in. in diameter (over 2 ft. long)	9.75 to 10.00
Rails for rolling	12.50 to 13.00
Cast iron borings, chemical	9.75 to 10.00
Prices per gross ton deliv'd consumers' yards:	
Textile cast	$14.00 to $14.50
No. 1 machinery cast	15.00 to 15.25
No. 2 machinery cast	13.00 to 13.25
Stove plate	11.00 to 11.50
Railroad malleable	18.00 to 18.50

Detroit

August Auto Output May Exceed July's

DETROIT, Aug. 27. — Automotive production apparently will be slightly larger in August than in July and should be better than the volume of August, 1928. The Ford Motor Co. and Chevrolet Motor Co. are proceeding at high production rates. The Ford Motor Co. is understood to have about 200,000 unfilled orders for the current month.

According to H. G. Klinger, vice-president and general sales manager of the Chevrolet Motor Co., the sales quota set for the period of Sept. 1 to Jan. 1 is 300,000 units.

There have been no changes in scrap prices during the past week. The market is firm and sales in small tonnages bring the top of the range.

Dealers' buying prices per gross ton, f.o.b. cars, Detroit:

Hvy. melting and shov. steel	$14.25 to $14.75
Borings and short turnings	9.00 to 9.50
Long turnings	8.50 to 9.00
No. 1 machinery cast	12.50 to 13.00
Automobile cast	13.00 to 13.50
Hydraul. comp. sheets	14.00 to 14.50
Stove plate	9.00 to 9.50
New No. 1 busheling	12.50 to 13.00
Old No. 1 busheling	11.00 to 11.50
Sheet clippings	8.75 to 9.25
Flashings	13.00 to 13.50

Cincinnati

Southern Pig Iron Weakness Does Not Affect Northern Iron—Sheet Orders Equal 80 Per Cent of Shipments

CINCINNATI, Aug. 27.—With most of the district consumers of pig iron apparently covered for the third quarter, sales of pig iron during the past week were slightly below those of the preceding week. Total sales were around 6000 tons, of which about 1000 tons was Southern iron. Sales of Southern iron gave further opportunity to test Southern prices here, and indicated that the market is about $13.50 to $14, base Birmingham, although price uncertainty still indicates a weak market. Reports that the Republic Iron & Steel Co. is booked for the remainder of this year and that other furnaces have cut surplus stocks helped to allay some of the apprehensions regarding the Southern situation. Recent sales of Northern iron indicate that the market is well established at about $18.50, base Valley Furnace, and virtually no concessions are being granted. A Mansfield, Ohio, consumer is inquiring for 350 tons of malleable iron and a Huntington, W. Va., melter is asking for 200 tons of Northern foundry.

Prices per gross ton, deliv'd Cincinnati:

So. Ohio fdy., sil. 1.75 to 2.25	$19.89 to $20.39
Ala. fdy., sil. 1.75 to 2.25	17.19 to 18.19
Ala. fdy., sil. 2.25 to 2.75	17.69 to 18.69
Tenn. fdy., sil. 1.75 to 2.25	17.19 to 18.19
S'th'n Ohio silvery, 8 per cent	26.89

Freight rates, $1.89 from Ironton and Jackson, Ohio; $3.69 from Birmingham.

Finished Material.—A slight recession of the demand for sheets last week was reported by district sheet mills. With mills maintaining capacity production, backlogs were reduced. In fact, the leading interest in this district indicates that backlogs are being cut at the rate of about 2000 tons a week and fresh bookings during the past week were about equal to 80 per cent of output. Although the demand for galvanized sheets is fairly brisk, the market is affected by reports of price concessions in the South. It is said that business has been placed at $3.35, Birmingham, as against the usual formal quotation of $3.75.

Coke.—Specifications of by-product foundry coke slackened slightly during the past week, although consumers have taken coke on contract at a good rate for August. While prices on foundry by-product coke will continue at about $10.05, delivered in Cincinnati, during September, quotations on domestic grades will be increased 25c. a ton on Sept. 1.

Old Material—The continued difficulty dealers have in obtaining sufficient good scrap to cover commitments is contributing strength to the old material market, but the reluctance of mills to pay higher prices has halted increases by dealers. There is very little buying, although consumers are accepting shipments on contract. Yard stocks of the steel grades are nearly depleted, and the only accumulation of old materials is in the cast iron grades.

Dealers' buying prices per gross ton, f.o.b. cars, Cincinnati:

Heavy melting steel	$14.25 to $14.75
Scrap rails for melting	14.25 to 14.75
Loose sheet clippings	9.00 to 9.50
Bundled sheets	11.00 to 11.50
Cast iron borings	9.25 to 9.75
Machine shop turnings	8.50 to 8.75
No. 1 busheling	10.50 to 11.00
No. 2 busheling	7.00 to 7.50
Rails for rolling	14.50 to 15.00
No. 1 locomotive tires	14.25 to 14.75
No. 2 railroad wrought	14.25 to 14.75
Short rails	18.50 to 19.00
Cast iron carwheels	12.75 to 13.25
No. 1 machinery cast	19.00 to 19.50
No. 1 railroad cast	15.25 to 15.75
Burnt cast	10.25 to 10.75
Stove plate	10.25 to 10.75
Brake shoes	10.25 to 10.75
Agricultural malleable	14.25 to 14.75
Railroad malleable	15.25 to 15.75

Youngstown

Production in Mahoning Valley Turns Upward

YOUNGSTOWN, Aug. 27.—Iron and steel production takes an upturn this week in the Mahoning Valley, showing a gain of two open-hearth furnaces.

The Mahoning Valley Steel Co. has started eight sheet mills at its Niles plant, bringing the total number of active units in the district to 113 out of 120, against 97 in the preceding week. Of 51 independent open-hearth furnaces, 46 are active.

Rolling mills will suspend next Monday for the Labor Day observance.

Steel operations average 85 per cent this week. The Sharon Steel Hoop Co. has one strip mill off and is operating its steel plant at Lowellville at 80 per cent. The Republic Iron & Steel Co. is operating all four of its blast furnaces in its Haselton group. Twenty-eight of the district's 34 stacks are in blast.

Structural Steel Orders Heavy in July

WASHINGTON, Aug. 23.—Orders for fabricated structural steel in July, reported to the Department of Commerce by 193 firms, totaled 277,119 tons, representing 91 per cent of their capacity of 302,990 tons. This compares with 279,729 tons in June, reported by 218 firms, representing 89 per cent of their capacity of 312,885 tons.

Computed orders in July were 350,350 tons, against 342,650 tons, and computed shipments were 304,150 tons, or 79 per cent of capacity, compared with 292,600 tons or 76 per cent. July orders were the largest, with the exception of March, for any month this year, and were exceeded only once (August) last year.

For the first seven months of the current year computed orders totaled 2,271,500 tons, against 1,867,250 tons for the like period of last year. Computed shipments were 2,009,700 tons, or 75 per cent of capacity, against 1,690,150 tons, or 63 per cent of capacity, last year.

Newton's Michigan Mill Ready in January

The Newton Steel Co. is now roofing the buildings for its new plant at Monroe, Mich., which will consist of eight sheet mills designed to produce high finished automobile stock. The plant will have capacity for 20,000 tons of sheets monthly, about the same as its plant at Newton Falls, Ohio. It is expected the plant will be ready for experimental rolling in December and for commercial production in January.

Doubt Special Session Will Pass Tariff Bill

WASHINGTON, Aug. 27.—With the administrative features drafted, the Senate Committee on Finance has now finished revising the House tariff bill and the measure will come up for consideration in the Senate on Sept. 4, according to present plans. Like all tariff measures it is to be bitterly contested and there appears to be the general view that it will not pass at the special session.

Indications that some of the Republican leaders share this opinion is the statement given out last week by Senator Watson of Indiana, majority leader, that the bill must be passed by the first of the year. Previously Senator Watson had expressed the opinion that the bill would be passed. at the special session, and apparently there are some who still think this may be done.

Much discussion has centered around the placing of manganese ore on the free list and despite the comparative obscurity of the item so far as the general public is concerned, it appears to be getting a political importance that had hardly been anticipated. Apparently but little notice has been given to the fact that the Senate Committee in making manganese duty free reduced the duty on virtually all important iron and steel products and some of their remanufactures. The assumption is that if manganese ore should be restored to the dutiable list by the Senate, the stated reduction in rates on steel also would be removed.

Chairman Smoot of the Finance Committee estimated that the average ad valorem rate in the metal schedule of the Committee bill is 34.76 per cent and that its revenue would be $42,848,180 annually as against an average ad valorem rate of 39.63 per cent, netting $51,535,850 in the House bill and an average ad valorem rate of 35.07 per cent, netting $45,603,592, in the present Fordney-McCumber act. He said that 51 changes were made in the metal schedule.

In its report last week THE IRON AGE stated that the Senate Committee reduced the duty on punches, shears and bar cutters to 35 per cent from the duty of 40 per cent carried in the House bill. The Senate Committee reduced the rate to 30 per cent.

Sheet Steel Sales Gain in July

Sales of steel sheets by independent mills gained 10 per cent in July over June and production and shipments showed only a slight decline from the previous month according to the monthly report of the National Association of Flat Rolled Steel Manufacturers. However, production and shipments in June were considerably below the peak attained in May. Sales during the month were only about 7000 tons less than shipments. Unfilled orders are still heavy although they have declined each month since the peak of 835,801 tons in April. The July report and comparisons, in net tons, follow:

	July	June	May
Total number of mills	723	722	722
Capacity per month, tons	486,430	451,125	502,600
Percentage reporting	67.9	67.8	67.6
Sales, tons	337,222	307,911	279,783
Production	323,905	337,841	393,430
Shipments	344,676	347,989	392,336
Unfilled orders	658,155	676,568	713,568
Unshipped orders	107,751	111,333	119,535
Unsold stocks	47,103	52,274	48,334
Percentages of Capacity			
Sales	102.2	100.6	82.4
Production	98.1	110.4	115.8
Shipments	104.4	113.7	115.5

Unshipped orders	32.6	36.4	35.2
Unsold stocks	14.3	17.1	14.2

Laclede Builds Tube Mill

The Laclede Steel Co., St. Louis, has broken ground for a tube mill on a site adjacent to its steel works at Alton, Ill. Steel pipe will be made to serve the St. Louis district and the Southwest.

Higher British Tool Steel Prices Expected

LONDON, ENGLAND, Aug. 19.—It is probable that prices of high-speed tool steels will increase owing to the recent rapid advance in the prices of tungsten, according to the *Commercial.* When the metal-working trades last year were consuming relatively little tool steel, ferrotungsten fell to 30c. a lb., and tungsten powder to 36c. When ferrotungsten is, say, 30c. per lb., wolfram ore from which it is made is worth $75 per ton. The slump in tungsten caused the closing of many of the wolfram ore mines in Burma.

In pre-war days German interests owned the major supplies of wolfram ore, but during the war period British steel interests, mainly those at Sheffield, became the owners of the wolfram ore mines in Burma. It remains to be seen how far it is necessary to increase output to meet the needs of the tungsten works at Widnes and those of the makers of British tool steels.

Austin Co. to Build Russian Automobile Plant

The Austin Co., Cleveland, has received official confirmation of the recently published report that it has been awarded a contract for the design and construction of an automobile plant for the Soviet Government at Nishni Novgorod, Russia. The plant will be designed to manufacture 100,000 Ford cars annually and the Ford Motor Co. will provide technical assistance in equipping the plant and will assist in the manufacturing operations when the factory is completed. The project involves an expenditure of $20,000,000. The engineering work will be handled in the main office of the Austin Co. in Cleveland.

The contract calls for a power house, foundry and complete automobile plant, which will cover a 5,000 acre site. Housing will be provided for 25,000 people. The works will be erected by Soviet labor under the direction of American construction engineers. Upon completion of the designing and engineering details of the project, the Austin Co. will send a staff of experts to Russia to start the work of actual construction. The plant is scheduled to be completed in about two years.

Ohio Foundries Operate at Over Capacity Rate

Ohio foundries operated at 105.3 per cent during July, a slight falling off from June when their operations were at the rate of 110.6 per cent, according to the monthly report of the Ohio Foundries Association, Inc., based on data supplied by 32 foundries. Operations during July, 1928, were 103 per cent of capacity.

Non-Ferrous Metal Markets

Copper More Active—Tin Very Dull—Lead Sales Larger —Zinc Firm—All Prices Steady

NEW YORK, Aug. 27.

Copper.—Demand from both domestic and foreign consumers is increasing and the market is gathering strength almost every day. Yesterday, in particular, sales to domestic consumers exceeded 7500 net tons, and the market was quite active today. Buying is largely for September delivery, but there has already appeared some October demand, which has been covered. It is estimated that domestic consumers have bought close to 65 per cent of their September requirements. There are also some sales each day for immediate shipment. Foreign buying has increased, with the average for the last few days approximating 2000 to 3000 gross tons a day. Conservative calculations place the foreign sales for this month at about 45,000 tons, as compared with 21,000 tons two weeks ago, and with average normal purchases of at least 50,000 tons monthly. Foreign buyers have purchased only about 35 per cent of their September needs. In general, the buying is broad, including wire makers, brass producers and miscellaneous melters. On Monday one producer's sales ranged from 50,000 lb. up to over 2000 tons in single transactions. There is no change in prices, which are firm at 18c., delivered in the Connecticut Valley for electrolytic copper. The quotation of Copper Exporters, Inc., is 18.30c. c.i.f., usual European ports. Lake copper, particularly for spot and nearby delivery, is in active demand. One producer sold 500,000 lb. Monday. Prices are unchanged at 18c. to 18.12½c., delivered.

Tin.—In a very quiet market, sales of spot Straits tin for the week ended Saturday, Aug. 24, were about 700 tons. The market is devoid of features. Transactions have been almost entirely for spot and early September delivery and they are made by consumers who do not usually buy far ahead. In London, the market is also very quiet. Price fluctuations are small and therefore the so-called group has neither to buy nor sell to stabilize the market. Sales in the Far East, which are in fair volume, are at full prices. Very little activity is looked for from now on until after Labor Day. Spot Straits tin today

THE WEEK'S PRICES. CENTS PER POUND FOR EARLY DELIVERY

Old Metals, Per Lb., New York

Buying prices represent what large dealers are paying for miscellaneous lots from smaller accumulators and selling prices are those charged customers after the metal has been properly prepared for their uses.

	Dealers' Buying Prices	Dealers' Selling Prices
Copper, hvy. crucible	14.75c.	16.25c.
Copper, hvy. and wire	14.50c.	15.75c.
Copper, light and bottoms	12.50c.	13.75c.
Brass, heavy	8.50c.	9.50c.
Brass, light	7.50c.	8.50c.
Hvy. machine composition	12.00c.	13.00c.
No. 1 yel. brass turnings	9.75c.	10.50c.
No. 1 red brass or compos. turnings	11.25c.	12.25c.
Lead, heavy	5.25c.	5.75c.
Lead, tea	4.25c.	5.25c.
Zinc	3.50c.	4.25c.
Sheet aluminum	14.00c.	16.00c.
Cast aluminum	12.25c.	14.25c.

was quoted at 46.12½c., New York. London prices today were a little lower than a week ago with spot standard quoted at £208 7s. 6d., future standard at £212 7s. 6d., and spot Straits at £212 7s. 6d. The Singapore price today is £217 10s.

Lead. — A considerably stronger market has developed. Sales have increased in volume and some fairly large transactions are reported. Delivery involved in some cases includes October, with some inquiry appearing for November, but most of the demand is for nearby and September. Prices are unchanged, that of the leading interest in the West standing at 6.55c., St. Louis. The leading interest continues to quote 6.75c., New York, as its contract price.

Zinc.—A better demand is reported, with a consequently firmer market. A week ago some shading of the quotation of most sellers was heard of, but this has disappeared. Demand for spot is better than for futures. There has, however, been no change in quotations, which continue at 6.80c., East St. Louis, or 7.15c., New York. Ore is still selling at $44 a ton, Joplin. Sales for the week ended Saturday, Aug. 24, were smaller than the previous week at 10,930 tons. Shipments, however, were the largest since April at over 13,200 tons, about the same as the production for the week, estimated at 13,550 tons. Reports are that efforts are being made to shut down the mines the week of Labor Day.

Antimony. — Conditions continue about the same as a week ago. Demand is more active and prices are very firm, owing partly to the prospect of an increase in the duty. Chinese metal is quoted and sold at 9c. a lb., New York, duty paid, for spot and nearby delivery, with futures at 8.87½c.

Nickel.—In wholesale lots, ingot nickel is quoted at 35c. a lb., with shot nickel at 36c. and cathode electrolytic nickel at 35c.

Aluminum.—Virgin metal, 98 to 99 per cent pure, is obtainable at the published quotation of 23.90c. a lb., delivered.

Non-Ferrous Metals at Chicago

Aug. 27.—There has been a considerable increase in interest in all the metals, with business generally in somewhat better volume. Tin has declined to 47½c., but the other metals are unchanged. Old metal prices are unaltered.

Prices per lb., in carload lots: Lake copper, 18.50c.; tin, 47.40c.; lead, 6.70c.; zinc, 6.87½c.; in less-than-carload lots, antimony, 9.85c. On old metals we quote copper wire, crucible shapes and copper clips, 14c.; copper bottoms, 11.50c.; red brass, 11.50c.; yellow brass, 8c.; lead pipe, 4.50c.; zinc, 3.25c.; pewter, No. 1, 24.50c.; tin foil, 26c.; block tin, 36c.; aluminum, 12.87½c.; all being dealers' prices for less-than-carload lots.

OBITUARY

DR. JEREMIAH W. JENKS, research professor of government at New York University and president of the Alexander Hamilton Institute, died in New York, Aug. 24, aged 72 years. He graduated from the University of Michigan, studied law and was admitted to the bar but later became a teacher, being appointed in 1885 to the chair of political science at Knox College, Illinois. Later came professorships in Indiana University, Cornell, and New York University. He frequently served on Federal commissions dealing with economic questions. From 1889 to 1901 he was expert agent of the United States Industrial Commission charged with investigating trusts and industrial combinations in the United States and Europe. He acted in 1903 in the interest of the Mexican and Chinese Governments in their effort to secure the cooperation of the United States in establishing a fixed relationship between the money of gold standard and silver using countries. He was an authority on Oriental affairs and an official adviser and firm friend of the Chinese. In 1922 he investigated economic conditions in Germany to aid the Government in stabilizing the mark. He wrote a number of books on economic, educational and social questions and many Government reports on labor, finance and industry. He will be remembered as a friend of youth who gladly served his day and labored in season and out of season for betterment in government, in business and in the lives of every-day men and women.

GEORGE W. THOMSON, for many years Chicago district manager of the Norton Co., died Aug. 22, following a short illness. He was born in Fall River, Mass., 50 years ago. He was 12 years old when the family moved to Worcester, Mass., and a few years later went to work for the Norton Co. In 1910 he was assigned to the sales department covering Connecticut, and later Philadelphia.

—

WALTER A. WINDSOR, president, Marietta Mfg. Co., Point Pleasant, W. Va., manufacturer of steel barges, died on Aug. 20 in a Cincinnati hospital, following an operation. He was born at Marietta, Ohio, 40 years ago, and entered the business of which his father was the head, soon after his graduation from Marietta College. During his presidency the plant of the company was removed from Marietta to Point Pleasant, and became one of the leading barge builders on the lower river. Mr. Windsor was also president of the Point Pleasant and Gallipolis Bridge Co., and of the Citizens National Bank, Point Pleasant.

—

JOHN J. THEOBALD, for many years superintendent of the Spencer, Mass., plant of the Wickwire Spencer Steel Corporation, and for the past six years retired, died suddenly on Aug. 20, while attending the funeral of a friend in Spencer. He had served as president of the Spencer Chamber of Commerce and was a trustee of the Spencer Savings Bank.

Further Decrease in Imports of Pig Iron

Imports of pig iron into the United States in July dropped to 6743 gross tons from 11,396 tons in June and 14,393 tons in May. The July figures, however, were more than 10 per cent higher than a year ago, when 6055 tons came in.

For the seven elapsed months of the calendar year incoming tonnages have been within 2 per cent of the corresponding total last year. There has been only a slight change in the line-up of the supplying countries, British India having replaced United Kingdom in the lead, with the Netherlands, as last year, in third place.

UNITED STATES IMPORTS OF PIG IRON BY COUNTRIES OF SHIPMENT
(In Gross Tons)

	July		Seven Months Ended July	
	1929	1928	1929	1928
United Kingdom	412	50	27,284	34,777
British India	5,120	2,994	30,559	26,774
Germany	....	....	103	95
Netherlands	818	2,325	18,292	15,840
Canada	54	....	525	378
France	....	300	101	300
Belgium	....	....	184	202
Norway	....	....	1,340	91
Sweden	306	355	1,309	1,396
All others	33	31	507	1,497
Total	6,743	6,055	80,204	81,350

The Weaver Brothers Co., Adrian, Mich., has been made sales representatives in the metal pickling field for the Johnson-Carlson Tank Co., Chicago, manufacturer of wood tanks.

PERSONAL

K. L. GRIFFITH has been elected president of the Seneca Iron & Steel Co., Buffalo, succeeding Hugh Kennedy, deceased. JAMES PATERSON and CLIFFORD HUBBELL were elected vice-presidents, ALEX PATERSON and T. W. PATERSON, treasurer and secretary, respectively.

—

S. S. FOX has been made manager and W. R. COLLARD, assistant manager of the Detroit office of the Joseph Schonthal Co., Columbus, Ohio.

—

J. J. BRADY has been appointed district manager of the Boston office of the Combustion Engineering Corporation, New York, and M. E. YEAGER, sales engineer. The company's New England representation through the Schumaker-Santry Co. has been discontinued.

—

F. L. FARRELL and D. F. JONES, formerly of the Schumaker-Santry Co., Boston, have associated themsevles as Farrell & Jones, 10 High Street, Boston, and have taken over the accounts formerly handled by Schumaker-Santry Co.

—

THOMAS L. THOMAS, formerly of the McKay Machine Co., has joined the Youngstown Foundry & Machine Co., Youngstown, Ohio, as manager of the machine department, and takes charge of production and sales. The company manufactures shears, roll lathes, spike machines and sheet mill equipment and will soon extend the latter line.

—

DR. OTTO PETERSEN, managing director of the Verein deutscher Eisenhüttenleute, Düsseldorf, Germany, and editor of *Stahl und Eisen*, will arrive in New York, Sept. 2, aboard the steamer New York to spend a short time in the United States en route to the Engineering Congress in Japan this fall.

—

I. F. BAKER has been appointed European sales manager of the Westinghouse Electric International Co., with headquarters at 2 Norfolk Street, Strand, London. He has been sales manager of the power division of the company in New York, and during his connection with the Westinghouse company, which began in 1909, he has served in the export sales department of the parent company, as Japanese manager for the International company, and as managing director of the company's Japanese subsidiary.

—

B. F. PIERSON, for many years with the Boston office of Niles-Bement-Pond Co., has joined the sales force of Manning, Maxwell & Moore.

WILLIAM J. WALSH, founder and president of the Walsh Holyoke Steam Boiler Works, Inc., Holyoke, Mass., has relinquished his activities in the business other than in an advisory capacity. He is succeeded by W. BRUCE PIRNIE, Springfield, Mass., a director of the Cheney-Bigelow Wire Co., and president of the Pirnie-Simmons Co. C. E. HEYWOOD and VINCENT P. MARRIN will continue as treasurer and assistant treasurer, respectively, of the boiler company.

—

F. J. MUELLER, general foreman of the core department, Hammond, (Ind.) works, American Steel Foundries, has been appointed assistant works manager at the Indiana Harbor, Ind., plant.

—

WILLIAM A. FORBES, assistant to president, United States Steel Corporation, New York; CHIH-HUNG CHOW, metallurgist, Lorain works, National Tube Co.; LEONARD C. GRIMSHAW, assistant metallurgist, Ludlum Steel Co., Watervliet, N. Y.; WALTER G. HILDORF, metallurgical engineer, Timken Roller Bearing Co. and Timken Steel & Tube Co., Canton, Ohio; SAMUEL R. ROBINSON, foundry manager, Industrial Brownhoist Corporation, Bay City, Mich.; WILLIAM H. STEWART, vice-president, Bethlehem Steel Export Corporation, New York, and LAWRENCE H. WETHERELL, Cambridge, Mass., metallurgist, Wetherell Brothers Co., are on the voting list of the autumn meeting, Sept. 10, for election to membership in the (British) Iron & Steel Institute.

—

WILLIAM GUMMERE, open-hearth superintendent, John A. Roebling's Sons Co., Trenton, N. J., has been appointed general manager in charge of operation at Trenton and is succeeded in the open-hearth department by R. MERCUR, JR.

—

STANTON L. DREIFUS, who has been connected with the scrap iron and steel industry for 25 years, has joined the organization of the Schiavone-Bonomo Corporation, scrap dealer, 11 West Forty-second Street, New York.

Extensive Safety Program at Chicago Meeting

Many sections of the National Safety Council have individual programs in the eighteenth annual Safety Congress to be held in the Stevens and Congress Hotels, Chicago, Sept. 30 to Oct. 4. Among the items are the following:

Paper, "Industrial Relations in Accident Control," by C. W. Bergquist, Western Electric Co., Chicago.

"Talk for Junior Safety Men," by Earl F. Blank, Jones & Laughlin Steel Corporation, Pittsburgh.

"Safety Committee in Action," a playlet directed by J. W. Benner, Homestead Works, Carnegie Steel Co., Munhall, Pa.

"Report on Annealing of Chains," by R. F. Thalner, safety director, Buick Motor Co., Flint, Mich.

"Structural and Sheet Metal Fabrication." by Daniel L. Royer.

"Noise and Its Relation to Accidents," by Dr. H. Clyde Snook.

"Hazards of Inter-department Trucking," by R. F. Thalner.

"Mechanical Safeguards on Construction Equipment," by E. H. Lichtenberg, chief engineer, Koehring Co., Milwaukee.

"Training Workers for Safety in Industry," by J. C. Wright, director, Federal Board of Vocational Education, Washington.

"Symposium on Physical Examinations in Industry," by Dr. C. H. Watson, medical director, American Telephone & Telegraph Co., New York; F. B. Thatcher, assistant general manager, By-Products Coke Corporation, Chicago; A. T. Lancaster, general foreman, Hawthorne Works, Western Electric Co., Chicago, and Dr. Guy L. Kiefer, commissioner of health, State of Michigan, Lansing.

"Report of Foundry Research Committee," by F. G. Bennett, Buckeye Steel Castings Co., Columbus, Ohio.

"What Is Safety First?" by P. J. Stremmel, general superintendent, Granite City Steel Co., Granite City, Ill.

"Report of Safe Practices Committee," by J. M. Woltz, Youngstown Sheet & Tube Co., Youngstown, Ohio.

"Progress in Gas Welding Safety," by H. S. Smith, consulting engineer, Union Carbide Co., New York.

"Safety Kinks in the Metal Industry," a film-strip, by John A. Oartel, Carnegie Steel Co., Pittsburgh, followed by general roundtable discussion.

Addresses before the Metals Section, by Dr. Harry Myers, Frigidaire Corporation, Dayton, Ohio; George Seyler, works manager, Lunkenheimer Co., Cincinnati; and J. E. Culliney, Bethlehem Steel Corporation, Bethlehem, Pa.

"Method of Promoting Accident Prevention," by F. C. Miller, Colorado Fuel & Iron Co. Trinidad, Colo.

"Safe and Unsafe Practices in Mining," a film-strip, by H. G. Hensel, Youngstown Sheet & Tube Co., Chicago.

"Power Press Accidents and Their Causes," by J. E. Walters, General Electric Co., Lynn, Mass.

"Drop Forge Manufacturing and Safety," by S. M. Havens, Wyman-Gordon Co., Harvey, Ill.

"Safe Dies a Necessity," by R. A. Shaw, tool and die stamping division, Murray Corporation of America, Detroit.

"Safety Devices for Modern Machine Tools," by Luther D. Burlingame, Brown & Sharpe Mfg. Co., Providence.

Roundtable discussion on power press problems, led by C. B. Bartlett, Geuder, Paeschke & Frey Co., Milwaukee.

Crucible Steel Co. of America and the Halcomb Steel Co. have acquired a site, 156 x 180 ft., on East Fifty-fifth Street, Cleveland, on which they will build a two-story warehouse and office building with 30,000 sq. ft of floor space.

Fabricated Structural Steel

New Work, Amounting to 58,000 Tons, Is Largest Since Middle of July

MORE than one-half of the structural steel lettings the past week, totaling 22,000 tons, were for industrial projects. New work, amounting to 58,000 tons, was the largest since the middle of July. Twenty-seven thousand tons will go into the construction of bridges. Highway bridges at Cleveland and Portland, Ore., will require 15,000 tons and 8000 tons, respectively. Awards follow:

BOSTON, 1000 tons, South Station canopies, to New England Structural Co.

WALTHAM, MASS., 300 tons, hospital, to Barker Steel Co.

STATE OF NEW YORK, 175 tons, highway bridge, to American Bridge Co.

NEW YORK, 1500 tons, House of Detention on Tenth Street, to McClintic-Marshall Co.

STATE OF NEW JERSEY, 225 tons, highway bridge in Bergen County, to McClintic-Marshall Co.

STATE OF NEW JERSEY, 400 tons, highway bridge in Atlantic County, to Bethlehem Steel Co.

STATE OF NEW JERSEY, 1700 tons, highway bridge on route 75, sections 18 and 19, to Bethlehem Steel Co.

SAYREVILLE, N. J., 1000 tons, power house for Raritan River Power Co., to American Bridge Co.

PHILADELPHIA, 1000 tons, Dorset Boulevard, to Bethlehem Steel Co.

STATE OF PENNSYLVANIA, 100 tons, bridge over Cheat River, to Jones & Laughlin Steel Corporation.

STATE OF PENNSYLVANIA, 600 tons, highway bridge in Northumberland County, to McClintic-Marshall Co.

MONROE, LA., 2000 tons, Brown Paper Mill Co., to Virginia Bridge & Iron Co.

TONAWANDA, N. Y., 3000 tons, power house for General Electric Co., to McClintic-Marshall Co.

AUBURN, N. Y., 200 tons, cell building at Auburn prison, to Kellogg Structural Steel Co.

PITTSBURGH & WEST VIRGINIA RAILROAD, 2100 tons, viaducts on Connellsville extension, to American Bridge Co.

CLEVELAND, 900 tons, building for Bourne-Fuller Co., to Massillon Bridge & Structural Co.

DETROIT, 1100 tons, Wayne County airport hangar, to R. C. Mahon Co.

CHICAGO, 260 tons, plant addition, Taylor Forge & Pipe Works, to A. Bolter's Sons.

HAMMOND, IND., 800 tons, Lever Brothers soap plant, to Duffin Iron Works.

MILWAUKEE, 1250 tons, office building for the Milwaukee Electric Railway & Light Co., to Wisconsin Bridge & Iron Co.

MENASHA, WIS., 500 tons, factory addition for Marathon Paper Co., to Worden-Allen Co.

MILWAUKEE, WIS., 250 tons, emergency hospital of city of Milwaukee, to Wisconsin Bridge & Iron Co.

DALLAS, TEX., 1200 tons, Bell Telephone Co. Building, to McClintic-Marshall Co.

SAN FRANCISCO, 140 tons, apartment building, Pacific near Webster Street, to McClintic-Marshall Co.

Structural Projects Pending

Inquiries for fabricated steel work include the following:

FALL RIVER, MASS., 100 tons, State bridge.

LITTLE FALLS, N. Y., 400 tons, high school.

SCARSDALE, N. Y., 300 tons, New York Telephone Co. building.

NEW YORK, 600 tons, apartment house at 1050 Fifth Avenue.

NEW YORK CENTRAL RAILROAD, 3000 tons, commissary building on 161st Street, New York.

PENNSYLVANIA RAILROAD, 2000 tons, warehouse in Jersey City.

STATE OF NEW JERSEY, 1000 tons, six highway bridges.

EDGEWATER, N. J., 6000 tons, assembly plant for Ford Motor Co.

CAMDEN, N. J., 800 tons, Camden Athletic Club building.

PENNSYLVANIA RAILROAD, 2400 tons, miscellaneous transmission line equipment.

PHILADELPHIA, 1600 tons, Henry Avenue bridge; F. A. Canuso & Son, low bidder on general contract.

BUFFALO, 600 tons, school No. 67.

BUFFALO, 300 tons, New York Central viaduct, Harlem Avenue.

CLEVELAND, 15,000 to 18,000 tons, Lorain-Central bridge.

CHICAGO, 3700 tons, Wendell Phillips Senior High School; Vierling Steel Works, low bidder.

PORTLAND, ORE., 8000 tons, St. John's bridge.

PHOENIX, ARIZ., 550 tons, generating plant for Central Arizona Light & Power Co.; bids being taken.

SACRAMENTO, CAL., 738 tons, bridge.

OAKLAND CAL., 1000 tons, hotel at Fourteenth and Jackson Streets.

SAN FRANCISCO, 150 tons, addition to apartment building at Sacramento and Mason Streets.

Railroad Equipment

Delaware, Lackawanna & Western Orders 1393 Cars

ORDERS were placed the past week for slightly less than 1800 cars. Of that number, 1393 are for the Delaware, Lackawanna & Western. Fresh inquiries are light. Details of the week's business follow:

Brooklyn & Queens Transit Corporation has ordered 50 single and center exit surface car bodies from J. G. Brill Co. and 50 from Osgood Bradley Co. The former also will supply 100 sets of trucks.

Delaware, Lackawanna & Western has ordered 141 steel suburban motor cars, equipped with roller bearings, from Pullman Car & Mfg. Corporation, 700 box cars, 250 hopper cars and two baggage and mail cars from American Car & Foundry Co. and 300 box cars from Magor Car Corporation. This carrier has placed an order with American Car & Foundry Co. for conversion of 141 suburban passenger cars into multiple-unit trailer cars.

South Buffalo Railway is inquiring for three eight-wheel switching locomotives.

Nashville, Chattanooga & St. Louis is in the market for five mountain-type locomotives.

Southern Pacific, Texas Lines, is inquiring for replacement parts to rebuild 400 box cars.

Columbia & Greenville has bought 300 box cars from American Car & Foundry Co.

Canadian National has contracted for one gasoline combination passenger and baggage rail motor car with the J. G. Brill Co.

Natchez, Columbia & Mobile is in the market for one or two 2-8-2 type locomotives.

Condon, Kinzua & Southern is expected to buy one 2-10-2 type locomotive.

Reinforcing Steel

Awards Total 5200 Tons and Inquiries 5500 Tons

AWARDS in the past week totaled 5200 tons, the largest having been 1200 tons for a Philadelphia hosiery plant. New projects will take about 5500 tons. A wharf at Oakland, Cal., will require 2300 tons. Awards follow:

RENSSELAER, N. Y., 450 tons, factory, to Kalman Steel Co.

PHILADELPHIA, 1200 tons, hosiery plant, to Taylor-Davis Co.

BARRINGTON, ILL., 1000 tons, warehouse for Jewel Tea Co., to Kalman Steel Co.

CHICAGO, 100 tons, plant for Ajax Quilting & Mfg. Co., to Inland Steel Co.

CHICAGO, 100 tons, factory, Diversey Boulevard and Tripp Avenue, to Concrete Engineering Co.

CHICAGO, 400 tons, film exchange building for Warner Brothers, to Concrete Engineering Co. (previously credited to unstated distributer).

KOHLER, WIS., 700 tons, Kohler Co. plant addition, to American System of Reinforcing.

SEATTLE, WASH., 1150 tons, West Garfield Street bridge, to Northwest Rolling Mills.

PASADENA, CAL., 100 tons, Atheneum building of California Institute of Technology, to Soule Steel Co.

Reinforcing Bars Pending

PENNSYLVANIA RAILROAD, 1500 tons, warehouse at Jersey City.

HARRISBURG, PA., 800 tons, farm show building.

PHILADELPHIA, 280 tons, laboratory for Gulf Refining Co. at Girard's Point.

PHILADELPHIA, 300 tons, Henry Avenue bridge.

BUFFALO, 150 tons, school No. 67.

BUFFALO, 200 tons, New York Central viaduct, Harlem Avenue.

FINDLAY, OHIO, 125 tons, building for Ohio Oil Co.

CHICAGO, 200 tons, apartment building at 6230 Kenmore Avenue; H. Janisch & Co., general contractor.

SUPERIOR, WIS., 500 tons, elevator, general contract awarded to Fegles Construction Co., St. Paul, Minn.

OAKLAND, CAL., 2300 tons, wharf foot of Ninth Street.

OAKLAND, CAL., 210 tons, wharf foot of Fourteenth Street.

SACRAMENTO, CAL., 285 tons, paving in Marin County.

Large Steel Exports Continue

Seven-Month Total Largest Since 1921—Gain Over 1928 in Rolled and Finished Was 19 Per Cent—Imports Heavier, Too

WASHINGTON, Aug. 29.—Aggregating 270,532 gross tons, exports of iron and steel products from the United States in July of the present year exceeded those of June, amounting to 247,811 tons, by 22,721 tons and were the largest since April, when they totaled 287,297 tons. For the seven months ended with July exports were 1,862,371 tons, or 251,604 tons greater than last year, with a total of 1,610,371 tons. Exports in July of last year amounted to 253,405 tons. The daily average for July, 1929, was 8727 tons, compared with 8260 tons in June.

Imports in July also showed an increase, rising to 71,378 tons from 63,635 tons in June, a gain of 7743 tons. For the first seven months they were 429,223 tons, a decrease of 18,432 tons under the imports of 447,655 during the corresponding period of last year. Imports in July of last year were 53,567 tons. The daily average in July was 2302 tons, against 2121 tons in June.

Of the 37 classes listed in THE IRON AGE export table, gains were made in outgoing shipments in 20, with losses in the remaining 17, when compared with exports in June. Pig iron exports increased to 7777 tons from 3101 tons and reflected an unusual situation in that outgoing shipments exceeded imports, the latter amounting to only 6743 tons. Exports of scrap in July were 47,018 tons, against 42,816 tons.

In the finished lines, galvanized sheets exported in July increased to 14,154 tons from 12,604 tons and exports of black steel sheets increased to 18,259 tons from 15,718 tons while exports of plates rose to 19,675 tons from 17,640 tons. Among the products showing declines were plain structural shapes which dropped to 29,946 tons from 31,268 tons and tin plate, which fell to 16,875 tons from 18,041 tons.

Pig iron was exported in July chiefly to Japan, 5702 tons, and to Canada, 1724 tons. Scrap exports were widely distributed, Canada taking 11,281 tons; Italy, 9609 tons; Japan, 8861 tons; Poland, 6633 tons; Germany, 4900 tons; Spain 2347 tons and Mexico, 2007 tons.

Of the 6447 tons of casing and oil line pipe exported, 2112 tons went to Venezuela and 1370 tons to Canada. Canada took 4050 tons and the United

Kingdom 1024 tons of the 10,773 tons of black welded pipe exported. Of the 17,183 tons of steel bars exported, 8433 tons went to Canada, 2688 tons to the United Kingdom and 2265 tons to Japan. Canada took 26,601 tons of the plain structural shapes and 4334 tons of the tin plate shipments, while China took 2737 tons of tin plate and Japan 1994 tons. The great bulk of steel plates, 16,931 tons, went to Canada.

Philippine Islands was the largest buyer of galvanized sheets, taking 3302 tons, Canada taking 2546 tons. Exports of black steel sheets to Canada were 7559 tons, while Japan took 3624 tons. The exports of black steel sheets to Canada were 7559 tons, while Japan took 3624 tons. The exports of steel rails, amounting to 9999 tons, were distributed rather evenly, Argentina taking 1857 tons; Chile, 1609 tons; Mexico, 1413 tons and Canada, 1128 tons. Japan took only 175 tons.

Total exports to Canada in July were 118,069 tons. For the seven months ended with July, shipments to Canada amounted to 792,942 tons, compared with 633,877 tons for the corresponding period of last year. This gain was almost two-thirds of the total gain to all countries. Exports to Japan in July totaled 31,330 tons; for the first seven months they were 218,072 tons, compared with 214,541 tons during the like period of last year.

UNITED STATES IMPORTS OF IRON AND STEEL PRODUCTS
(In Gross Tons)

	July	June
Austria	50	34
Belgium	15,497	9,888
Bulgaria	170	....

Europe	*52,723*	*48,448*
Canada	13,305	10,042
Mexico	33	39
Cuba	195	1,200
British India	5,120	3,903
Japan	2	3
Total	71,378	63,635

While there were gains made in imports in only 10 of the 26 classes as against 15 losses, with no incoming shipments in either month of telegraph and telephone wire, the increased movement in July as compared with June was due to the sharp rise in receipts of structural shapes, amounting to 18,247 tons as against 12,274 tons. Pig iron imports dropped from 11,396 tons in June.

Of the incoming shipments of structural shapes, Belgium provided 9322 tons; Germany, 4434 tons and France, 4233 tons. France supplied 6213 tons of the 6383 tons of cast iron pipe imported. Of the 3209 tons of steel bars imported, 1550 tons came from Sweden, 682 tons from Belgium, 407 tons from France and 359 tons from Germany.

Canada was the source of 2799 tons of the 5213 tons of ferromanganese imported; Norway, 1212 tons and the United Kingdom, 1077 tons. Soviet Russia provided 41,355 tons of the 48,406 tons of manganese concentrates imported; Brazil, 4077 tons and India, 2844 tons. The principal countries from which products were imported in July were Belgium, 15,497 tons; France, 13,556 tons; Canada, 13,305 tons and Germany, 13,163 tons. In June no country furnished as much as 13,000 tons.

Increased Orders for Steel Castings

WASHINGTON, Aug. 27.—Making a gain of 8451 tons, orders for commercial steel castings in July totaled 103,447 tons, or 71 per cent of capacity, compared with 94,996 tons, or 65 per cent of capacity, in June, according to reports received by the Department of Commerce from 127 producers with a present capacity of 145,700 tons, which represents more than 80 per cent of the total capacity of the country. Production in July was 119,474 tons, or 82 per cent of capacity, against 116,009 tons, or 80 per cent of capacity, in June.

Orders for railroad specialties in July were 37,383 tons, or 55 per cent of that class of capacity, against 34,947 tons, or 52 per cent of capacity, in June. Orders for miscellaneous castings were 66,064 tons, or 85 per cent of such capacity, compared with 60,049 tons, or 77 per cent of capacity.

Total orders for the first seven months were 827,176 tons, against 576,260 tons for the corresponding period of last year. Production was 790,757 tons in seven months, compared with 605,913 tons.

New Fractional Motor Plant

The Domestic Electric Co., Cleveland, according to Carl A. Duffner, president, has purchased a group of buildings and a tract of land at Kent, Ohio, to be devoted to the manufacture of fractional horsepower motors of the universal type. The new plant will more than double the capacity of the present plant in Cleveland. All buildings are reinforced concrete with automatic sprinkler systems, three stories in height.

The motors are designed for nationally advertised electric household appliances, electric-driven tools and commercial electric appliances. The Domestic company is a division of Black & Decker, Towson, Md. Other companies in this group are the Van Dorn Electric Tool Co., Cleveland; Black & Decker Mfg. Co., Ltd., Canada; Black & Decker, Ltd., England; and Marschke Mfg. Co., Indianapolis.

Second Highest Machinery Exports

Total for Seven Months Greatest Ever Made—Imports Far Above Last Year—Agricultural Implements Large in Both Lists

WASHINGTON, Aug. 24.—Continuing their rising tendency, exports of machinery of all kinds in July were valued at $56,973,585, as compared with $49,732,282 in June, an increase of $7,241,303. The total was the second highest ever recorded, having been exceeded only by the $59,507,795 of last March. For July of last year they were valued at $47,830,687.

For the first seven months machinery exports were valued at $362,757,783, a gain of $74,177,580 (or 26 per cent) over exports for the corresponding period of 1928 with a value of $287,580,203. The total this year makes a new high record for that period.

Exports of machinery and vehicles in July were valued at $107,697,415, against $104,994,973 in the preceding month and $95,663,337 in July of last year. For the first seven months they were valued at $779,356,344, against $603,803,130 for the corresponding period of last year, an increase of $175,553,214, or 29 per cent.

Exports of industrial machinery in July, as classified by the Division of Statistics, Department of Commerce, were valued at $25,322,120, against $22,392,023 in June and $20,902,855 in July of last year. For the first seven months of 1929 they were valued at $163,872,038, compared with $129,259,555 for the corresponding period of 1928.

Exports of power-driven metal-working machinery, as listed in THE IRON AGE table, totaled 1180 units, valued at $1,480,982 as compared with 886, valued at $1,537,399 in June. Exports of agricultural machinery and implements in July were valued at $14,722,000, against $12,041,000 in June and $13,996,000 in July of last year. They aggregated $86,791,000 for the first seven months of the present year, against $68,007,000 for the same period of 1928.

Imports of machinery and vehicles in July were valued at $4,036,771, compared with $3,714,910 in June and $2,306,665 in July of last year. For the first seven months they were valued at $25,896,311, compared with $16,238,818 for the like period of last year.

Imports of industrial, office and printing machinery in July, 1929, were valued at $2,288,438, against $2,111,168 in June and $1,516,328 in July of last year. They rose to $14,775,972 during the first seven months of the current year, against $9,947,108 for the corresponding period of last year.

Imports of machinery as listed in THE IRON AGE table were valued at $2,855,506 in July, against $2,609,261 in June and $1,613,165 in July of last year. For the first seven months they were valued at $19,630,421, against $12,119,581 for the similar period of 1928.

Machinery Exports from the United States

(By Value, in Thousands of Dollars)

	July		Seven Months Ended July

July Automobile Output Lowest Since February

WASHINGTON, Aug. 23.—Motor vehicles to the number of 500,331 were produced in the United States in July, passenger units totaling 426,159; trucks, 73,118; and taxicabs, 1054, according to the Department of Commerce. Production in June totaled 545,375 vehicles, of which 452,624 were passenger cars, 91,373 were trucks and 1378 were taxicabs. Canadian production in July was 17,461 units, of which 13,600 were passenger cars and 3861 were trucks, comparing with 21,492 in June, of which 16,511 were passenger cars and 4981 were trucks.

For the first seven months of the current year 3,723,723 motor vehicles were produced in the United States, 3,198,497 being passenger cars, 513,539 trucks and 11,687 taxicabs. Motor vehicle production for the corresponding period of last year totaled 2,593,607 units, of which 2,301,199 were passenger cars, 288,835 trucks and 3573 taxicabs. The increase in passenger cars was 39 per cent; in trucks, 78 per cent; in taxicabs, 227 per cent.

Truck and taxicab production in seven months was greater than the entire year's production for any year previous to 1928, when 527,623 were made. Passenger car output in seven months was greater than for the 12 months of 1927. Total production in July, while larger than for any month of any preceding year, was the lowest since February.

Canadian output for the first seven months of 1929 was 205,822, of which 165,213 were passenger cars and 40,609 were trucks. For the corresponding period of last year the total was 150,214 units, of which 127,991 were passenger cars and 22,223 were trucks.

Labor Maintains Efficiency

Although high wages have in the past been regarded as a signal for a falling off in labor efficiency, no such tendency seems apparent in the present era of prosperity, according to the Business Conditions Weekly of the Alexander Hamilton Institute. Since 1919 factory wages have increased 19 per cent. At the same time, factory output has increased 43 per cent and the cost of labor per unit has fallen about 22 per cent.

This extraordinary increase in factory labor efficiency, doubtless due partly to use of machinery, is accompanied by evidence of labor contentment. During the first five months of 1929 there has been a monthly average of only 72 strikes as compared with a monthly average of 303 for 1919.

Malleable Castings Orders, Output, Shipments Fall

WASHINGTON, Aug. 24.—Orders for malleable castings in July totaled 61,988 net tons, compared with 65,377 tons in June, according to reports received by the Department of Commerce from 123 firms operating 137 plants. A year ago the orders were 60,964 tons in July. Output was 70,132 tons, or 73.2 per cent of capacity in July, against 72,512 tons, or 75.2 per cent of capacity, in June and 60,290 tons, or 63.1 per cent, a year ago. Shipments were 69,940 tons in July, 72,608 tons in June and 60,084 tons in July, 1928.

For the first seven months, orders aggregated 526,867 tons this year, against 444,973 tons last year. Production was 538,718 tons, or 80.4 per cent of capacity, compared with 455,164 tons, or 67.4 per cent of capacity.

Orders, shipments and production in July made the lowest totals for any month so far in 1929. Production, however, was higher in July than for any month of 1928, and shipments were above any 1928 month except March.

Factory Earnings Remain High

Average weekly earnings in representative factories in New York State, including all employees in both office and shop, were $30.02 in June. There has been a gradual drop from the record of $30.35 in March to $30.07 in April and $30.03 in May. Otherwise, except for $30.12 last December, there has been no month in which the average has been above $30. It was $29.48 in June, 1928, registering a drop to $29.15 in July before the fall improvement began.

Employment and Payroll Totals in Identical Plants in June and May[a]

	Establishments	Number on Payroll		Weekly Payroll [b]	
		June	May	June	May
Iron and steel	206	286,815	286,103	$9,415	$9,590
Foundry and machine shop	1,057	291,801	290,977	9,109	9,265
Machine tools	145	39,929	39,329	1,321	1,312
Hardware makers	69	32,559	32,795	853	863
Steam and hot-water appliances	111	32,584	33,258	948	988
Stoves	113	20,136	20,291	566	579
Structural ironwork	165	28,536	27,994	863	853
Cast iron pipe	44	12,477	12,069	293	281

Fabricated Plate Orders Ahead of Last Year

WASHINGTON, Aug. 26.—Orders for fabricated steel plate in July totaled 46,686 tons, according to reports received by the Department of Commerce from 48 firms, and represented 61.7 per cent of capacity. This compares with 45,918 tons or 57.5 per cent of capacity in June, and with 35,959 tons and 46.8 per cent in July, 1928. Orders in July and June, respectively, were distributed as follows: Oil storage tanks, 14,963 tons and 6890 tons; refinery materials and equipment, 3180 tons and 4383 tons; tank cars, 1835 tons and 1998 tons; gas holders, 5352 tons and 5444 tons; blast furnaces, 2650 tons (the largest total in many months) and 1003 tons; stacks and miscellaneous, 18,706 tons and 26,200 tons.

For the first seven months orders have aggregated 330,300 tons, or 59.5 per cent of capacity, against 296,442 tons, or 53.3 per cent of capacity, for the corresponding period of last year.

Pittsburgh Water Shipments in July

The United States Engineer Office, Pittsburgh, reports a movement of 102,963 net tons of iron and steel products on the Ohio River in July, compared with 116,679 tons in June, and 90,145 tons in July, 1928. On the Monongahela River 109,051 net tons of these products were carried in July, against 116,157 tons the month before and 91,834 tons in July last year. Allegheny River commerce in iron and steel products amounted in July to only 25 tons; in June it was 722 tons, while it was nil in July last year.

Factory Building Cost Down

The cost of new factory construction is 10 per cent below the average for the last 10 years, according to a survey of building costs throughout the country just made by the Austin Co., engineer and builder, Cleveland. This company has found that the cost of industrial construction is now 40 per cent under the peak reached in 1920 and is at its lowest point since late in 1922. The computation is based on a standard building, 100 x 200 ft., and includes the cost of material and labor.

Trackwork Shipments Drop

Shipments of trackwork in July, as reported by the American Iron and Steel Institute, totaled 13,844 net tons, compared with 14,838 tons in June and 16,333 tons in May. Shipments in July, 1928, were 11,776 tons. The year to Aug. 1 shows shipments of 99,281 tons, against 88,905 tons for the corresponding seven months of 1928,

Machinery Markets and News of the Works

Tool Market Shows Vitality

New York District Bookings Unusually Good, But Business Elsewhere Has Tapered

ALTHOUGH August sales have not kept pace with those of July, largely on account of seasonal conditions, the machine tool business has shown remarkable midsummer vitality.

Bookings in the New York district have been especially good, and one important Eastern seller expects August to be the best month of the year. However, the volume of orders in other parts of the country has tapered somewhat and the actual placing of contracts has been delayed in many cases because of the absence of executives on vacations.

With few exceptions, sales have consisted of one or two machines each. The unfavorable delivery situation is proving a handicap to machine tool builders in closing inquiries. In fact, some buyers, notably the smaller ones, are withdrawing from the market rather than wait indefinitely for delivery of tools.

The General Electric Co. has made further purchases and has issued a fair-sized list, which includes equipment to be used in a department developing new apparatus for recording and reproducing talking motion pictures. The International Harvester Co. is reported to have bought most of its equipment for its tractor plant at Rock Island, Ill., and the Westinghouse Electric & Mfg. Co. has been ordering freely against its third quarter requirements.

The New York Central is inquiring for a number of tools for its Harmon, N. Y., shops, but otherwise prospective railroad business is negligible. A Connecticut manufacturer has contracted for 12 milling machines and another New England company has purchased $40,000 worth of tools.

New York

NEW YORK, Aug. 27.—Machine tool business in this district shows remarkable midsummer vitality. One of the important New York sellers expects that its August business will be the largest of any month this year. Others are also doing well, although some report slightly less volume than was booked in July. One of the large orders of the week came from a New England company and totaled more than $40,000. Pending inquiries from a New Jersey company total about $80,000. The General Electric Co. has bought a number of tools and has issued a fair-sized list, some of the new equipment to be used in the department which is developing a new apparatus for recording and reproducing talking moving pictures. The New York Central Railroad has issued a number of inquiries for tools for its new shop at Harmon, N. Y., and it is understood that a list of considerable size will be purchased. A Western aircraft company will locate in Elizabeth, N. J., and is expected to be a buyer of some shop equipment.

Contract has been let by American Can Co., 230 Park Avenue, New York, to United Engineering & Construction Co., Front Street, Elizabeth, N. J., for additions to plant at 330-32 Elizabeth Avenue, Newark, consisting of three one-story units 100 x 120 ft., 81 x 84 ft., and 60 x 81 ft., last noted with three-story extension, and one-story boiler plant, to be used for machine shop and other mechanical service, reported to cost about $140,000 with equipment. Company engineering department is in charge. Following recent purchase of plant of Canadian Canners, Ltd., Simcoe, Ont., for reported consideration of approximately $1,000,000, plans are reported under way for two and three-story plant, 100 x 150 ft., and 100 x 250 ft., at that place, to cost upward of $800,000 with equipment.

N. Liesenbein's Sons, Inc., 257 Hancock Street, Long Island City, manufacturer of furniture frames, etc., has purchased four-story factory, 80 x 100 ft., at Hinsdale Street and Atlantic Avenue, Brooklyn, and will occupy for new plant at early date.

F. L. Smith Machine Co., Inc., 633 West Forty-fourth Street, New York, has filed plans for extensions and improvements in five-story plant, reported to cost about $35,000. Russell G. Cory, 30 Church Street, is architect and engineer.

Aero Supply Co., College Point, L. I., manufacturer of aircraft hardware, etc., has work under way on new addition and will equip to provide about 25 per cent in present capacity, reported to cost more than $60,000. Company has recently acquired National Steel Products Co., Dayton, Ohio, manufacturer of steel specialties for aircraft; and Standard Automatic Products Corporation, Corry, Pa., manufacturer of turnbuckles, etc., for airplane service.

Cutler-Hammer Mfg. Co., 8 West Fortieth Street, New York, manufacturer of electrical control devices and equipment, with main plant at Milwaukee, is having plans drawn for a six-story addition, 90 x 150 ft., to New York works at Southern Boulevard and 144th Street, to cost more than $300,000 with equipment. Barney-Ahlers Construction Corporation, 110 West Fortieth Street, is architect and engineer.

Airport Lighting, Inc., 10 East Fortieth Street, New York, recently organized under Delaware laws with capital of 100,000 shares of stock, no par value, plans operation of plant for manufacture of automatic electric lighting equipment for night landing at airports. F. G. Ericson is president.

Brooklyn Edison Co., Pearl and Willoughby Streets, Brooklyn, operated by New York Edison Co., Irving Place and Fifteenth Street, New York, has authorized enlargement of steam-operated electric generating plant on Hudson Avenue, to increase capacity from 340,000 to 450,000 kw., estimated to cost $7,000,0000. Contract for prime movers has been let, and awards for auxiliary equipment will be made at early date. Expansion is scheduled for completion in about 12 months.

Alfred Hofmann, Inc., 635 Fifteenth Street, West New York, N. J., manufacturer of knitting machinery for hosiery mills, with assembling division for imported machines for like service, has plans for a two-story addition, 100 x 125 ft., including improvements in present plant, reported to cost more than $70,000 with equipment. Lockwood Greene Engineers, Inc., 1 Pershing Square, New York, is architect and engineer.

American Transformer Co., 178 Emmet Street, Newark, manufacturer of transformers for electric power and radio service, has awarded general contract to J. J. Thomas, 428 Peshine Avenue, for two-story addition to cost close to $40,000 with equipment.

Durant Motor Co., 250 West Fifty-seventh Street, New York, will discontinue operations at plant on Frelinghuysen Avenue, Newark, on Sept. 30, and works will be closed down permanently about middle of October. Equipment now in service for metal division, last remaining unit at plant, will be removed to plant of City Auto Stamping Co., Toledo, Ohio, which will furnish metal stampings in future for main plant of Durant company at Lansing, Mich. Negotiations are reported un-

der way by American Eagle Aircraft Corporation, Kansas City, Mo., for acquisition of Newark plant, for use as Eastern branch works.

Pennsylvania Dock & Warehouse Co., Jersey City, N. J., recently organized, will construct and operate eight-story cold storage warehouse and refrigerating plant, 230 x 900 ft., on local site, near Exchange Place, referred to in these columns last week as project of Pennsylvania Railroad Co., which will have financial interest in new company. Entire plant will cost close to $5,000,000 with machinery, instead of smaller amount previously noted. Company has arranged for bond issue of $5,750,000, to provide funds for project. George F. Bial, 147 Summit Avenue, Union City, N. J., is architect. W. J. MacMillan is president.

Charles Shilowitz, 26 Journal Square, Jersey City, N. J., architect, has plans for a four-story automobile service, repair and garage building at Sip and Summit Avenues, reported to cost over $400,000 with equipment.

Philadelphia

PHILADELPHIA, Aug. 27.—Delta File Works, Inc., 4837 James Street, Philadelphia, manufacturer of files, rasps, etc., has awarded general contract to William F. Lotz, Frankford Street and Oxford Avenue, for one-story addition, 40 x 75 ft., reported to cost about $25,000 with equipment.

I. Fischman & Sons, Inc., Tenth Street and Allegheny Avenue, Philadelphia, manufacturer of soda fountain equipment, is planning consolidation of three existing plants in new two- and three-story factory on Erie Avenue, from F to G Streets, including former plant of Stanley H. Knight Co., 216 West Superior Street, Chicago, lately acquired for consolidation with Fischman organization. New plant will provide about four times present floor space, and is estimated to cost $1,500,000 with machinery. Maurice Fischman is president.

Wilkening Mfg. Co., Fifteenth and Mount Vernon Streets, Philadelphia, manufacturer of piston rings, etc., is considering new two-story plant at Spring and Sevent-first Streets, reported to cost more than $45,000 with equipment. F. W. Wilkening is president.

City Council, Philadelphia, will take title early in September to Hog Island shipyard from the Government, totaling about 995 acres of land, as site for proposed municipal airport. Plans will be prepared for hangars, repair and reconditioning shops and other mechanical field units, as well as marine and rail facilities, entire project to cost $1,000,000, in which amount a bond issue is being arranged.

Hiergesell Brothers, 2011 Bellevue Avenue, Philadelphia, manufacturer of scientific instruments, thermometers, etc., has leased a floor in building at 2518 North Broad Street, and will occupy for increased manufacture.

Interests headed by Janney & Co., 1529 Walnut Street, Philadelphia, and Prince & Whitely, 25 Broad Street, New York, investment securities, have purchased control of Autocar Co., Ardmore, Pa., manufacturer of motor trucks. Company will be reorganized and general expansion program carried out for increased production. Robert P. Page, Jr., will continue as president; J. C. Taney, heretofore treasurer, has been elected senior vice-president.

City Council, Haddonfield, N. J., is reported considering construction of municipal electric light and power plant, and artificial gas plant, and will have estimates of cost made in near future. Frederick T. Holloway is commissioner of public works.

Board of Education, Mechanicsburg, Pa., is said to be planning installation of manual training equipment in new addition to high school at High and Simpson Streets, to cost $180,000, for which bids have been asked on general contract. C. J. Lappley, Front and Harris Streets, Harrisburg, Pa., is architect.

Glen Alden Coal Co., Scranton, Pa., will carry out an expansion and improvement program at its Diamond colliery near Hazleton, Pa., to include the electrification of the properties, with installation of electric hoists, pumping apparatus, etc. Colliery will be closed for six weeks to carry out work.

Plans have been arranged for merger of Wilburham-Greene Blower Co., Pottstown, Pa.; Cartersville Blower Co., Cartersville, Pa.; and Stacey Brothers Gas Construction Co., Carthage Pike, Cincinnati, manufacturers of gas works machinery, mechanical blowers, etc. Consolidated organization plans expansion program for increased output. Carmi H. Thompson will be president.

Lycoming Mfg. Co., Williamsport, Pa., Manufacturer of automobile engines, parts, etc., a subsidiary of Auburn Automobile Co., Auburn, Ind., has awarded general contract to Austin Co., 1015 Chestnut Street, Philadelphia, and Cleveland, for two-story addition on Park Avenue, reported to cost about $90,000 with equipment. It is understood that erection will be carried out by Fell Co., William Street, Williamsport.

Delaware Electric Power Co., Wilmington, Del., is carrying out an expansion and improvement program in power plants and system to cost more than $1,000,000, providing for increased generating and transmission line facilities.

Board of Trustees, Benton School District, Benton, Pa., is having plans drawn for a one-story manual training shop in connection with new gymnasium. W. Walter Witman, 1916 Market Street, Harrisburg, Pa., is architect.

New England

BOSTON, Aug. 27.—Compared with June and July, August will be a lean month for a majority of New England machine tool dealers and manufacturers but will compare favorably with August, 1928. Manufacturers have sufficient backlogs, in a majority of instances, to keep plants running on current operating hours during the remainder of 1929, and quite a few well into 1930. The only important sale reported the past week by local dealers was more than a dozen milling machines to a Connecticut manufacturer.

Eastern Aircraft Corporation, Pawtucket, R. I., recently organized to manufacture all-metal aircraft, is establishing new plant near What Cheer airport, and will specialize in production of seven and three-passenger cabin type planes from designs and patents of Bayerische Flugzeugwerke, A. G., Augsburg, Germany, for which American rights have been secured. Company has arranged for stock issue to total $875,000, portion of fund to be used for plant facilities and operations. Ray C. Van Arsdale is president; Alexander Klemin is consulting engineer.

Superior Spring & Mfg. Co., 373 Washington Street, Hartford, Conn., with headquarters at New Haven, Conn., has acquired property at 397 Washington Street, 60 x 150 ft., as site for new plant, reported to cost more than $45,000 with equipment.

Union Twist Drill Co., 70 Monroe Street, Athol, Mass., has plans for a two-story addition, 60 x 100 ft., reported to cost close to $45,000 with equipment.

Federal Electric Co., 8700 South State Street, Chicago, has concluded arrangements for purchase of Loper Fire Alarm Co., Stonington, Conn., manufacturer of wireless fire alarm systems and devices, and will consolidate with organization. It is proposed to remove Stonington plant to Chicago, where production will be concentrated and increased. A. P. Loper, heretofore head of acquired company, will continue with organization as consulting engineer.

Yale & Towne Mfg. Co., Stamford, Conn., locks, etc., is building a one-story, 100 x 150 ft. unit No. 19 and foundry addition.

South Atlantic

BALTIMORE, Aug. 27.—Western Electric Co., 195 Broadway, New York, has approved plans for a one-story power house at new cable and telephone equipment manufacturing plant at River View Park, Baltimore, now in course of construction, to cost about $150,000 with equipment. Entire project will cost more than $10,000,000. H. K. Ferguson Co., Hanna Building, Cleveland, is engineer.

Excelsior Pearl Works, Inc., 131 Ingraham Street, Brooklyn, N. Y., manufacturer of buttons, has purchased property at Federalsburg, Md., and plans early erection of one-story factory, totaling about 30,000 sq. ft. floor space, reported to cost about $70,000 with equipment. Company is now operating three plants and plans removal of branches to new location, with later concentration of all production at that location, following building of other units.

Sylvania Industrial Corporation, 122 East Forty-second Street, New York, has awarded general contract to Hughes-Foulkrod Co., Schaff Building, Philadelphia, for initial units of proposed mill for manufacture of transparent paper products at Fredericksburg, Va., to include a machine shop and boiler plant, estimated to cost $750,000 with equipment. Ballinger Co., Twelfth and Chestnut Streets, Philadelphia, is architect and engineer.

Consolidated Gas, Electric Light & Power Co., Lexington Building, Baltimore, has filed plans for seven-story equipment storage and distributing plant, 86 x 140 ft., at 416-30 South Eutaw Street, to include mechanical repair and service shop, estimated to cost $170,000 with equipment.

Coastal Public Service Co., Guyton, Ga., is planning extensions and improvements in local electric light and power plant, including installation of generator unit, crude oil engine and auxiliaries, reported to cost more than $100,000.

City Council, Griffin, Ga., is planning for bids early next month for pumping machinery and auxiliary power equipment, pipe lines, etc., for a municipal waterworks, to develop capacity of 3,000,000 gal. a day, estimated to cost about $275,000. Robert & Co., Bona Allen Building, Atlanta, Ga., are engineers.

Norfolk & Western Railway Co., Norfolk, Va., plans installation of elevating, conveying and other mechanical-handling equipment at new warehouses and dis-

tributing plants at Lambert's Point, consisting of two units, 120 x 500 ft., and 120 x 800 ft., estimated to cost $260,000. General contract has been let to John P. Pettyjohn, 212 Eighth Street, Lynchburg, Va. W. P. Wiltsee is chief engineer.

Virginia Public Service Co., Charlottesville, Va., has acquired plant and property of Leesburg Electric Co., Leesburg, Va., and will consolidate with organization. Plans are under way for extensions and improvements in Leesburg plant, with installation of additional equipment for increased output; additions will be made in transmission lines.

Detroit

DETROIT, Aug. 27.—Western Gear Co., 3428 Scotten Street, Detroit, has arranged for a division of operations, including general manufacture of new gears and transmissions for automobile service, and formation of subsidiary organization to take over replacement branch of business. New building has been leased and will be used to more than double former capacity. Arrangements have been made for a heat-treating plant to occupy a separate unit.

Ford Motor Co., Detroit and Dearborn, Mich., is having plans completed for new power plant on Oakman Boulevard, near Ford airport, Dearborn, reported to cost in excess of $150,000 with equipment. Albert Kahn, Inc., Marquette Building, Detroit, is architect and engineer.

Covel Mfg. Co., Benton Harbor, Mich., manufacturer of saw-filing machinery and kindred mechanical equipment, has awarded general contract to M. W. Stock & Sons, Broad Street, St. Joseph, Mich., for one-story addition on Graham Avenue, estimated to cost about $40,000 with equipment.

Board of Water Commissioners, 735 Randolph Street, Detroit, is asking bids until September 11, for equipment for municipal waterworks at Springwells Station, including two 1000-hp. steam boiler units with complete accessories, two superheaters for boilers, two underfeed stokers for boilers, two economizers and two air preheaters. Specifications on file at Department of Water Supply, Division of Engineering, 8100 West Warren Avenue, Dearborn, Detroit; George H. Kenkell is general manager and chief engineer.

Ex-Cell-O Aircraft & Tool Corporation, 1200 Oakman Street, Detroit, manufacturer of precision tools, Diesel engine parts, etc., has filed plans for addition to plant to increase present floor space by more than 150 per cent, reported to cost more than $150,000 with equipment. Portion of new unit will be used for production of line of new specialties, including new precision equipment and parts for airplane motors. N. A. Woodworth is president.

Central Machine Co., 6320 East Fort Street, Detroit, is planning two-story addition to machine shop, 60 x 100 ft., to cost about $45,000 with equipment.

Wayne County Board of Supervisors, Barlum Tower Building, Cadillac Square, Detroit, will soon take bids for aircraft hangar at county airport, Middlebelt and Goddard Roads, with repair and reconditioning shop facilities, estimated to cost more than $300,000 with equipment. Plans are also under way for one-story power plant at same location to cost in excess of $85,000. B. Russell Shaw, Arcade Building, St. Louis, is architect and engineer for both projects.

Department of Water and Electric Light, 116 West Ottawa Street, Lansing, Mich., has awarded general contract to H. G. Christman Co., Lansing, for addition to municipal electric light and power plant at Moores River Park, to cost about $750,000 with machinery. J. E. Woodwell, 501 Fifth Avenue, New York, is consulting engineer.

Pittsburgh

PITTSBURGH, Aug. 27.—Westinghouse Electric & Mfg. Co. is reported to be buying freely against its third quarter machine tool list. The report of most dealers is that business still is good, although typical of this time of the year, the absence on vacations, of those in charge of purchases, means that the actual placing of orders is delayed. With the awarding of the cranes for the steel works at the McKeesport works, National Tube Co., it is believed the machine tool requirements are nearer consideration.

Standard Steel Specialty Co., Beaver Falls, Pa., manufacturer of machine keys and other mechanical products, has plans for one-story addition, 60 x 120 ft., to plant at West Mayfield, reported to cost about $75,000 with equipment.

Fokker Aircraft Corporation of America, Inc., Glendale, near Wheeling, W. Va., is projecting plans for two new branch plants, one to be located in vicinity of San Francisco, for parts production and assembling, and other at McCook Field, Dayton, Ohio, recently acquired, both works reported to cost more than $200,000.

Youghiogheny & Ohio Coal Co., of Pennsylvania, Inc., Commonwealth Building, Pittsburgh, operating bituminous coal mining properties in western Pennsylvania, has arranged for a bond issue of $2,000,000, portion of fund to be used for extensions and improvements in plants for increased capacity.

West Virginia Airways, Inc., Charleston, W. Va., recently organized by Harold B. Shadle, Edgewood Drive, and associates with capital of $100,000, plans establishment of flying school and commercial flying facilities at municipal airport, including repair and reconditioning shops, airplane accessory shop, and other units, reported to cost over $60,000.

Hale Aeroplane & Motor Vehicle Mfg. Co., Welch, W. Va., has been organized with capital stock of $50,000 to manufacture airplanes. Company is contemplating construction of plant. William Hale is president.

Buffalo

BUFFALO, Aug. 27.—Consolidated Aircraft Corporation, 2050 Elmwood Avenue, Buffalo, has acquired tract of 30 acres of land near municipal airport, Long Beach, Cal., and plans new plant for Pacific Coast trade, one-story, including parts and assembling divisions, reported to cost more than $100,000 with equipment. Company recently secured a substantial interest in Kinner Airplane & Motor Corporation, Glendale, Cal., manufacturer of aircraft motors, and which will be used in airplanes to be built by company at projected plant.

Cutler Desk Co., 20 Churchill Street, Buffalo, manufacturer of metal and wood office furniture, has awarded general contract to B. Rebascher & Sons, Inc., 110 Timon Street, for extensions and improvements in factory to cost about $30,000.

Morrison Steel Products Co., 201 Urban Street, Buffalo, manufacturer of automobile parts and equipment, has filed plans for one-story plant at 127 Kehr Street, to cost close to $30,000 with equipment.

Vernon E. Cook, 724 North Washington Street, and Leo R. H. Burton, 109 West Garden Street, Rome, N. Y., have organized new company under name of Burton, Cook & Co., and plan operation of local plant for manufacture of machinery and mechanical equipment.

Simmons Co., 420 Canal Street, Syracuse, N. Y., manufacturer of brass and other metal bedsteads, springs, etc., with main works at Kenosha, Wis., has asked bids on general contract for new three-story branch plant and distributing works at Sizer Street and Raynor Avenue, reported to cost over $85,000 with equipment. Paul Hueber, 212 Harrison Street, is architect.

Irving Air Chute Co., 372 Pearl Street, Buffalo, manufacturer of aviation equipment, is said to be arranging for early operation of new branch plant at Los Angeles, to cost more than $75,000 with equipment. New unit will be used for manufacturing for Pacific Coast trade.

Cleveland

CLEVELAND, Aug. 27.—Machine tool sales continue to taper off. Starting with a fair volume of business at the first of the month there has been a rather steady decline in orders from week to week. Buying the past week was limited for the most part to single tools for replacement purposes. Detroit reports a quiet market as the motor car industry is buying little equipment at present. While some machine tool manufacturers have caught up a little on shipments of tools in some sizes, the general delivery situation shows little improvement and some business is not being placed because prospective purchasers cannot secure fairly prompt deliveries.

Dill Mfg. Co., 684 East Eighty-second Street, Cleveland, manufacturer of automobile tire valves, valve fittings, steering locks, etc., is said to be planning new one-story addition on Mandalay Road, to cost in excess of $40,000 with equipment. J. D. Williamson is president.

Cleveland Universal Jig Co., 2005 Rockwell Avenue, Cleveland, has awarded general contract to Ellsasser Construction Co., 1517 Prospect Avenue, for one and two-story plant unit on St. Clair Avenue, reported to cost close to $40,000 with equipment. Kalsch & Hoeffler, 4500 Euclid Avenue, are architects and engineers.

Boom Boiler & Welding Co., 2313 Elm Street, Cleveland, has taken over the plant and business of Blackwell Welding Co., Toledo, Ohio, and will continue operations as a branch. W. J. Heller will be manager.

Linderme Tube Co., 1291 East Fifty-third Street, Cleveland, manufacturer of steel tubing, etc., has plans under way for one-story addition, 60 x 100 ft., to cost close to $50,000 with equipment. Emil Linderme is president.

Newburgh Steel Co., 6318 Kinsman Road, Cleveland, will soon take bids for a one and two-story addition on Tullamore Road, reported to cost more than $70,000 with equipment. George S. Rider Co., Century Building, is architect and engineer.

General Fireproofing Co., Youngstown, Ohio, has work under way on new addition to cost about $100,000 and will equip for production of aluminum chairs for office service and kindred furniture. Unit is scheduled to be ready for occupancy in November.

Bruce-Macbeth Engine Co., 2111 Center Street, Cleveland, manufacturer of gas engines, parts, etc., is reported planning one-story addition to cost in excess of $45,000 with equipment. C. E. Curtis is general manager.

Middle States Air Service, Inc., Akron, Ohio, care of C. W. Frank, Akron Savings & Loan Building, architect, has plans under way for hangar at Fulton Field, with repair and reconditioning shop facilities, estimated to cost $80,000 with equipment.

Chicago

CHICAGO, Aug. 27.—Purchases of machine tools for the "Farmall" tractor plant of the International Harvester Co. at Rock Island, Ill., may be completed this week. Outside of this list there are no large inquiries in the market. Business is at about the same rate as in July, but somewhat smaller than in earlier months of the year. Demand is well diversified and is generally of a hand-to-mouth character, since prompt delivery is commonly asked. In fact, some buyers, notably the smaller ones, are withdrawing inquiries because of the delayed shipments on many types of machine tools. Deliveries on most classes of tools range from 10 to 12 weeks, and in extreme instances manufacturers will not promise shipments before January or February. Chicago, Burlington & Quincy is in the market for two axle lathes.

Illinois Anthracite Corporation, 307 North Michigan Avenue, Chicago, has awarded contract for seven-story electric transformer building, 47 x 84 ft., to cost $20,500.

Crane Co., 936 South Michigan Boulevard, Chicago, placed contract for one-story plant addition, 120 x 220 ft., at 4100 South Kedzie Avenue, to cost $110,000.

Iver Larsen & Sons, pattern makers, 165 North Jefferson Street, Chicago, sustained damage to their plant recently by fire.

E. A. Wheeler and William F. Walker have opened a machine shop at 330 Wabash Avenue, Decatur, Ill.

Anaconda Wire & Cable Co., Sycamore Ill., will install wire-drawing machines and electric annealing ovens in its plants and expects to require 100 to 150 additional employees.

Cook Electric Co., 2700 Southport Avenue, Chicago, has acquired from Teletype Corporation property 123 x 232 ft., at 2731 High Street, improved with a one and two-story plant and office building and a one-story warehouse.

General Porcelain Enameling Co., 4100 Schubert Avenue, Chicago, has awarded contract for a one-story factory, 26 x 125 ft., to cost $3,000.

Wolverine Carburetor Co. of Michigan, manufacturer of carbureters, has taken possession of factory formerly occupied by the J. C. Mfg. Co. at Jackson, Mich.

Chicago, Rock Island & Pacific Railroad Co., La Salle Street Station, Chicago, has filed plans for addition to engine house, 20 x 300 ft., with repair facilities, at 4701 Wentworth Avenue, to cost about $45,000 with equipment. A. T. Hawk is company architect.

The Crane Market

INQUIRY for locomotive cranes is increasing with some good business in prospect for export and a fair volume of inquiry from contractors. The Amtorg Trading Corporation, New York, is taking bids on two 20-ton and one 15-ton locomotive cranes for export to Russia and Japanese trading companies in New York are in the market for a locomotive crane for Japan. In the domestic field, the New York Central Railroad is inquiring for a 25-ton locomotive crane. In the New York district, the Brooklyn Edison Co., is in the market for a 75-ton trolley for a Case overhead crane in a sub-station. The United States Metals Refining Co., Carteret, N. J., is about to close on seven 15-ton electric traveling cranes for Copper Cliffs, Canada. Low bidder on the sub-stations to be erected for the Board of Transportation, New York, which will require six 30-ton electric cranes was the Erickson Engineering Co., New York.

It is rather generally conceded in the Pittsburgh district that this year has been the best since the war. Most builders have sufficient orders to insure full operation to the end of the year. The National Tube Co., which recently bought 24 cranes for McKeesport, Pa., will shortly buy a number for the new seamless tube mill. Cranes have also been placed by the Wheeling Steel Corporation and the Corrigan, McKinney Steel Co.

Among recent purchases are:

Arizona Edison Co., Casa Grande, Ariz., 10-ton 50-ft. span hand power crane from Box Crane & Hoist Corporation.

De Laval Cream Separator Co., Poughkeepsie, N. Y., two 2-ton, 23-ft. and 28-ft. spans, 3-motor overhead cranes and seven 1-ton, 23-ft. span hand power cranes with electric hoists from Shepard Niles Crane & Hoist Corporation.

Wright Aeronautical Corporation, Paterson, N. J., 2-ton hand power crane from Box Crane & Hoist Corporation.

Temple Corporation, 1925 South Western Avenue, Chicago, manufacturer of all-electric radio equipment and devices, has purchased property at West Sixty-fifth Street and La Vergne Avenue, as site for new plant which will more than triple present capacity. Existing plant will be removed to new location as soon as unit is ready. Project is estimated to cost more than $400,000 with equipment. Foltz & Co., 510 North Dearborn Street, are architects.

Mid-West Bottle Cap Co., Belvidere, Ill., manufacturer of metal bottle caps, etc., has asked bids on general contract for one and one-half story addition, reported to cost about $30,000 with equipment. Bradley & Bradley, Brown Building, Rockford, Ill., are architects.

Iowa-Nebraska Light & Power Co., Lincoln, Neb., has approved plans for addition to steam-operated electric power plant at Shenandoah, Iowa, 53 x 75 ft., reported to cost in excess of $100,000 with equipment.

Chicago & Northwestern Railways Co., 400 West Madison Street, Chicago, has awarded contract to G. A. Johnson & Sons, 730 Rush Street, for addition to engine house, with repair facilities, at Council Bluffs, Iowa, reported to cost about $40,000 with equipment.

Sundstrand Machine Tool Co., Rockford, Ill., manufacturer of machine tools, has disposed of a stock issue of 63,250 shares, portion of proceeds to be used for expansion. Hugo L. Olson is president.

McQuay Radiator Corporation, 1600 Broadway, N. E., Minneapolis, Minn., manufacturer of unit heaters for industrial service, is completing erection of new two-story and basement plant unit, and plans early installation of equipment. Expansion will cost in excess of $50,000. Perry E. Crosier, New York Life Building, is architect.

George D. Whitcomb Locomotive Works, Rochelle, Ill., is erecting plant addition, 52 x 63 ft., at cost of $15,000.

Milwaukee

MILWAUKEE, Aug. 27.—Whatever decline there may have been recently in orders for machine tools or other metalworking equipment has hardly been perceptible locally. Deliveries have not improved in the slightest up to this time, although some manufacturers through increased manufacturing facilities or increased factory efficiency expect to hasten deliveries. Some dealers say that a considerable share of their August volume may be attributed to the closing of business during August which had been pending in July and even in June. Demand now is greatest from agricultural implement factories at Milwaukee, Racine and Madison, from commercial truck manufacturers and from manufacturers of electrical equipment both for public utilities and private industrial plants. Demand from passenger automobile manufacturers and railroads is at low ebb.

Rundle Mfg. Co., Milwaukee, manufacturer of enameled iron ware and bathroom equipment will triple its output through the construction and equipment of a new plant, ground for which is now broken at Camden, N. J., with adjoining deep water wharfage on the Delaware River. Financing of the new factory has been arranged by an issue of $1,000,000 first mortgage 6 per cent bonds. At least 80 per cent of the company's output during the life of the issue is contracted to Sears, Roebuck & Co., according to the company's statement in the bond issue circulars. The new Camden plant will be only one story high but will contain 240,000 sq. ft. Henry Held is president and H. J. Held, secretary and general superintendent, both at Milwaukee. A. C. Held is treasurer, vice-president and general manager at Camden.

Control of Milwaukee Air Power Pump, 10 Keefe Avenue, Milwaukee, has passed from John R. Ball, late president and treasurer, to Julius P. Heil, president of the Heil Co., Milwaukee, manufacturer of steel tanks and dump bodies, but the Heil Co. is in no way concerned. The pump concern manufactures forced water systems and oil burning appliances for domestic or industrial uses. Under Julius Heil as the newly named president, his son, Joseph F. Heil, treasurer, Homer S. Rogers, continuing as vice-president, and F. W. Richert, as secretary, the concern will install additional equipment in the present building and seek national distribution for all its products.

Smith Engineering Works, 78 Capitol Drive, Milwaukee, has begun construction of one story plant addition, 90 x 150 ft., at about $75,000 cost, to increase production in the rock crusher department. A new portable type of rock crusher will be introduced. Charles F. Smith is president and general manager.

Wisconsin Ornamental Iron & Bronze Co., 1665 Booth Street, Milwaukee, manufacturer of bronze products used in build-

ing construction, following its recent merger with the General Bronze Co., Long Island City, N. Y., will double its output through the construction of additions on which work has not yet been started. E. A. Ernst, president of the Wisconsin company will remain in charge at Milwaukee.

Michigan College of Mining and Technology, Houghton, Mich., has selected Derrick Hubert, Menominee, Mich., as architect for $300,000 mechanical engineering building, plans scheduled to be ready late in September or early in October. R. R. Seeber is dean of college of mechanical engineering.

Tank Aero Corporation, 271 First Avenue, Milwaukee, plans two-story addition, 100 x 150 ft., or will lease equivalent space for production of a new design of air-cooled V-type, 8-cylinder, 125 h. p. aircraft engine already tested in flights and which will supplement present production of 42 water cooled airplane engines monthly. New machinery valued at $60,000 has already been installed in the Tank plant and the Milwaukee Parts Co., manufacturers of automotive and aircraft parts has been merged with the concern. A. J. Tank is chief engineer, general manager and vice-president.

Wisconsin-Timken Axle Co., Oshkosh, Wis., has broken ground for one-story, 40 x 132 ft., addition to heat treating plant to cost about $30,000. An addition to the machine shop is being completed. The Wisconsin plant produces double reduction drive axles for buses and trucks besides axles for railroad gas or oil-driven coaches.

State Industrial School for Girls, Oregon, Wis., will construct $20,000 water works improvements including 100,000 gal. storage reservoir, 10,000 gal. receiving reservoir, air compressor, air lift, motor and steam-driven centrifugal pumps, sewer and water mains, manholes, hydrants and valves. School is under the jurisdiction of the State Board of Control, A. W. Bayley, secretary.

Eggers Veneer Seating Co., Two Rivers, Wis., has let contracts for construction of additions to cost about $75,000.

Cincinnati

CINCINNATI, Aug. 27.—Demand for machine tools shows a slight seasonal recession, affording district manufacturers further opportunity to cut into their large amount of unfilled orders. Fresh bookings are still greater than those of a year ago, and the number of small inquiries indicates that business for the remainder of this year will continue at a high level. The demand continues to be well diversified and is for both replacements and new equipment, but orders rarely call for more than two machines. An Eastern manufacturer placed an order with a local builder of planers for two large tools.

Andrews Steel Co., Newport, Ky., has awarded general contract to D. Meinken & Son, 2143 Bernard Avenue, Cincinnati, for two-story addition, to be equipped primarily for laboratory service, reported to cost about $40,000. Tietig & Lee, 34 West Sixth Street, Cincinnati, are architects.

Tennessee Eastman Corporation, Kingsport, Tenn., has approved plans for steam-operated electric power plant at local chemical works, reported to cost more than $150,000 with equipment, in connection with a general expansion and improvement program to cost more than $1,500,000. Baker & Spencer, 17 Battery Place, New York, are engineers for power station.

United States Foil Co., Grand and Thirtieth Streets, Louisville, manufacturer of tin foil, etc., has plans under way for two-story plant, 100 x 200 ft., on Hall Avenue, for production of tin, aluminum and lead foils, reported to cost close to $70,000 with equipment.

Holston River Power Co., Kingsport, Tenn., has secured Federal permission for construction of power dams on Holston and Watauga Rivers for a hydroelectric power project to develop a capacity of 74,000 hp. It will include transmission system and is reported to cost more than $1,500,000. Company is affiliated with American Cyanamid Co., 535 Fifth Avenue, New York.

St. Louis

ST. LOUIS, Aug. 27.—Elmore Centrifugal Products Corporation, 6527 Manchester Avenue, St. Louis, has been incorporated with capital of $150,000 to take over business of G. H. Elmore, Philadelphia, manufacturing Elmore continuous centrifugal dryer. A solid bowl type machine, which separates liquids from solids by a continuous process is being developed. A testing laboratory and offices have been established at above address, but temporarily the machine will be manufactured on contract. Harry Scullin, president Scullin Steel Co., is chairman of executive committee. G. H. Elmore is president and A. L. Sautter secretary and treasurer.

Multiplex Display Fixture Co., 918 North Tenth Street, St. Louis, has asked bids on general contract for two-story and basement addition, 96 x 105 ft., reported to cost about $40,000 with equipment. Otto J. Krieg, Wainwright Building, is architect.

Board of Education, Lyons, Kan., is considering installation of manual training equipment in new two-story and basement senior high school, estimated to cost $180,000, for which bids are being received on general contract. Mann & Co., Rorabaugh-Wiley Building, Hutchinson, Kan., are architects.

Black Servant Mfg. Co., 2951 North Market Street, St. Louis, William F. Brinkman, president, manufacturer of underfeed stokers for power plant service, has acquired building and will establish new plant, including departments for parts production and assembling, reported to cost in excess of $75,000 with equipment.

Indiana

INDIANAPOLIS, Aug. 27.—Inca Mfg. Corporation, Fort Wayne, Ind., recently organized to manufacture magnet wire, windings and electrical specialties for the automotive, radio and electrical industries, has awarded general contract to Buesching-Hagerman & Co., local, for plant, 200 x 300 ft., on New Haven Avenue. Company is in market for materials and equipment for plant, which will begin operations in October. George W. Spindler is secretary and treasurer.

Wandtke Pattern & Foundry Co., Inc., 1700 Ohio Avenue, Anderson, Ind., has been incorporated for $25,000 to manufacture wood and metal patterns and brass, bronze and aluminum castings. Company is now conducting jobbing foundry in new plant at above address. H. J. Wandtke is president.

Mid-states Steel & Wire Co., Oak Street, Crawfordsville, Ind., is said to be considering new one-story addition to cost over $40,000 with equipment. E. J. Sommer is general manager.

Borg-Warner Corporation, Muncie, Ind., manufacturer of automobile brakes, gears, and kindred products, has concluded arrangements for purchase of Norge Corporation, 670 East Woodbridge Street, Detroit, manufacturer of electric refrigerating equipment, and its affiliated interest, Detroit Gear & Machine Co., same address. Acquiring company will continue operations at present location and plans expansion program for larger output.

Davis Foundry Co., Newcastle, Ind., manufacturer of grey iron castings, plans rebuilding of portion of foundry destroyed by fire, Aug. 17, with loss estimated at $45,000, including equipment.

Merger plans have been perfected by Buescher Band Instrument Co., and C. G. Conn, Ltd., manufacturer of brass musical instruments, both of Elkhart, Ind., and Leedy Mfg. Co., 1033 East Palmer Street, Indianapolis, manufacturer of similar instruments. Companies will retain present identities and plants will continue at existing locations, with expansion in different divisions for enlarged output.

Pacific Coast

SAN FRANCISCO, Aug. 27.—Marchant Calculating Machine Co., Emeryville, Cal., manufacturer of computing machines and parts, has awarded general contract to W. C. Keating, Central Bank Building, Oakland, Cal., for one and two-story addition to cost about $60,000 with equipment. Miller & Warnecke, 1404 Franklin Street, Oakland, are architects.

Burgess Aeronautical & Engineering Corporation, 128 Santa Monica Boulevard, Santa Monica, Cal., is planning new local plant for manufacture of special aircraft of amphibian type, with rotary valve engines and accessories, consisting of one-story units, reported to cost in excess of $70,000 with equipment.

Wise Mfg. Co., Berkeley, Cal., manufacturer of mechanical equipment, has concluded arrangements for purchase of Standard Die & Tool Co., Oakland, Cal., and will consolidate with organization. It is proposed to continue Standard plant at present location and carry out expansion program for increased capacity.

Board of Education, San Francisco, will soon take bids on general contract for addition to junior high school at Francisco, Powell and Stockton Streets, to include group of six machine shops for manual training service, estimated to cost $400,000. S. Heiman, 57 Post Street, is architect; Coddington & Duncan, 222 Kearny Street, are the engineers in charge.

Puget Sound Power & Light Co., Seattle, has made application for permission to use water from Lake Washington, near site of proposed new steam-operated electric generating plant for service for that station, estimated to cost $7,000,000, including steel tower transmission line for connection with system at Seattle and other points.

Pacific Electric Railway Co., Pacific Electric Building, Los Angeles, has plans under way for a new terminal at Long Beach, to include group of repair and mechanical shops for electric car service, car house and other traction units, with service, repair and garage building for motor coaches. Entire project will cost

in excess of $250,000. Engineering department of company is in charge.

Pacific Gas & Electric Co., 245 Market Street, San Francisco, has filed plans for an equipment storage and distributing plant on block bounded by Shotwell, Folsom, Eighteenth and Nineteenth Streets, including meter repair and mechanical division, with automobile service, repair and garage unit, and other shops, reported to cost more than $500,000 with equipment.

Day & Night Water Heater Co., Monrovia, Cal., manufacturer of water heaters for domestic service, parts, etc., is having plans drawn for a one-story addition to cost about $35,000 with equipment. A traveling crane will be installed. Hamm, Grant & Bruner, Inc., Ferguson Building, Los Angeles, is architect and engineer.

Gulf States

BIRMINGHAM, Aug. 27. — Central Power & Light Co., Frost Bank Building, San Antonio, Tex., operated by Central & South West Utilities Co., Dallas, Tex., is said to be planning new steam-operated electric light and power plant in vicinity of Laredo, Tex., with initial capacity of about 30,000 kw. Project will include transmission line to connect with main system of company, and it is reported will cost in excess of $400,000.

P. H. Schindler Machine Works, 423 Poydras Street, New Orleans, La., has leased a one-story building at 623 Peters Street, and will establish a new machine shop at that location.

City Council, Delray, Fla., will receive bids until Sept. 16 for equipment for municipal waterworks, including one engine-driven centrifugal pumping unit and four motor-driven centrifugal pumps, with accessory equipment. Main Engineering Co., 112 Marion Street, Daytona Beach, Fla., is engineer.

Canada

TORONTO, ONT., Aug. 27. — Ratepayers of Simcoe, Ont., have passed a by-law granting a fixed assessment to the American Can Co. of $200,000 for 10 years. Company recently purchased the can plant of the Canadian Canners and two blocks of land at Simcoe. It is the intention of the company to start work immediately on the erection of a plant to cost $1,000,000.

Ferranti Electric Co., Ltd., 26 Noble Street, Toronto, has awarded general contract to Thomson Brothers, Toronto, for the erection of manufacturing plant at Mount Dennis, Ont., to cost $250,000. Reid & Brown Structural Steel & Iron Works, Toronto, has the steel contract.

Canadian Steel Foundries, Ltd., has awarded contract to John MacGregor, Ltd., 1410 Stanley Street, for the erection of a two-story plant addition at Longue Pointe, Que., to cost $75,000.

Canadian National Railways will erect car shops at Truro, N. S., to be 40 x 180 ft. Construction work will be carried out by company bridge and building departments. R. U. Appleton is general manager of Atlantic region.

McKinnon Industries division of General Motors of Canada, St. Catharines, Ont., will award contracts immediately for the erection of a $175,000 addition to plant, it was announced by H. J. Carmichael, president of McKinnon Industries.

Dominion Bridge Co., 1139 Shaw Street, Toronto, Ont., has purchased a site at Mount Dennis, Ont., where it will erect a plant to cost $1,500,000. Construction work to be started next spring.

Beauharnois Electric Co., 107 Craig Street West, Montreal, has awarded contract to the Beauharnois Construction Co., 112 St. Lawrence Street, for the construction of canal and power development plant at Beauharnois to cost $65 - 000,000. Preliminary work will be started at once and it is expected to have the plant completed in 1932. Consulting engineer is Fred Brown, 117 St. Catharine Street West, Montreal.

Western Canada

Dominion Bridge Co., Calgary, Alta., has permit to erect a plant at 801 Twenty-fourth Street, to cost $80,000.

City council, Calgary, Alta., intends to spend $2,000,000 to $3,000,000 on waterworks plant and system.

Canadian Industries, Ltd., 611 Paris Building, Winnipeg, Man., has purchased site at East Selkirk, Man., and will start work immediately on the erection of a plant for the manufacture of explosives, etc.

Western Foundries, Ltd., Lethbridge, Alta., is planning to build a plant to cost $25,000. Two buildings will be erected, one 48 x 80 ft. and the other 60 x 115 ft. Equipment and tools will be purchased.

The Radio Industries of Canada, Ltd., Winnipeg, Man., has established headquarters at Calgary, Alta., and intends to erect $30,000 manufacturing plant.

Seaboard Oil Refining Co., Vancouver, B. C., has been incorporated with a capital stock of $2,000,000. Company will immediately proceed with the erection of an oil refinery. David B. Boyd, Standard Bank Building, is local manager for the company.

Foreign

ELECTRICAL Administration, Soviet Russian Government, Moscow, is arranging an appropriation of 415,000,000 rubles (about $207,500,000) for power plant construction during fiscal year 1929-30, starting Oct. 1, to include 10 new central generating plants comprising station at Malaya Vishera, with capacity of 132,000 kw.; at Bobrikov, 150,000 kw.; Uzh, 150,000 kw.; Samara, 22,000 kw.; Kuznetz, Siberia, 44,000 kw., all of hydroelectric generating type; with steam-electric generating stations at Moscow and Leningrad, with capacities of 75,000 kw. and 30,000 kw. respectively. From fund noted, 42,000,000 rubles (about $21,000,-000) will be used for work on Dnieper River hydroelectric power project during fiscal year, work on which is now under way and which is scheduled for completion in October; this station will have a capacity of 800,000 hp., divided into 10 turbo-generator units. Hugh L. Cooper, 101 Park Avenue, New York, is consulting engineer for last-noted project. Amtorg Trading Corporation, 261 Fifth Avenue, New York, is official buying agency for Soviet Union.

International General Electric Co., Schenectady, N. Y., subsidiary of General Electric Co., in cooperation with International Pirelli Co., Ltd., Brussels, Belgium, an interest of Pirelli Co., Milan, Italy, has concluded arrangements for purchase of controlling interest in National Copper Mfg. Co., Rio de Janeiro, Brazil, known as "Conac," manufacturer of electric wire, cables, etc. New owners plan immediate expansion in present plant, with installation of equipment for production of underground transmission cables, telephone wire, etc., reported to cost over $250,000.

Grigsby-Grunow Co., Ltd., subsidiary of Grigsby-Grunow Co., 2038 North Kolmar Avenue, Chicago, manufacturer of radio sets and equipment, has taken option on plant site at London, England, and will soon begin erection of multi-story unit, reported to cost over $350,000 with equipment. It is proposed to have plant ready for service by close of year. Bert J. Grigsby is president and general manager.

Soviet Russian Rubber Trust, Moscow, through Amtorg Trading Corporation, 261 Fifth Avenue, New York, has closed negotiations with Seiberling Rubber Co., Akron, Ohio, manufacturer of automobile tires and tubes, for technical assistance for new plant at Yaroslavl, to be equipped for initial capacity of 3100 automobile tires, 9000 bicycle tires and 480 motorcycle tires a day, reported to cost over $1,000,000 with equipment. Seiberling company will prepare plans for plant, supervise construction and operation. Machinery purchases will be made by Amtorg organization. M. Nickoforov, chairman of board of Rubber Trust, is now in United States to perfect final arrangements.

Compania Electrica de Santo Domingo, C. por A., Puerto Plata, Dominican Republic, West Indies, a subsidiary of Southern Cities Utilities Co., Fox Building, Philadelphia, has concluded arrangements for purchase of electric light and power properties, and waterworks of Dominican Republic, at Puerto Plata and Santiago. Plants and system will be consolidated under one management, including properties at La Vega, lately acquired by same interests. Expansion and improvements are planned for increased power facilities and transmission service.

Soviet Russian Government, Moscow, through Amtorg Trading Corporation, 261 Fifth Avenue, New York, official buying agency, is said to have awarded general contract to Austin Co., Euclid Avenue, Cleveland, for construction of plant at Nizhni-Novgorod for manufacture of Ford type automobiles and motor trucks, for which agreement for technical service was recently made with Ford Motor Co., Detroit. New plant will be equipped for annual production of 70,000 motor trucks and 30,000 automobiles, including parts and assembling, and is reported to cost more than $10,000,000 with machinery.

New Trade Publications

Locomotives With Internal Combustion Engine Drive. — George D. Whitcomb Co., Rochelle, Ill. The advantages, uses and economies effected by using locomotives powered with internal combustion engines are set forth in an eight-page pamphlet.

Casters and Trucks.—Service Caster & Truck Co., Albion, Mich. Catalog No. 29, containing 24 illustrated pages, gives the specifications of and describes the company's casters and trucks. A special page is devoted to information about how to measure a caster and what to call the parts.

Seamless Steel Tubes.—Globe Steel Tubes Co., 1345 Burnham Street, Milwaukee. Booklet of 24 pages, illustrating and describing the manufacture of seamless steel tubes. The tubes made by this company have special reference to the automotive industry and locomotive and merchant boilers.

THE IRON AGE

New York, September 5, 1929

VOL. 124, No. 10

Materials Handled Economically

Marked Savings Obtained by Studebaker Corporation from Operation of Transportation Department Employing 200 Men and Like Number of Equipment Units

BY JOHN R. SULLIVAN*

AT the Studebaker Corporation, production is carried on in a number of separate buildings. Bodies, for example, are made in a five-story factory located at some distance from the assembly building. Body stampings are turned out in another structure, while other parts originate in the foundry, forge shop and power plant departments, each of which occupies its own building. In addition, there are still other buildings that contribute their share toward the manufacture of Studebaker automobiles.

It is little wonder, under the circumstances, that efficient and economical means of transporting materials in and among the many buildings is a major problem. For its solution the company created some years ago a transportation department, the growth of which has paralleled that of the company's production facilities.

*Supervisor of transportation, Studebaker Corporation, South Bend, Ind.

Today the department consists of approximately 200 men and a similar number of equipment units. Among the types of carriers are steam locomotives, Fordson tractors, gasoline trucks, electric trucks, electric-lift trucks, hand-lift trucks, side-dump trucks and various kinds of truck trailers.

The use of hand-lift trucks is minimized. Wherever possible they are in service only for short hauls to deliver material to power trucks, and for moving parts from one floor to another in the same building. Wherever power trucks have been installed, electric trucks are employed for transportation inside buildings, and gasoline trucks and tractors for outside work and for interdepartmental hauls.

An effort is made to move materials between departments on the ground floor or outside buildings so that power equipment can be used. In the body department, for instance, there are several stations to which hand

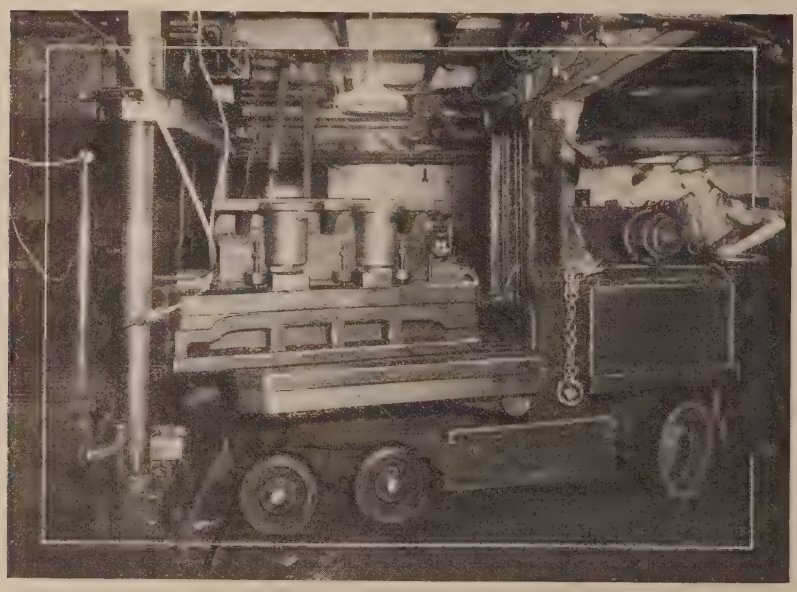
BODIES Are Transported from Body Plant to Assembly Building on Flat-Type Railroad Cars with Specially Constructed Double-Deck "Uprights"

trucks bring material on elevators to the main floor, where it is prepared for haulage by tractors operating on regular schedules.

Trucks Handle Overflow from Conveyors

Delivering parts from the machining, forging, stamping, foundry and spring departments to the assembly lines, the transportation department must coordinate its activities with those of mechanical conveyors, which have recently been installed in numerous departments. Sometimes a conveyor is taxed beyond its capacity, and in such instances the transportation department with trucks and trailers relieves the pressure. To cite a specific case, the final assembly lines might unavoidably be slowed up temporarily and before word could be passed along to sub-assembly departments, parts on conveyors might accumulate so rapidly as to create congestion. Trucks and trailers then are used to take off some of the material and deliver it to its destination.

So far as possible each operator has a routine daily schedule. Generally he traverses his route a number of times during the day, recording the time of arrival at the end of every trip. The department has a central office where all telephone calls pertaining to special movements of material are received. The routing man there enters calls on a special chart, turning them over to the operators whose schedules are light at the moment. This is done through working gang bosses, who keep in touch with the office in person or by telephone. When assigned a special job, the operator receives from the routing office a slip giving information about the task. Upon completing the work, he delivers the slip back to the routing clerk, who records the closing of the transaction.



LIFT Trucks, Capable of Handling Dies Weighing 30,000 Lb., Are Used to Mount Dies on Presses

Schedule Based on Number of Cars Produced

The department's daily schedule is based on the number of finished automobiles produced each hour. In the majority of departments supplying assembly lines with parts, deliveries are made every half hour. However, at some points the time is reduced to 15 min. This is necessitated by the fact that there is practically no "bank" or stock of certain parts for the assembly lines, so that deliveries must be made to the assembly building almost as quickly as parts are produced.

Since there is no storage space for finished parts, except a small bank, which soon would disappear unless frequently and regularly replenished, any department which falls much under its scheduled output is likely to tie up production in the entire plant. The same condition would be created if the transportation department failed to meet its responsibilities.

Incoming and outgoing freight cars are handled in the company's yards by the Studebaker industrial railroad, which operates in the same manner as independent carriers and is under the supervision of the Interstate Commerce Commission. It has a personnel of 30 men and owns 12½ miles of track. Four locomotives are in service, each having a crew of five men, including an engineer, fireman, switchman and a conductor. Four railroads—New York Central, Pennsylvania, Wabash and Grand Trunk—have receiving tracks at the entrance to the company's yards and at this point deliver freight cars to the company's railroad system. All incoming and outgoing freight cars are weighed by a weighmaster and are routed by a yardmaster. The railroad handles approximately 9000 carloads of raw materials and finished automobiles each month.

The duty of maintaining its locomotives devolves upon the railroad, and a special crew of three men, two during the day and one at night, is assigned this task. Track maintenance, however, is taken care of by the maintenance department.

Sixty Per Cent Saved in Hauling Refuse Sand

Marked savings have been made in the cost of hauling refuse cinders and sand from the foundry to a dumping ground outside the city limits of South Bend. A few years ago the department contracted with a hauling company to have this material removed, but installation of its own equipment for this purpose has reduced the expense 60 per cent. Equipment comprises various types of refuse side-dump wagons, ramps, chutes and gasoline tractors. The refuse, which amounts to about 300 cu. yd. daily, is handled by a train consisting of a gasoline tractor and six side-dump wagons.

One of the most important tasks of the department is the transportation of bodies from the body factory to the assembly building. This is accomplished by means of a locomotive and four flat-type railroad cars with specially constructed double-deck "uprights." Each car has a capacity of 12 bodies, six on the lower deck and six on the upper.

Bodies Lowered to Loading Dock

At the end of the body assembly lines on the sixth floor of the body factory is a "lowerator" elevator, which delivers bodies to the loading dock on either the mezzanine or the main floor, the delivery point depending upon whether bodies are to be loaded on to the upper or lower decks of the railroad cars. Each loading dock is equipped with an electric hoist, which lifts bodies on to trucks. The trucks operate on rails extending from the dock to the door of the railroad cars, on to which bodies are pushed by hand. When a car is filled the gates on the sides of the car are closed and the bodies are automatically locked in position.

When cars reach the assembly building, bodies are unloaded in a manner similar to that in which they were

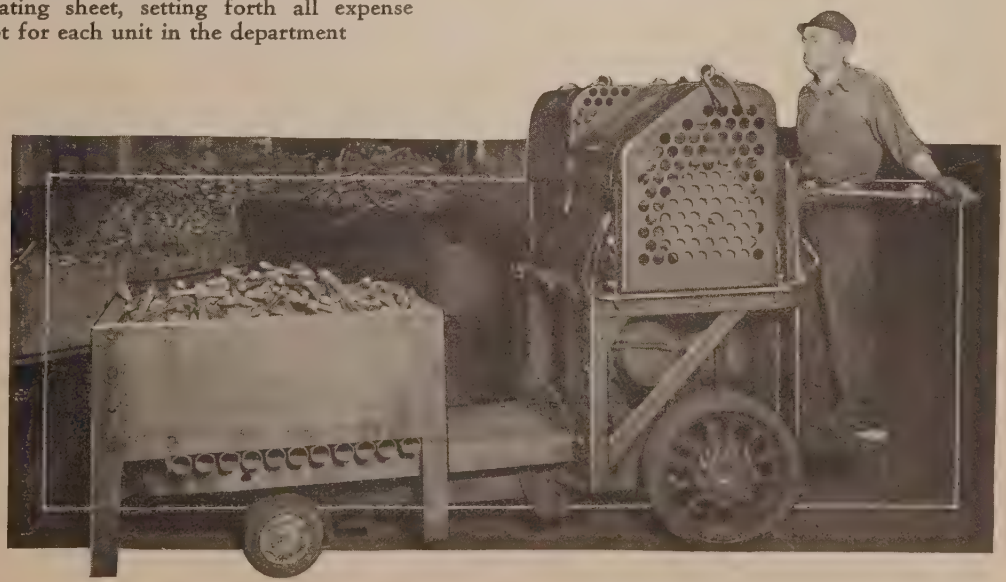
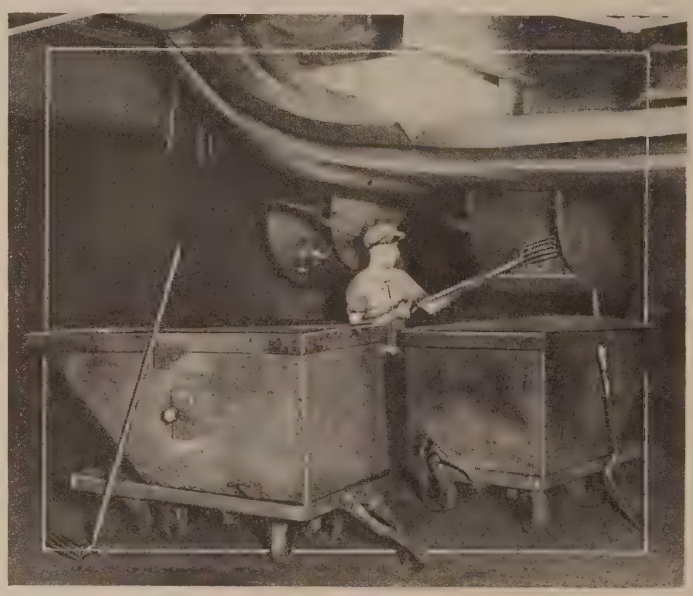
IN Forge Shop Material Is Moved from One Operation to Next in Steel Trays Carried by Electric Lift Trucks



loaded at the body factory and are taken by elevator to the fourth floor, where they are held temporarily until they go to the assembly line. Through a hole in the floor they are lowered by electric hoist to the chassis on the assembly line on the third floor. Numerous models of cars are assembled at the same time on one chassis line, and therefore it is imperative that bodies be delivered to the chassis line according to the sequence of the model of cars going through at the moment. The lowerator in the body factory and the elevator in the assembly building each have a capacity of 120 bodies an hour, or one every half minute. In handling bodies the transportation department employs 30 men.

Panels, doors and other metal parts produced in the body stamping department are delivered to the assembly department by gasoline tractors and trailers. Within the body stamping department, electric lift trucks and trailers are used. The outstanding pieces of equipment are two Elwell-Parker electric "hi-low" lift trucks capable of handling dies weighing 30,000 lb. These trucks are utilized to mount dies on presses. They make possible a change from one set-up to another in a few minutes as compared with several hours by the former method, the quick change keeping the presses in almost continuous operation and thus cutting down production costs. The labor expense of eight men has been saved in this manner.



REFUSE from Foundry, Such as Core and Molding Sand, Passes from Foundry Floor Down Through Chutes into Trailers Stationed in Tunnels Running Underneath Foundry. Trailers are hauled by electric tractors to crane bay, where refuse material is transferred by crane to large chutes, through which it is dumped into refuse wagons outside building

Trucks Facilitate Forge Shop Operations

In the forge shop, material in process is moved from one operation to the next in steel trays carried by electric lift trucks. Trays are of various sizes and shapes and are placed at the side of hammers and heat treating furnaces, where they are in the most accessible position. The department is so laid out that material passes through a complete cycle without backtracking and the use of electric lift trucks and trays facilitates the forward movement. During final inspection the material is transferred from trays to trailers to be hauled by a gasoline tractor to the assembly building.

Getting into the foundry, the duties of the transportation department are as well defined as in other departments. The industrial railroad delivers all raw materials in freight cars into the foundry receiving bay. Charges for the cupolas are handled by specially designed conveyors and trucks operating on tracks. Electric trucks and trailers are used extensively in taking castings from the molding floor to the cleaning room and thence, after inspection, to the machine shop. Refuse, such as core and molding sand, passes from the foundry floor down through chutes into trailers stationed in tunnels running underneath the foundry. The trailers are hauled by electric tractors to the crane bay of the foundry, where refuse material is transferred by crane from the trailers to large chutes, through which it is dumped into refuse wagons outside the building.

For foundry work the transportation department has 20 men and a like number of pieces of equipment. Men are divided into gangs directed by gang bosses. In every case the gang boss drives a piece of equipment, but his duties in this respect are so arranged that he has considerable free time in which to supervise the activities of his men and to coordinate them.

Incoming and outgoing express shipments and less-than-carload freight are handled by two Fordson tractors and a fleet of trailers. Each morning the drivers of the tractors distribute the trailers at the four railroad freight depots. On the return trip the trailers are hauled to various receiving points, to which the materials are to be delivered. This plan has proved economical, because it keeps trucks in active service rather than tied up for an indefinite period at depots during loading and unloading.

Maintenance and repair of all rolling stock used by the department have been so systematized that an accurate record of operating costs is available at all times. The department carries its own stores division. Every part or piece of equipment is requisitioned out of stores and is charged against the individual unit for which it is intended. Incidentally, each unit has a number for identification purposes.

For each unit a monthly maintenance operating sheet is carried, and on it is recorded the driver's wages, repair men's wages and the cost of all supplies, such as gasoline, oil, charging of batteries and repair parts. At the end of every month the actual operating expenses for the previous 30 days are calculated so that the department knows exactly what each unit in service is costing. For large expenses, such as the purchase of tires, the amount is not charged against a single month, but is pro-rated over a period of several months.

Germany Takes Half the World's Tungsten

China dominates the world tungsten market due to the possession of huge deposits permitting surface mining with cheap labor. Of the 8000 metric tons of ore (basis 60 per cent WO_3) produced in the Orient, 5200 net tons was imported by Germany. According to Colin G. Fink, *Metal Industry*, 1928, this is almost half the world's output. A great many deposits are known in the United States, but only a few are producing; the total marketed in 1928 was 1290 net tons of 60 per cent WO_3 concentrate, valued at $761,000. The largest producer is the Nevada-Massachusetts Co. at Mill City, Nev., where the output is expanding.

Assembling an Airplane Engine

Process Is Done Twice, with Intermediate Close Inspection —Frame Used to Hold Crankcase

BY FAY LEONE FAUROTE*

IT is interesting to watch the assembly of a Wright Whirlwind engine. In the first place, all of the parts, which have been manufactured in the various bays, after traveling in the logical order from one machine to another as the process progresses, finally, after numerous tests and inspections, are carefully wrapped or placed in sub-divided trays to protect them from harm in transit, and taken from the stockroom. A group of finished parts required, withdrawn from here as needed, begins the small assembly.

The crankcase is set on a frame—a special assembling device mounted on wheels and capable of being rolled along a track from one assembly station to another. After putting up the crankcase, the smaller parts are added to it. The crankshaft with its bearings next goes in; then the master rod. The link rods with the pistons attached are fitted to the master rod and the whole mounted on the crankshaft.

The intermediate section of the crankcase, carrying the valve tappets, is then added. The camshaft, the cam driving gear, go in next. Finally, the cylinders with the valve rockers, valves and springs are bolted to the crankcase. The push-rod housing, the push rods, intake manifold, magnetos and spark plugs are next added.

After wiring, the engine is timed, the magnetos synchronized, the carbureter and the manifold assembly and the rear section of the crankcase attached; the rocker-box covers screwed on. The engine is then ready for test.

It is given a run of 5 hr., driving a four-bladed propeller (see test chart). If it measures up to established standards, it is then disassembled, thoroughly washed, minutely inspected and examined for flaws, then taken back to the assembly line and carefully reassembled for delivery to the purchaser. After being weighed, dry, it is then greased and oiled, taken to the final testing room and run for 2 hr., where a final record of its performance must meet the same standards. Then it is retouched and is coated with slushing oil for protection, numbered, registered and crated for delivery.

Nowhere along the line is close vigilance slackened. There is always ever present the knowledge that here is a piece of mechanism upon which a man's life may depend.

*Mechanical engineer, New York. In THE IRON AGE of July 18, page 148, Mr. Faurote described the Wright airplane engines. In subsequent articles he described various machining operations: Aug. 8, the connecting rods; Aug. 15, the crankshaft; Aug. 22, the cylinders, and Aug. 29, the crankcase.

SECONDARY Assembly Line of Whirlwind Engines Is Shown at Left

PULLING a Dismantled Production Engine (Right) Back on the Secondary Assembly Line. All Army and Navy engines after primary assembly are tested for 5 hr., then completely torn down and inspected and re-assembled. Then they are given a secondary run-in test for 2 hr.

Inhibitors in Pickling Process

Experiments Show That Only Enough Acid Is Consumed to Remove Scale—Hydrogen Evolved Reduces Inhibitor Rather Than Replaces Metal

BY ALLISON D. TURNBULL*

IT is a well known fact inhibitors have a two-fold purpose in the pickling bath, namely, to prevent the reaction between acid and metal and to reduce acid evaporation from the surface of the bath. Generally speaking, the latter is a result of the first mentioned.

Steam cannot be entirely prevented from issuing from a pickling bath; it would be against the laws of aqueous tension and vapor pressure. But the protective coating that forms on a bath containing inhibitors will stop much of the steaming. The comparative vapor tensions of the atmospheric layer immediately above the blanket cannot be in equilibrium with the attenuating layer of the pickling solution found just beneath this foam coating. The coat is frequently punctured, acid being carried over in the steam bubbles, an action which can be compared to break-down of an overcharged condenser.

A more stable condition may indeed be secured if the solutions are indirectly heated, i.e., by closed pipe systems made of non-corrosive metal. Shooting live steam into a pickling vat causes dilution of the acid and creates eddy currents that sweep the inhibiting substance away from the surface of the metal.

Inhibitor Should Not Be Proportioned to Make-Up Acid

Unless a correct balance is achieved between the inhibitor and the conditions that influence the cleaning, efficient action cannot be expected. The amount of acid added from time to time is frequently but erroneously taken as a criterion of the proper quantity of inhibitor necessary to prevent the actions mentioned in the first paragraph. This misapprehension is responsible for a control that gives only more or less satisfactory results. There are other factors that should be taken into consideration; for instance, the diameter of the steel rod to be cleaned has a distinct bearing on the amount of inhibiting substance, inasmuch as the surface area of the metal is governed by the diameter, and the action desired is distinctly a surface effect.

When steel rods are cleaned in dilute acid, the oxide scale first succumbs; after the metal is laid bare the steel begins to corrode. Hydrogen gas is evolved, which causes the surface of the metal to become embrittled. This action is more intense when the percentage of acid is low, necessitating long cleaning periods. Rough, embrittled surfaces offer ample secretion for occluded hydrogen, which if left in the metal will cause breaks in the drawing dies because of the ineffectiveness of the lubricant. In passing, it might be remarked that it is imperative that moisture be kept out of all wire drawing greases or soaps, used in the dry drawing process.

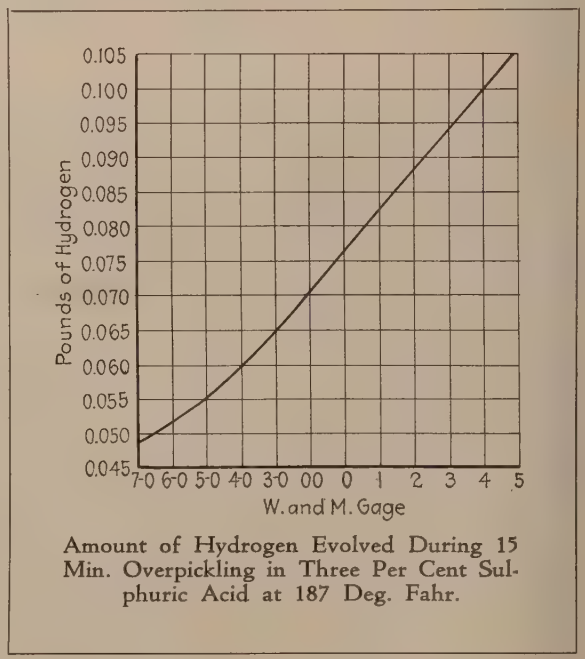
In dilute acids having no inhibitor, the greater the surface to be pickled, the greater the metal lost. Curve 1 shows the evolved hydrogen gas that accompanies over-pickling various sizes of rods for 15 min. in a 3 per cent solution of sulphuric acid (by weight) at 187 deg. Fahr.

Pickling Without Inhibitor Forms Hydrogen

When one ton of rods having a diameter of 0.207 in. are overpickled for a period of 15 min. in a 4.21 per cent sulphuric acid solution at 200 deg. Fahr., 30 lb. of iron dissolves, according to the following equation:

$$Fe + H_2SO_4 = FeSO_4 + 2H$$

For each pound of ferrous iron dissolved there is 0.036 lb. of hydrogen gas liberated. (If the solution is highly oxidizing the change from the ferrous to ferric sulphate occurs almost instantaneously.) Hence in the case under consideration 0.036 times 30 or 0.108 lb. of hydrogen was set free. Similarly in overpickling a No. 4 gage (W. & M.) wire rod, which incidentally has a smaller surface, 0.100 lb. of the gas was liberated. These calculations follow curve 1 very closely.



Amount of Hydrogen Evolved During 15 Min. Overpickling in Three Per Cent Sulphuric Acid at 187 Deg. Fahr.

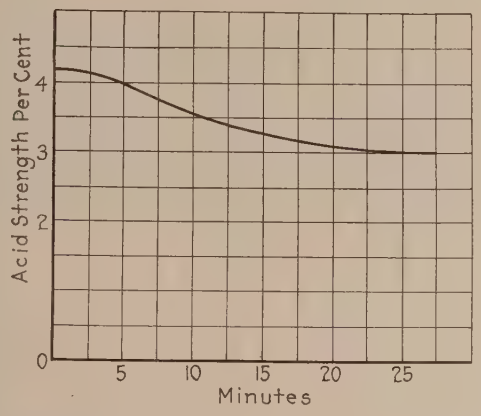
Curve 2 pictures what happened in the above pickling bath where the 30 lb. of iron were dissolved. For the first minute or two the acid is not affected because the metal is absorbing heat from the solution. At three minutes the acid was rapidly attacking the oxide scale, continuing for another 9½ min. At this time all the scale was removed and the acid concentration had fallen from 4.21 to 3.4 per cent, a loss of 0.8 per cent. After

*Research Products Engineering Department, Northern Electric Co., Ltd., Montreal, Canada.

CARNEGIE LIBRARY OF ATLANTA

this the curve still droops, indicating that acid was being consumed. At 27½ min. the rods were removed; the bath had only 3 per cent acid. (The stock selected for the test was medium carbon steel, having a moderate scale.)

This example shows the utter waste of both metal and acid that accompanies improper pickling. The rods were practically free of any oxide film at 13 min. but a



Consumption of Sulphuric Acid When Pickling 0.207-In. Rods at 200 Deg. Fahr.

few spots remained, necessitating further immersion, during which time the acid was free to attack the steel of the rod as well as the spots of oxide.

Pickling With Inhibitor Forms Water

Compare this with curve 3, representing a pickling solution that is properly inhibited. The action in such a case is as follows:

$$FeO + H_2SO_4 = FeSO_4 + H_2O$$

Instead of the harmful hydrogen gas being produced, water only is formed.

As a case in point, steel rods of the type usually classified as "white ends," having 0.04 per cent carbon, were pickled for 28 min. in a 4 per cent sulphuric acid bath. The inhibitor was a very cheap substance found to suit the average pickling vat. It can be seen that the acid concentration dropped 0.5 per cent in 10 min. and at 15 min. from the start was at 3.45 per cent; thereafter it remained constant until the batch of rods was removed. One infers from this that the scale was practically removed in the 15-min. period; after that time the acid remained dormant.

Vats used for all these tests were of the standard groove fit, wood construction. The capacity of each was exactly 1006 imperial gallons. Although live steam is utilized for heating, all steam valves were tightly shut during the trials. Before the test was made the accurate weight of the batch of rods was taken, viz., 2144 lb. During the pickling the loss in weight was exactly 36 lb. or 1.67 per cent. The specific gravity of the bath before and after the trial was 1.08 and 1.0836 respectively. The total percentage drop in the acid was 0.55 per cent and the consumption was 55 lb. of 66 deg. Baumé sulphuric acid.

Theoretically, the amount of 100 per cent acid necessary to remove 36 lb. of ferrous oxide is 49.1 lb., which is equivalent to 51.5 lb. of 66 deg. Baumé acid.

The difference between the theoretical and actual usage is 3.5 lb., which is creditable indeed. When it is considered that there was some evaporation and that no tub is 100 per cent efficient, the figures are remarkably close.

Proof That Steel Is Not Attacked

As was previously stated, 36 lb. of scale was removed during the pickling. To further show that the acid did not attack the steel base, a check can be made in the following manner:

Weight of solution before the rods were immersed is: 1106 gal. x 1.08 sp. gr. x 10 lb. or 10864.8 lb.

Similarly the weight of the solution after the test is 1106 x 1.0836 x 10 or 10901.0 lb.

Difference in the two values = 10901.0 — 10864.8 = 36.2 lb., the amount of iron oxide removed from the rod combining with acid to form ferrous sulphate and water.

Inhibitor Is Essentially Cellulose

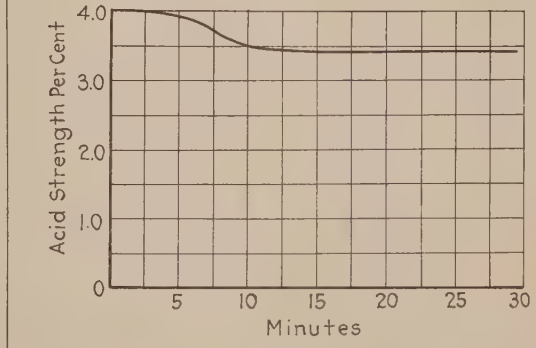
The question now arises, just what is an inhibitor? Inhibiting action is undoubtedly due to organic substances present in the compound. Carbohydrates having a high value of the carbo-hydrogen radical, such as sugar ($C_{12}H_{22}O_{11}$) or starch ($C_6H_{11}O_6$) have good inhibiting qualities. We might go further up in the scale and say that the supposedly existant C_{100} H_{300} O_{150} is the formula of a true inhibitor.

If cellulose be placed in a dilute solution of sulphuric acid which is evolving hydrogen from a metal, the following reaction occurs between cellulose and water

$$C_6H_{10}O_5 + H_2O = C_6H_{12}O_6$$

While $C_6H_{12}O_6$ is in the process of formation all the free hydrogen is powerless to attack the metal. Pure cellulose could be used in pickling solutions, providing that there was a correct amount of the substance placed in the bath. Too little would be inefficient, while too much would be a waste.

What takes place in a pickling bath when an inhibitor is present? Many theories have been advanced. Observa-



Consumption of Acid Containing Proper Inhibitor

tions taken over a period of eight months, using four different classes of inhibitors, lead the writer to believe that a highly reducing condition must be created in the solution.

Numerous bodies with sluggish reactions are capable of chemical combination at the instant they break away from another compound. Speaking generally, when a chemical change occurs between molecules, there is, first of all, a decomposition of the molecules and then a rearrangement of the constituent atoms to form new molecules. But an appreciable amount of time necessarily elapses while the atoms are falling into the new arrangements; during this momentary freedom or nascent state,

the atoms act as individuals, and enter into combination more easily than if held in restraint by the forces binding them into molecule.

In the case of inhibitors the hydrogen acts as a reducing agent by actually entering into the molecule.

Carbohydrates like dextrose and glucose are highly reducing. For instance if we place a quantity of starch into a dilute solution of sulphuric acid at 120 deg. Fahr., and add an alkali to neutralize the acid, we have a reducing solution. This fact is utilized in metal plating, where the solution must be of a reducing nature.

Returning to the example previously considered, of a bath of acid ranging around 4.21 per cent at 190 deg. Fahr. Suppose we add a measured quantity of inhibitor of such a grade as associated with "mill wheat" (such substance being capable of releasing 76 per cent of cellulose under proper conditions). It seemingly dissolves. We then immerse a batch of rods in the solution, and shortly thereafter particles of ferric oxide and ferric sulphate can be observed floating to the surface of the bath. The mucilaginous character of the inhibitor binds these substances into a thick, reddish brown coating. The bath is now in a reducing condition. A sample of the solution when examined under a polariscope shows a distinct rotation of the plane of polarized light, nearly always toward the right, indicating that dextrose has been formed, but possibly there has been a formation of glucose, since it gives the same indication (both these are isomeric compounds, i.e., they have the same composition although with different properties, since the atoms are located differently in the molecule).

What Happened When Rods Were Overpickled

Nascent hydrogen tends to oxidize the dextrose, hence it is not capable of plating out on the metal, and hence the metal does not dissolve.

Consider again the first example where a ton of 16.5-gage rods was overpickled for approximately 15 min. and 30 lb. of iron was dissolved. The hydrogen liberated in this instance was 0.108 lb. Referring to the formula:

$H_2O + C_6H_{10}O_5 = C_6H_{12}O_6$ it is seen that for each pound of the inhibitor ($C_6H_{10}O_5$) there is 0.0123 pounds of hydrogen oxidized to H_2O. Actually the substance used in these trials was composed of 76.4 parts cellulose ($C_6H_{10}O_5$) so 1.31 lb. of it must be used to take up 0.0123 lb. of the gas.

But there happened to be 0.108 lb. of hydrogen evolved in this process, necessitating $\frac{0.108 \times 1.31}{0.0123} = 11.5$ lb. of inhibitor.

From experiment it was found that 11 to 12 lb. of the substance was necessary to give the results obtained in the second trial. It will be remembered that this was the test where the acid did not react with the metal after the oxide was removed. Consequently, practice bears out the theory.

Amount of Inhibitor Added Decreases With Age of Solution

A sufficient quantity of the substance must be added from time to time in order to make up for depreciation and losses sustained when the rods are removed from the vats. It was found that once the salting charge was given, i.e., 11.5 lb., a tapering amount was necessary to continue the protection. Usually one pound was added with each ton charged. Such additions were made five or six times. Following batches then receive an amount that varies from ½ lb. down to ¼ lb. per ton of charge. The last two batches do not require any inhibitor. The average consumption over a period of say one month ranges between ¾ and 1 lb. per net ton of rods pickled.

Curve 1 shows the fact that as the gage of the rod decreases, the hydrogen gas capable of being evolved from that rod also decreases. This curve is true for all sizes of wire and rods when they are overpickled as noted, i.e., for 15 min. in a 3.0 per cent solution heated to nearly 200 deg. The real criterion determining the amount of inhibitor is the square feet of surface of metal to be cleaned.

During an average month, using the inhibitor under discussion, 2594 tons of rods was cleaned. Exactly 132-100 lb. of 66 deg. acid was consumed doing this work, or an average of 50.9 lb. per net ton. Pains were taken to secure accurate data regarding the amount of oxide on an average rod, the result being 1.7 per cent. Theoretically 48.3 lb. of acid would be required to remove this quantity of scale from one ton of stock, leaving a difference of 2.6 lb. per net ton between the actual usage and the theoretical. It is understood that the solutions are not "killed" down to such a weak concentration that a long period of time would be necessary for the pickling operation, consequently there was always some free acid remaining in the bath when it was discarded. This accounts for most of the 2.6 lb. surplus.

Airplane Disaster Caused by Fatigue of Steel

FRACTURE under fatigue of studs in the front big-end bearing of the starboard engine is found to be the cause of the disaster of the London-Paris airplane which, on June 17, plunged into the British Channel, killing several passengers. A report, recently issued by the British Air Ministry, based on a formal investigation, states that this was the primary cause, according to the London *Iron and Coal Trades Review.*

Speaking in more detail, the report says that this mishap is described as of a type which is unavoidable. The report also is to the effect that Major Cooper's detailed examination revealed that the front, or No. 4, connecting rod assembly was completely broken up, obviously the result of a fracture of the big-end bearing studs. According to his opinion, with which the court agrees, the pair of studs on the port side of the bearing fractured due to fatigue, the front stud being the first to fail, followed by the two studs on the starboard side also failing. None of the damaged or broken parts was discolored by heat, so it was said.

After a careful consideration of the evidence, which dealt exhaustively with the manufacture of these studs and the suitability of the steel used therein, the court gave out the opinion that nothing that human foresight could have done, in providing against this primary cause of the starboard engine becoming relatively useless, had been omitted either by D. Napier & Sons, Ltd., or on the part of Imperial Airways, Ltd., or their personnel. "It is a case," says Sir Arthur Colefax, author of the report, "similar to many with which all who have to do with machinery are familiar—the metal of some part becoming fatigued for some reason which remains an unsolved mystery. Evidence was given of an almost identical mishap to an engine in an R. A. F. machine, and also of some few other instances of studs failing. Such evidence has not enabled me to carry the matter any further."

Work in Process Is Stored in Skids in the Yard. At the end of article is shown the steel storage yard

Handling Forgings, Dies and Stampings in Transue & Williams Plant

WHAT constitutes the furnace equipment for a modern forging plant supplying forgings of a wide variety of size and weight was described in THE IRON AGE of Aug. 22, page 467, drawing on the practice and experience of the Transue & Williams Steel Forging Corporation, Alliance, Ohio, for this purpose. The present article is devoted to arrangements for handling, to three methods of cleaning forgings and to provisions for storing and preparing steel.

THE trimming presses are arranged in two lines and have a belt conveyor beneath each row of machines for carrying the forgings and another conveyor belt running in the opposite direction between the line of machines and located slightly above the floor level for handling the scrap. The forgings fall from the trimming presses to the conveyor belt and the press operator throws the flashings to the scrap belt.

At the end of the press line the scrap belt goes up a slight incline and the scrap is dumped from the belt into the hopper of a dump body skid in which an electric truck carries it to a baling press. All the forge shop scrap, except very heavy flashings, is baled.

The two belts carrying the trimmed forgings turn up an incline at the other end of the presses and then move along in a horizontal position for a short distance, providing ample space for inspection and sorting, which is done while the work is moving. Various kinds of forgings are moving on the belts at the same time and the inspectors throw each type in the proper skid. The receiving skids are placed in a row along the outer sides of the belt conveyors. The defective pieces are thrown into small tote boxes.

The trimming presses are individually driven through belts from motors located above the machines. The majority of the presses are of the Toledo make.

Tools and spare keys for setting the dies are conveniently carried in metal tables mounted on castors, one table being provided for six presses.

Three methods of cleaning are used, pickling, shot blasting and tumbling. Trimmed forgings after sorting go to a point where one of these three cleaning operations is done. Large forgings, such as rear axle housing forgings weighing up to 320 lb., are shot blasted on a rotary table machine. For cleaning No. 14 steel grit heat treated is used. Forgings in intermediate sizes are pickled. This is done in a separate detached pickling building, which is equipped with a 4-arm Mesta pickling machine with a 12,000-lb. lift. The building is 45 x 50 ft., 26 ft. high, with windows on all sides extending to the eaves.

Tumbling Smaller Forgings

THE smaller forgings are cleaned in two 48 x 60-in. continuous tumbling barrels located in the trimming department at the end of the press line. Each machine is served by a power loader designed so that a loaded skid is placed on the loader by a truck and the skid and its contents, about 2500 lb., is raised and the skid is dumped directly into the barrel. This is proving a highly economical handling arrangement. The forgings are rotated 20 to 30 min., and each machine has a capacity of 45 tons per day. Skids receive the forgings at the discharge end of the tumbling barrels. The tumbling mills were built by Ideal Industrial Machinery, Cincinnati.

A new arrangement has been provided in the handling of dies which is proving efficient. New dies are now prepared for the layout bench in the die storage building, which is equipped with two planers and a drilling machine for that work. Keyways and shanks are also put in the dies in this department. Then the dies go direct to the layout bench. With this arrangement it is not necessary to take the new dies to the regular die shop. The die

room is 100 by 200 ft. and contains about 75 machine tools used in die sinking. The die storage building is 52 x 175 ft. In it are stored 1800 sets of dies and there is sufficient room for 2500 sets. Dies are stored in steel racks, the width of which diminishes from the bottom shelf up, so that dies can be lifted from all shelves of the rack with an electric traveling crane. The racks are numbered and a complete filing system is kept for the dies.

The steel yard is conveniently arranged for the handling of stock. It is 600 ft. long and 60 ft. wide, its size being sufficient to store 5000 tons of material. The stock is carried in piles arranged according to types of material. The yard is served by a 15-ton gantry crane with a 60-ft. span. This unloads stock from cars to stock piles and also delivers it to a 4-wheel wagon at the entrance to the shear building. The wagon is moved a few feet to permit the stock to be picked up by a 5-ton electric traveling crane that serves the shear building and delivers the stock to the shear. This building is 60 x 120 ft.

Heavy Stock Sheared Hot

A HEATING furnace was installed recently in the shear house for heating plain carbon bars that are too large to cut cold or larger than 7½ in. in diameter and for heating alloy bars that if cut cold would sustain fracture. This is a continuous oil-fired pusher type furnace, 18 ft. long and 6 ft. 6 in. wide. The bars are heated to a temperature of 1000 to 1200 deg. for hot shearing. They pass through the furnace on skid bars and are discharged upon an incline leading to an alligator shear and after shearing pass to a roller table. This shearing unit is so arranged that it may also be used for cold shearing. In that case the bars are handled without passing through the furnace.

The shear house equipment includes a recently installed Pels shear with a capacity for shearing bars 7½ in. in diameter, three alligator shears, a guillotine and a friction saw with a 3½ ft. diameter cutting blade. As an auxiliary to the overhead crane the shear house has an industrial track extending through its center equipped with a car for handling stock. From the shears the stock is taken in skids to one of the three forging units as designated on a travel card.

The forging capacity has been increased by the recent addition of 20 hammers. The present forging equipment consists of 1000-lb., 1200-lb., 2000-lb., 2500-lb., 3000-lb., 4000-lb., 5000-lb., 6000-lb., 8000-lb., 10,000-lb., and 16,000-lb. steam hammers as well as 1000-lb., 1500-lb., 2000-lb., 2500-lb. and 3500-lb. board drop hammers; heading or upsetting machines ranging from 1 to 5 in. capacity and 2 bulldozers. In addition to replacing some of the larger hammers which are becoming obsolete, the company has placed orders for twelve additional new hammers, to be manufactured from its own design.

A central storeroom has just been completed in which practically all stores are kept. This is 80 ft. long and 40 ft. wide and has an 8-ft. balcony on each side. It is well

BELT Conveyors in the Cold Trimming Department Carry the Forgings from the Presses after Trimming. The forgings are inspected and sorted as they move along the belt and are thrown in the tote boxes back of the belts

lighted through a monitor roof. The inspection department consists of three divisions, hot, cold and final inspection. Shipping facilities are provided for handling 500,000 lb. of finished forgings per day. New departments include a chemical and metallurgical laboratory with 1500 sq. ft. of floor space and a hospital in a new building 16 x 36 ft., provided with first aid equipment.

The power plant equipment includes five 500-hp. Sterling boilers fired with Riley underfeed stokers and three Westinghouse low-pressure turbines, one of 1500-kw. capacity, one of 750-kw. capacity and one of 300-kw. capacity. A substation was recently built that enabled the company to purchase 1000 kw. of power from a commercial power company should a breakdown occur in its own power plant.

Stamping Department

THE stamping plant for the most part produces deep drawn stampings for the automotive and other industries. An overhead endless chain conveyor for handling work in process was recently erected in this plant. Its use is resulting in a reduction in handling costs, speeding up production and materially cutting down the amount of work stored on the floor. This conveyor, 730 ft. long, loops around through the press room, assembly room, inspection, pickling and annealing departments and shipping platform. The conveyor has hooks on 20-in. centers on which the work is suspended and it moves 35 ft. per min. It carries all work in process in which there are larger than ¼-in. holes, which comprises 60 per cent of the stampings. At various points the conveyor loops down from the ceiling, bringing it to a convenient level for loading and unloading. As pickling and annealing are required between press operations on nearly all deep drawn work, some of the work makes as many as three circuits of the conveyor.

Annealing is done in a continuous oil-fired furnace 22 ft. long provided with a chain type conveyor consisting of four chains that run in alloy steel channels. Work remains in the furnace 2½ to 3 min. The furnace tempera-

ture, which is under thermostatic control, is 1450 to 1700 deg. Fahr. Hoods connected to 24-in. stacks are located at the loading and discharge end to carry away the heat and fumes.

Recently construction was started on a new die room for the stamping plant. This is of the most modern daylight construction, 65 x 160 ft. New modern equipment for the manufacture of stamping dies is being installed and the building will be provided with two cranes for the efficient handling of large dies. A battery of six new Toledo presses has been ordered and will be installed within the next 60 days.

The aim of this company is to diversify its output. Extensive development has been under way for some months in forgings and stampings for industrial applications other than automotive, so that the fluctuation in automotive production will no longer affect the output or earnings of Transue & Williams. A good share of the output is now being taken by the electrical manufacturers, conveyor manufacturers, packing houses, boiler manufacturers, agricultural implement manufacturers, machine tool manufacturers, golf club manufacturers, etc.

The Transue & Williams plant occupies a 32½-acre site and includes 28 buildings with a floor space of 262,150 sq. ft. The company employs 1100 men. Its officers are J. R. Gorman, president; H. G. Sharp, vice-president and general manager; H. C. Senour, secretary-treasurer, and Charles T. Kingston, works manager.

A SECOND Hudson River Bridge at Poughkeepsie Has Reached the Cable Spinning Stage. Here is shown the gap between one of the two piers or towers and the shore anchorage. The bridge will be 4000 ft. long, with a 1500-ft. main river span. There will be a driveway of 30 ft. and five sidewalks

Fatigue Tests on Drums and Shells

Riveted Manganese Steel Drum Failed in Head; Riveted Carbon Steel Drum Did Not Fail; Welded and Forged Shells Failed at Tapped Hole

BY H. F. MOORE*

ADVENT of higher pressures in steam boilers has necessitated the use of plate material of increased thickness for the shells. This has appreciably affected the problems of design and manufacture of boiler drums. In the United States, riveted drums are in service for steam pressures up to approximately 800 lb. per sq. in., which seems to be about the limit for this type of construction. For steam pressures of the order of 1500 lb. per sq. in., solid or forged drums have been used. For pressure vessels other than steam boilers, drums have been built with welded seams in quite heavy plates.

In view of the highly satisfactory service obtained from riveted drums, it has seemed desirable to have a direct experimental comparison of strength between riveted drums and other types of drums, and also to make tests of drums with riveted seams using plate material of greater tensile strength than that of ordinary boiler plate.

Realizing that an ordinary static pressure test to destruction gives only a limited measure of the value of the construction used, the Babcock & Wilcox Co. has for some time been making tests on drum shells of various types under repeated applications of pressure. These experiments are still in progress, but it seems desirable to present certain results already obtained for information, with the distinct understanding that the conclusions here given are tentative and that further results may be expected as the tests proceed.

The apparatus described in this article and the methods of test developed have been designed and developed by the laboratory force of the Barberton plant of the Babcock & Wilcox Co. The writer has served as a special consultant in the conduct of the fatigue experiments.

The specimens tested were full size boiler drums, or shells of full size drum diameter (3 ft. to 3 ft. 6 in. inside). The expense and time necessary for preparing such specimens and making the tests was so great that comparatively few specimens have been tested. In making ordinary fatigue tests, six or more small specimens of each metal to be tested are subjected to various stresses, and usually some tests for each metal are run to at least 10,000,000 cycles of stress. In this manner it is possible to determine the "endurance limit" for nearly every metal below which the metal in question will withstand an indefinitely large number of cycles of stress without fracture.

This method was not feasible for the tests of full size drum shells. It was decided to determine the relative length of endurance of specimens (that is, the number of repetitions of stress to failure), although this is by no means the best criterion of strength under repeated stress. However, in the ordinary service of a boiler the cycle of stress on the shell is repeated at most a few thousand times, and the stress is not reversed, varying from zero to a maximum with slight fluctuations near the maximum stress. Thus it was feasible to run the tests to numbers of cycles of stress greatly in excess of the number of cycles to be expected in the normal service of a boiler.

It is a well known fact that a very slight change in the stress, if it is above the endurance limit of a metal, will make a large change in the number of times that stress must be imposed to cause fracture. From his general experience with fatigue testing, the writer believes that a decrease of 33⅓ per cent in the stress might mean an increase in "life" of about 25 times. It would seem, then, to be a conservative statement that if, under test, a boiler drum shell withstood without fracture 150,000 cycles of stress varying from zero to a stress 50 per cent above working stress, it might be concluded that a similar drum shell made of the same material would not fail by fatigue under normal length of service at working stress.

The tests herein described were planned on this basis, applying repeated cycles of stress 50 per cent above the working stress to specimen drum shells, and noting the length of life before fracture, and the location and character of the fracture.

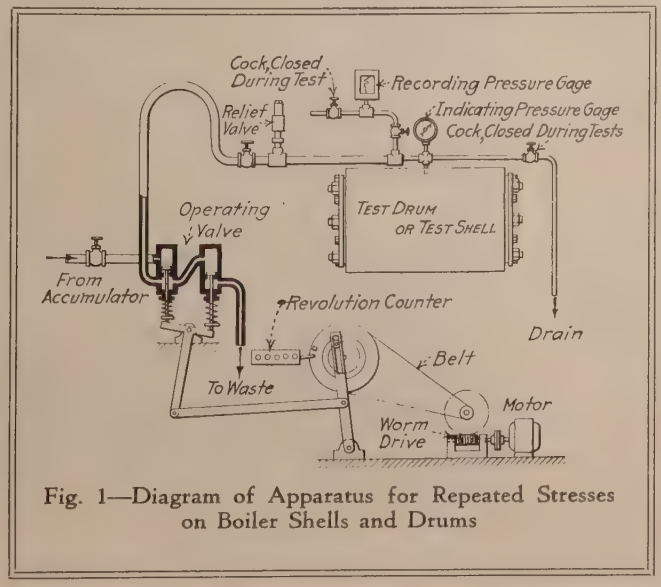

Fig. 1—Diagram of Apparatus for Repeated Stresses on Boiler Shells and Drums

A diagram of the apparatus used is shown in Fig. 1, and photographs of the set-up at the Barberton shops of the Babcock & Wilcox Co. are shown in Figs. 2, 3 and 4. Water under a pressure of 1600 lb. per sq. in. is taken from the accumulator-controlled pressure mains of the plant. This water goes through a reducing valve to produce the pressure desired in the test, and then through

*Research professor of engineering materials, University of Illinois; in connection with these tests, special consulting engineer with the Babcock & Wilcox Co.

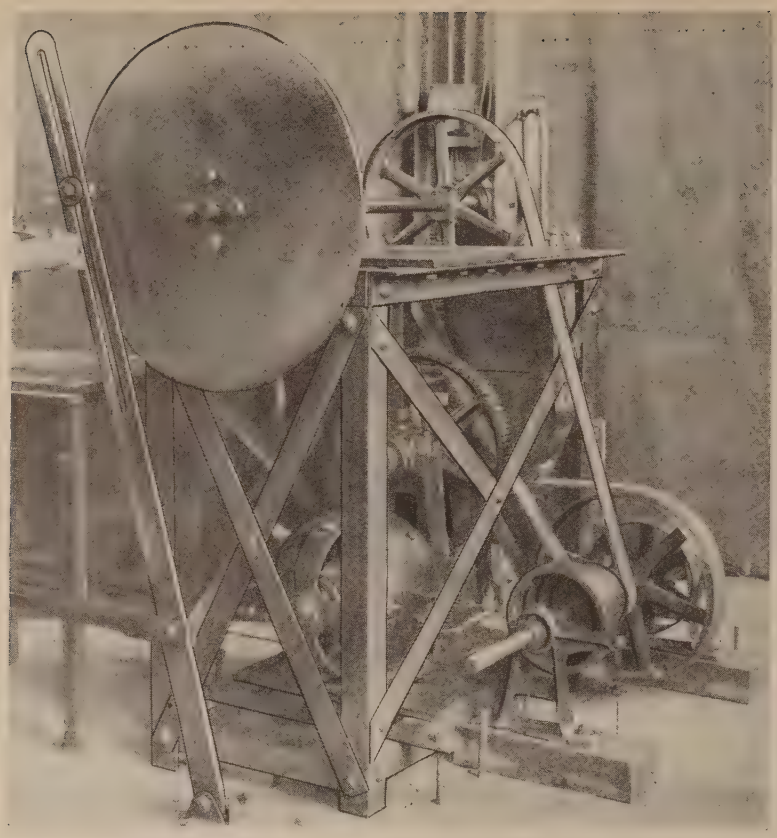

Fig. 2—Motor Drive and Link Motion for Operating Hydraulic Valves

a set of mechanically operated valves (Fig. 3), which alternately admit water under pressure to the test drum shell and allow the pressure in the drum shell to be relieved through the exhaust pipe. These mechanically operated valves are driven through link work by an electric motor whose speed can be varied, and the link work is fitted with a revolution counter which indicates the number of cycles of pressure applied. Several sets of such valves are operated by the one motor, and several test drum shells can be tested at one time. The pressure applied to each specimen is shown on a Bourdon gage directly attached to the specimen, and is also measured on a recording pressure gage. The equipment was ordinarily operated so as to give six repetitions of stress per minute.

In addition to observations to detect incipient fracture in a test shell (usually shown by leakage or a fine stream or spray of water), careful measurements of the minute changes of form under load were made. Some of these were made by means of a 2-in. Berry strain gage and others by means of micrometer dial gages attached to a framework supported from the test drum shell. The principal utility of the measurements of minute strain was to determine whether any marked permanent distortions of the specimens occurred as the tests progressed.

Two types of test specimen were used. The first, which was used for riveted construction, consisted of a drum shell with standard heads riveted to it. This type of specimen is referred to as a "test drum." The second type of specimen consisted of the test shell with an inner shell of smaller diameter, leaving an annular space between the two shells into which water under pressure was admitted. Figure 5 shows the general arrangement of this type of specimen, which is referred to as a "test shell."

Drums and Shells Tested

One of the specimens was a manganese steel test drum. The plate material in this specimen showed an analysis of 0.29 per cent carbon, 1.95 per cent manganese, 0.025 per cent phosphorus, and 0.036 per cent sulphur. Physical properties were: yield point 83,500 lb. per sq. in., tensile strength 106,500 lb. per sq. in., elongation in 8 in. 16 per cent, and reduction of area 36 per cent. The plate material for the remaining specimens was ordinary carbon steel boiler plate, and both the chemical analysis and the physical properties showed thoroughly satisfactory results for the metal in each specimen.

The designation of each test specimen, ruling dimensions of each test specimen, the type of joint, the range of test pressures and resultant computed stresses, the number of cycles of stress for fracture, and the character of the fracture, are given in Table I.

Comments on Each Test

The manganese steel test drum was cold riveted Slight trouble with the gaskets at the manholes occurred

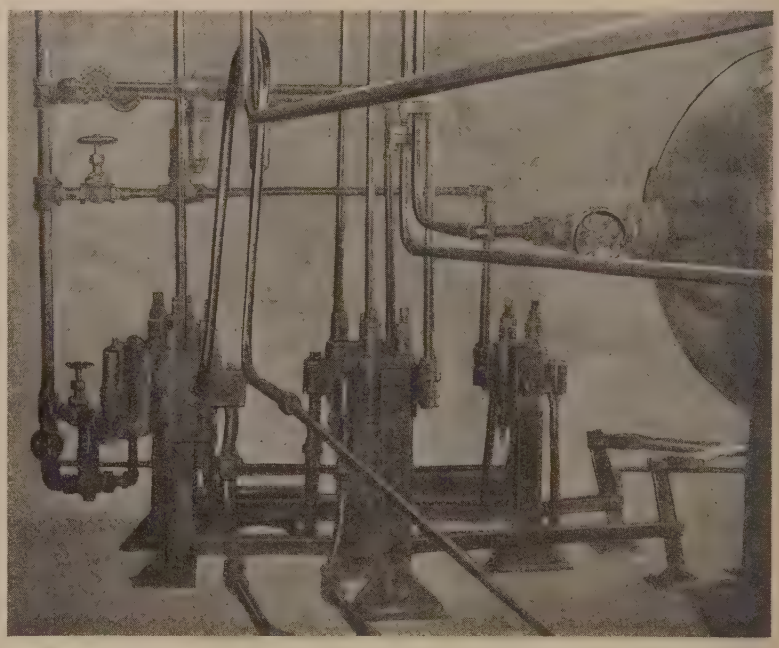

Fig. 3—Hydraulic Valves for Testing Several Drums Simultaneously

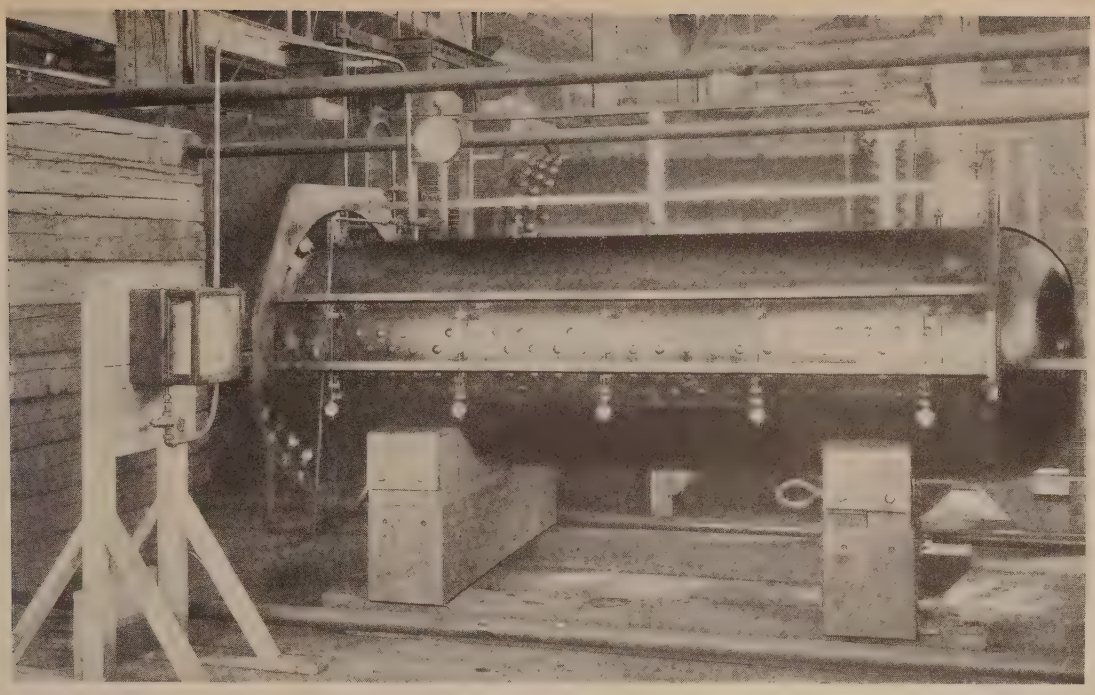

Fig. 4—Two Drums Under Test

during the first few hundred cycles of pressure. Between 3000 and 4000 cycles slight leaks appeared along the buttstraps and in one head seam. No leaks developed at the rivets. At 7100 cycles it was necessary to stop the test to replace a gasket on one manhole cover, and at this time the head seam was calked. The test was resumed, and after 45,000 cycles of pressure a slight leak appeared in both head seams. One of these leaks increased until at 65,000 cycles it was necessary to stop the test and recalk this head seam. Test was resumed, and at 92,000 cycles one manhole cover was replaced by a heavier cover. After 130,225 cycles a leak had developed near the manhole opening which was evidently a fracture. The test was stopped and examination showed a crack about 3¾ in. long located as shown in Fig. 6. The metal around this fracture was removed, a thin plate fitted into the hole and the rest of the opening filled with weld metal. The test was started again, but after 143 additional cycles of pressure the drum head split violently, as shown in Fig. 7. Examination showed a slight fracture extending into the edge of the shell. Strain measurements showed considerable variation, but no outstanding evidence of permanent distortion except in the immediate vicinity of the location where the original crack developed.

The A. S. M. E. standard drum (that is, one designed and constructed according to the provisions of the boiler code) was riveted in the usual way. After 25,000 cycles of pressure had been applied minute leaks developed along the lower edge of a buttstrap and in both head seams. After 32,000 cycles the test was stopped and the seams calked. The test was resumed and after 431,000 cycles a very minute leak (about one drop per minute) developed at the bottom of one head seam. At 629,000 cycles slight leaks had developed along the lower edge and the end of one buttstrap. The test was stopped and the joints recalked; thereupon the test was resumed, a total of 1,013,840 cycles of pressure was applied without developing any fracture. The measurements of strain gave no evidence of permanent deformation during the test.

Arc welded test shell "A" is shown, in diagram, in Fig. 5. The stresses set up were practically pure hoop tension. Arc welding was done by hand, using ordinary bare welding wire. After 5530 cycles of pressure, fracture developed in the welded seam at the junction of base metal and weld metal.

Arc welded test shell "B" is also shown, in diagram, in Fig. 5. The seam was arc welded by hand, using a processed electrode (covered electrode). After 163,000 cycles of pressure, the longitudinal seam of the *inner* shell of the test apparatus fractured. This inner shell was repaired and the test continued. After 417,381

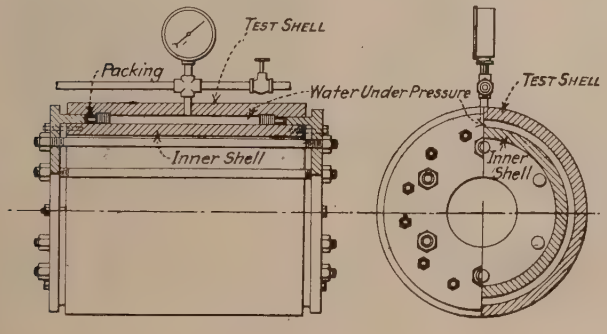

Fig. 5—(At Left) Test Shell for Determining Fatigue Strength of Welded or Forged Cylinders

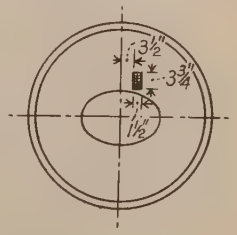

Fig. 6—Sketch of Original Check in Drum Head and Method of Repair

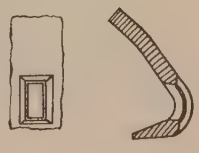

cycles, the outer shell fractured, not in the weld, but at the tapped hole where the pressure gage connection was made. This is a point of stress concentration, and its significance is discussed later. During the test the strain measurements showed no sign of permanent deformation.

Arc welded test shell "C" is shown, in diagram, in Fig. 5. The seam was also welded, using a processed electrode. After 160,000 cycles of pressure the packing of the joint between inner and outer shells became loose. The test was stopped and the packing replaced; thereupon the test was resumed, and after 561,984 cycles the outer shell cracked at the gage connection (a ½-in. pipe thread). The failure was similar to that for arc welded test shell "B," and is shown in Fig. 8. The crack barely reached through to the outer surface, but was several inches long on the inside. During the test the strain measurements showed no evidence of permanent deformation in the steel test shell.

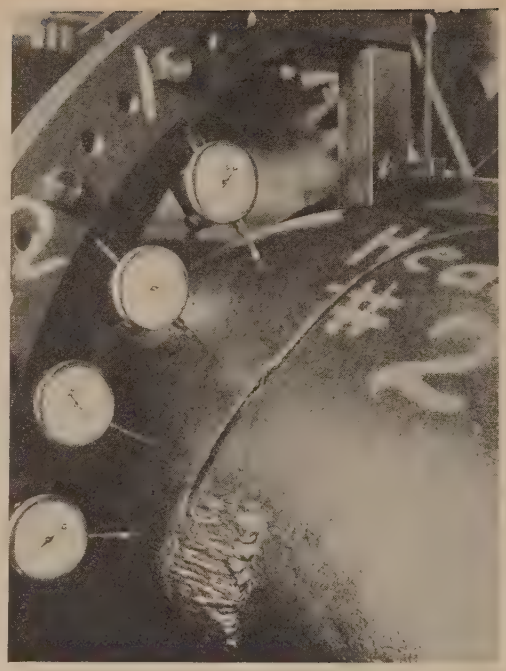

Fig. 7—Long Crack Skirting Edge of Welded Patch in Drum Head of Manganese Steel

Arc welded test shell "D" was a duplicate of shell "C" in construction, type of welding wire used, and method of testing. After 435,883 cycles of pressure failure occurred at the gage connection, as in the case of shell "B" and shell "C."

The forged steel test shell was a forging without any longitudinal seam. After 20,000 cycles of pressure the inner shell of the test apparatus cracked in the longitudinal seam; it was repaired and the test continued. After 446,950 cycles the outer shell fractured at the pressure gage connection in a manner very similar to the fracture for arc welded test shells "B," "C" and "D." The strain measurements showed no evidence of permanent distortion.

Stresses Concentrated at Holes

It is obvious that, until many more tests have been made, nothing in the nature of final conclusions can be drawn as to the fatigue resistance of boiler seams. However, in view of the very meager amount of data concerning the behavior under repeated stress of such seams, and of welded joints in general, these few test results seem worthy of attention.

In the case of the test shells which fractured at the tap hole for the gage connection, it is to be noted that according to the theory of elasticity such a hole would cause a stress-intensification at its edge amounting to three times the computed stress in the plate. The practical effect of such holes, as judged by repeated-stress tests seems to be less than this theoretical value. Haigh and Wilson[1] have made tests of specimens of structural steel under cycles of tensile stress varying from zero to a maximum, and they report a reduction of strength due to a hole of only a very slight amount for structural steel, although later tests showed a larger reduction for harder steel with a hole in it. Tests at the University of Illinois[2] on specimens of soft steel subjected to cycles of reversed bending show a reduction of strength of about 50 per cent due to the hole. In this connection it is to be noted that the "A. S. M. E. standard drum" (line 2, table I), which did *not* fracture, had such a tapped hole in its outer shell. However, owing to the allowance for efficiency of the riveted joint, the stress at the tapped hole (which was some distance away from a riveted seam) was only 13,200 lb. per sq. in., as compared with 16,500 lb. per sq. in. for the stress at the riveted seam.

A fair value for endurance limit of boiler plate steel under reversed bending is 26,000 lb. per sq. in. For cycles of stress varying from zero to a maximum it may be expected that the value of endurance limit will rise to about 39,000 lb. per sq. in.[3] This would indicate that the practical stress-concentration factor at the tapped hole in the case of the shells tested lay between 39,000 ÷ 13,200

[a] Test pressure 1.5 times working pressure. Maximum stress under test pressure is 1.5 times working stress.
[b] The higher of the two ranges is the range of computed stress through the line of rivets; the lower of the two ranges is the range of computed stress in the shell away from the riveted seam.
[c] The efficiency of the welded joints is taken at the nominal value of 100 per cent.

and 39,000 ÷ 16,500, that is between 2.95 and 2.36. Possibly the rather rough finish left by the tap, and the irregularities of outline due to the threads, may make this factor higher than would have been the case for a smooth drilled hole.

It should be noted that the riveted drum specimens stood up well under repeated cycles of pressure, and it seems in order to inquire why the stress-concentration at the rivet holes was not more in evidence. In the case of the "A. S. M. E. standard drum," the grip of the rivets on the plate may have spread the stress in the vicinity of the rivet hole. There also may be a factor affecting strength of riveted joints similar to the effect reported by R. R. Moore[4], later checked by tests at the University of Illinois, who found that a *single* groove in a test specimen reduced the fatigue strength much more than did a series of grooves. Possibly a series of holes acts in a similar fashion.

[4] Proceedings, American Society for Testing Materials, Vol. 26, Part II, page 225, (1926).

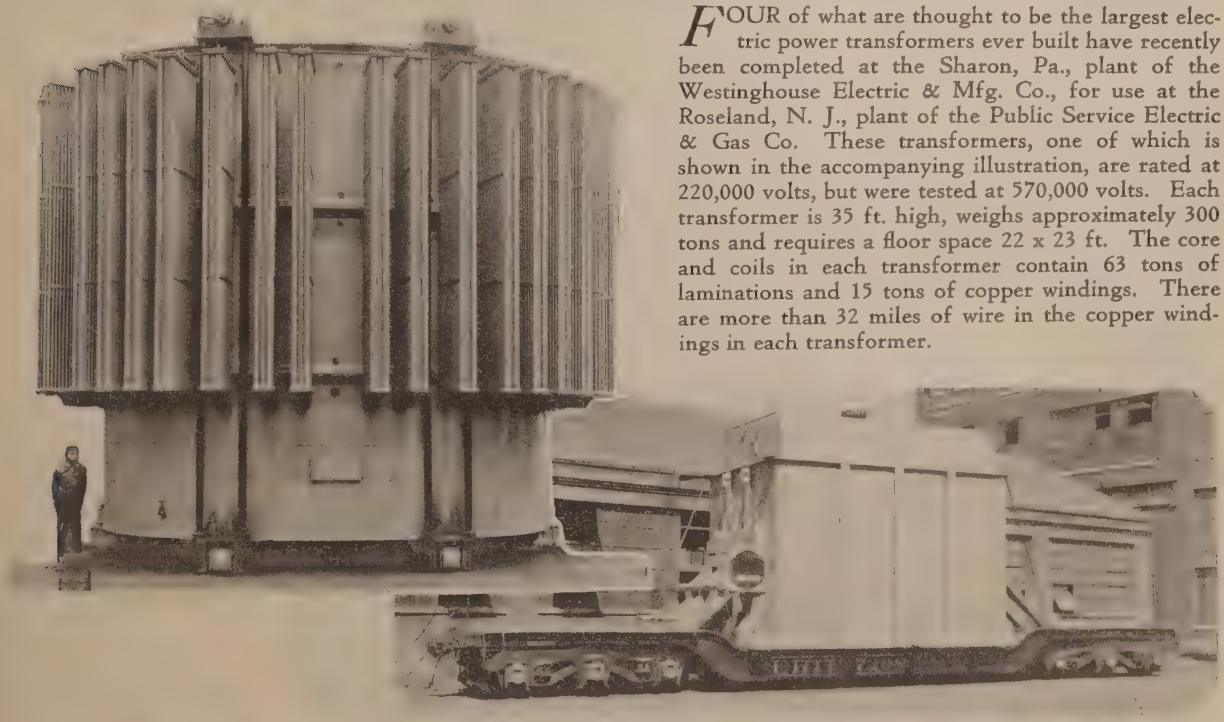
During the tests some corrosion of the metal was noted, but there is no apparent evidence that corrosion fatigue played an important part in the test results.

The results of these few tests do seem to furnish a basis for three conclusions:

(1) Welded joints in test drum shells have been made which do not weaken the fatigue strength of the shell as much as does the tapping of a hole for a gage connection.

(2) Welded joints in test drum shells have been made which withstood cycles of stress varying from zero to a value 50 per cent above the allowable working stress for more than 400,000 cycles. This is at least 50 times as many cycles as would be developed in the normal life of a boiler.

(3) The strength of a welded seam under repeated cycles of pressure is greatly affected by variation of welding practice. It is evident that, if it is expected to obtain welded joints at all resistant to repeated stress, it is very necessary to develop and maintain good, uniform welding practice, and carefully inspect the welding.



FOUR of what are thought to be the largest electric power transformers ever built have recently been completed at the Sharon, Pa., plant of the Westinghouse Electric & Mfg. Co., for use at the Roseland, N. J., plant of the Public Service Electric & Gas Co. These transformers, one of which is shown in the accompanying illustration, are rated at 220,000 volts, but were tested at 570,000 volts. Each transformer is 35 ft. high, weighs approximately 300 tons and requires a floor space 22 x 23 ft. The core and coils in each transformer contain 63 tons of laminations and 15 tons of copper windings. There are more than 32 miles of wire in the copper windings in each transformer.

To Melt 2200 Tons of Iron a Day

Enlarged Chevrolet Gray Iron Foundry Has 11 Cupolas and 14 Continuous Molding and Pouring Conveyors

BY FRED L. PRENTISS

A DAILY melting output of 2200 tons of iron is expected to be obtained in the enlarged gray iron foundry of the Chevrolet Motor Co., Saginaw, Mich. Large extensions to this plant were recently completed, more than doubling its capacity, and already 1875 tons has been melted and poured in one day.

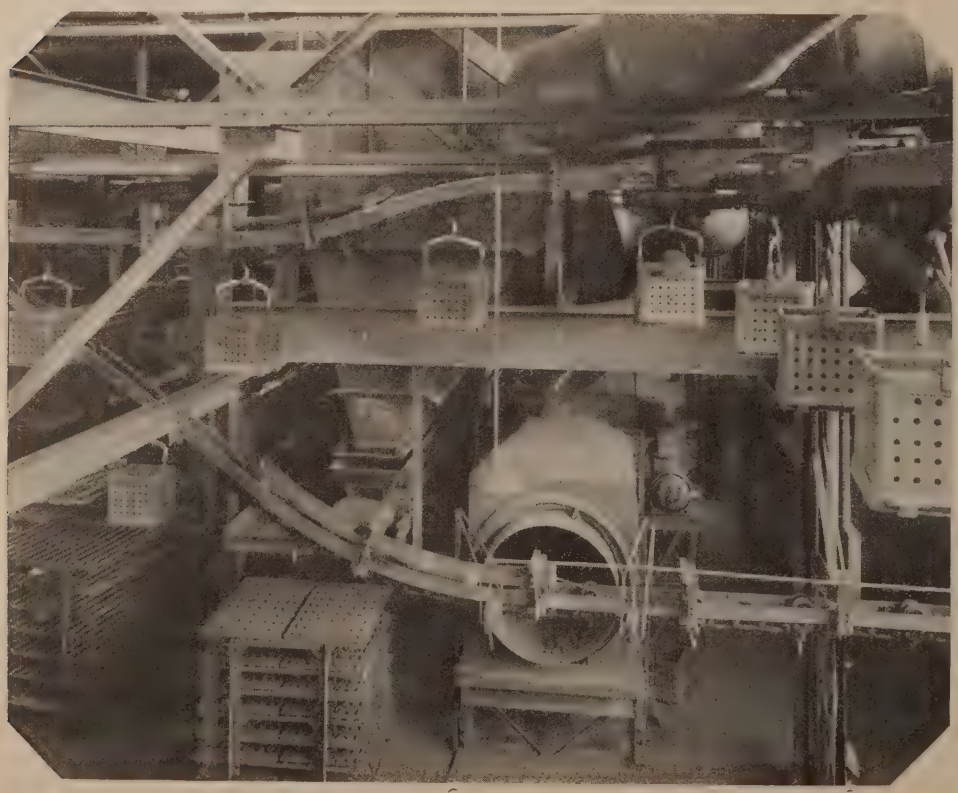
Built in 1919 as the foundry of the Saginaw Products Co., a unit of the General Motors Corporation, this plant was enlarged and modernized in 1926. A description of the foundry as then equipped appeared in THE IRON AGE, April 8, 1926. With the shifting of foundry production work by the General Motors Corporation and the building of two large new foundries, the Buick foundry at Flint and the Oakland-Pontiac foundry in Pontiac, the Saginaw foundry that had been making cylinder blocks and other castings for Buick and Chevrolet cars became a Chevrolet foundry, and the name of this unit was changed accordingly.

More Than Twice as Many Units

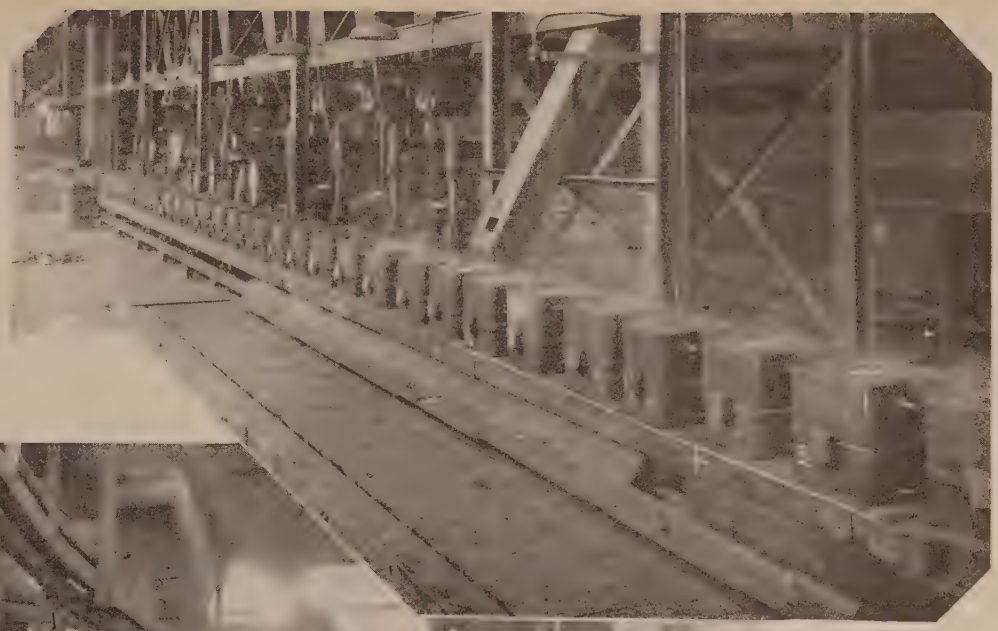
With the recent enlargement the number of cupolas has been increased from 5 to 11, and the number of conveyors for continuous molding and pouring from 6 to 14. The plant has been enlarged materially to provide additional floor space to make room for the increased capacity. While the layout of the old foundry has been generally followed in the arrangement of the new equipment, the new portion of the plant has some new and interesting features in equipment and handling arrangements which represent developments that have been made in the foundry industry in the past two or three years. Probably the most important innovation is the change in the method of handling castings between the shake-out and the cleaning room.

Large production makes possible the provision of a separate molding unit for each of the more important smaller castings. In the new part of the foundry there are two mold conveyors for pistons, one for clutch housings, one for transmission housings, one for flywheels, one for tappets and two for miscellaneous small castings. Cylinder blocks are made on three of the old conveyors and cylinder heads on the other three.

The mold conveyors are of the run-around car type, which have taken the place of the drag line conveyors now being generally used. Cast iron cars on 4-ft. centers support the ends of ship channel sections 18 in. wide, which overlap the car, forming a continuous plate type



PASSING from the Shake-out to an Apron Conveyor, the Castings and Sand Are Delivered to a Revolving Screen (Shown in Lower Center). From this the castings are discharged into buckets, in which they are picked up, and after cooling while moving on this 1400-ft. conveyor, are delivered to the cleaning department



ONE of the Molding Units Used in Making Pistons. The pouring conveyor is shown at the side of the mold conveyor (At Right)

COOLING Conveyor Carries the Castings into the Cleaning Room, Where the Loaded Baskets Are Dumped into Hoppers Above the Tumbling Barrels (At Left)

table which protects the rails and conveyor chain from falling sand and runouts and makes the table easier running and safer for the workmen. Each car is mounted on four bronze-bushed wheels with closed ends. The conveyor is driven by a drop forged chain suspended from the bottom of the cars, the drive being of the cantilever type.

Three of the mold conveyors are 220 ft. long, four 115 ft. long and one 161 ft. long. The conveyors have a speed range of 15 to 30 ft. a minute, the speed being adjusted according to the kind of molds being poured. At the side of the pouring zone are pouring conveyors 25 to 50 ft. long raised slightly above the foundry floor and moving at the same speed as the mold conveyors. Molds after pouring run around the end of the conveyor to the shake-out, passing beneath a hood on the return side for carrying away heat and fumes. Each unit has a power return flask conveyor. The molding machinery and other foundry equipment were supplied by William H. Nicholls Co., Inc., Richmond Hill, N. Y.

At the shake-out end the castings and sand are knocked out through a grating on to an apron conveyor. Gases and smoke are drawn away through a hood above the shake-out. The castings and sand are carried upward and discharged from the apron conveyor into a revolving screen located on the foundry floor. This screen is 54 in. in diameter and 10 ft. 4 in. long over all. The screen itself is a perforated plate 6 ft. long at the center of the revolving barrel. The screen is set at a slight angle, so that gravity will cause the castings to move slowly through it while it revolves. At the discharge end the castings fall into baskets under an overhead castings conveyor or, if desired, can be discharged on to a truck.

The castings are carried in buckets suspended from this conveyor, which also serves as a cooling conveyor. The buckets are of perforated steel, about 2 ft. square, holding up to 800 lb. In front of the discharge end of the screen at the floor level is a turntable equipped with two air jacks. An empty basket is lifted off the conveyor and at the same time a loaded basket is hung on the conveyor by means of these jacks. The table is then swung around, placing the empty basket in the loading position. To allow them to cool off, before reaching the tumbling mills in the cleaning room, the castings travel overhead for about 2 hr. The cooling conveyor extends over hoppers above the tumbling mills, into which the castings are discharged by tripping the hinged bottom of the basket. From the hoppers they are discharged through gates into the tumbling mills.

Each molding unit has a screen for separating the sand from the castings. There are three castings conveyors, one serving three units. These travel from 3 to 12 ft. a minute, depending on the kind of casting. Each is 1400 ft. long, and the baskets are hung on 3-ft. centers.

Various advantages are claimed for this method of handling castings from the shake-out to the tumbling

mills. As the castings are carried below the floor when shaken out, only the flasks remaining on the floor, there is less smoke and heat in the vicinity of the shake-out. The castings are always kept moving and less sand is carried into the tumbling mills than would be the case were the castings not carried through the revolving screen.

Sand-Handling System Carries Many Tons

The sand shaken from the castings in the revolution of the screen passes through the screen on to a belt conveyor beneath, over a magnetic pulley which removes the iron and is carried upward to an overhead sand screen. From this screen the sand is discharged into a pug mill, then passes through a conditioner and into a 75-ton storage bin. From this it is fed through cutting feeders on to a belt into a bucket elevator, which discharges it to a flight conveyor for distribution into the molders' hoppers. Each unit has its own sand conditioning and distribution plant.

LARRY Car Loaded by an Automatic Skip, Delivering Coke to a Bin Back of the Cupolas

In the new core room 100 tons of core sand is used an hour. In this department are 64 two-rack type oil-fired core ovens arranged in two batteries, each consisting of 16 ovens in a row placed back to back with another 16. These ovens are 6 ft. wide x 12 ft. 4 in. deep by 7 ft. high, inside dimensions. Each battery is fired with four 3-in. Multi-spray oil burners supplied by the Industrial Heating Equipment Co., one burner for eight ovens, automatically controlled by a Wilson-Maeulen automatic controller.

Three Melting Units Always Fired

The new cupolas are 9½ ft. in diameter, lined down to about 72 in. Three cupolas are always in use and are operated for nearly 22 hr. Because of the long period of operation, unusually heavy linings are provided in the melting zones.
